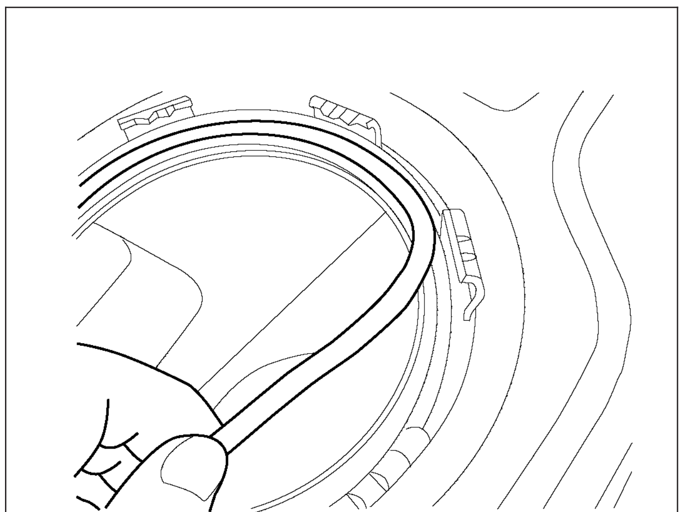
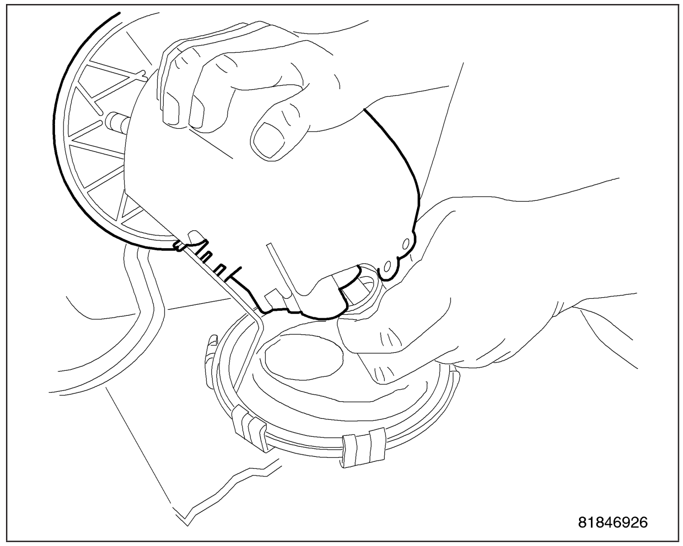
11. Drain fuel from fuel pump module. Do not spill fuel in interior of vehicle.



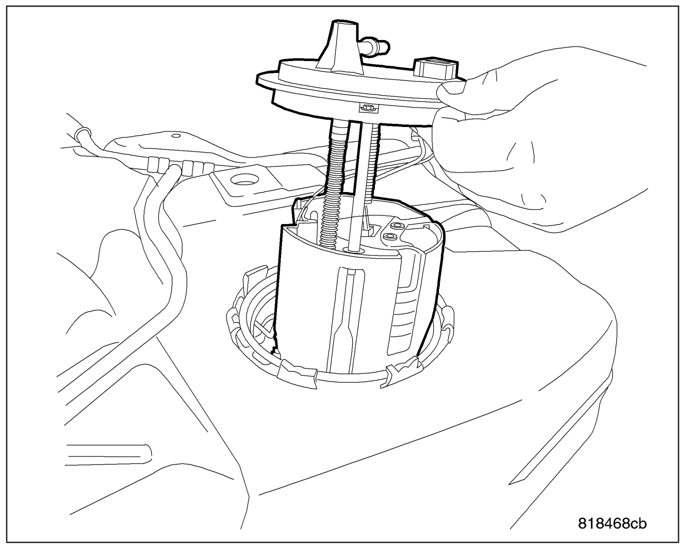
8184691b

INSTALLATION



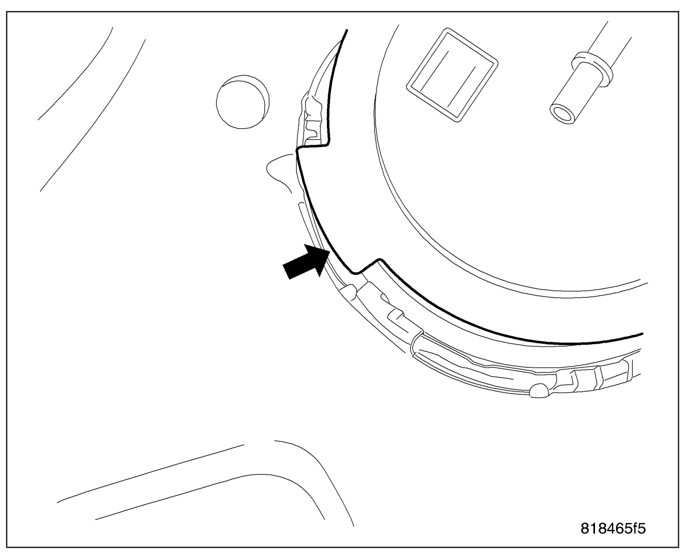
ALL WHEEL DRIVE

NOTE: The pump has to properly located to the tank for the fuel gauge to work properly.

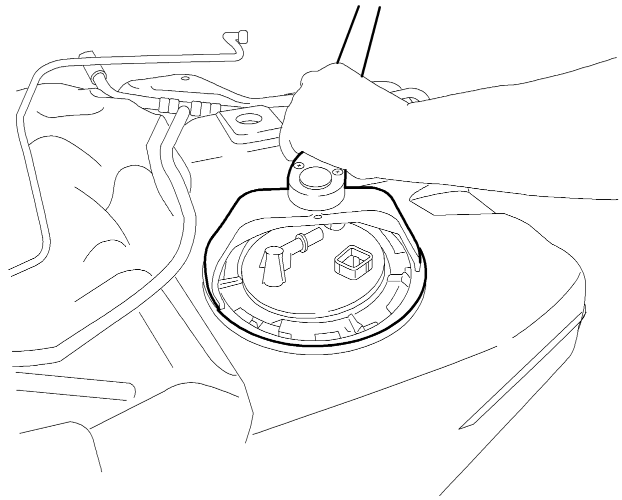


1. Wipe seal area of tank clean. Place a new seal between the tank threads and the pump module opening.

81725318

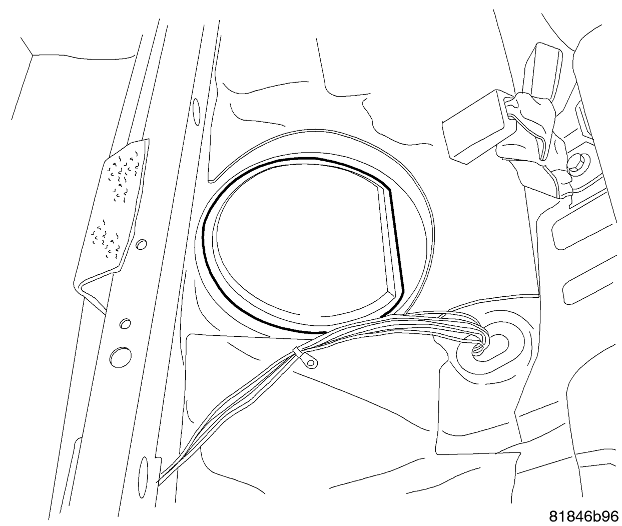


2. Connect line to module.

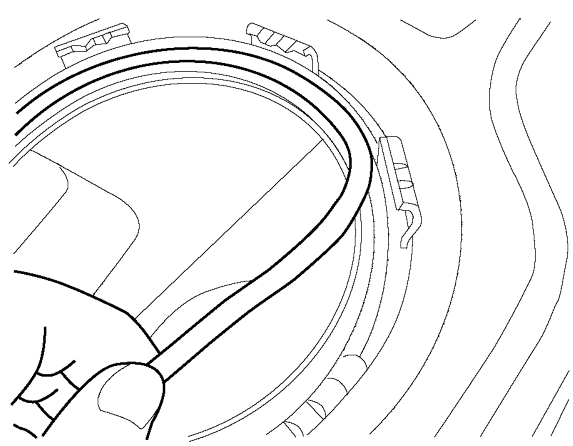


3. Install module.

4. Position fuel pump module in tank. Make sure the alignment tab line up on the fuel tank and pump module for Gas or Diesel fuel tanks.

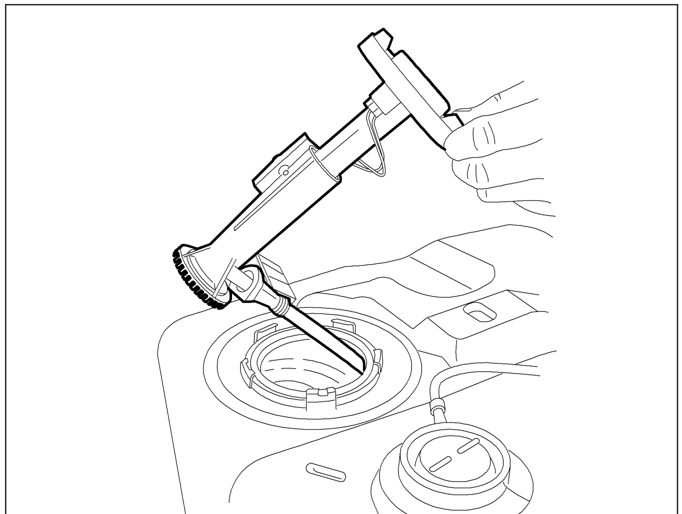


5. While holding the pump module in position, install lock ring and use special tool #9340 to tighten lock ring.



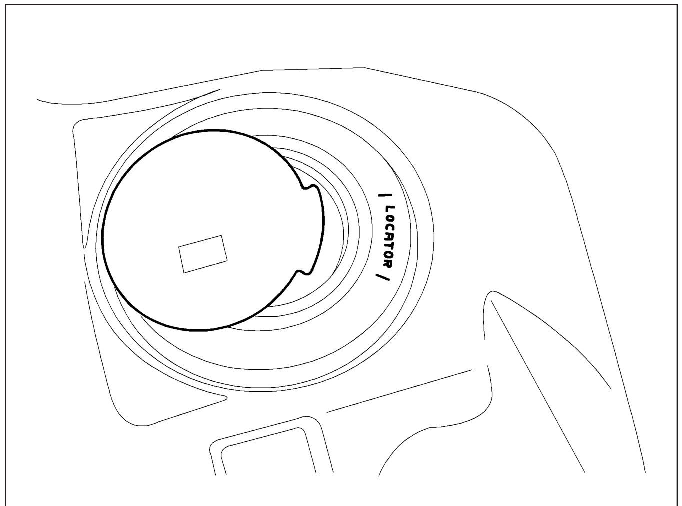
81846497

6. Install plastic cover.



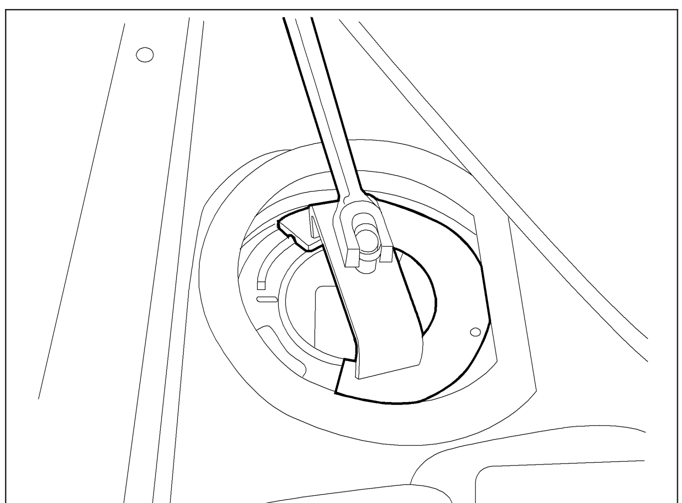
81846b96

7. Wipe seal area of tank clean. Place a new seal between the tank threads and the pump module opening.



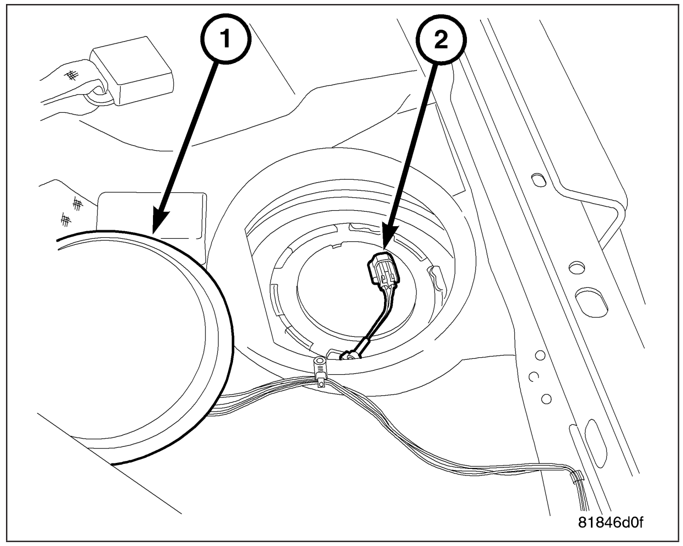
81725318

8. Connect line and install venturi module.



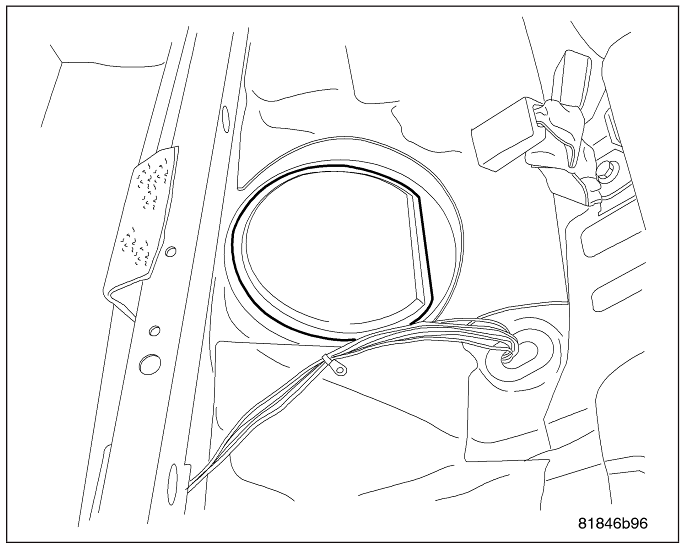
81846a02

9. Position fuel pump module in tank. Make sure the alignment tab line up on the fuel tank and pump module for Gas or Diesel fuel tanks.

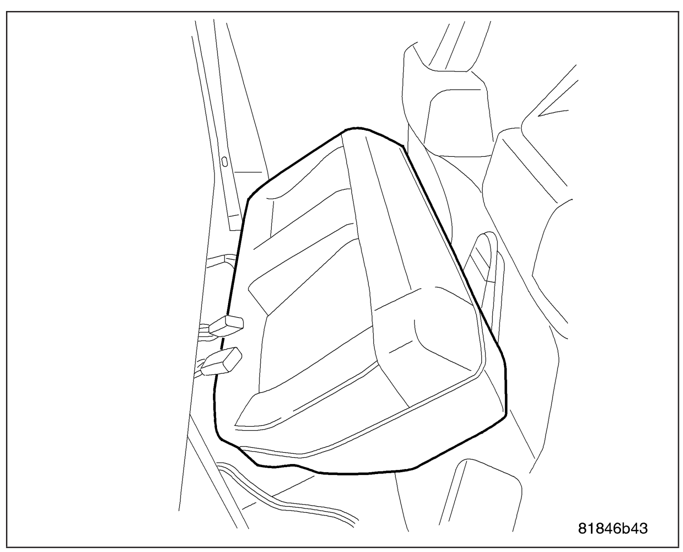


818469fc

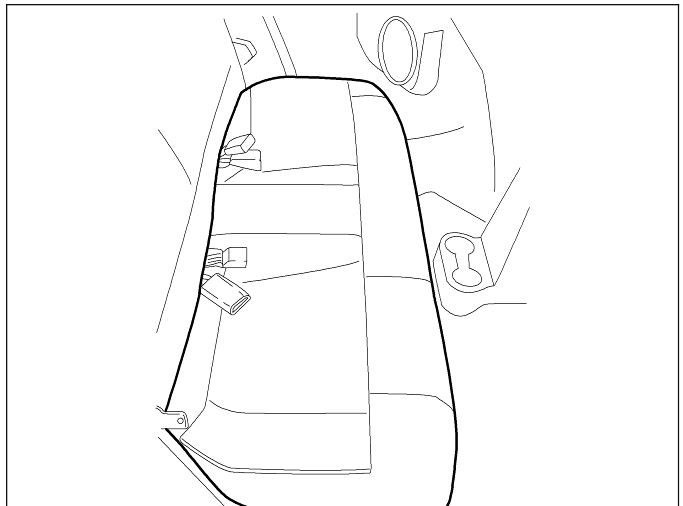
10. While holding the pump module in position, install lock ring and use special tool #9340 to tighten lock ring.



81846f8a

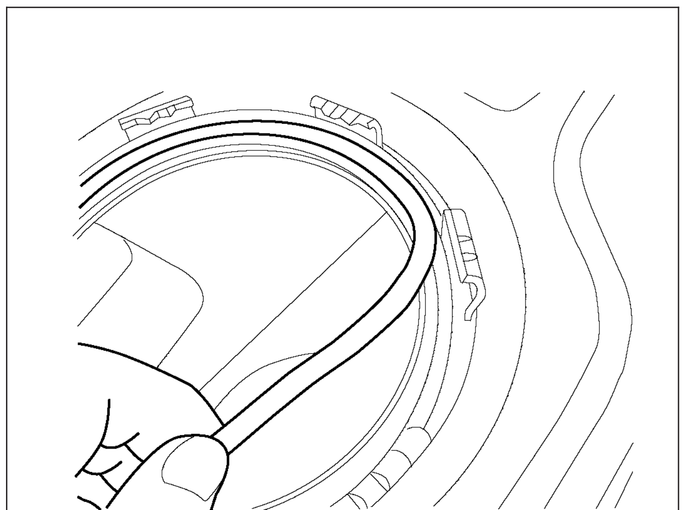


11. Connect electrical connector.



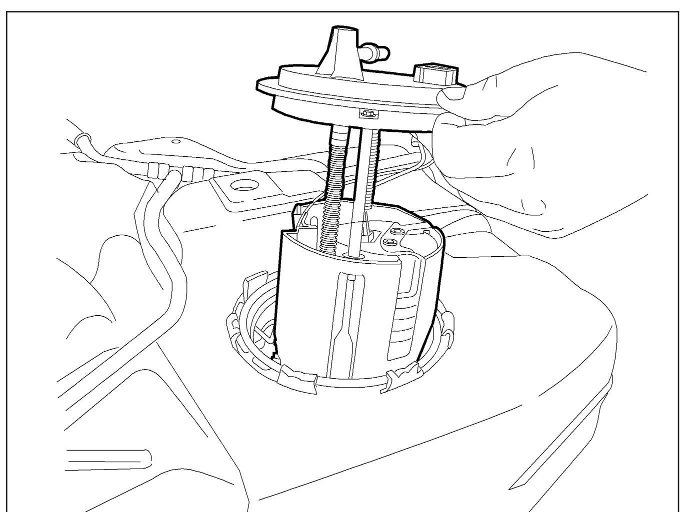
12. Install plastic cover.

13. Install rear cushion.



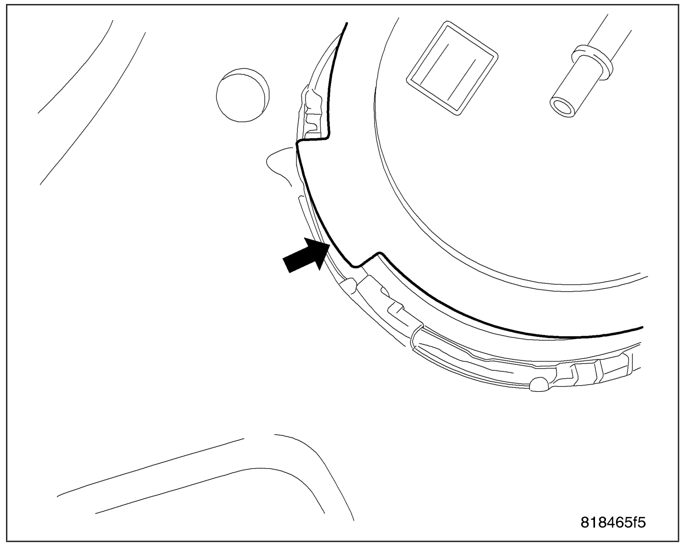
14. Install the negative battery cable.
15. Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.
16. Fill fuel tank with clean fuel. Use the Scan Tool to pressurize the system and check for leaks.

81846afb



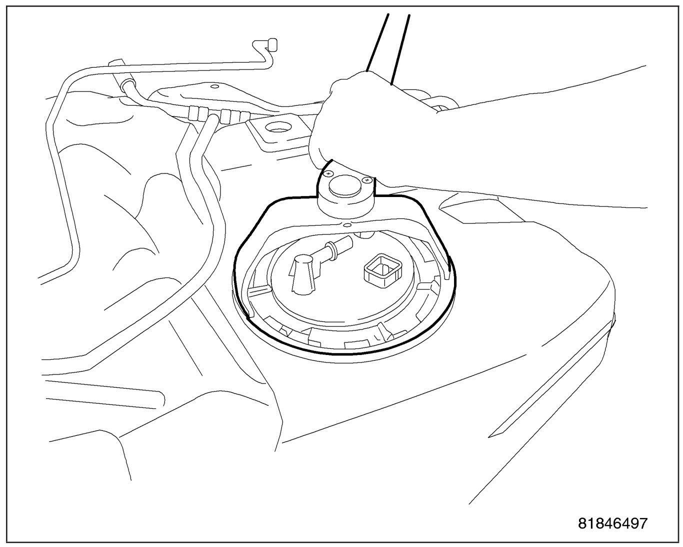
FRONT WHEEL DRIVE

NOTE: The pump has to properly located to the tank for the fuel gauge to work properly.



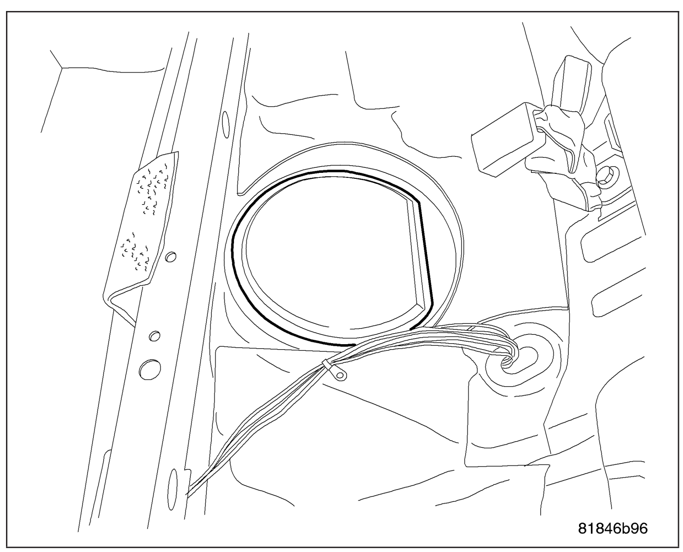
1. Wipe seal area of tank clean. Place a new seal between the tank threads and the pump module opening.

81725318

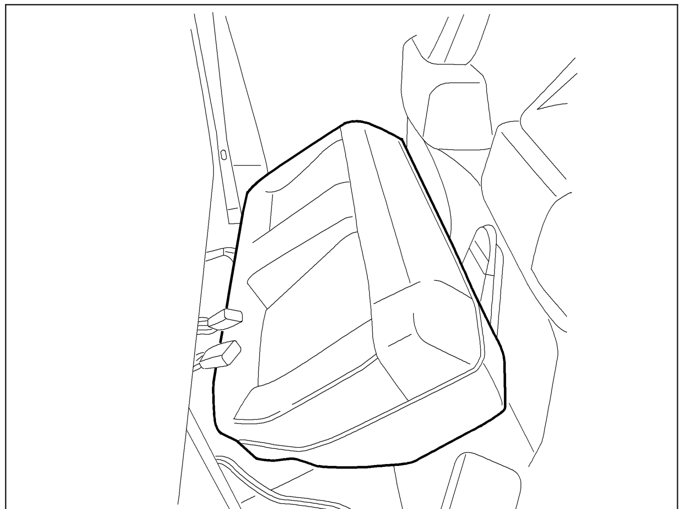


2. Install module.

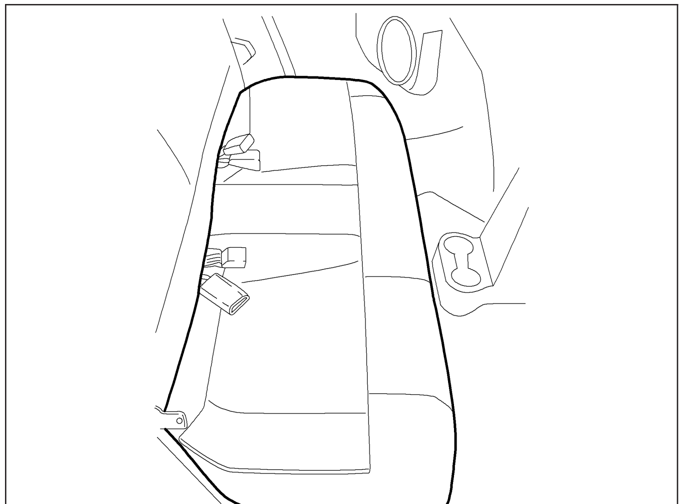
818468cb



3. Position fuel pump module in tank. Make sure the alignment tab line up on the fuel tank and pump module for Gas or Diesel fuel tanks.



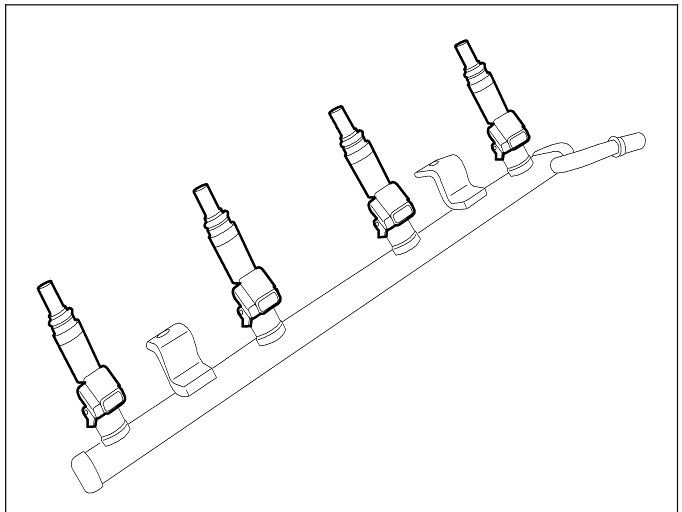
4. While holding the pump module in position, install lock ring and use special tool #9340 to tighten lock ring.



5. Install plastic cover.

6. Install rear cushion.

81846b43



7. Install the negative battery cable.
8. Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.
9. Fill fuel tank with clean fuel. Use the Scan Tool to pressurize the system and check for leaks.

81846afb

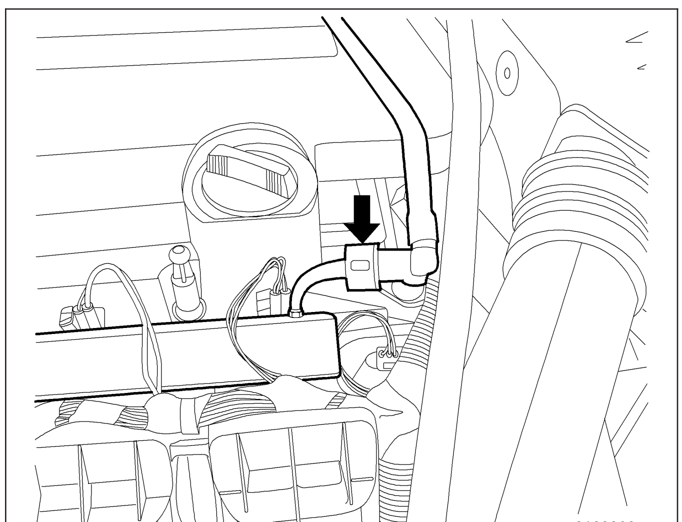
FUEL RAIL

DESCRIPTION

The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the intake manifold

818384d6

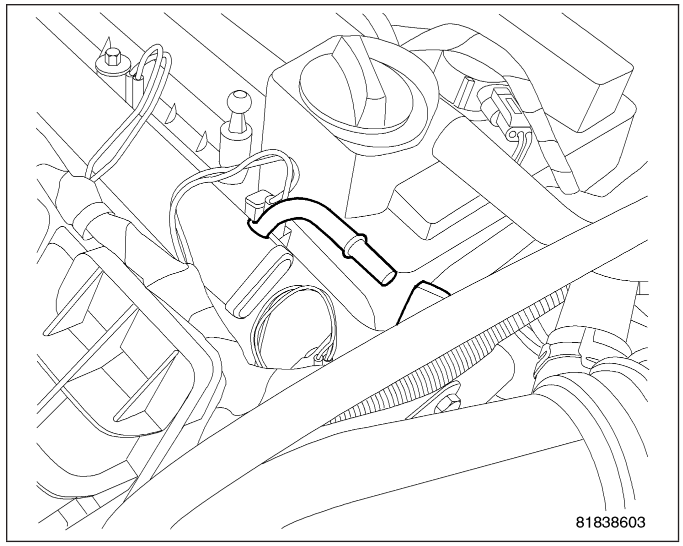
OPERATION



The fuel pressure regulator is no longer mounted to the fuel rail on any engine. It is now located on the fuel tank mounted fuel pump module. Refer to Fuel Pressure Regulator in the Fuel Delivery System section of this group for information. The fuel rail is not repairable.

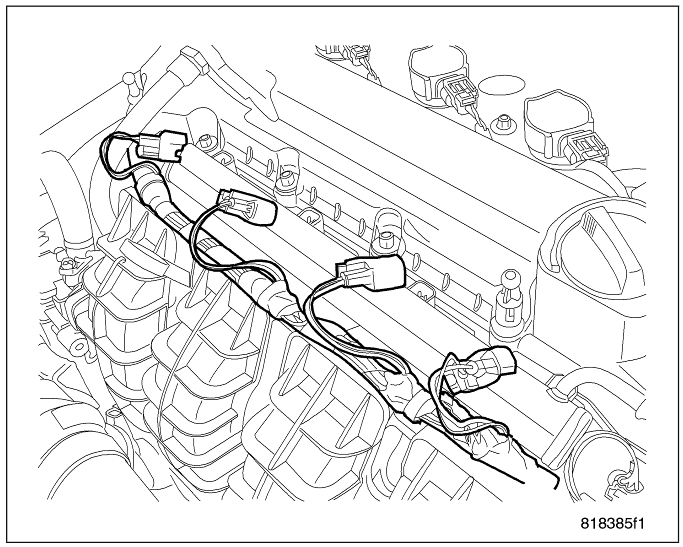
REMOVAL

WARNING: Release fuel system pressure before servicing fuel system components. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle. This may result in personal injury or death.

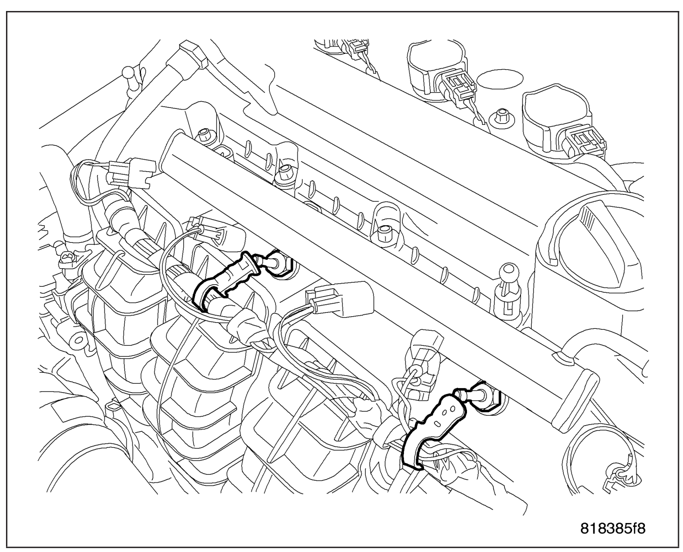


NOTE: Wrap shop towels around hose to catch any gasoline spillage.

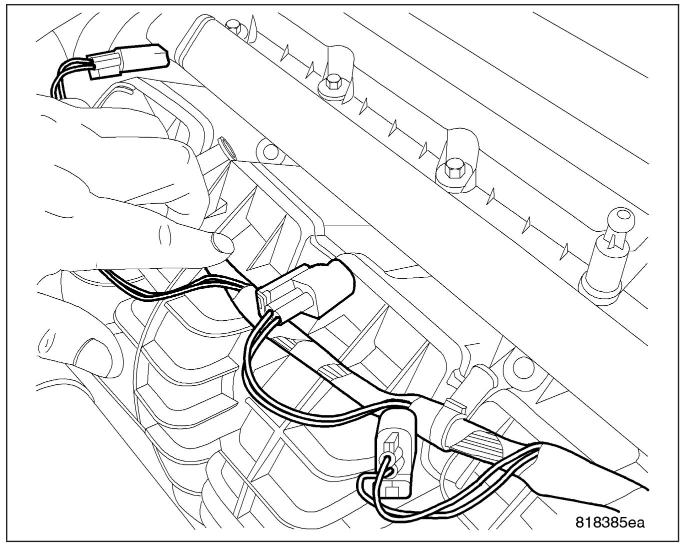
1. Release the fuel system pressure.
2. Disconnect the negative battery cable.
3. Disconnect the fuel line from the fuel rail. Refer to the Quick-Connect Fittings in this section.



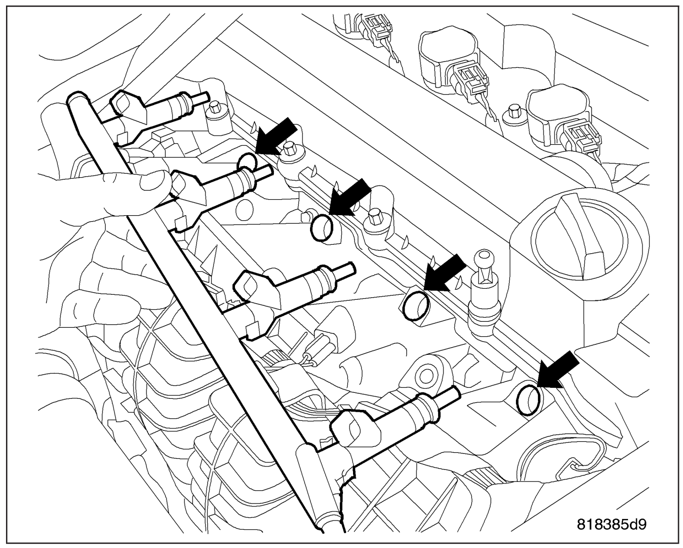
8183860a



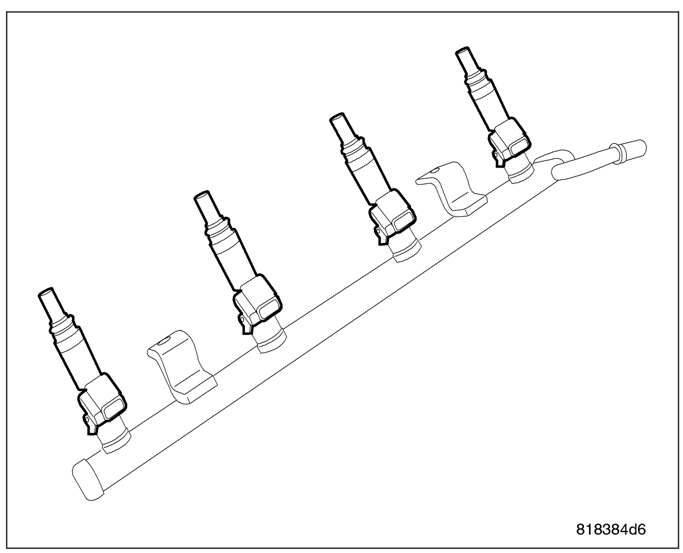
4. Fuel line removed from the fuel rail.



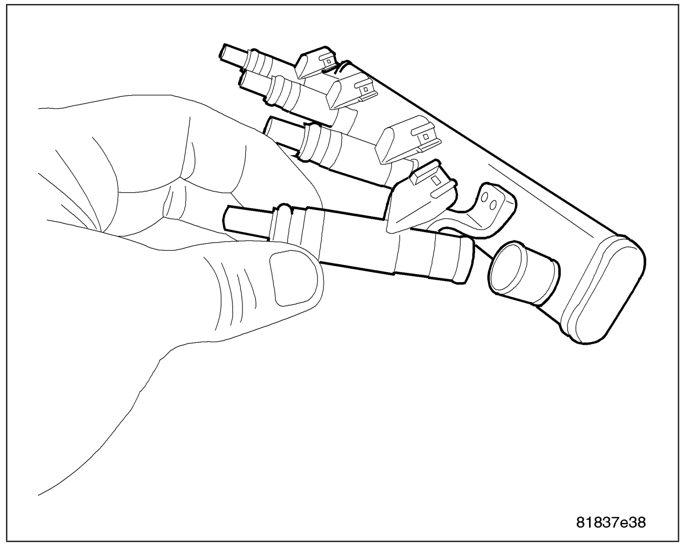
5. Unlock and disconnect the electrical connectors from the fuel injectors.



6. Remove the wiring harness from the fuel rail studs.

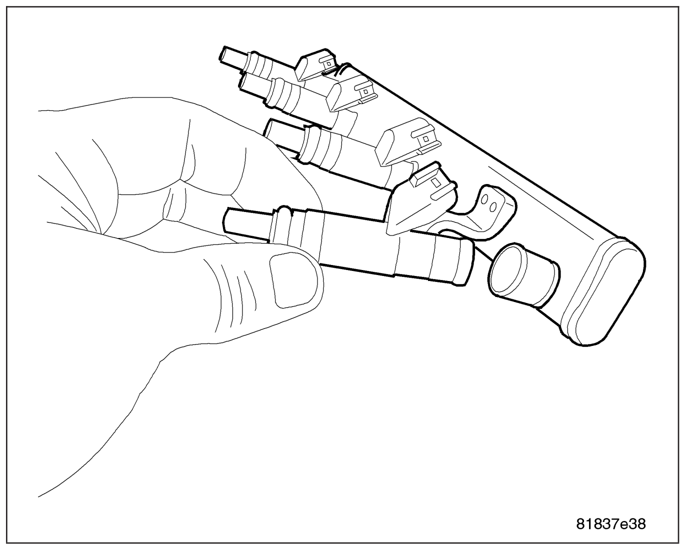


7. Remove the 2 bolts from the fuel rail.

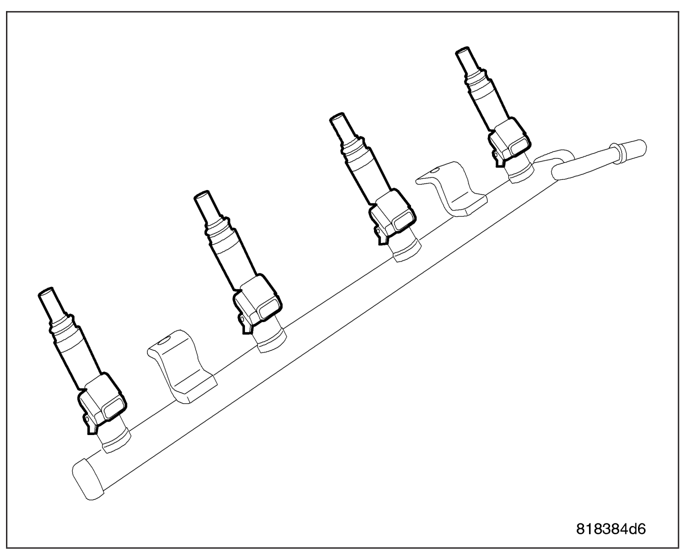


8. Remove the fuel rail and injectors from the intake manifold.

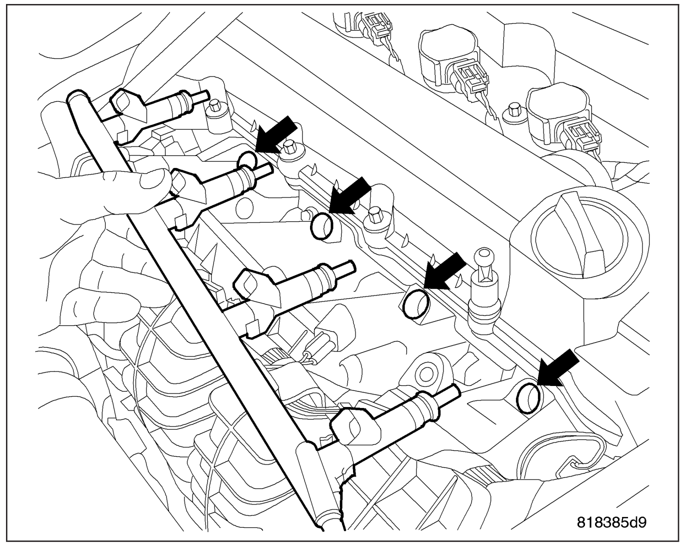
9. Fuel rail removed from intake manifold.



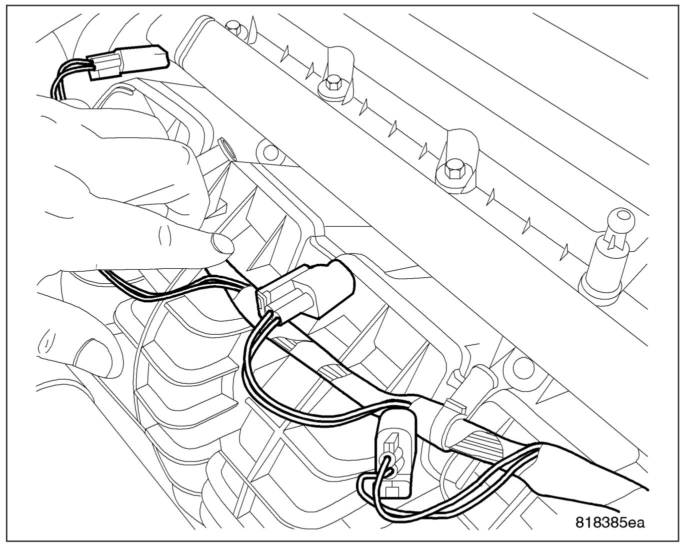
10. Remove fuel injectors from fuel rail.



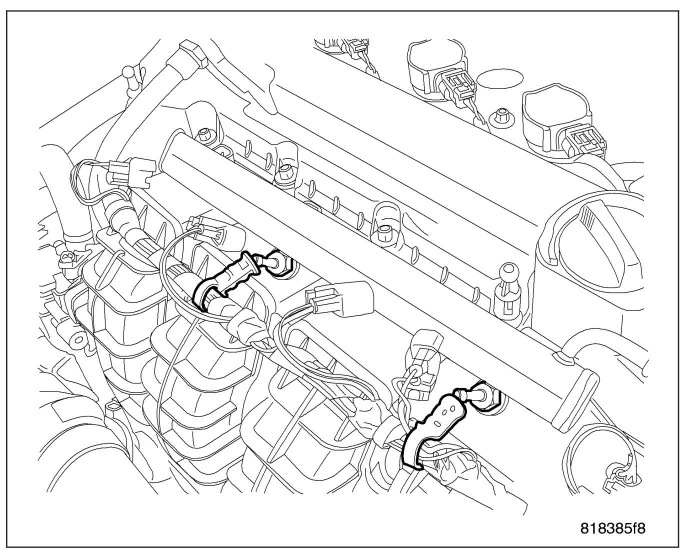
INSTALLATION



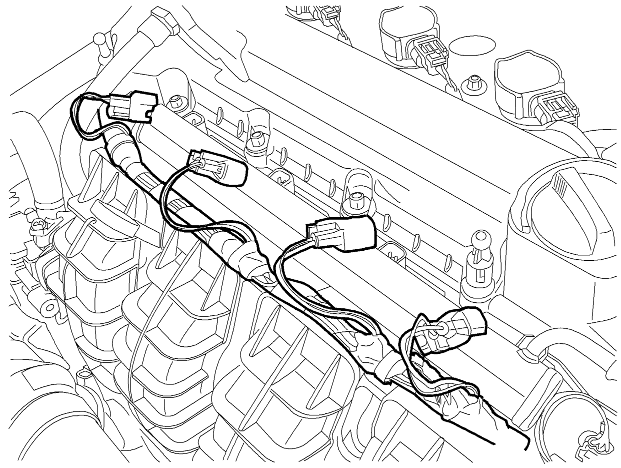
1. Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.
2. Install the fuel injectors to the fuel rail.
3. Install injector into cup of fuel rail.
4. Install retaining clip and check to ensure injector is properly captured.



Fuel rail assembly.

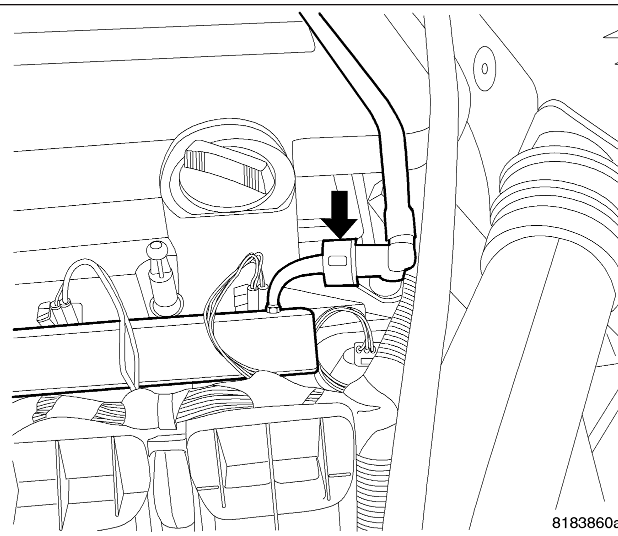


5. Insert fuel injector nozzles into openings in intake manifold. Seat the injectors in place.



6. Install the 2 bolts to the fuel rail. Tighten fuel rail bolts to 27 N·m (20 ft. lbs.).

7. Install the wiring harness to the fuel rail.



8. Connect and lock the electrical connectors to the fuel injectors.

818385f1

9. Connect the fuel line to the fuel rail. Refer to Quick Connect Fittings in the Fuel Delivery Section of this Group.
10. Connect the negative battery cable.
11. Use the San Tool Fuel System Test to pressurize the fuel system. Check for leaks.

8183860a

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module. The tank is made from High density Polyethylene (HDPE) material.If equipped with ORVR (Onboard Refueling Vapor Recovery) it has been added to the fuel tank to control refueling vapor emissions.

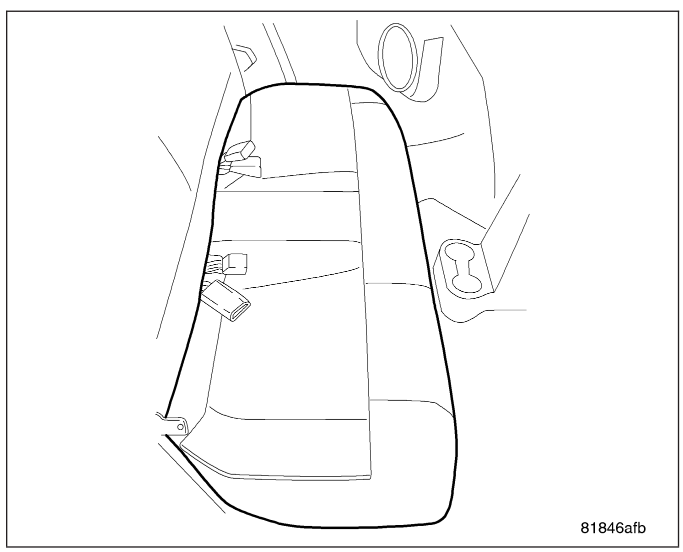
OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two check valves mounted into the top of the fuel tank (or pump module).

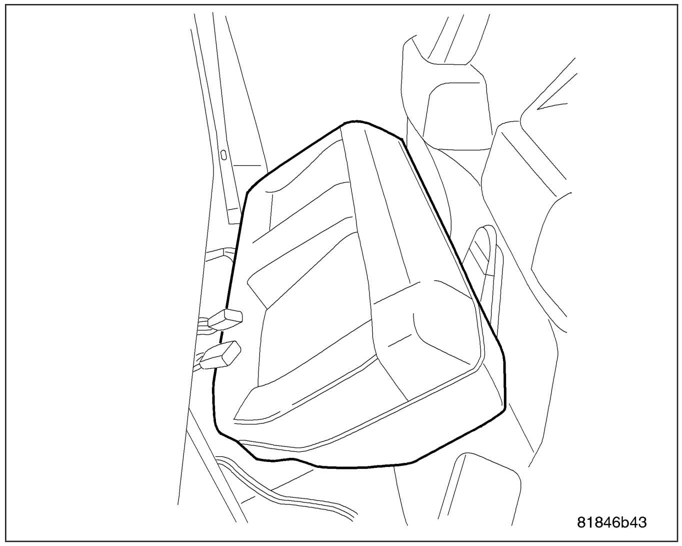
An evaporation control system is connected to the check valve(s)/control valve (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS/ORVR - OPERATION) to reduce emissions of fuel vapors into the atmosphere, when the tank is vented due to vapor expansion in the tank. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hoses/tubes to the charcoal canister(s) for temporary storage (prior to being drawn into the intake manifold). All models are equipped with a self-diagnosing system using a Leak Detection Pump (LDP) or Natural Vacuum Leak Detection (NVLD). Refer to the Emission Control System for additional information.

INLET CHECK VALVE



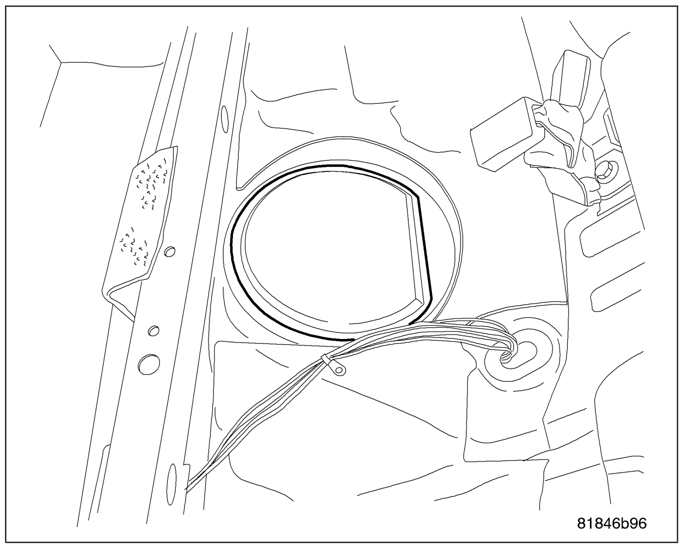
All vehicles have an inlet check valve on the inside of the fuel tank at the filler inlet

The valve prevents fuel from splashing back on customer during vehicle refueling. The valve is a non-serviceable item.



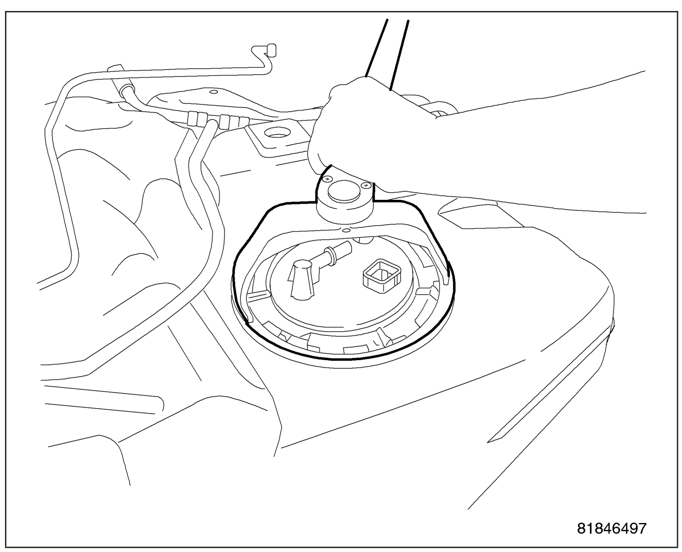
REMOVAL

WARNING: Release fuel system pressure before servicing fuel system components. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle. This may result in personal injury or death.

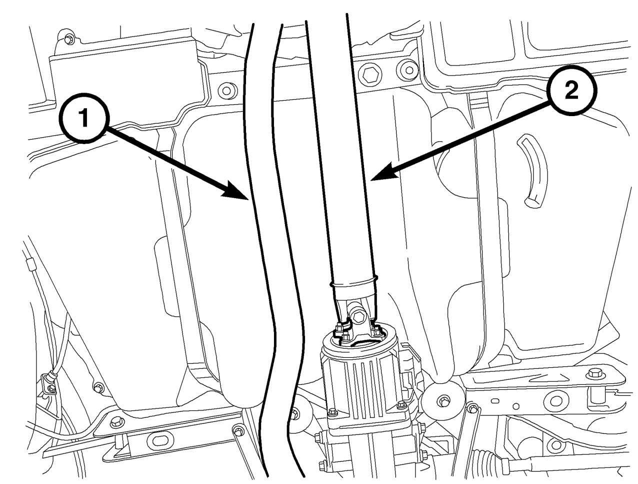


1. Release fuel system pressure. Refer to Fuel Pressure Release Procedure in this section.
2. Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
3. Remove the negative battery cable.
4. Remove the rear seat cushion.

5. Rear seat cushion loose.



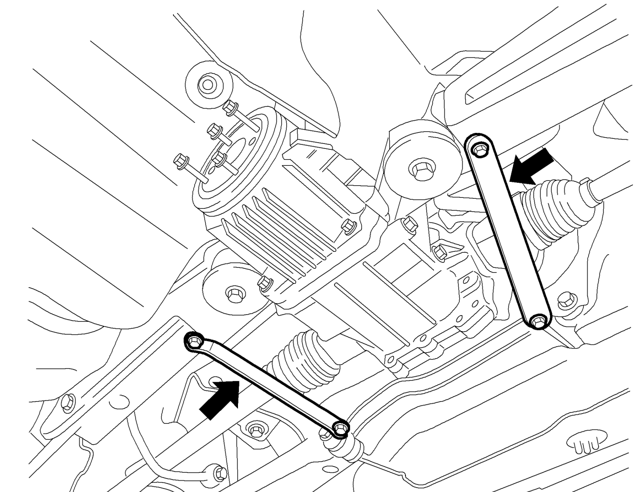
6. Remove plastic cover.



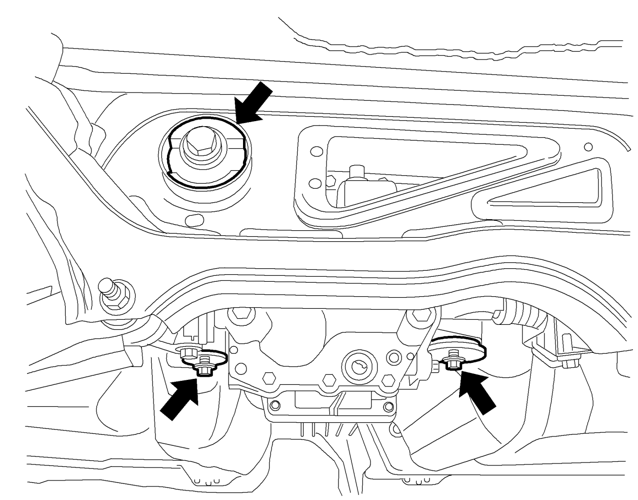
7. Clean top of tank to remove loose dirt and debris.
8. Use special tool #9340 to remove left side module lock ring.

NOTE: wrap shop towels around hoses to catch any gasoline spillage.

9. Disconnect electrical and fuel lines from module.
10. Drain fuel from tank.
11. Raise and support the vehicle.

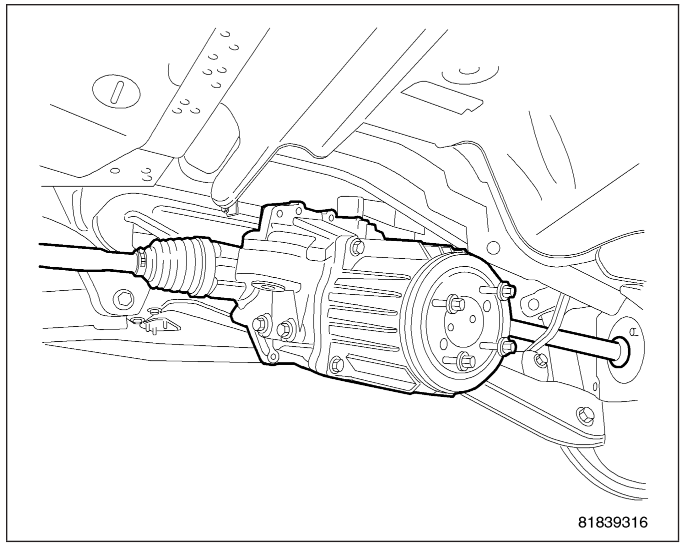


12. Remove exhaust system.
13. For All Wheel Drive vehicles, remove drive shaft



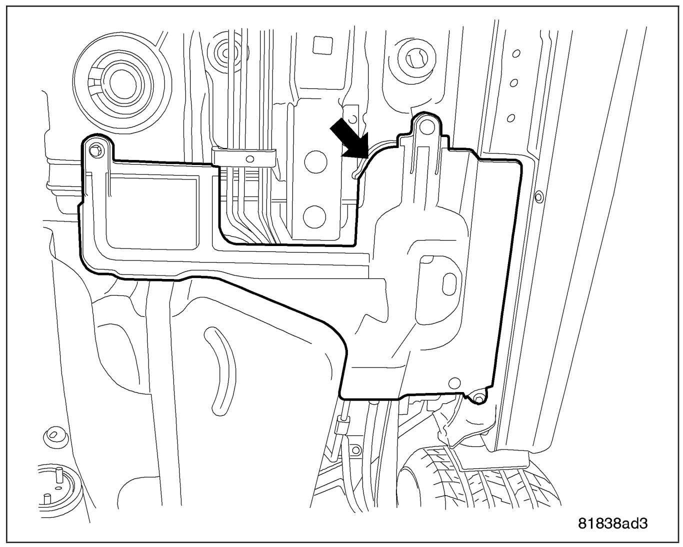
81838988

14. Remove stay bars.



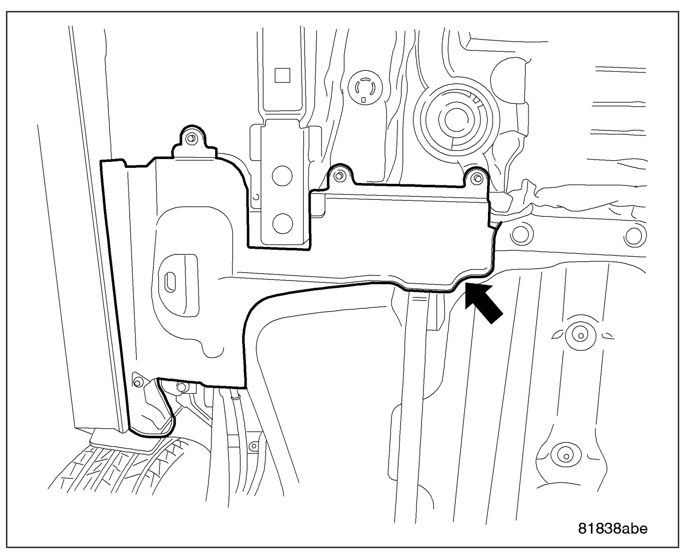
8183929c

NOTE: For All Wheel Drive vehicles the rear driveline module most be lowered to remove fuel tank assembly.

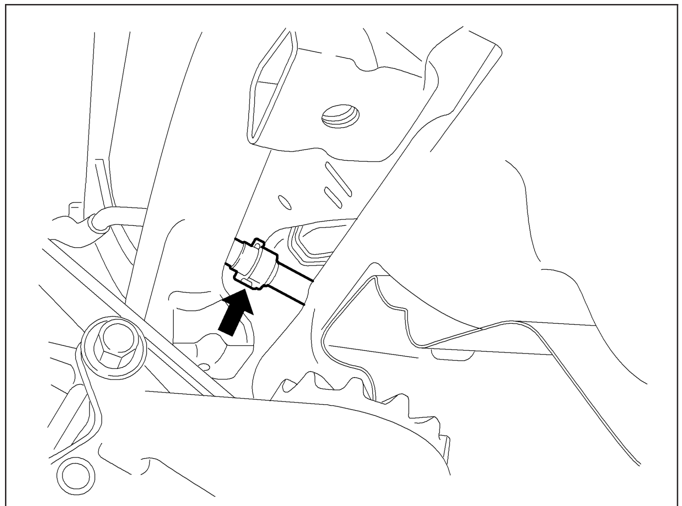


15. Tie rear driveline module to suspension crossmember.
16. Support rear driveline module.
17. Remove 3 mounting bolts and lower rear drive line module from suspension crossmember.

81839264

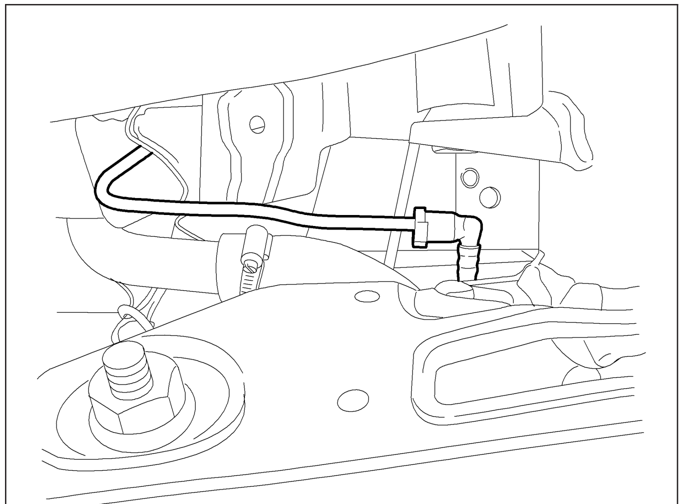


18. Module lowered.



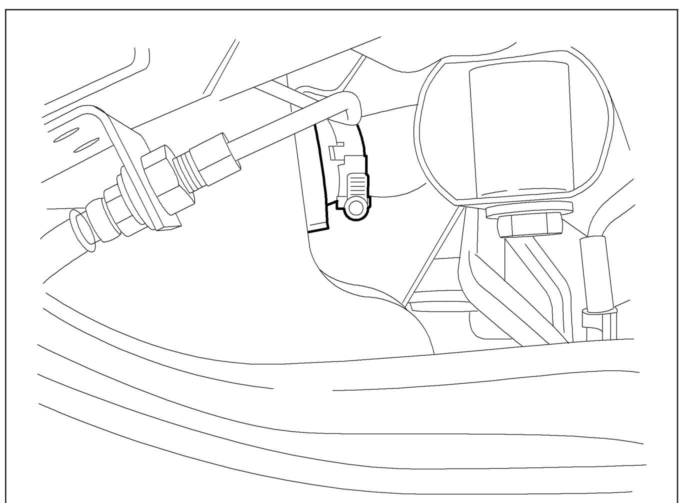
19. Remove splash shield.

20. Remove splash shield.



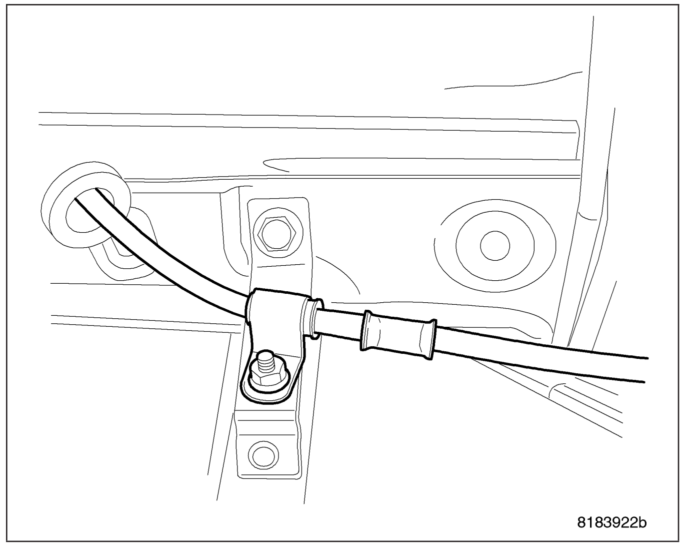
21. Disconnect vapor canister line.

8183924a



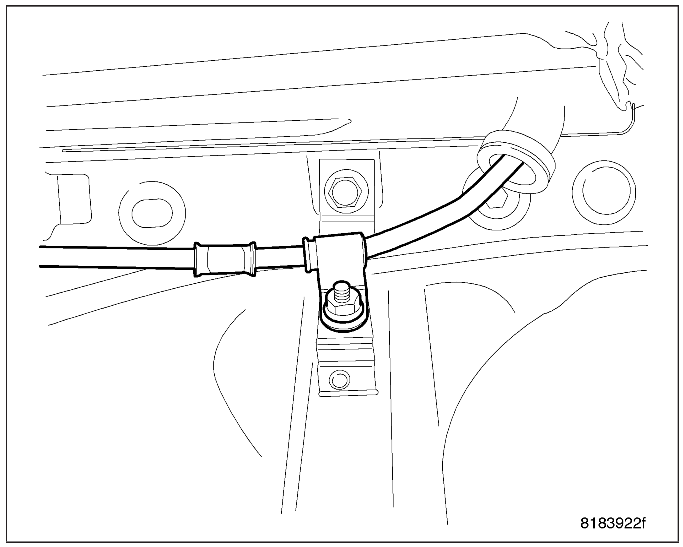
22. Disconnect filler tube recirculation vent line and purge line.

8183923a

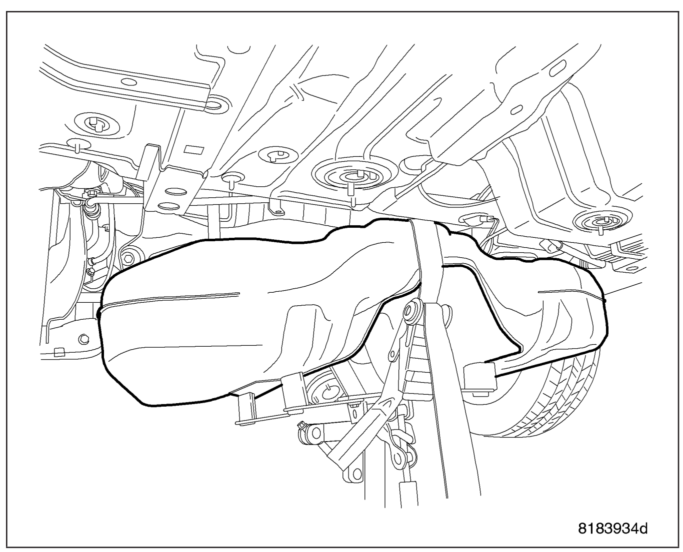


CAUTION: There may be fuel in the fill tube. Remove hose carefully to reduce fuel splash.

23. Disconnect fuel tank from rubber fill hose.

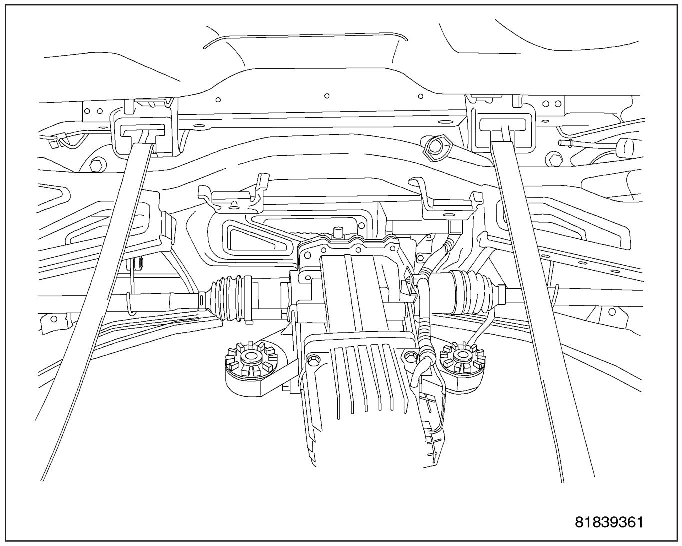


8181243a

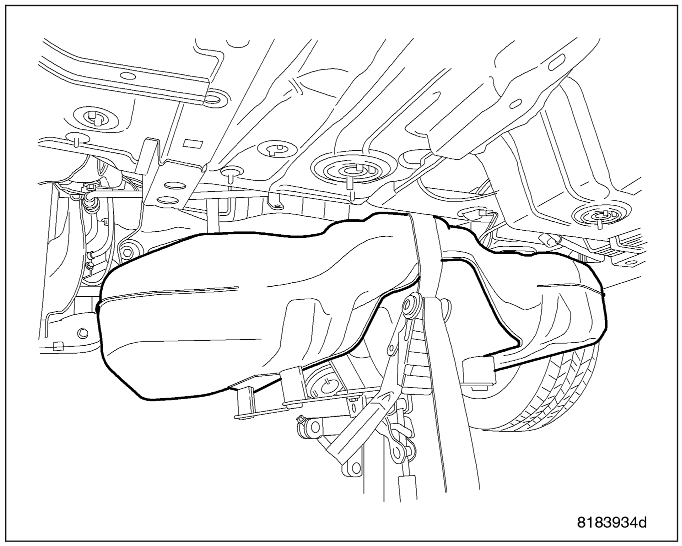


24. Remove parking brake cable mounting.

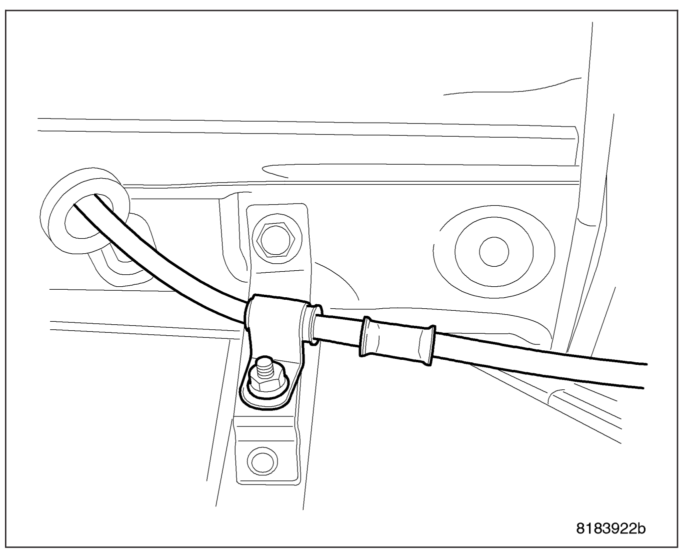
25. Remove parking brake cable mounting.



26. Support fuel tank.
27. Remove bolts from the fuel tank straps.
28. Remove fuel tank from vehicle.

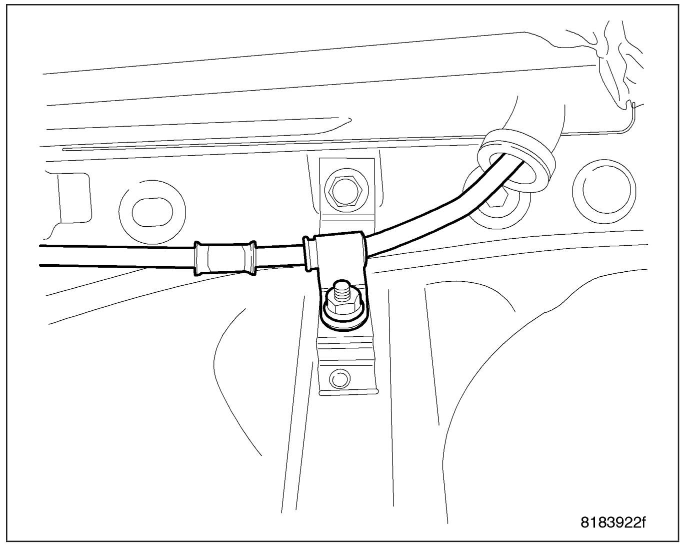


INSTALLATION



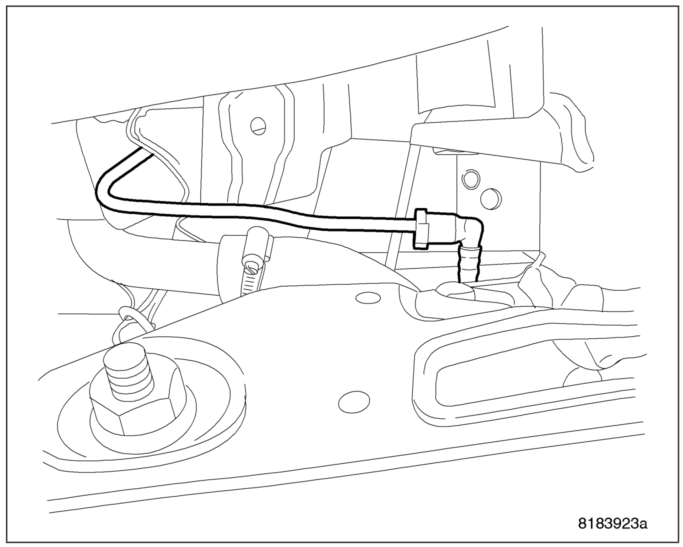
1. Install fuel tank straps.

81839361



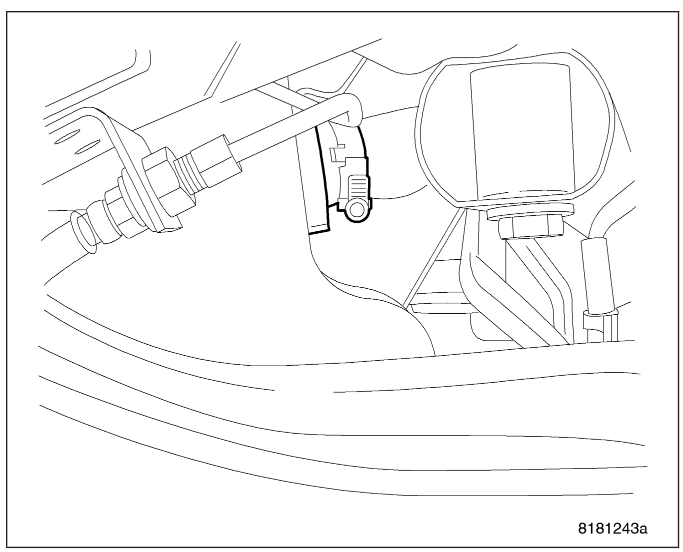
2. Raise fuel tank into position.
3. Position fuel tank straps. Tighten fuel tank strap bolts to 47 N·m (34.5 ft. lbs.) torque. Remove transmission jack. Ensure straps are not twisted or bent.

8183934d

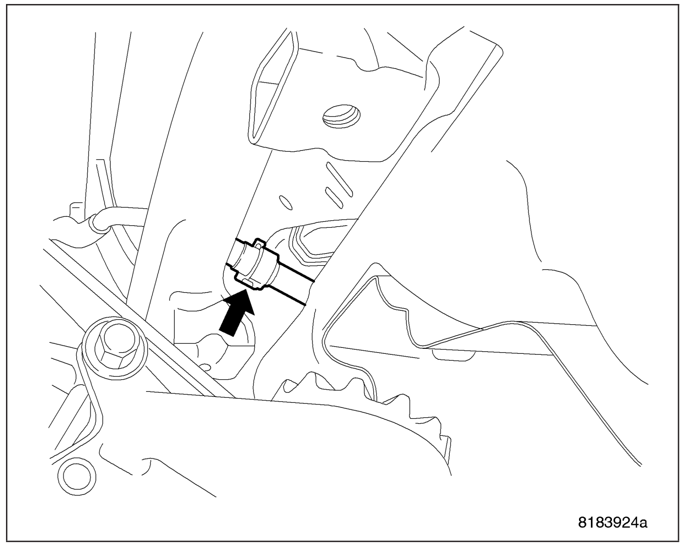


4. Install parking brake cable,

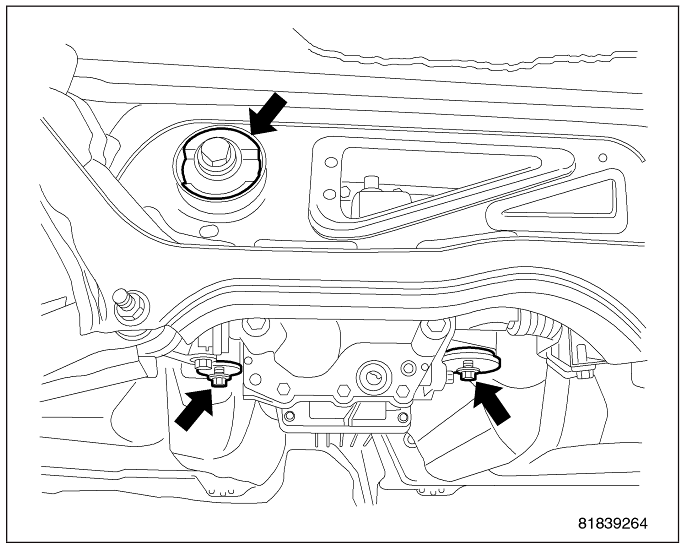
8183922b



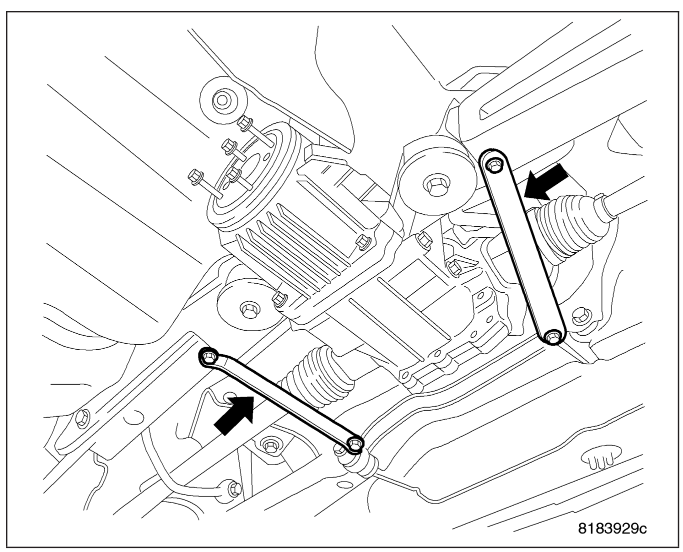
5. Install parking brake cable,



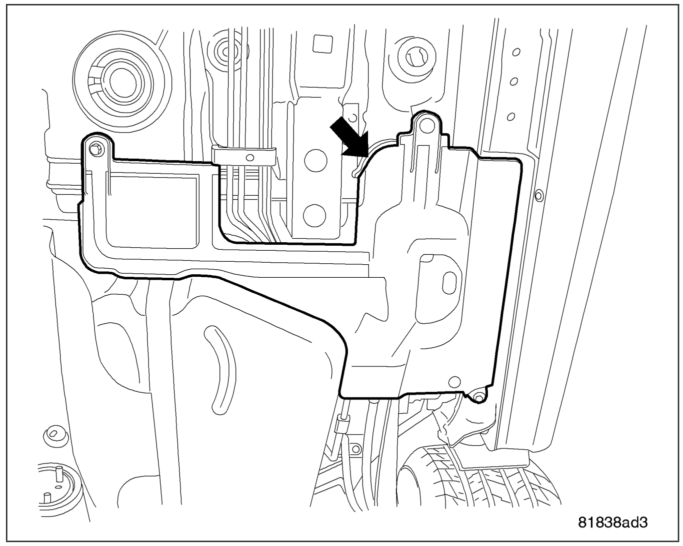
6. Connect filler tube recirculation vent and line purge line.



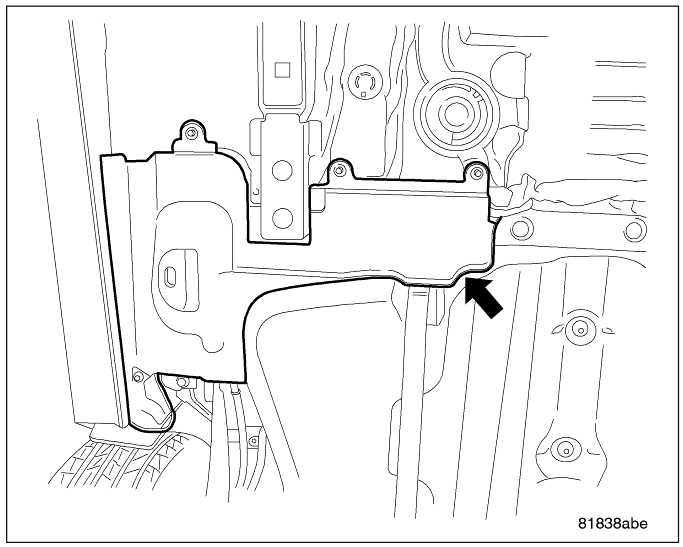
7. Connect fuel fill tube to tank inlet. Tighten hose clamp to 4.1 N·m (38 in. lbs.) torque.



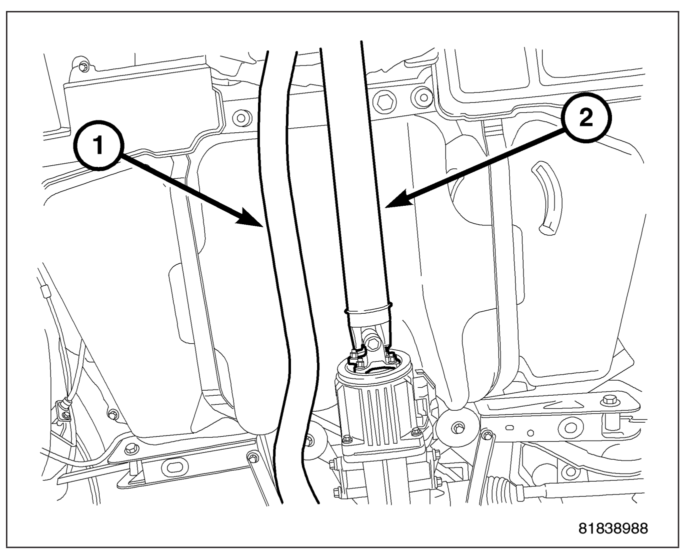
8. Connect vapor canister line.



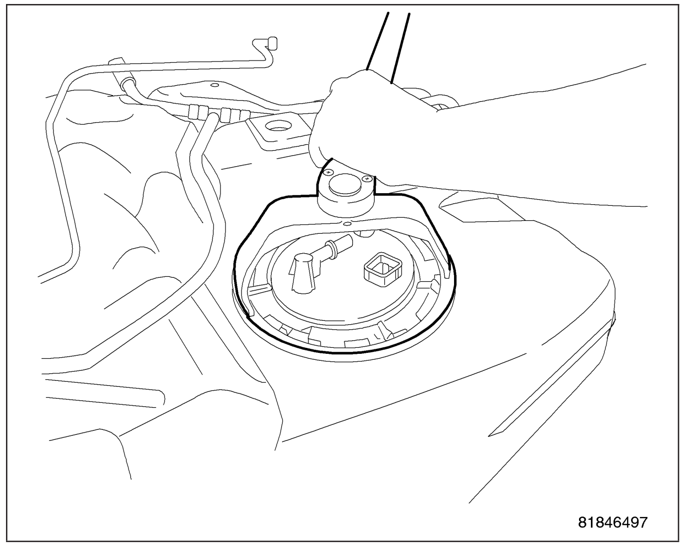
9. Install rear driveline module, (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - INSTALLATION).



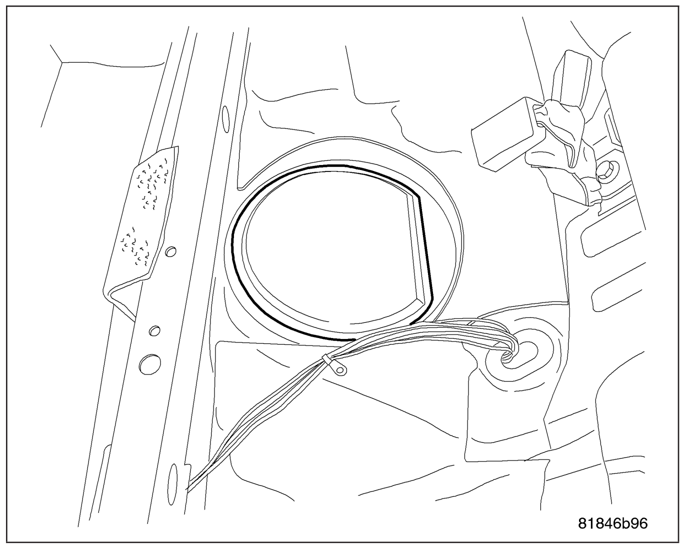
10. Install stay bars, (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - INSTALLATION).



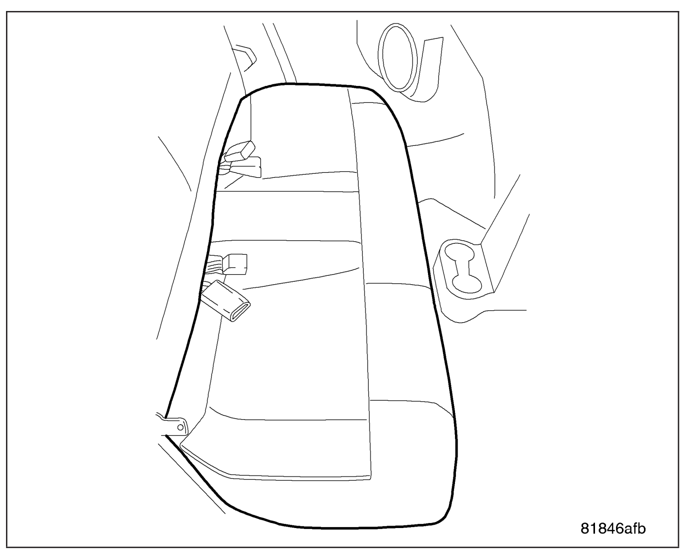
11. Install splash shield.



12. Install splash shield.



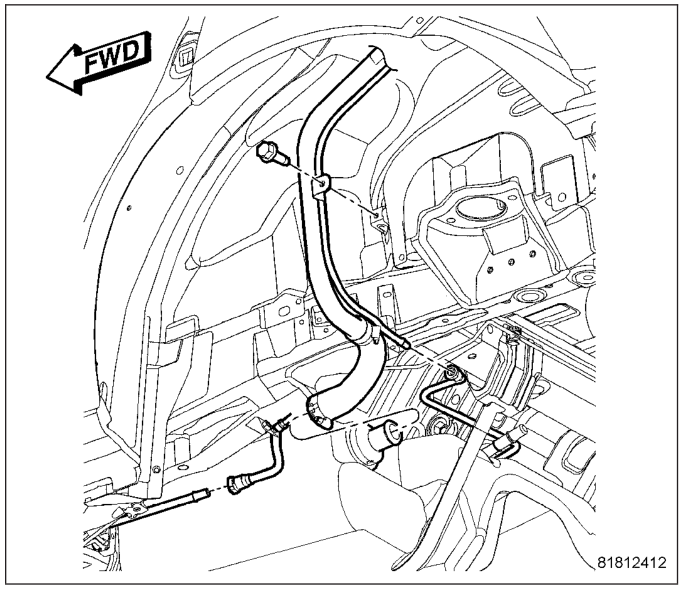
13. Install exhaust system (1).
14. Install drive shaft (2), (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).



15. While holding the pump module in position, install lock ring and use special tool #9340 to tighten lock ring.
16. Connect electrical connector and lock the connector.
17. Connect the fuel line. Refer to Quick Connect Fittings in this section.

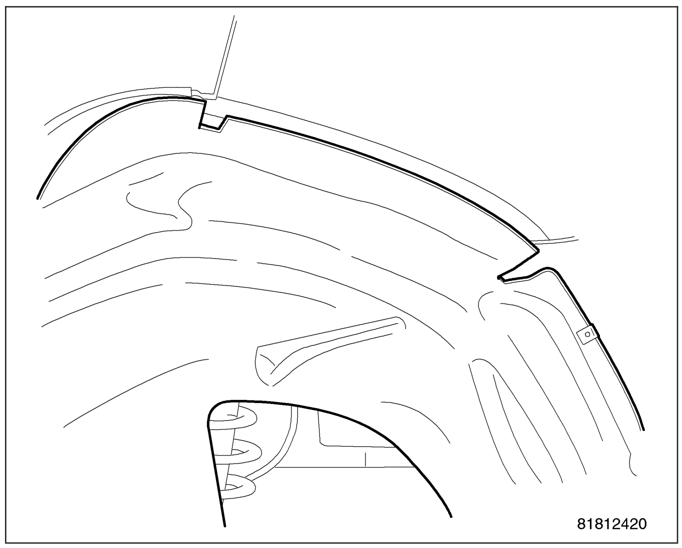
18. Install plastic cover.

19. Install rear cushion.
20. Install the negative battery cable.
21. Install the air cleaner lid, connect the inlet air temperature sensor and makeup air hose.
22. Fill fuel tank with clean fuel. Use the Scan Tool to pressurize the system and check for leaks.



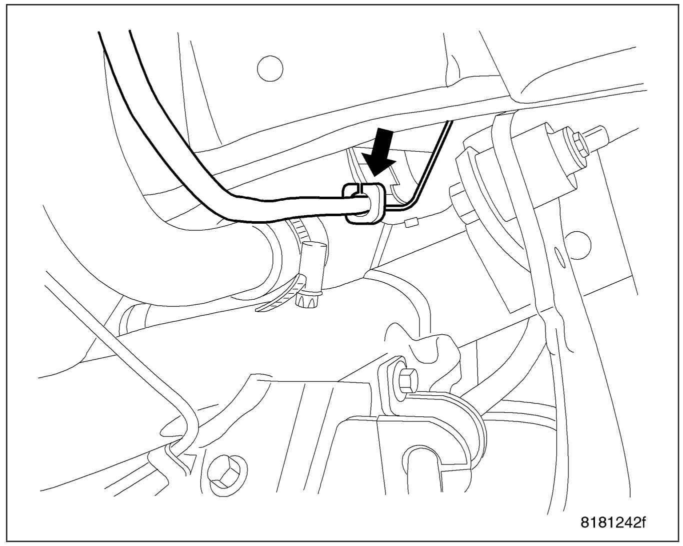
FUEL TANK FILLER TUBE

REMOVAL

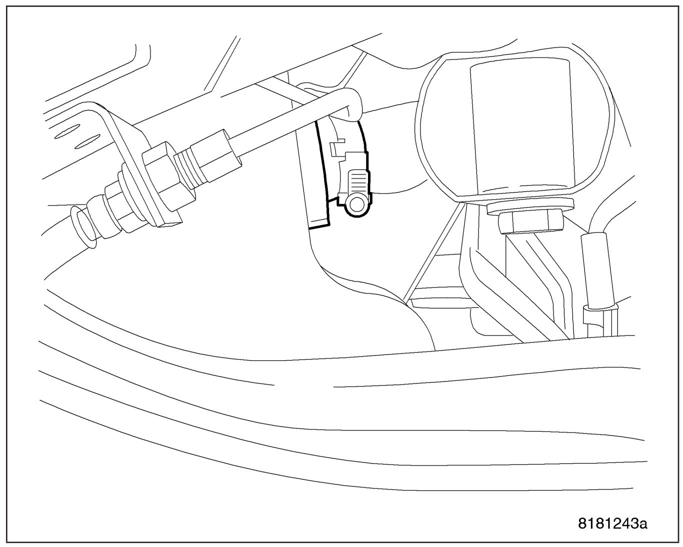


NOTE: Drain fuel tank if it is more than half full.

1. Remove the negative battery cable.
2. Loosen fuel filler tube cap.
3. Raise vehicle and support.

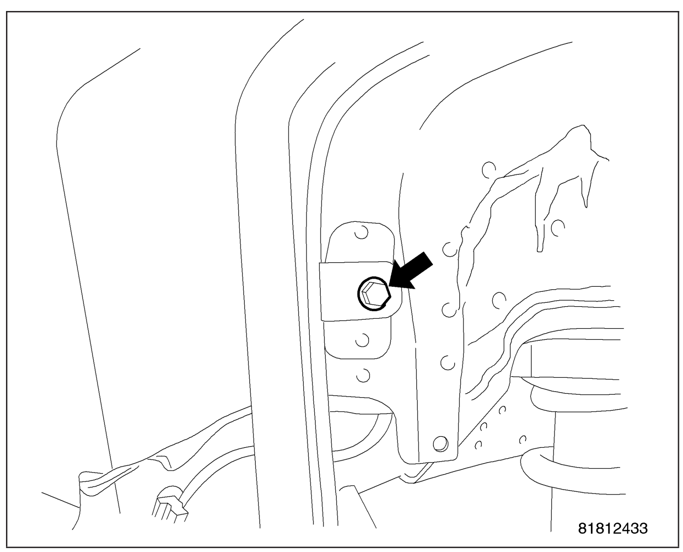


81812412



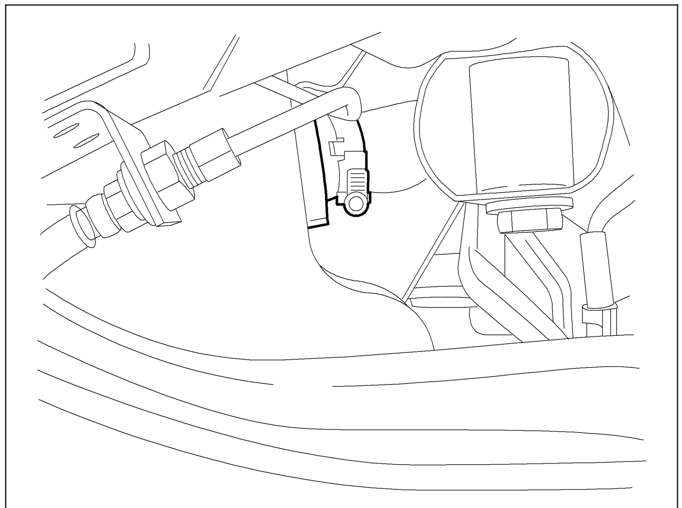
4. Remove the left rear wheel.
5. Remove the inner splash shield.

81812420

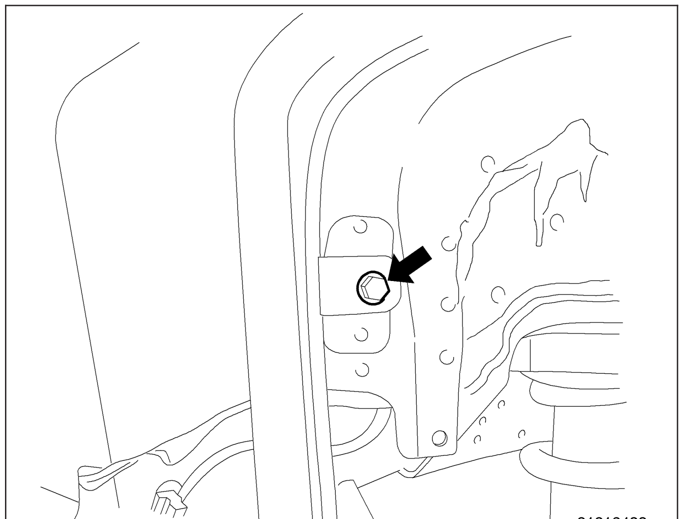


6. Disconnect filler tube recirculation vent line.

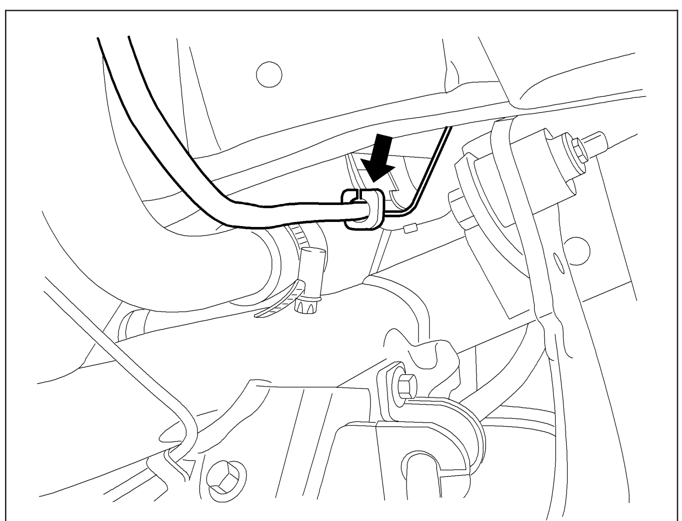
7. Disconnect fuel filler tube hose from fuel tank neck.



8. Remove filler tube mounting screw.
9. Remove fuel filler tube assembly.

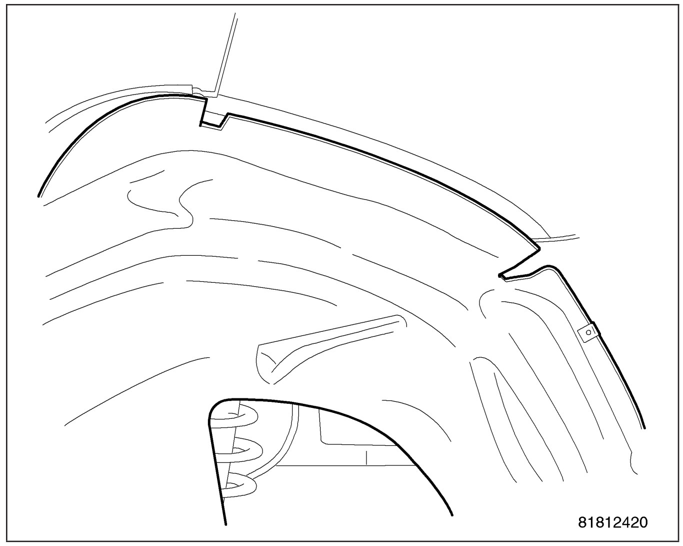


INSTALLATION



1. Install fuel filler tube. Connect fuel filler tube hose to fuel tank neck and tighten clamp to 2.8 N·m (24 ins. lbs.).

8181243a



2. Install fuel filler tube mounting screw and tighten to 9 N·m (79.5 ins. lbs.).

81812433

3. Connect filler tube vent line.

8181242f

4. Install the inner splash shield.
5. Install rear tire.
6. Lower vehicle.
7. Install fuel filler tube cap.
8. Install the negative battery cable.
9. Install the air cleaner lid and makeup air hose.

INLET FILTER

DESCRIPTION

The fuel pump inlet strainer is a non-serviceable part.

FUEL INJECTION

TABLE OF CONTENTS

FUEL INJECTION

OPERATION

INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F (1.6°C).
   - If the coolant is over 35°F (1.6°C) the PCM will wait 38 seconds.
   - If the coolant is over 50°F (10°C) the PCM will wait 15 seconds.
   - If the coolant is over 167°F (75°C) the PCM will wait 3 seconds.
2. For other temperatures the PCM will interpolate the correct waiting time.
3. O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.
4. The multi-port fuel injection systems has the following modes of operation:
   - Ignition switch ON (Zero RPM)
   - Engine start-up
   - Engine warm-up
   - Cruise

- Idle
- Acceleration
- Deceleration
- Wide Open Throttle
- Ignition switch OFF

5. The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the fuel pump. If the PCM does not receive both signals within approximately one second, it will not energize the fuel pump. The PCM supply voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ±64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the fuel pump relay has been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position

- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature

- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor

The PCM may receive a closed throttle input from the APPS when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the APPS it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL CORRECTION or ADAPTIVE MEMORIES

DESCRIPTION

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30° to 35° F (-1.1° to 1.6°C), the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

OPERATION

Short Term

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O2 Sensor input. The maximum range of authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

Ther number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells has a specific MAP voltage range Typical Adaptive Memory Fuel Cells .

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O2 Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.

The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F (77° to 88°C), with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

Typical Adaptive Memory Fuel Cells

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
MAP volt =	0	1.4	2.0	2.6	3.3	3.9		

Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ POWERTRAIN CONTROL MODULE - DESCRIPTION) .

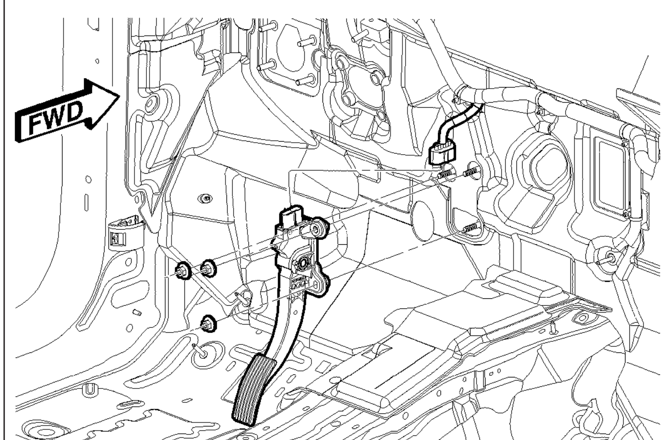
SENSOR-ACCELERATOR PEDAL POSITION

DESCRIPTION

The Accelerator Pedal Position Sensor (APPS) is a variable resistor that provides the PCM with an input signal (voltage). The signal represents pedal angle position. As the position of the accelerator pedal changes, the resistance of the APPS changes.

REMOVAL



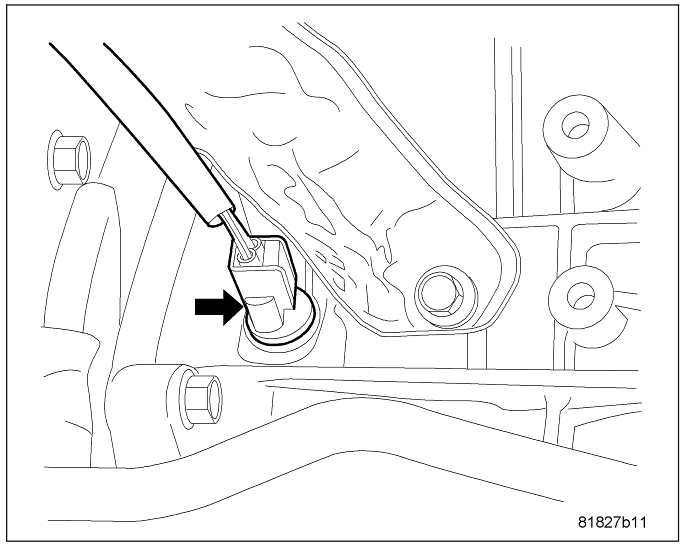
1. Disconnect negative battery cable.
2. Unlock the electrical connector and then disconnect the electrical connector from the module
3. Remove the mounting nuts.
4. Remove assembly from the mounting studs.

8181ca1c

INSTALLATION

1. Install APPS module.
2. Tighten the mounting nuts.
3. Connect electrical connector and lock.
4. Connect negative battery cable.

8181ca1c

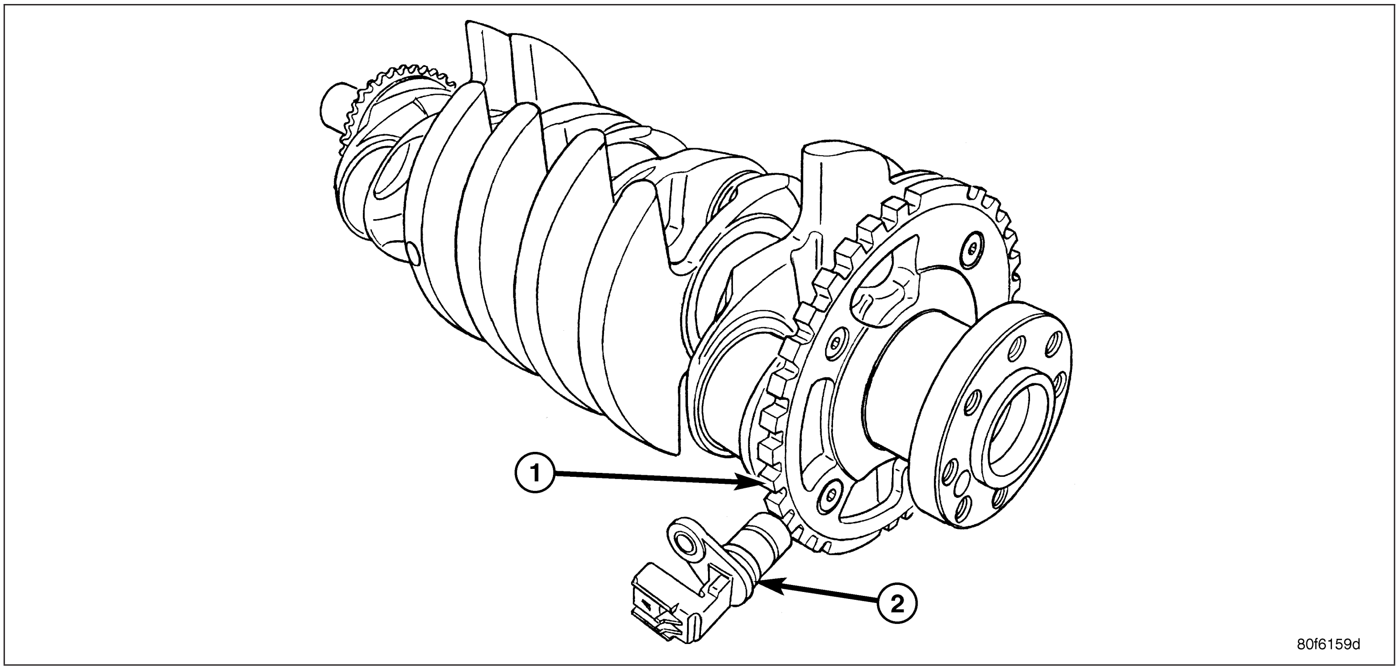


CRANKSHAFT POSITION SENSOR

DESCRIPTION

The crankshaft position sensor mounts to the rear of the engine block near the transmission.

The PCM uses the Crankshaft Position sensor to calculate the following:

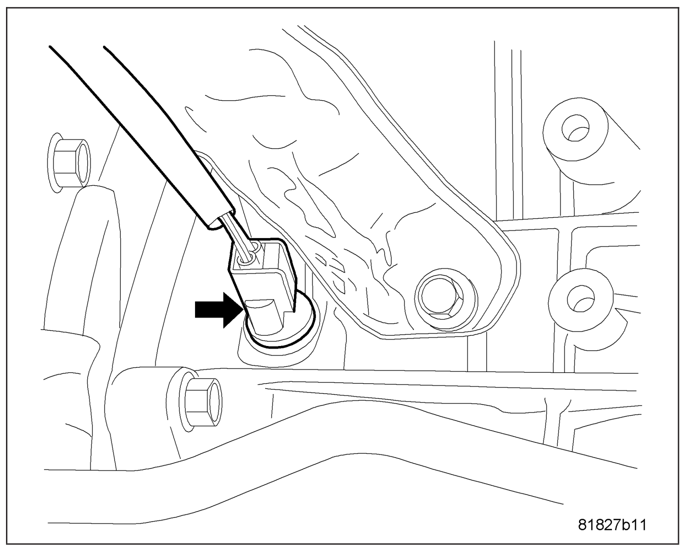


- Engine RPM
- TDC number 1 and 4
- Ignition coil synchronization
- Injector synchronization
- Camshaft-to-crankshaft misalignment (Timing belt skipped 1 tooth or more diagnostic trouble code).

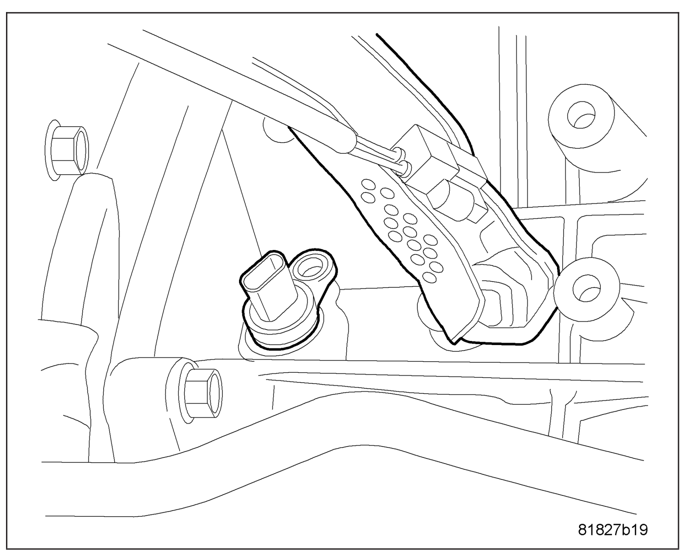
OPERATION

The PCM sends approximately 5 volts to the Hall-effect sensor. This voltage is required to operate the Hall-effect chip and the electronics inside the sensor. A ground for the sensor is provided through the sensor return circuit. The input to the PCM occurs on a 5 volt output reference circuit that operates as follows: The Hall-effect sensor contains a powerful magnet. As the magnetic field passes over the dense portion of the counterweight, the 5-volt signal is pulled to ground (.3 volts) through a transistor in the sensor. When the magnetic field passes over the notches in the crankshaft counterweight, the magnetic field turns off the transistor in the sensor, causing the PCM to register the 5-volt signal. The PCM identifies crankshaft position by registering the change from 5 to 0 volts, as signaled from the Crankshaft Position sensor (2).

The PCM determines what cylinder to fire from the crankshaft position sensor input and the camshaft position sensor input. The #8 crankshaft counterweight has a target ring with 32 teeth and notches (1), including one long reference tooth and notch. From the crankshaft position sensor input the PCM determines engine speed and crankshaft angle (position).

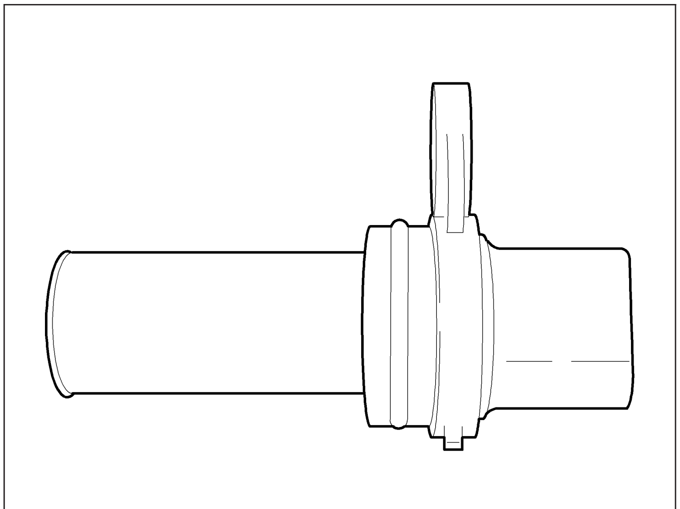


REMOVAL



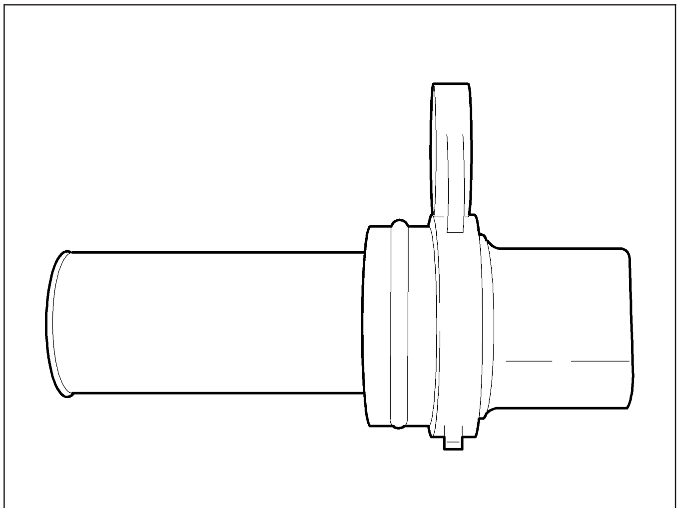
The Crankshaft Position Sensor is in the rear of the engine block near the transmission.

If vehicle is All Wheel Drive the Power Transfer Unit must be removed, (Refer to 21 - TRANSMISSION/ TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).



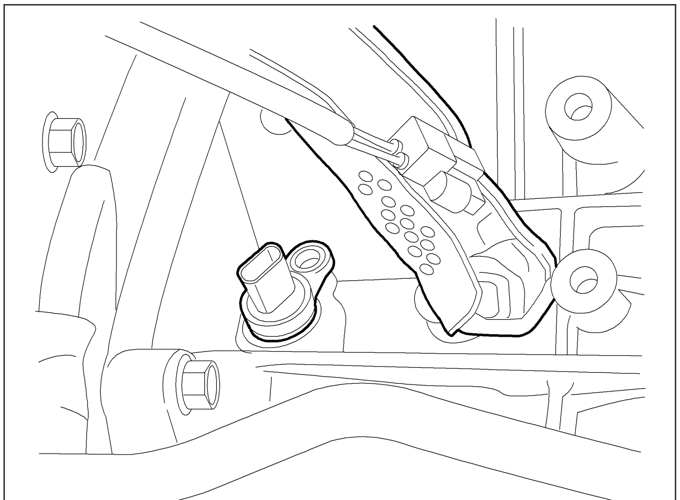
1. Disconnect the negative battery cable.
2. Raise vehicle and support.

3. Remove heat shield retaining bolt.
4. Move heat shield.
5. Unlock and disconnect the electrical connector to the crankshaft position sensor.



6. Remove the crankshaft position sensor bolt.
7. Remove the sensor.

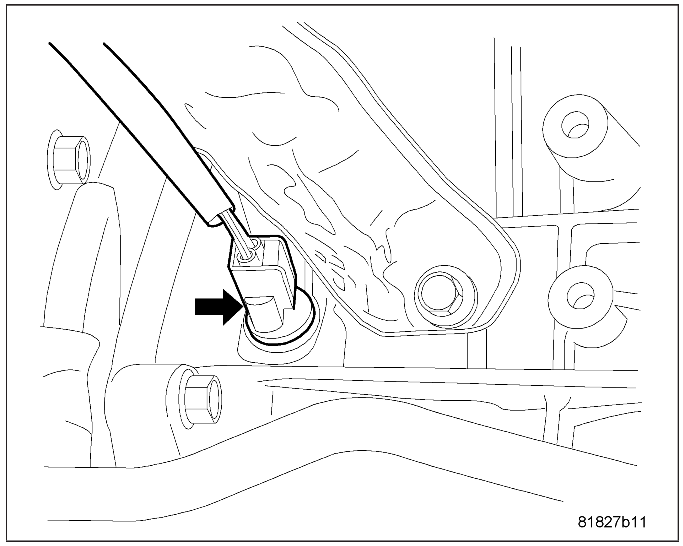
81827b1d



INSTALLATION

1. Check o-ring for damage and lubricate the o-ring with engine oil before installing sensor.
2. Use a twisting motion when installing the sensor.

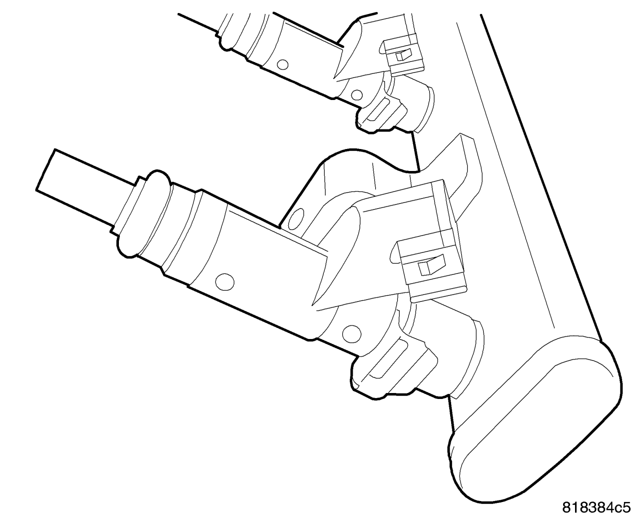
81827b1d



3. Install and tighten the crankshaft position sensor bolt and tighten to 9 N·m (79.5 ins. lbs.).
4. Connect and lock the electrical connector to the crankshaft position sensor.
5. Install heat shield and retaining bolt.

81827b19

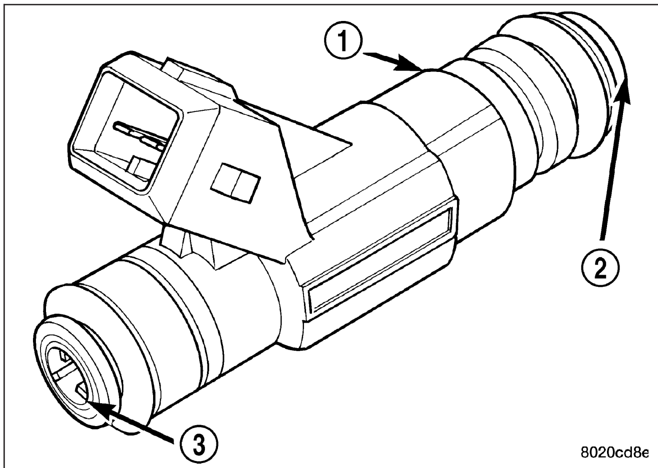
If vehicle is All Wheel Drive the Power Transfer Unit must be installed, (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).



6. Lower vehicle.
7. Connect the negative battery cable.

FUEL INJECTOR

DESCRIPTION

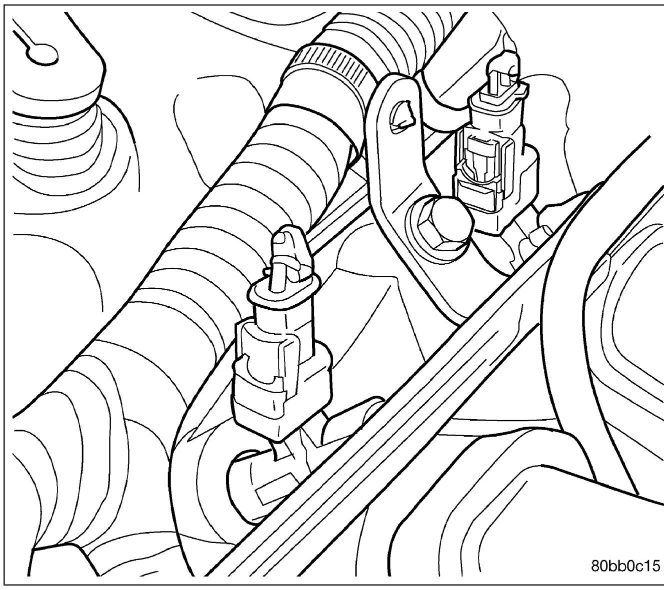


The injectors are positioned in the intake manifold with the nozzle ends directly above the intake valve port.

818384c5

OPERATION

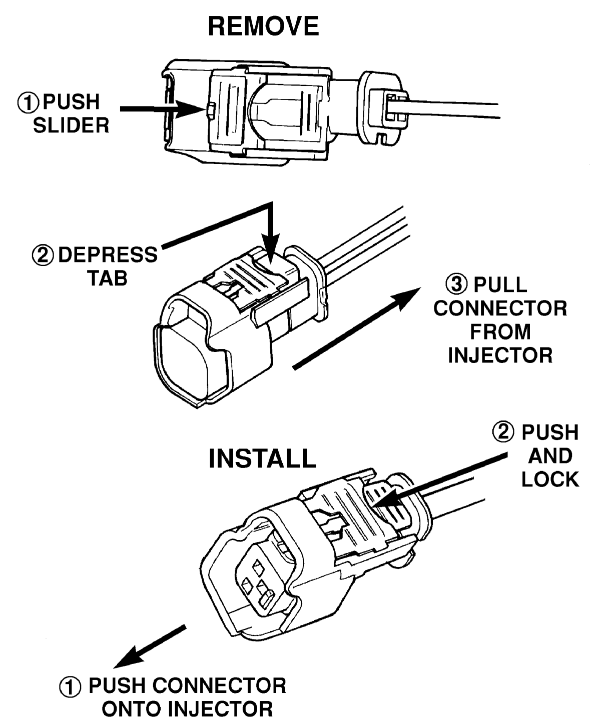
The fuel injectors are 12 volt electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a hollow cone or two streams. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber. Fuel injectors are not interchangeable between engines.



8020cd8e

The PCM provides battery voltage to each injector through the ASD relay. Injector operation is controlled by a ground path provided for each injector by the PCM. Injector on-time (pulse-width) is variable, and is determined by the PCM processing all the data previously discussed to obtain the optimum injector pulse width for each operating condition. The pulse width is controlled by the duration of the ground path provided.

STANDARD PROCEDURE

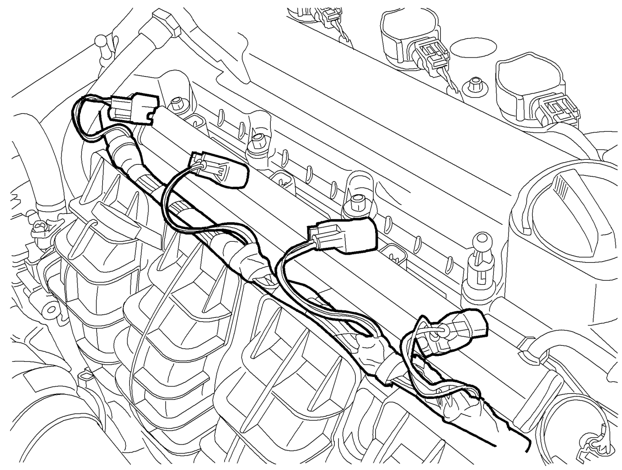


REMOVAL - INJECTOR CONNECTOR

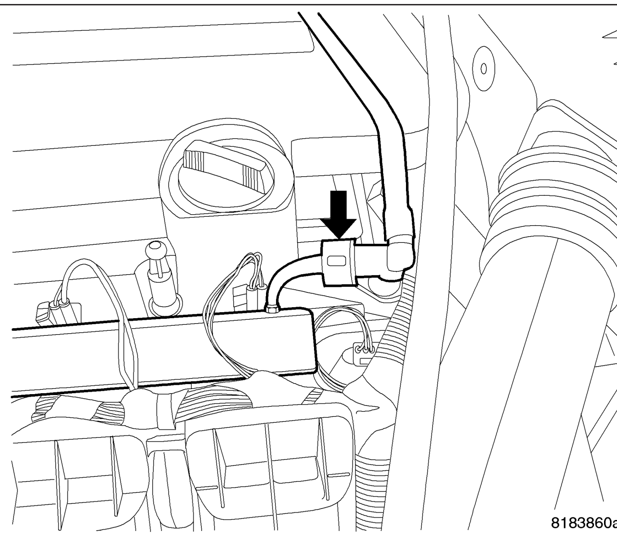
1. Disconnect electrical connectors at the fuel injectors.

80bb0c15

2. To remove connector pull the red colored slider away from injector (1). While pulling the slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, make note of wiring location before removal.

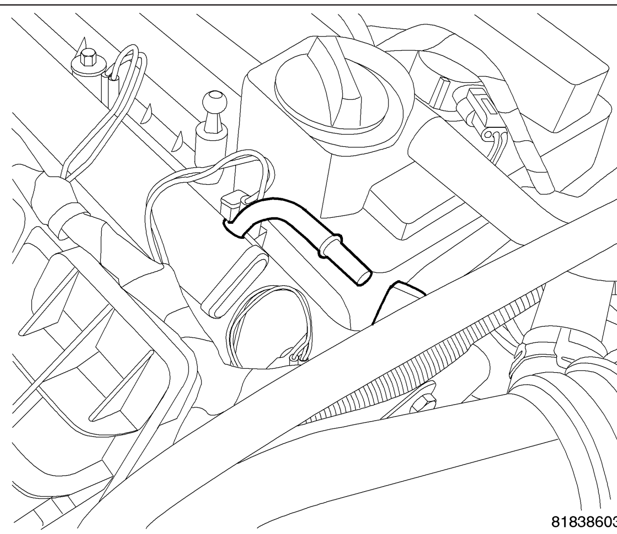


80b6f033



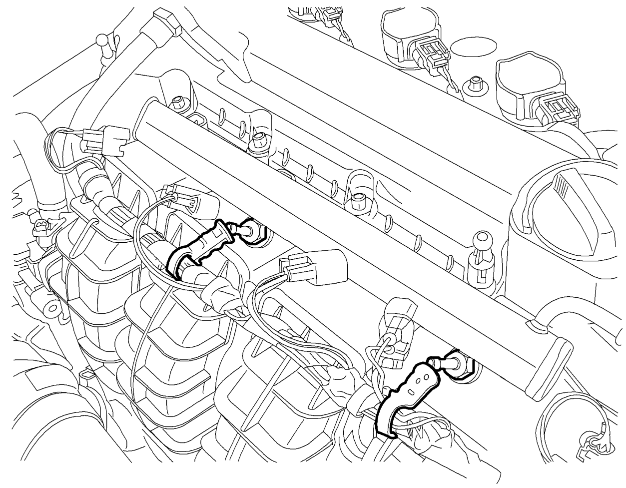
REMOVAL

WARNING: Release fuel system pressure before servicing fuel system components. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle. This may result in personal injury or death.



1. Release the fuel pressure, refer to the fuel pressure release procedure.
2. Disconnect the negative battery cable.
3. Disconnect the electrical connectors from the fuel injectors.

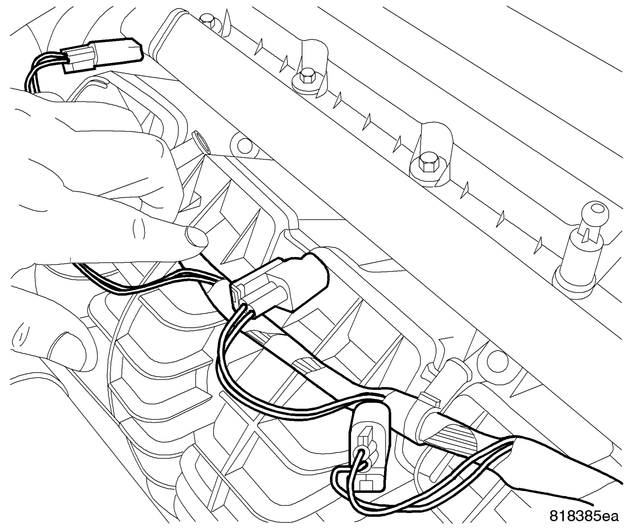
818385f1



4. Fuel line connection at fuel rail.

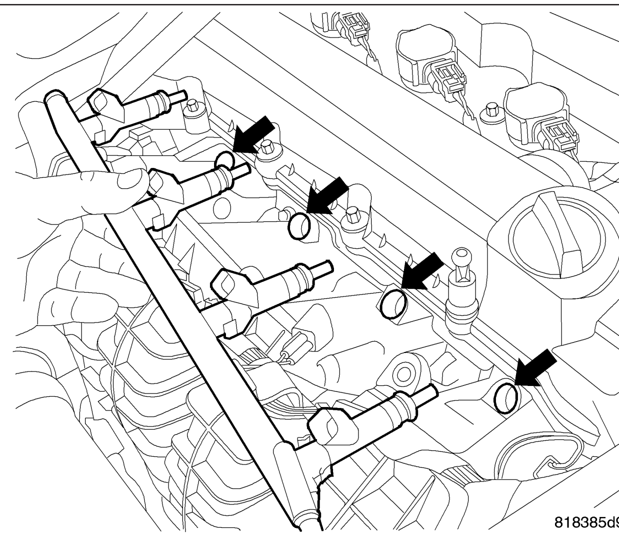
8183860a

5. Remove the fuel line from the fuel rail.



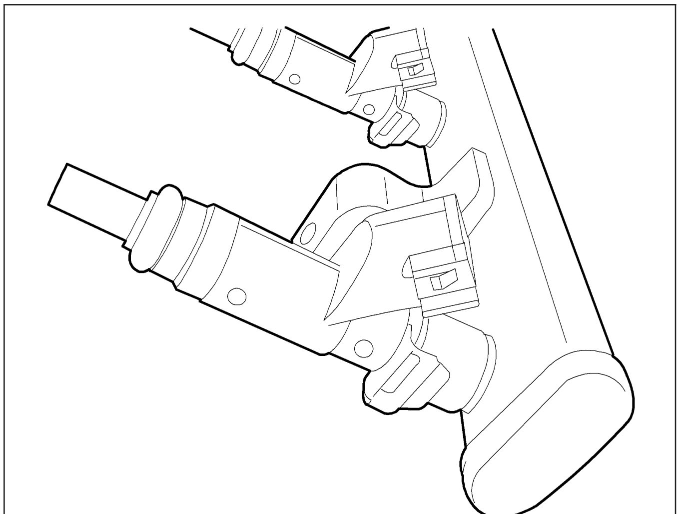
81838603

6. Remove wire harness from fuel rail mounting studs.



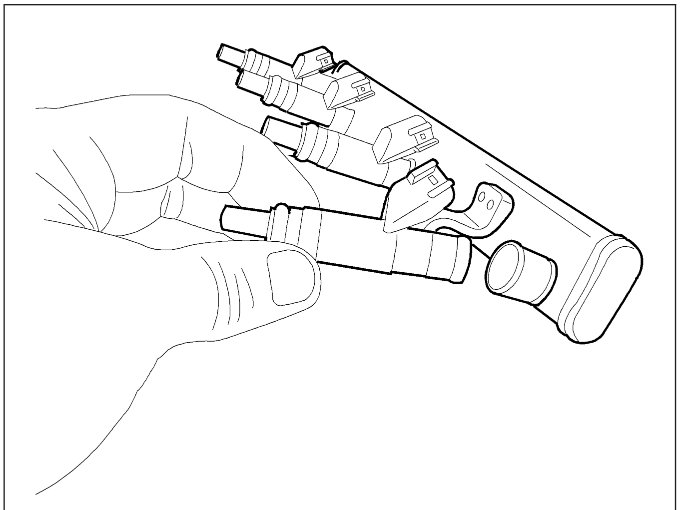
818385f8

7. Remove the 2 bolts to the fuel rail at the lower manifold.



818385ea

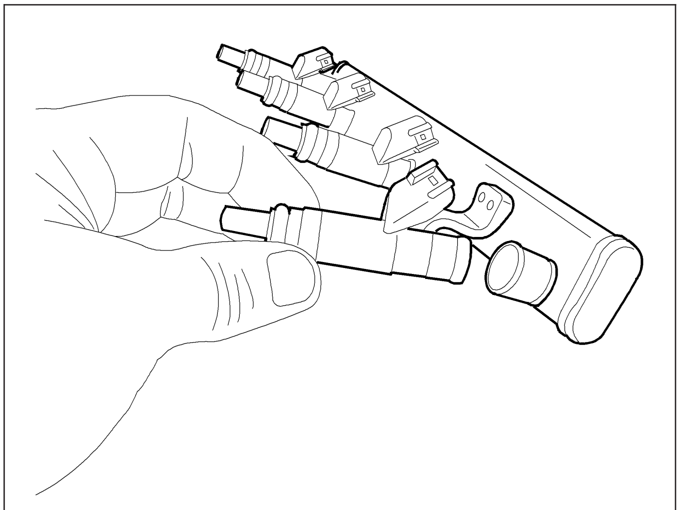
8. Remove the fuel rail



818385d9

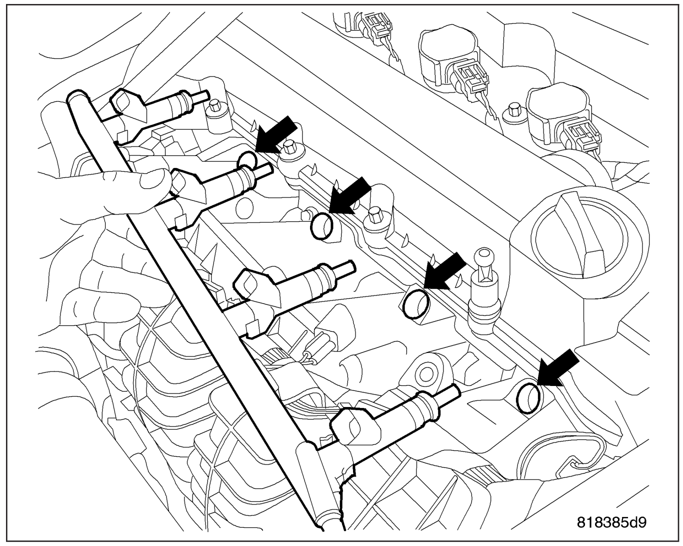
9. Remove clip holding fuel injector to fuel rail.

818384c5



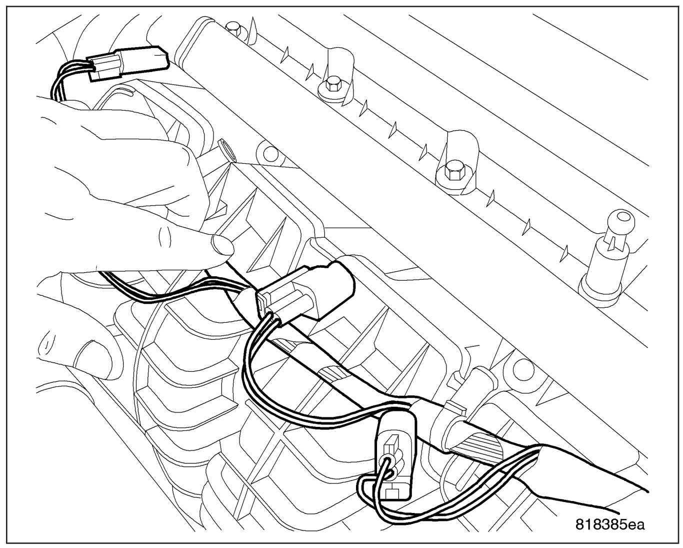
10. Remove fuel injector from fuel rail.

81837e38

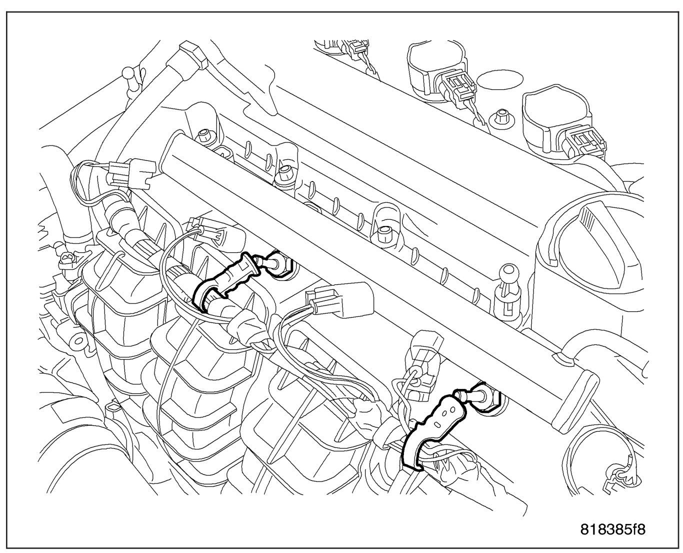


INSTALLATION

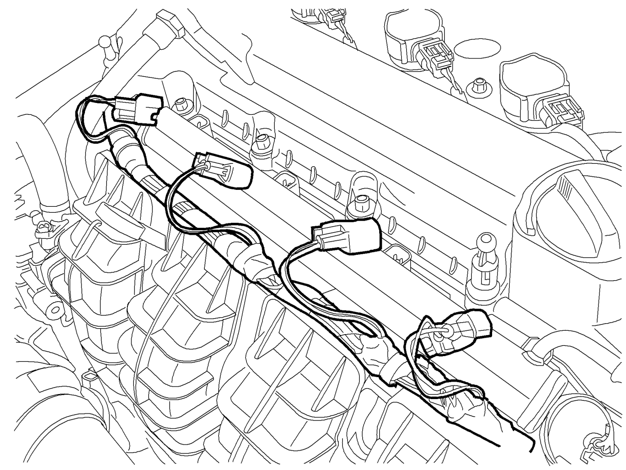
1. Apply a light coating of clean engine oil to the upper O-ring.
2. Install injector in cup on fuel rail.
3. Install retaining clip.



81837e38

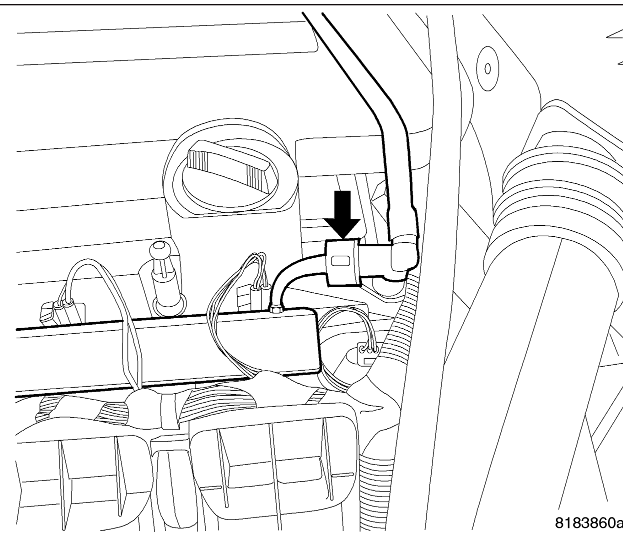


4. Apply a light coating of clean engine oil to the O-ring on the nozzle end of each injector.
5. Insert fuel injector nozzles into openings in lower intake manifold. Seat the injectors in place.



6. Tighten fuel rail mounting screws to 27 N·m (20 ft. lbs.).

7. Install wiring harness clips to the fuel rail mounting studs.



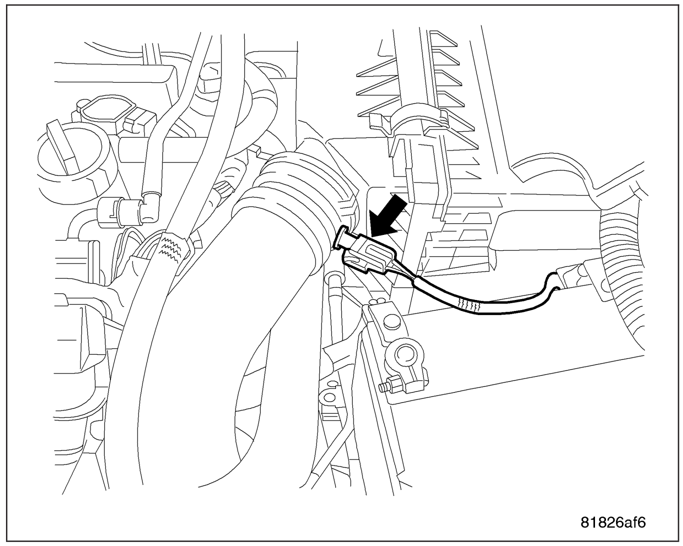
8. Attach electrical connectors to fuel injectors, refer to the fuel injector connector section for electrical connector installation.

818385f1

9. Connect fuel supply tube to fuel rail.
10. Connect the negative battery cable.
11. Use the scan tool to pressurize the fuel system. Check for leaks.

8183860a

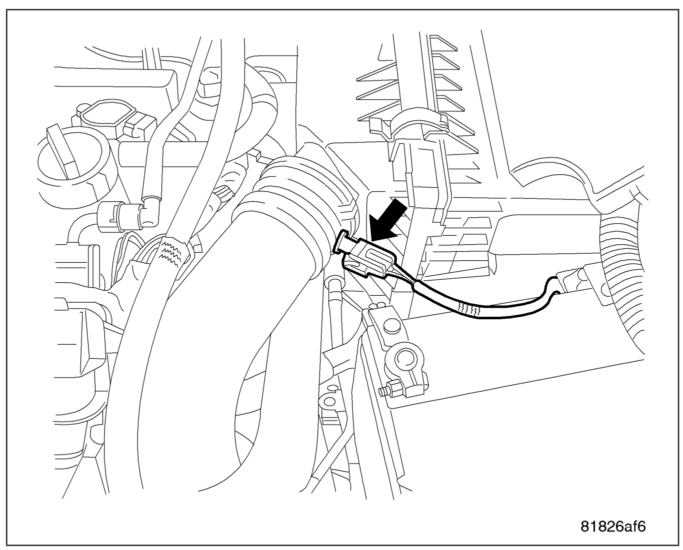
INLET AIR TEMPERATURE SENSOR



DESCRIPTION

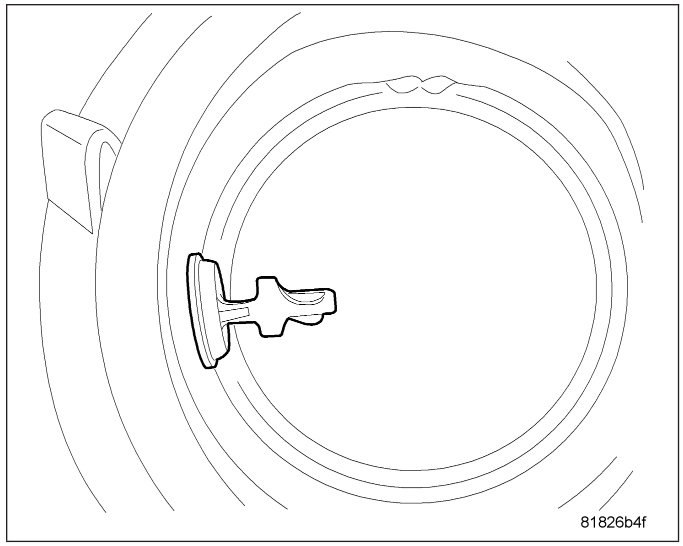
The IAT Sensor is a Negative Temperature Coefficient (NTC) Sensor that provides information to the PCM regarding the temperature of the air entering the intake manifold.

REMOVAL



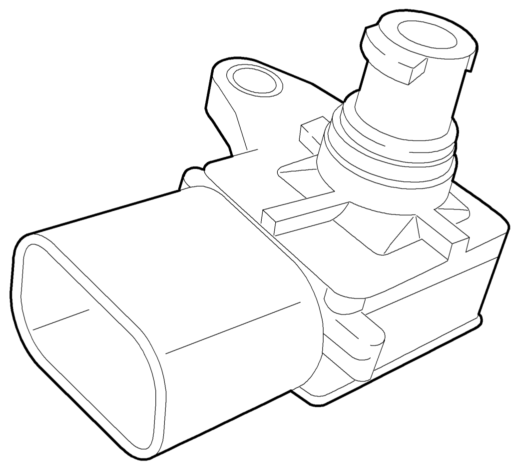
The sensor is located in the clean air duct (1)

1. Disconnect the negative battery cable.
2. Disconnect electrical connector from the sensor.
3. Remove the sensor.



INSTALLATION

The sensors is in the clean air duct.



1. Install sensor. Make sure of sensor orientation.
2. Attach electrical connector to sensor.
3. Connect the negative battery cable.

MAP SENSOR

DESCRIPTION

The MAP sensor mounts to the intake manifold.

8184efa2

OPERATION

The MAP serves as a PCM input, using a silicon based sensing unit, to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When MAP equals Barometric pressure, the pulse width will be at maximum.

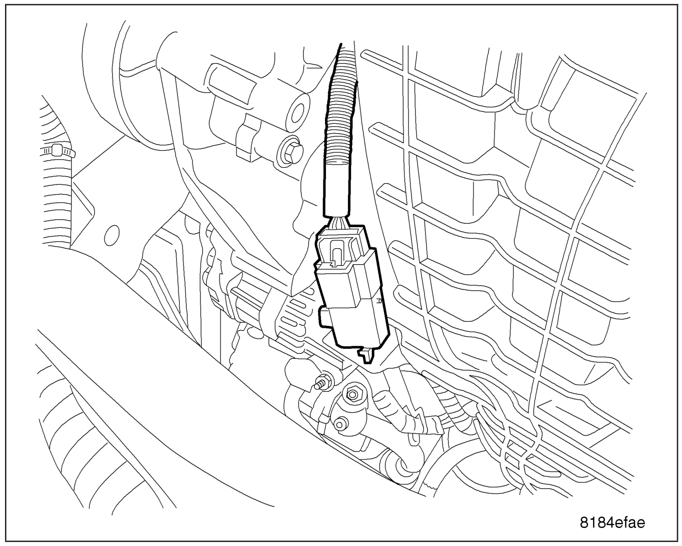
Also like the cam and crank sensors, a 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0 — 15 psi the voltage changes 4.0V. The sensor is supplied a regulated 4.8 to 5.1 volts to operate the sensor. Like the cam and crank sensors ground is provided through the sensor return circuit.

The MAP sensor input is the number one contributor to pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or is it in Denver at 5000 feet above sea level, because the air density changes with altitude. It will also help to correct for varying weather conditions. If a hurricane was coming through the pressure would be very, very low or there could be a real fair weather, high pressure area. This is important because as air pressure changes the barometric pressure changes. Barometric pressure and altitude have a direct inverse correlation, as altitude goes up barometric goes down. The first thing that happens as the key is rolled on, before reaching the crank position, the PCM powers up, comes around and looks at the MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure relative to altitude. Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key on. The difference between current and what it was at key on is manifold vacuum.

During key On (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring known good sensor in you work area.

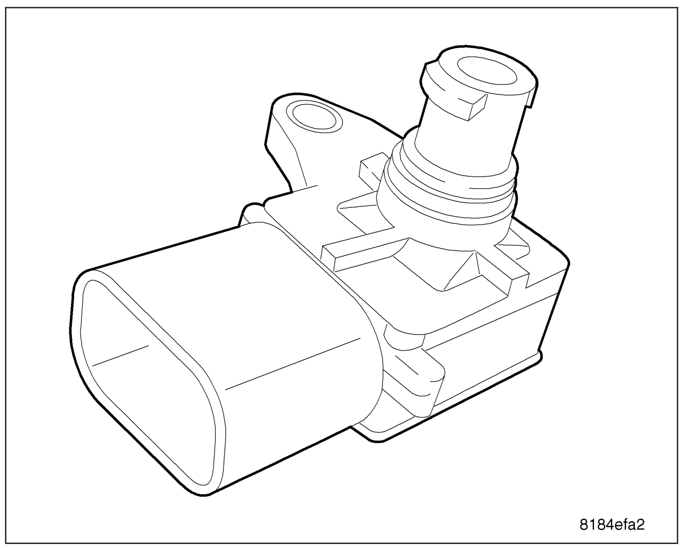
As the altitude increases the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key On the barometric pressure needs to be updated. Any time the PCM sees Wide Open throttle, based upon TPS angle and RPM it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor to aid in calculating the following:



- Barometric pressure
- Engine load
- Manifold pressure
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (F4AC1 transmissions only, via the PCI bus)
- Idle speed

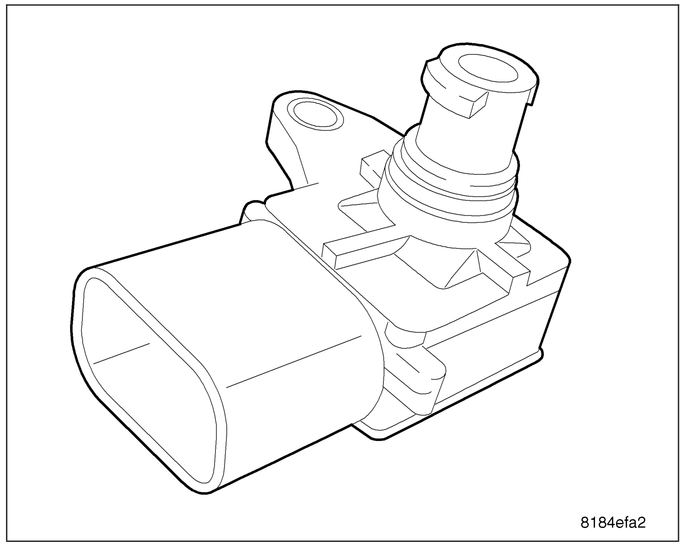
- Decel fuel shutoff



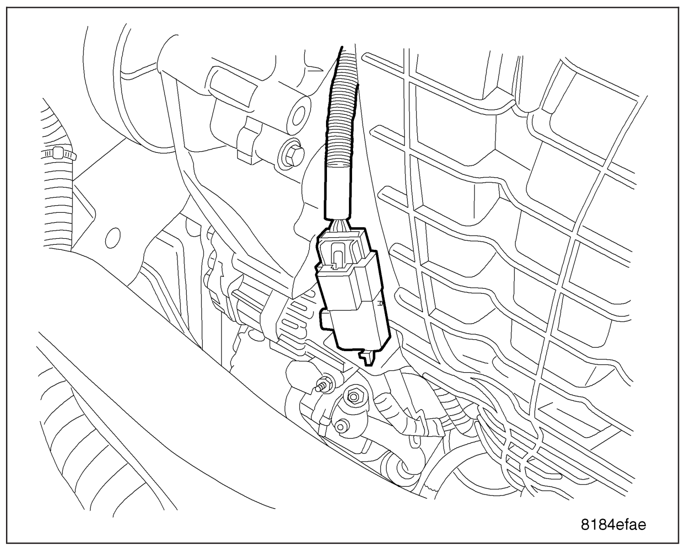
The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is 29.92 in Hg. For every 100 feet of altitude barometric pressure drops .10 in. Hg. If a storm goes through it can either add, high pressure, or decrease, low pressure, from what should be present for that altitude. You should make a habit of knowing what the average pressure and corresponding barometric pressure is for your area.

REMOVAL

1. Remove the air cleaner cover.
2. Disconnect the negative battery cable.
3. Disconnect the electrical connector from the MAP sensor.
4. Remove the screws from the MAP sensor.



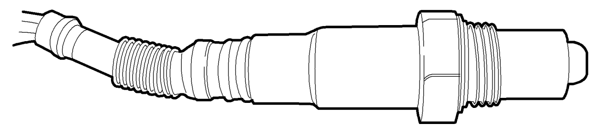
5. Remove the MAP sensor.



INSTALLATION

1. Make sure that the manifold is clean.
2. Install sensor to manifold.

3. Tighten screw.
4. Connect the electrical connector to the sensor.
5. Connect the negative battery cable
6. Install the air cleaner cover.



SENSOR-OXYGEN

DESCRIPTION

The upstream oxygen sensor threads into the outlet flange of the exhaust manifold.

The downstream heated oxygen sensor threads into the system depending on emission package.

81821bd0

OPERATION

A separate upstream and downstream grounds are used on the NGC vehicles (4 Cyl.).

As vehicles accumulate mileage, the catalytic convertor deteriorates. The deterioration results in a less efficient catalyst. To monitor catalytic convertor deterioration, the fuel injection system uses two heated oxygen sensors. One sensor upstream of the catalytic convertor, one downstream of the convertor. The PCM compares the reading from the sensors to calculate the catalytic convertor oxygen storage capacity and converter efficiency. Also, the PCM uses the upstream heated oxygen sensor input when adjusting injector pulse width.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the malfunction indicator lamp (MIL).

The O2 sensors produce a constant 2.5 volts on NGC vehicles, depending upon the oxygen content of the exhaust gas. When a large amount of oxygen is present (caused by a lean air/fuel mixture, can be caused by misfire and exhaust leaks), the sensors produces a low voltage. When there is a lesser amount of oxygen present (caused by a rich air/fuel mixture, can be caused by internal engine problems) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation the PCM monitors the O2 sensors input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

NGC Controller - Has a common ground for the heater in the O2S. 12 volts is supplied to the heater in the O2S by the NGC controller. Both the upstream and downstream O2 sensors for NGC are pulse width modulation (PWM). **NOTE**: When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C-1 connector or momentarily disconnecting the Battery negative terminal. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.

UPSTREAM OXYGEN SENSOR

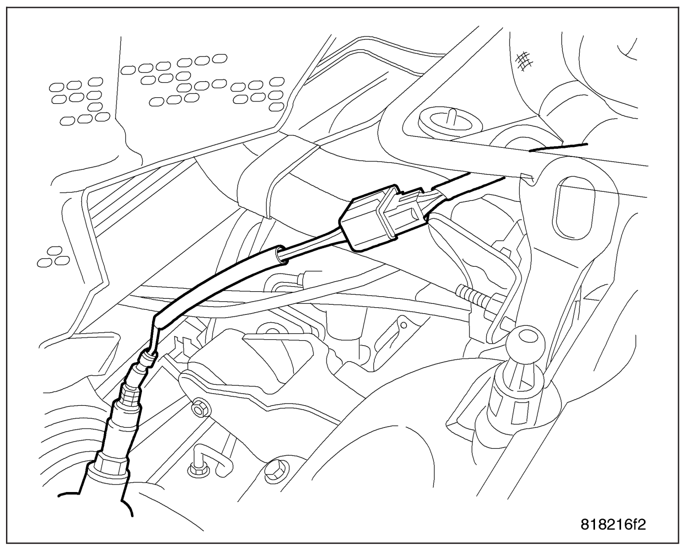
The input from the upstream heated oxygen sensor tells the PCM the oxygen content of the exhaust gas. Based on this input, the PCM fine tunes the air-fuel ratio by adjusting injector pulse width.

The sensor input switches from 2.5 to 3.5 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air-fuel mixture), the sensor pro-

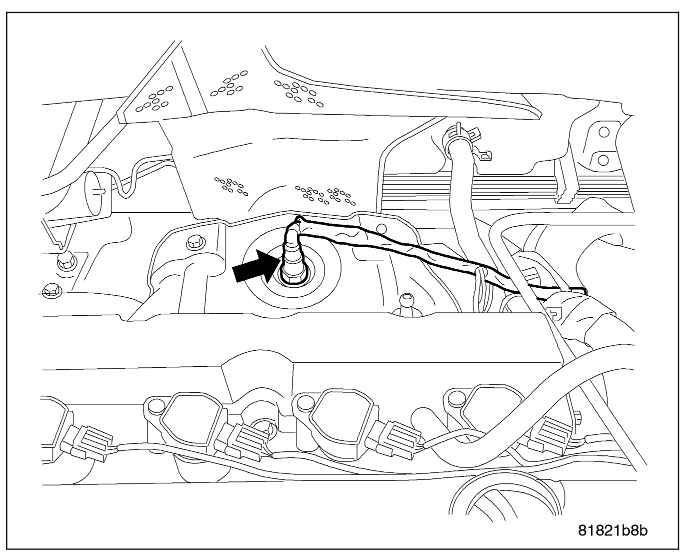
duces voltage as low as 2.5 volt. When there is a lesser amount of oxygen present (rich air-fuel mixture) the sensor produces a voltage as high as 3.5 volt. By monitoring the oxygen content and converting it to electrical voltage, the sensor acts as a rich-lean switch.

The heating element in the sensor provides heat to the sensor ceramic element. Heating the sensor allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop, the PCM adjusts injector pulse width based on the upstream heated oxygen sensor input along with other inputs. In Open Loop, the PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

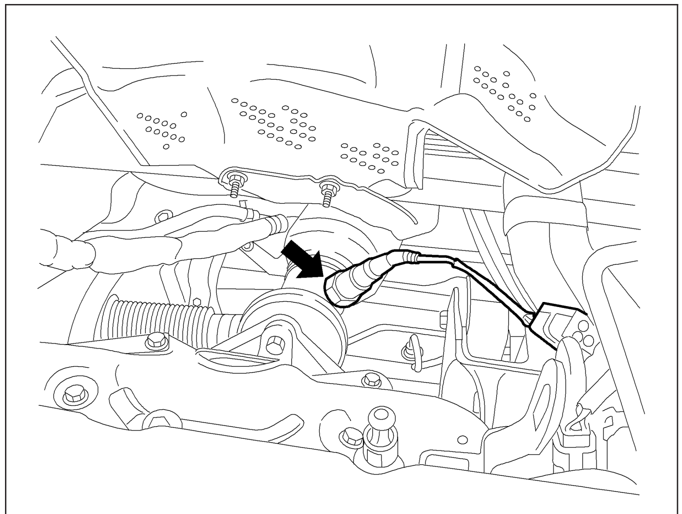


DOWNSTREAM OXYGEN SENSOR



The downstream heated oxygen sensor input is used to detect catalytic convertor deterioration. As the convertor deteriorates, the input from the downstream sensor begins to match the upstream sensor input except for a slight time delay. By comparing the downstream heated oxygen sensor input to the input from the upstream sensor, the PCM calculates catalytic convertor efficiency. Also used to establish the upstream O2 goal voltage (switching point).

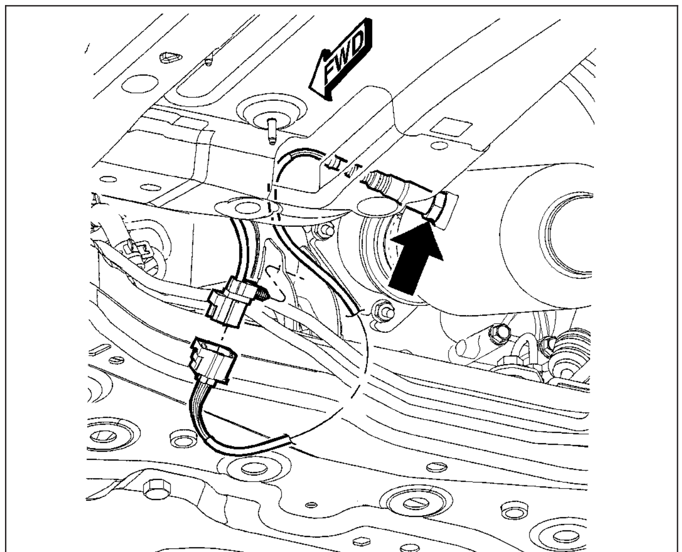
REMOVAL



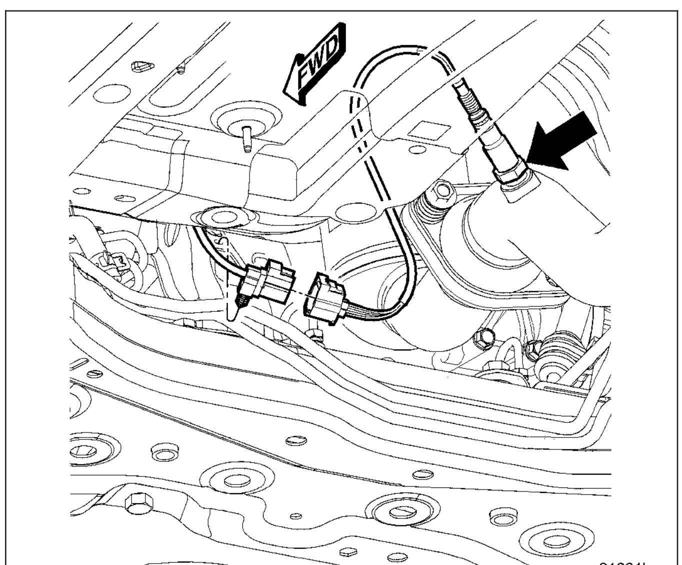
1/1 UPSTREAM

1. Remove the engine cover.
2. Remove the negative battery cable.
3. Disconnect electrical connector from O2 sensor.

4. Remove sensor using an oxygen sensor crow foot wrench such as Snap-On tool YA8875 or equivalent.



81821ba2

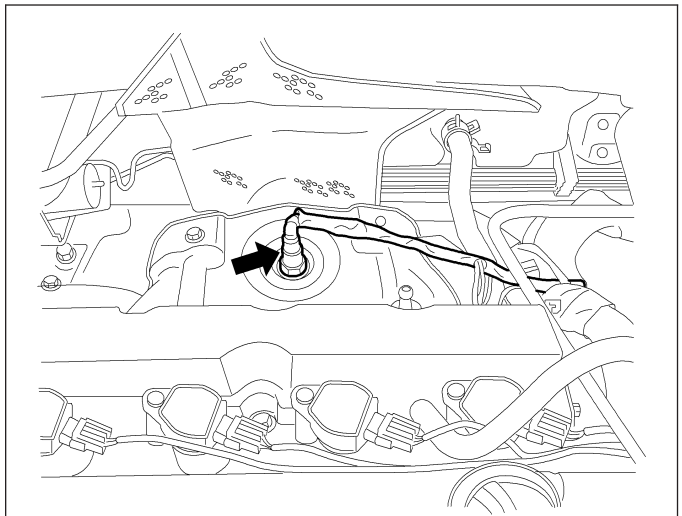


1/2 DOWNSTREAM

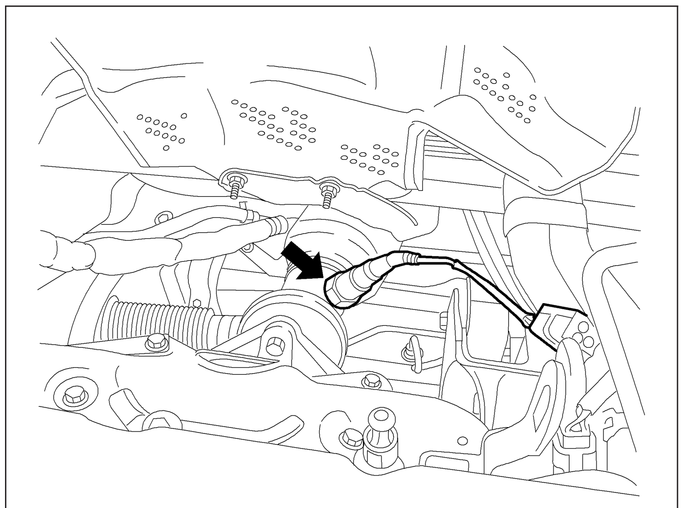
The downstream heated oxygen sensor threads into the catalytic convertor.

1. Remove the negative battery cable.
2. Raise vehicle and support.
3. Disconnect electrical connector from sensor.
4. Disconnect sensor electrical harness from clips along body.
5. Remove sensor using an oxygen sensor crow foot wrench such as Snap-On tool YA8875 or equivalent.

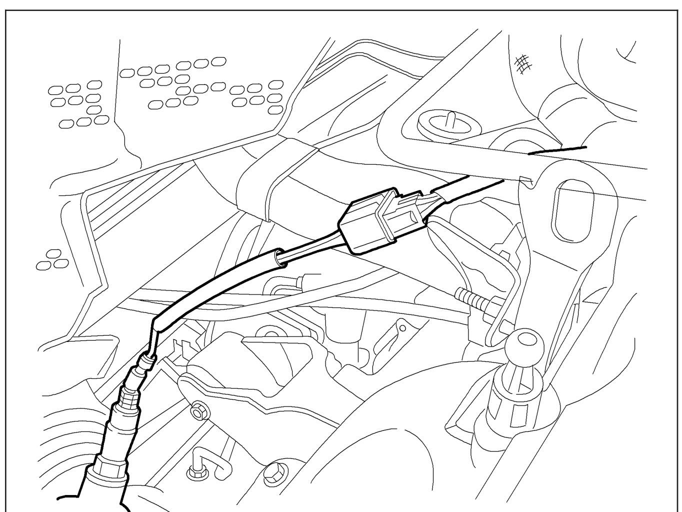
81821bc8



81821bcc



INSTALLATION

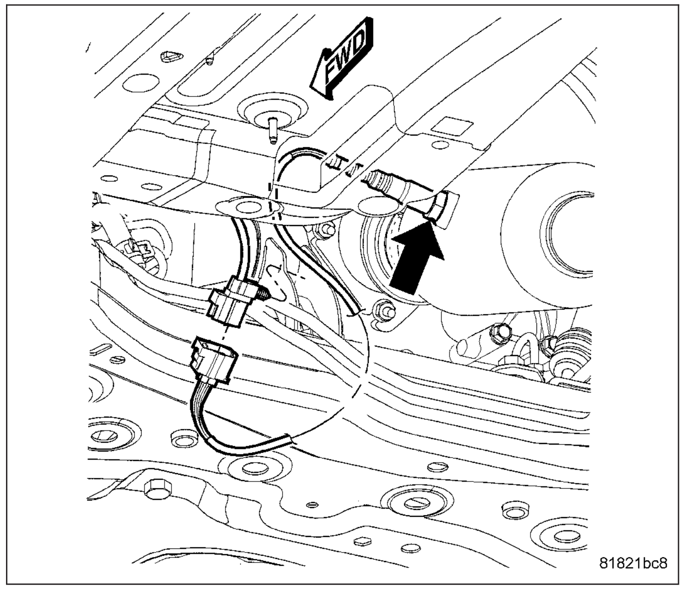


1/1 UPSTREAM

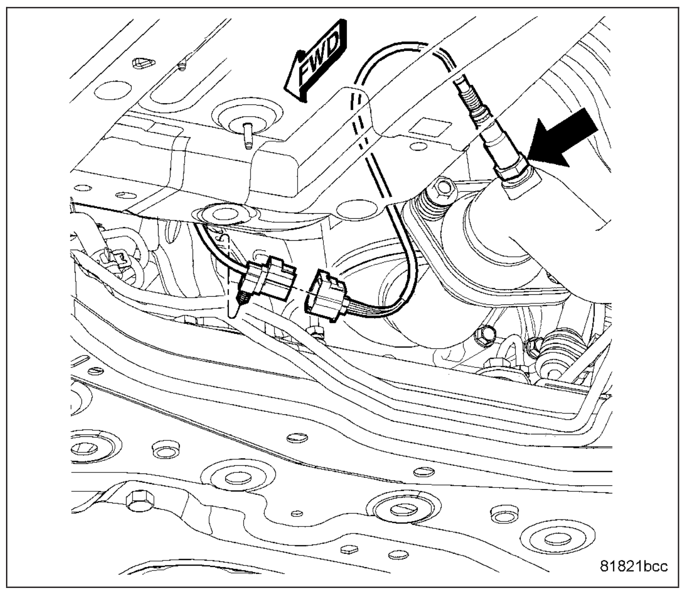
1. After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite® 771-64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
2. Install sensor using an oxygen sensor crow foot wrench such as Snap-On tool YA8875 or equivalent

81821b8b

3. Connect electrical connector to sensor.
4. Install the negative battery cable.
5. Install the engine cover.



81821ba2



818216f2

1/2 DOWNSTREAM

The downstream heated oxygen sensor threads into the exhaust pipe behind the catalytic convertor.

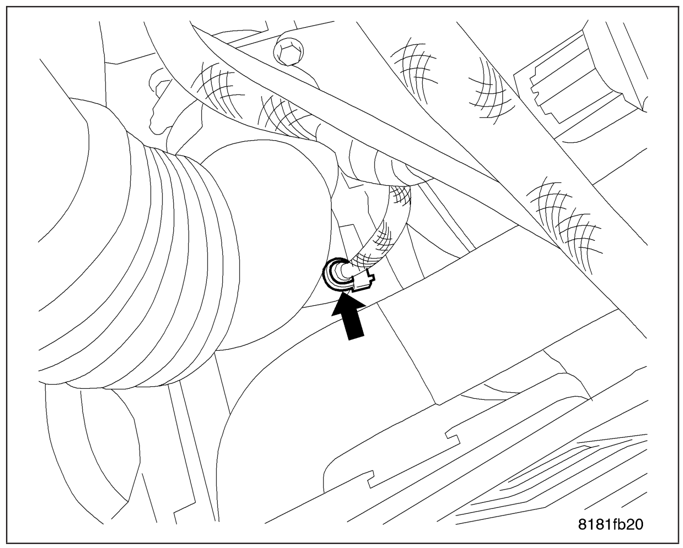
1. After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite® 771-64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
2. Install sensor using an oxygen sensor crow foot wrench such as Snap-On tool YA8875 or equivalent
3. Connect sensor electrical harness to clips along body.
4. Connect electrical connector to sensor.
5. Lower vehicle.
6. Install the negative battery cable.

THROTTLE BODY

DESCRIPTION

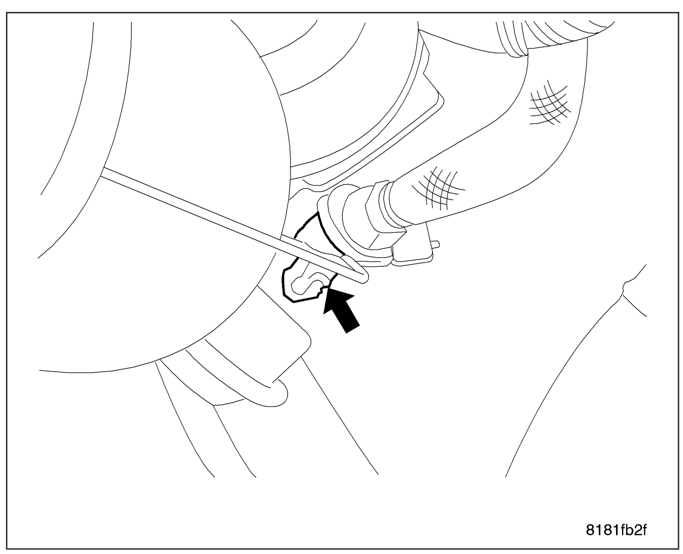
The throttle body mounts to the intake manifold. The throttle position sensor and idle air control motor attach to the throttle body.

OPERATION



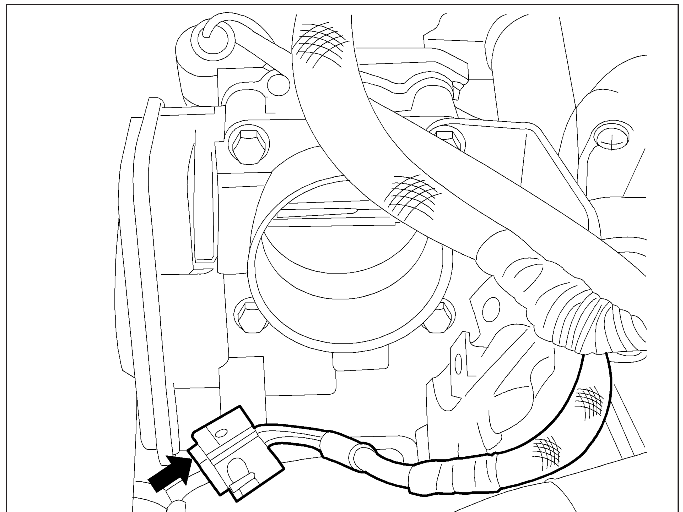
Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable are connected to the throttle body cam.



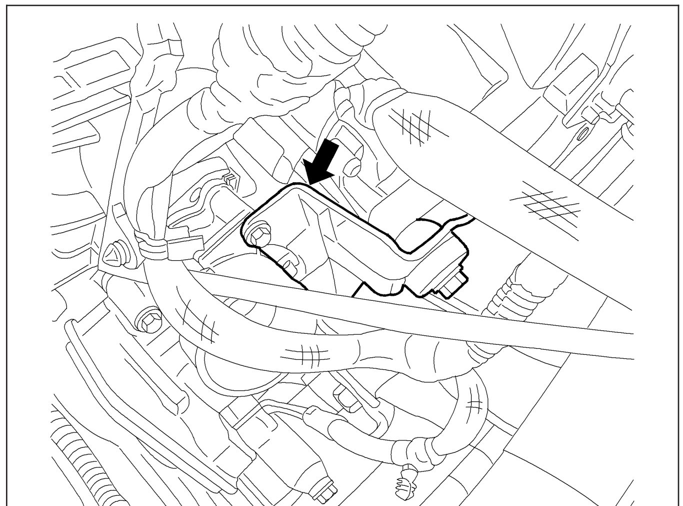
A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

REMOVAL

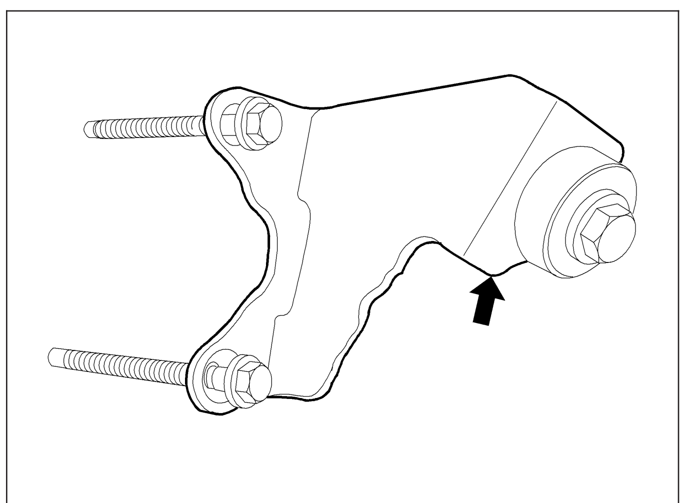


1. Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
2. Remove the negative battery cable.
3. Remove the engine cover.

4. Remove wire harness clip from air tube.

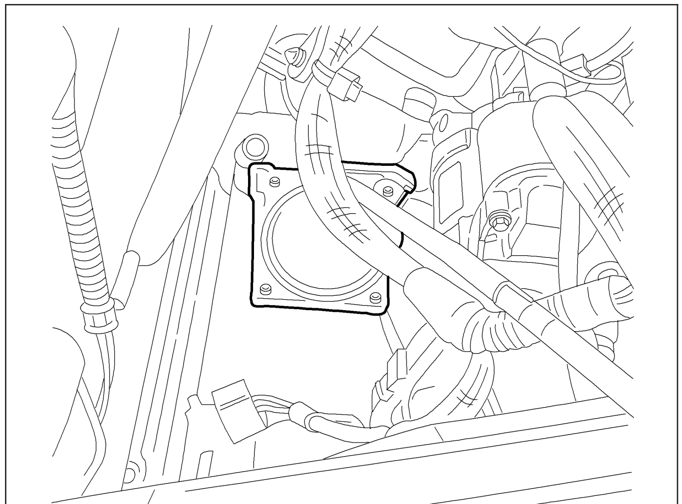


5. Remove the electrical connectors from the throttle body.



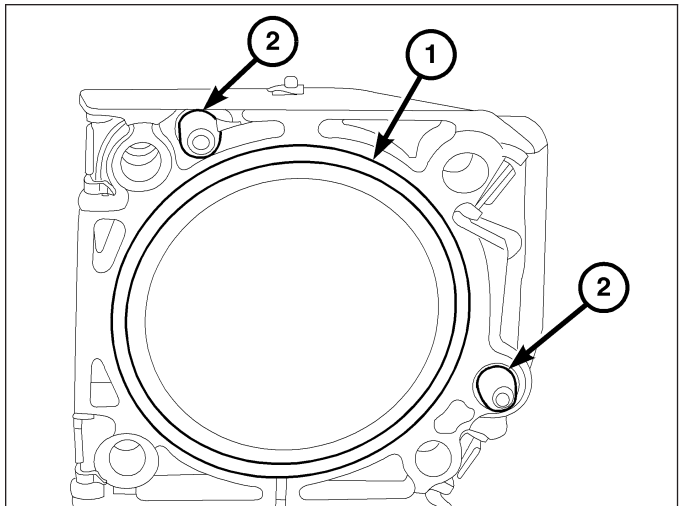
8181fb77

6. Remove throttle body support bracket and bolts.



8181fb48

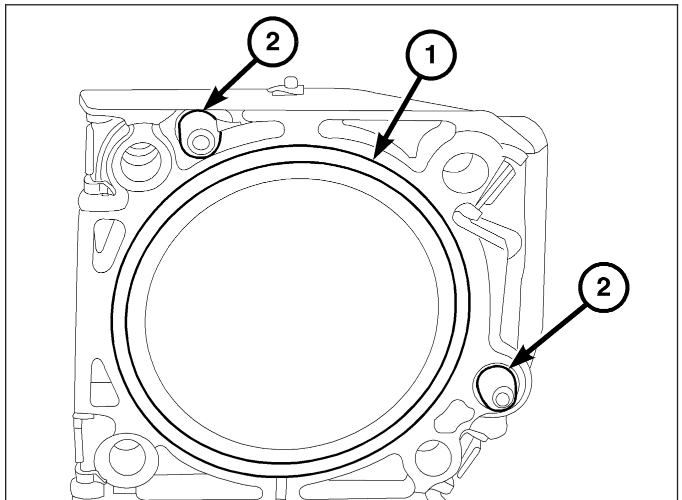
7. Bracket removed and bolts.



8181fb66

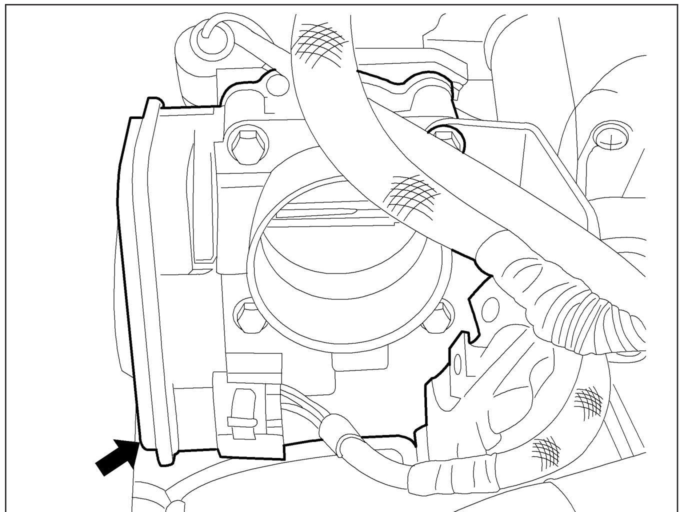
8. Remove throttle body mounting bolts.

8181fb7e



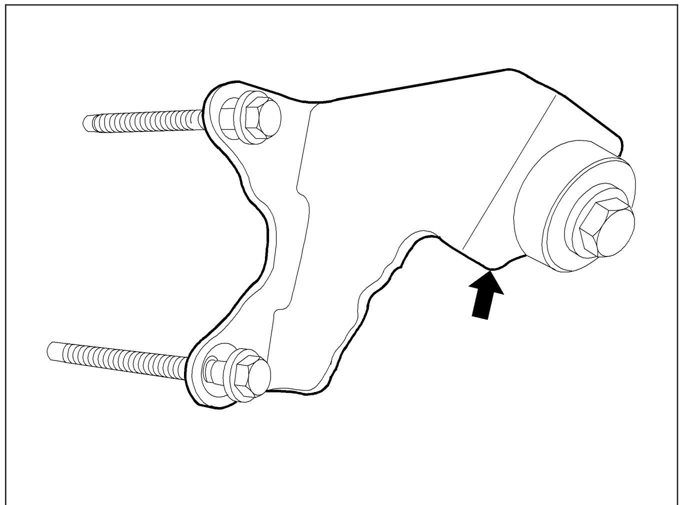
9. Throttle body o-ring (1) and location pins (2).

8181fb9d



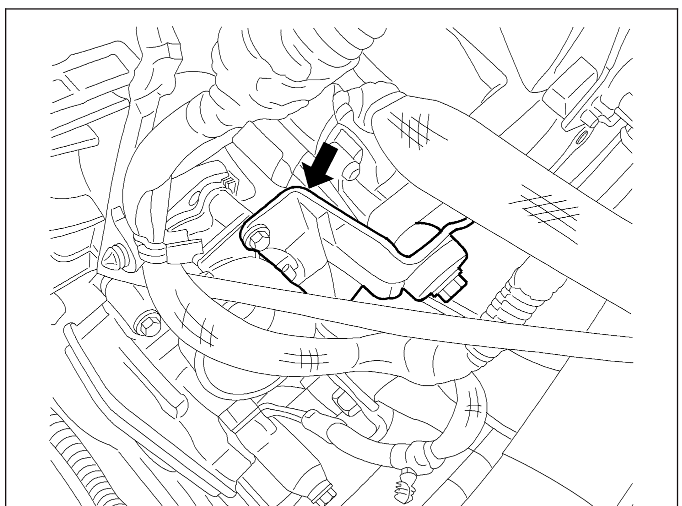
INSTALLATION

1. Make sure that the throttle body gasket (1) is in place in the manifold.



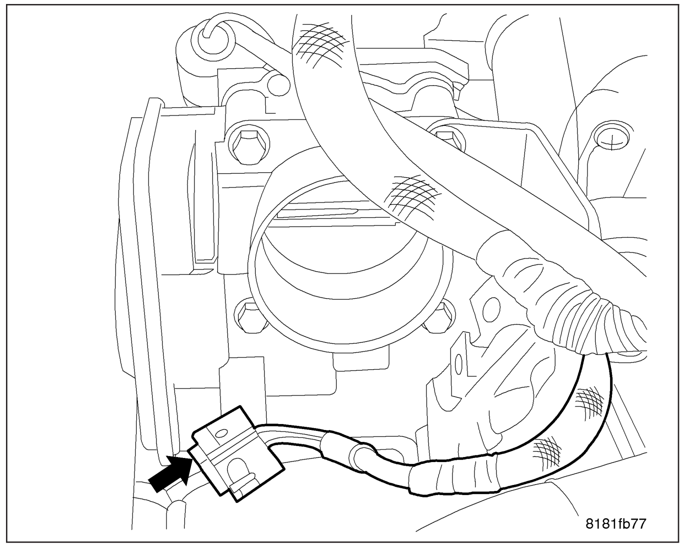
8181fb9d

2. Position throttle body on intake manifold alignment pins and install 2 mounting bolts. Do Not tighten bolts at this time.



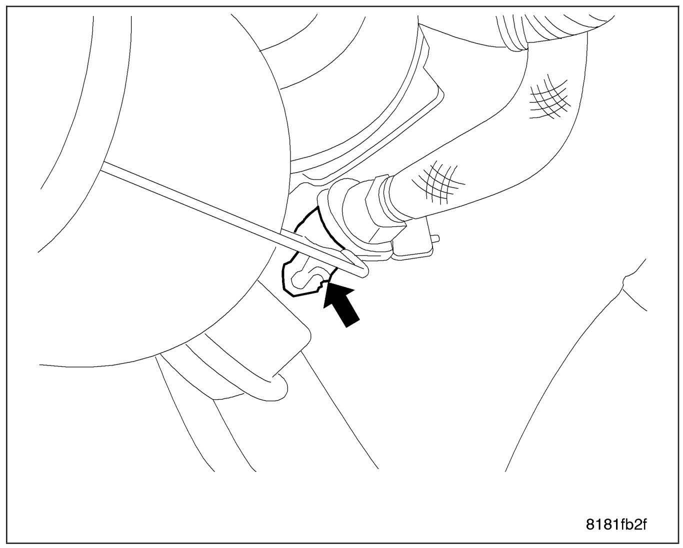
8181fb33

3. Install throttle body bracket.
4. Tighten throttle body bolts to 9 N·m (79.5 in. lbs.) torque.



8181fb66

5. Throttle body bracket installed.



8181fb48

6. Connect electrical connectors to throttle body.

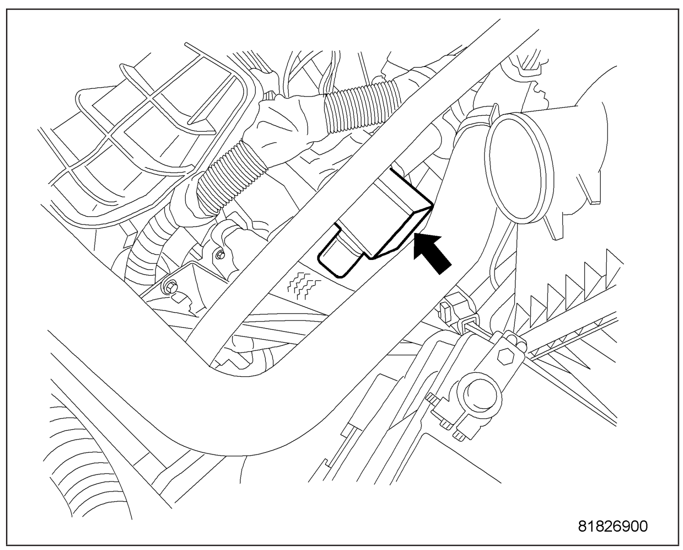
7. Install air tube and connect wiring harness to air tube.
8. Connect negative battery cable.

MANIFOLD FLOW VALVE

OPERATION

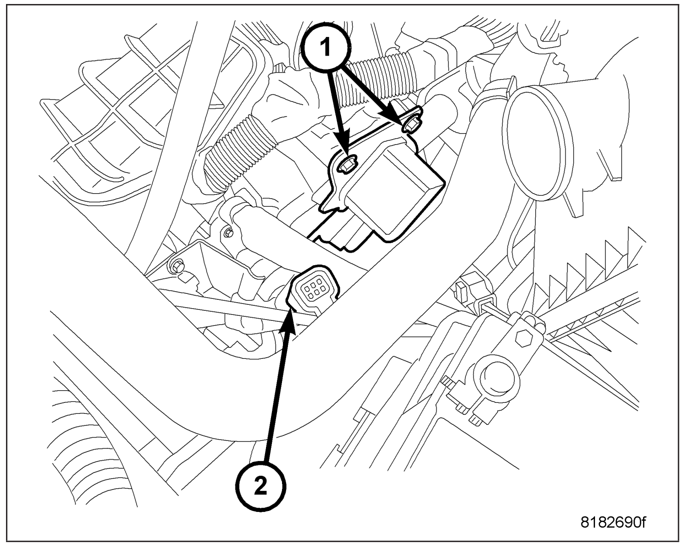
The World Engine is equipped with an intake manifold flow control valve to promote maximum air/fuel atomization. The valve restricts airflow, causing it to tumble or swirl. The tumbling action helps ensure that the fuel and air mix thoroughly and burn faster. The intake manifold flow control valve and variable valve timing work together to improve fuel economy, idle stability, and emissions.

The electrically controlled intake manifold flow control valve is located in the intake manifold at the cylinder head. The intake manifold is constructed of composite material and divided into equal length runners. At the end of each runner is an intake manifold flow control valve flap. The intake manifold flow control valve actuator controls the flaps through a common shaft.



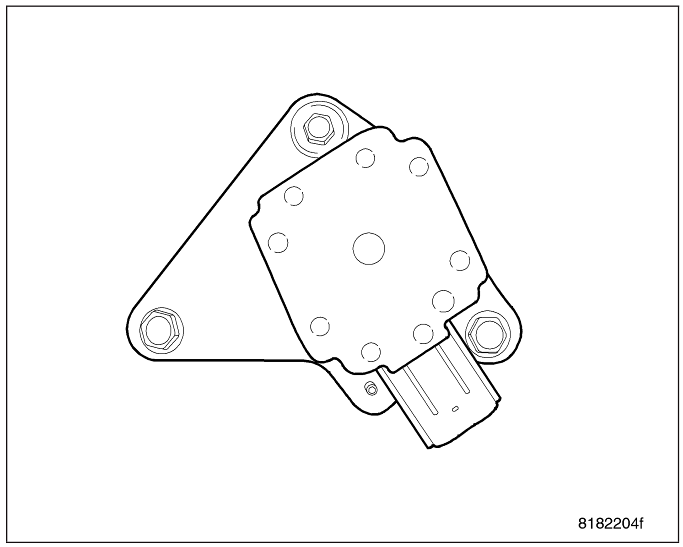
The intake manifold flow control valve actuator is a two-position torque motor that is pulse-width driven by the GPEC1. The actuator is either energized to move the flaps out of the way to the wide-open position or de-energized to move the flaps up, to a restricted position.

The intake manifold flow control valve actuator also contains a potentiometer feedback system to aid in diagnosis. The potentiometer circuit reports the actual position of the intake manifold flow control valve flaps. The GPEC1 compares the actual position with the desired position to ensure that the system is functioning correctly. The intake manifold flow control valve flaps are the mechanical components that restrict airflow to the intake ports. When the valves are moved upward, airflow is restricted and tumble occurs. When the valves are flat against the manifold, the full, unrestricted air charge flows to the intake ports.

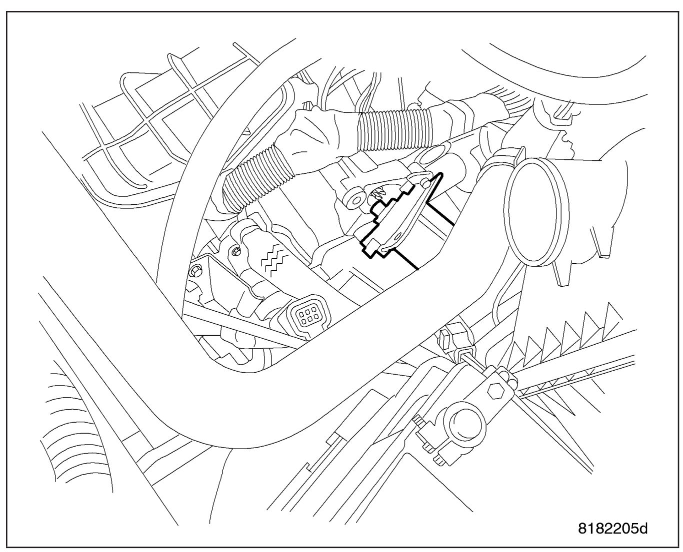


It is energized under specific operating conditions: At high engine speeds (greater than 3600 rpm on the 1.8 and 2.0 liter or greater than 4000 rpm on the 2.4 liter) or at wide-open throttle, the intake manifold flow control valve actuator is energized and the flaps move to the wide-open position, at lower engine speeds (less than 3600 rpm on the 1.8 and 2.0 liter or less than 4000 rpm on the 2.4 liter), the actuator is de-energized allowing the flaps to remain in the restricted position. The flap is held at that position by the return spring.

REMOVAL

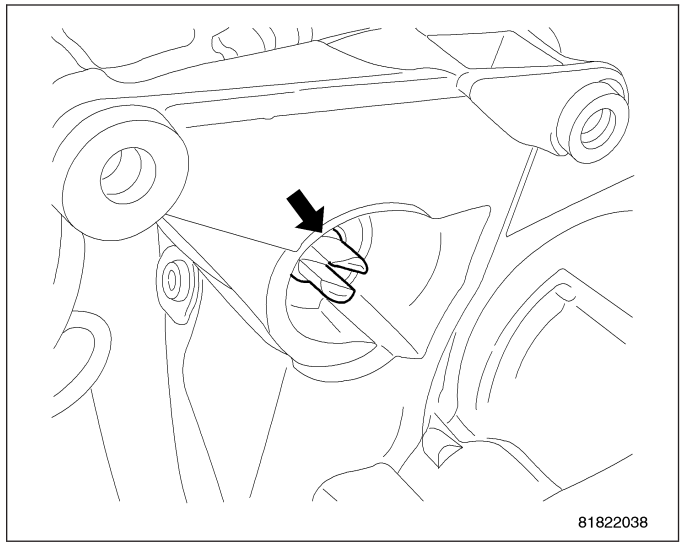


1. Disconnect negative battery cable.
2. Remove air tube,

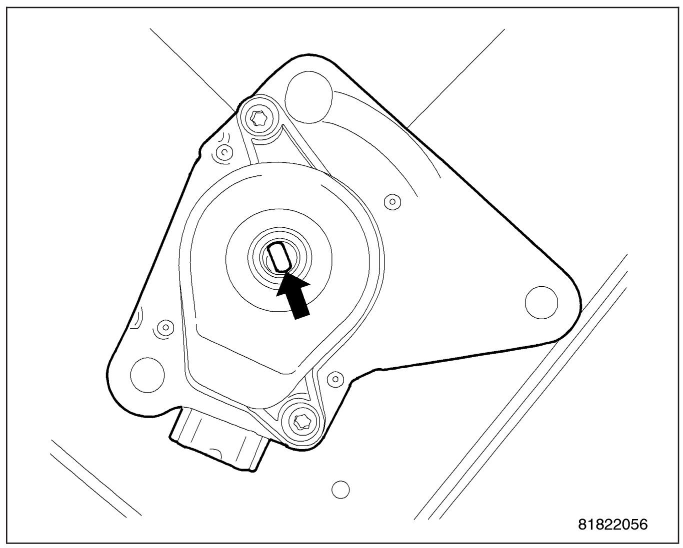


3. Disconnect electrical connector.

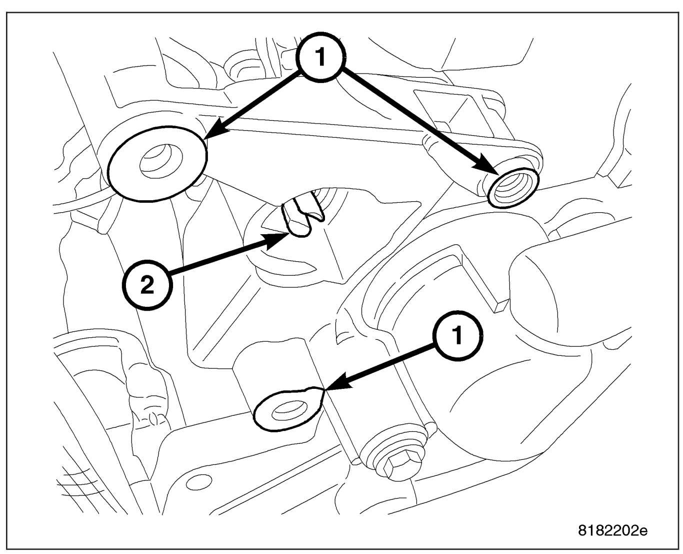
4. Remove 3 mounting screws.



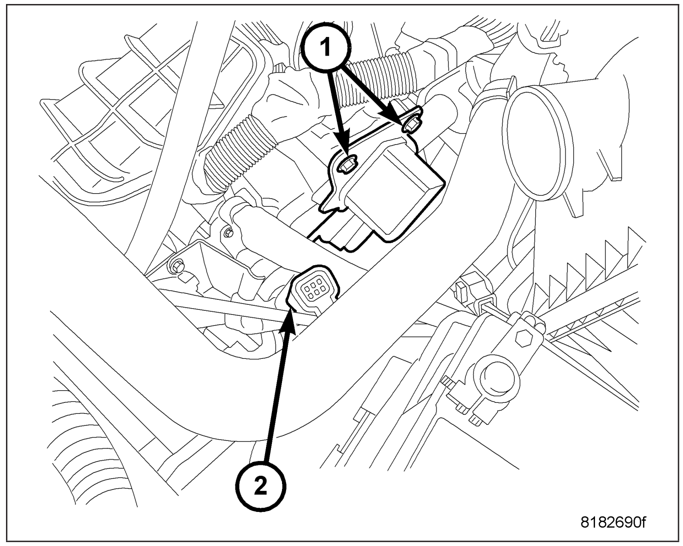
5. Remove valve.



INSTALLATION



1. Make sure that slot in shaft is not damaged.



2. Make sure that tab in valve is not damaged.

3. Align tab in valve with slot in intake manifold shaft (2) and rotate valve counterclock-wise until valve drops onto location pin mounting (1).
4. Install mounting screws.

5. Connect electrical connector.
6. Install air tube.
7. Connect negative battery cable.

STEERING

TABLE OF CONTENTS

STEERING

DESCRIPTION - POWER STEERING SYSTEM

This vehicle comes with power steering as standard equipment and it is the only steering system available. The power steering system consists of these major components:

- Power Steering Pump
- Power Steering Gear
- Power Steering Fluid Reservoir
- Power Steering Fluid Pressure Hose
- Power Steering Fluid Return Hose
- Power Steering Fluid Cooler

For information on the first two components, refer to their respective sections within this service manual group. Information on the remaining components can be found in Power Steering Pump.

OPERATION - POWER STEERING SYSTEM

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by a belt driven rotary type pump. It directs fluid through power steering fluid hoses to the power steering gear where it is used to assist the driver's turning effort.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

WARNING

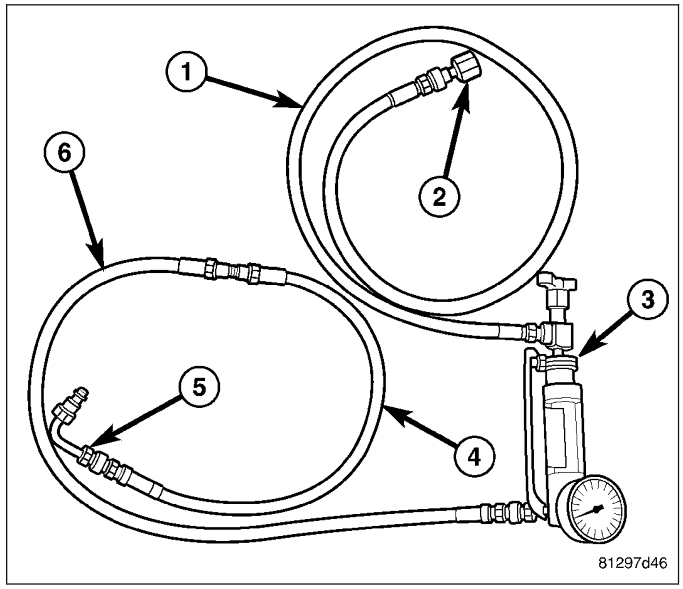
WARNINGS AND CAUTIONS

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

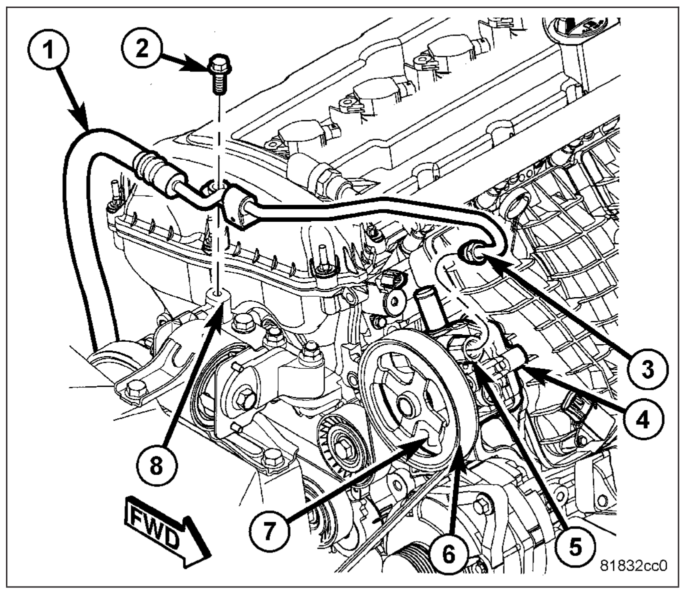
WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION: When the system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

DIAGNOSIS AND TESTING

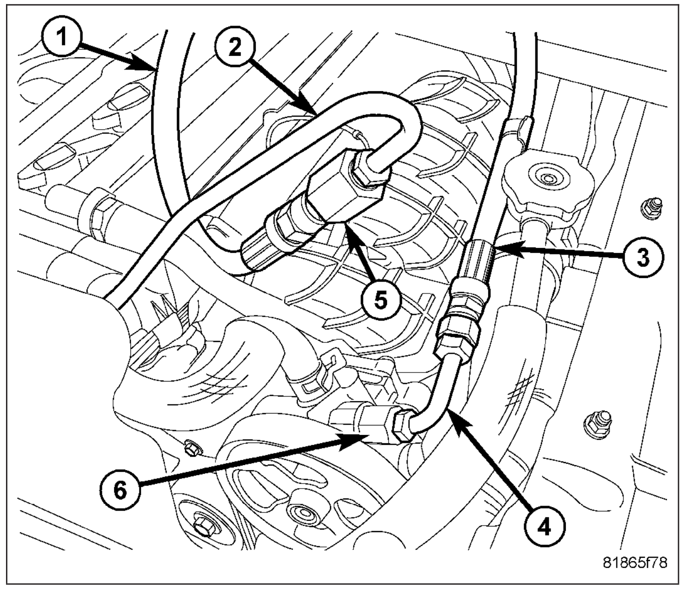


HYDRAULIC FLOW AND PRESSURE TEST



WARNING: To prevent personal injury, safety goggles should be worn at all times while performing any test procedures on the power steering system.

The following procedure is to be used to test the operation of the power steering system on this vehicle. This test will provide the flow rate (Gallons Per Minute (GPM)) of the power steering pump along with the maximum relief pressure. Perform this test any time a power steering system problem is present. This test will help determine if the power steering pump or power steering gear is not functioning properly. The test is performed using tools in the



Power Steering Analyzer Kit 6815 with appropriate hoses and adapters. (Refer to 19 - STEERING - SPECIAL TOOLS)

1. Check the power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble the following hoses and adapters on the Flow Meter And Gauge 6800 (1):
   a. Gauge end (inlet) – Hose 6905 (6) (in 6893 kit), Hose 6713 (4) (in 6815 kit), Adapter Tube 6844 (5) (in 6893 kit)
   b. Valve end (outlet) – Hose 6959 (1), Adapter Fitting 6826 (2)

3. Unthread the tube nut (3) and disconnect the power steering pressure hose (1) at the power steering pump pressure fitting (5).
4. Connect the vehicle's power steering pressure hose (2) to Adapter Fitting 6826 (5) (on Hose 6959 (1) leading to Analyzer outlet). Tighten the tube nut to specifications. (Refer to 19 - STEERING - SPECIFICATIONS)
5. Connect Adapter Fitting 6844 (6) (on Hose 6713 (3) leading to Analyzer inlet), to the open power steering pump pressure fitting (6). Tighten the tube nut to pressure hose specifications. (Refer to 19 - STEERING - SPECIFICATIONS)
6. Route the hoses away from the exhaust system as well as possible.

TEST PROCEDURE

1. Completely open the valve on the Power Steering Analyzer flow meter.
2. Start the engine and let idle long enough to circulate power steering fluid through the analyzer and hoses, until the air is out of the fluid. Shut the off engine.
3. Check the power steering fluid level and add fluid as necessary. Start the engine again and let idle.
4. The analyzer gauge should read below 862 kPa (125 psi). If above, inspect the hoses for restrictions and repair as necessary. The initial pressure should be in the range of 345-552 kPa (50-80 psi). The flow meter should read between 1.5 and 1.7 GPM.

CAUTION: The following test procedure step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

NOTE: Power steering pump maximum relief pressure is 9308 to 9998 kPa (1350 to 1450 psi.).

5. Close the flow meter valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**
   - If the power steering pump pressures are above specifications, but not within 345 kPa (50 psi) of each other, replace the power steering pump.
   - If the pressures are within 345 kPa (50 psi) of each other, but below specifications, replace the power steering pump.

If the power steering pump requires replacement, (Refer to 19 - STEERING/PUMP - REMOVAL).

CAUTION: During the next step, do not force the pump to operate against the stops for more than 5 seconds at a time as pump damage may result.

6. Completely open the valve on the Power Steering Analyzer flow meter. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest output pressure reading against one stop is not within 345 kPa (50 psi) of the highest reading at the other stop, the steering gear is leaking internally and must be replaced.

If the power steering gear requires replacement, (Refer to 19 - STEERING/GEAR - REMOVAL).

STEERING DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover the topics Power Steering Noise, Steering Wheel Feel, and Power Steering Fluid.

POWER STEERING NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONABLE HISS OR WHISTLE*	1. Damaged or mispositioned steering column shaft/coupling dash panel seal.	1. Reposition steering column/shaft. Lubricate dash panel seal or replace dash panel seal as necessary.
	2. Noisy valve in power steering gear.	2. Replace power steering gear.
RATTLE OR CLUNK	1. Power steering gear loose on front suspension crossmember.	1. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	2. Front suspension crossmember mounting fasteners loose at frame.	2. Tighten the front suspension crossmember mounting fasteners to the specified torque.
	3. Loose tie rod (outer or inner).	3. Check tie rod pivot points for wear. Replace worn/loose parts as required.
	4. Loose lower control arm mounting bolts at front suspension crossmember.	4. Tighten control arm mounting bolts to the specified torques.
	5. Loose strut assembly mounting fasteners at strut tower.	5. Tighten strut assembly fasteners to the specified torques.
	6. Power steering fluid pressure hose touching the body of the vehicle.	6. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing.
	7. Internal power steering gear noise.	7. Replace power steering gear.
	8. Damaged front suspension crossmember.	8. Replace front suspension crossmember.
CHIRP OR SQUEAL (POWER STEERING PUMP)	1. Loose power steering pump drive belt.	1. Check and replace automatic belt tensioner as necessary. Replace belt if worn or glazed.
WHINE OR GROWL (POWER STEERING PUMP)**	1. Low fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks.
	2. Power steering hose touching vehicle body or frame.	2. Adjust hose to proper position by loosening, repositioning, and tightening fitting to specified torque. Do not bend tubing. Replace hose if damaged.
	3. Extreme wear of power steering pump internal components.	3. Replace power steering pump and flush system as necessary.
SUCKING AIR SOUND	1. Loose clamp on power steering fluid return hose.	1. Tighten or replace hose clamp.
	2. Missing O-Ring on power steering hose connection.	2. Inspect connection and replace O-Ring as required.

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Low power steering fluid level. 4. Air leak between power steering fluid reservoir and power steering pump.	3. Fill power steering fluid reservoir to proper level and check for leaks. 4. Replace power steering pump (with reservoir).
SQUEAK OR RUBBING SOUND	1. Steering column shroud rubbing. 2. Steering column shaft rubbing. 3. Steering column shaft dry-rubbing seal at dash panel. 4. Steering gear internally noisy.	1. Realign shrouds as necessary. 2. Move or realign item rubbing shaft. 3. Lubricate contact surface. 4. Replace steering gear.
SCRUBBING OR KNOCKING NOISE	1. Incorrect tire or wheel size. 2. Interference between steering gear and other vehicle components. 3. Steering gear internal stops worn excessively.	1. Replace incorrect size tire or wheel with size used as original equipment. 2. Check for bent or misaligned components and correct as necessary. 3. Replace steering gear.

NOTE: * There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

NOTE: ** Power steering pump growl results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

STEERING WHEEL FEEL

CONDITION	POSSIBLE CAUSES	CORRECTION
STEERING WHEEL/ COLUMN CLICKING, CLUNKING OR RATTLING	1. Loose steering coupling pinch bolt. 2. Steering column bearings.	1. Replace pinch bolt and torque to specifications. 2. Replace steering column.
STEERING WHEEL HAS FORE AND AFT LOOSENESS	1. Steering wheel retaining screw not properly tightened and torqued.	1. Tighten the steering wheel retaining nut to its specified torque.
STEERING WHEEL OR DASH VIBRATES DURING LOW SPEED OR STANDSTILL STEERING MANEUVERS	1. Air in the fluid of the power steering system. 2. Tires not properly inflated. 3. Excessive engine vibration. 4. Engine torque struts out of alignment.	1. Bleed air from system following the power steering pump initial operation service procedure.* 2. Inflate tires to the specified pressure. 3. Ensure that the engine is running properly. 4. Align engine torque struts.

CONDITION	POSSIBLE CAUSES	CORRECTION
	5. Loose tie rod end jam nut.	5. Tighten the inner to outer tie rod jam nut to the specified torque.
	6. Overcharged air conditioning system.	6. Check air conditioning pump head pressure and correct as necessary.
STEERING CATCHES, STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to specified level and check for leaks.
	2. Tires not inflated to specified pressure.	2. Inflate tires to the specified pressure.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	4. Lack of lubrication in steering gear outer tie rod ends.	4. Lubricate tie rod ends if they are not a lubricated for life type. If tie rod end is a lubricated for life type, replace tie rod end.
	5. Loose power steering pump drive belt.	5. Check and replace automatic belt tensioner as necessary. If drive belt is worn or glazed, replace belt.
	6. Faulty power steering pump flow control (Follow Power Steering System Flow and Pressure Test procedure).	6. Replace power steering pump.
	7. Excessive friction in steering column or intermediate shaft.	7. Isolate and correct condition.
	8. Binding upper strut bearing.	8. Disassemble strut assembly. Correct binding condition in strut bearing or replace bearing.
	9. Excessive friction in power steering gear.	9. Replace power steering gear.
STIFF, HARD TO TURN, SURGE, MOMENTARY INCREASE IN EFFORT WHEN TURNING	1. Tires not properly inflated.	1. Inflate tires to specified pressure.
	2. Low power steering fluid level.	2. Add power steering fluid as required to power steering fluid reservoir to obtain proper level. Check for leaks.
	3. Loose power steering pump drive belt.	3. Check and replace automatic belt tensioner as necessary. If drive belt is worn or glazed, replace belt.
	4. Lack of lubrication in control arm ball joints.	4. Lubricate ball joints if ball joints are not a lubricated for life type ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	5. Low power steering pump pressure (Follow Power Steering System Flow and Pressure Test procedure).	5. Replace the power steering pump as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. High internal leak in power steering gear (Follow Power Steering System Flow and Pressure Test procedure).	6. Replace power steering gear.
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	1. Tires not inflated properly.	1. Inflate tires to specified pressure.
	2. Improper front wheel alignment.	2. Check and adjust wheel alignment as necessary.
	3. Lack of lubrication in front suspension control arm ball joints.	3. Lubricate ball joints if ball joints are not a lubricated for life type of ball joint. If ball joint is a lubricated for life ball joint, replace ball joint or control arm.
	4. Steering column coupling joints misaligned.	4. Realign steering column coupling joints.
	5. Steering wheel rubbing.**	5. Adjust steering column shrouds to eliminate rubbing condition.
	6. Damaged, mis-positioned or un-lubricated steering column coupler to dash seal.**	6. Replace, reposition, or lubricate dash seal.
	7. Binding upper strut bearing.	7. Disassemble strut assembly. Correct binding condition in strut bearing or replace bearing.
	8. Tight shaft bearing in steering column.	8. Replace the steering column.
	9. Excessive friction in steering column coupling.	9. Replace steering column coupling.
	10. Excessive friction in power steering gear.	10. Replace power steering gear.
EXCESSIVE STEERING WHEEL KICKBACK OR TOO MUCH STEERING WHEEL FREE PLAY	1. Air in the fluid of the power steering system.	1. Bleed air from system following the power steering pump initial operation service procedure.*
	2. Power steering gear loose on front suspension crossmember.	2. Inspect power steering gear mounting bolts. Replace as necessary. Tighten to the specified torque.
	3. Steering column coupling worn, broken or loose.	3. Replace steering column coupling and pinch bolt. Tighten to specifications.
	4. Free play in steering column.	4. Check all components of the steering system and repair or replace as required.
	5. Worn control arm ball joints.	5. Replace ball joint or control arm as required.
	6. Loose steering knuckle to ball joint stud pinch bolt.	6. Inspect pinch bolts, replace as necessary, and tighten to specified torque.
	7. Front wheel bearings loose or worn.	7. Replace wheel bearing or knuckle as necessary.
	8. Loose outer tie rod ends.	8. Replace outer tie rod ends that have excessive free play.
	9. Loose inner tie rod ends.	9. Replace power steering gear.

CONDITION	POSSIBLE CAUSES	CORRECTION
	10. Defective steering gear rotary valve.	10. Replace power steering gear.

NOTE: * Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

NOTE: ** To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be re-centered following the procedure found within the procedure for steering column installation in the steering column section.

POWER STEERING FLUID

CONDITION	POSSIBLE CAUSES	CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK	1. Loose power steering hose fittings.	1. Tighten the fitting to its specified torque.
	2. Damaged or missing fitting seal, gasket, or O-ring.	2. Replace as necessary.
	3. Power steering pump or power steering gear leaking.	3. Repair or replace the leaking component as required.
AERATED FLUID*	1. Low fluid level.**	1. Fill power steering fluid reservoir to proper level.
	2. Air leak between power steering fluid reservoir and pump.	2. Inspect for proper sealing. Replace the power steering pump (with reservoir).
	3. Cracked power steering pump housing.	3. Replace the power steering pump.
RESERVOIR FLUID OVERFLOW AND FLUID IS MILKY IN COLOR	1. Water contamination.	1. Drain the power steering fluid from the system. Flush the system with fresh clean power steering fluid, drain, then refill to the proper level.

NOTE: * Aerated fluid will appear with bubbles or foam, somewhat like champagne, when viewed through the reservoir fill opening.

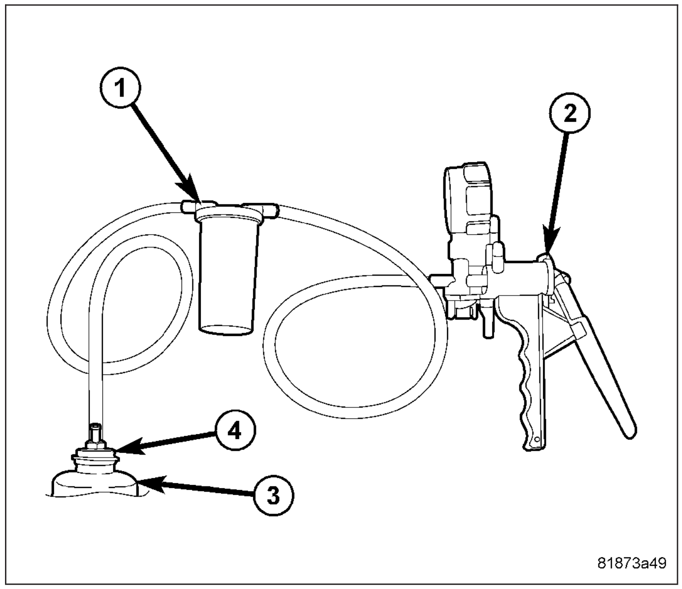
NOTE: ** Extremely cold temperatures may cause power steering fluid aeration, if the power steering fluid is low.

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.



CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between MAX and MIN when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. (Refer to 19 - STEERING/PUMP/FLUID - STANDARD PROCEDURE)
2. Tightly insert Power Steering Cap Adapter (4), Special Tool 9688, into the mouth of the reservoir (3).

CAUTION: Failure to use a the vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool C-4207 or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the engine while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (1), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to Step 1.
7. Repeat Step 1 through Step 6 until the fluid no longer drops when vacuum is applied.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

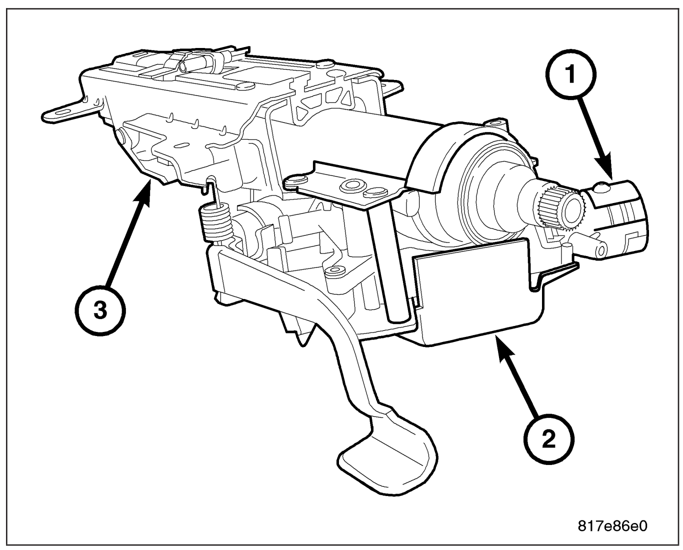
COLUMN

TABLE OF CONTENTS

COLUMN

DESCRIPTION

This vehicle is equipped with a tilt type steering column (1). The steering column is designed to be serviced only as complete assembly if an internal component is found to be defective. The shaft, bearings and intermediate shaft are all serviced with the column.



The serviceable components on the steering column assembly are:

- Clockspring (Integral part of Steering Column Control Module (SCCM))
- Driver Airbag
- Ignition Switch
- Key Cylinder
- Lock Cylinder Housing
- Multi-Function Switches (left and right)
- Tilt Lever
- Shrouds
- Steering Wheel

These components can be serviced without removal of the steering column from the vehicle. Refer to the appropriate section for servicing these components separately.

A special steering column is used in some Export areas meeting Thatcham security requirements. This steering column (3) is much the same as the standard steering column except for the addition of a tamper-proof shield (2) around the lock cylinder housing and an antitheft cup (1) surrounding the key cylinder. The tamper-proof shield disallows service of the lock cylinder housing. The antitheft cup can be removed allowing access to the key cylinder for service purposes.

The Thatcham steering column also features a ratcheting slip collar. This collar is not serviceable.

WARNING

WARNINGS AND CAUTIONS

WARNING: Safety goggles should be worn at all times when working on steering columns.

WARNING: Before beginning any service procedures that involves removing the air bag: Remove and isolate the negative (-) battery cable (ground) from the vehicle battery. This is the only sure way to disable the air bag system. Failure to do this could result in accidental air bag deployment and possible personal injury.

WARNING: The air bag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the air bag system components you must first disconnect and isolate the battery negative (ground) cable. Failure to do so could result in accidental deployment of the air bag and possible personal injury. The fasteners, screws, and bolts, originally used for the air bag components, have special coatings and are specifically designed for the air bag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books. Before servicing a steering column equipped with an air bag, (REFER to 8 - Electrical/Restraints - Warning).

WARNING: When handling an undeployed air bag during servicing of the steering column, the following precautions should be observed:
- **At no time should any source of electricity be permitted near the inflator on the back of the air bag.**
- **When carrying a live air bag, the trim cover should be pointed away from the body to minimize injury if the air bag should accidently deploy.**
- **If the air bag is placed on a bench or other surface, the plastic cover should be face-up to minimize movement, in case of accidental deployment.**

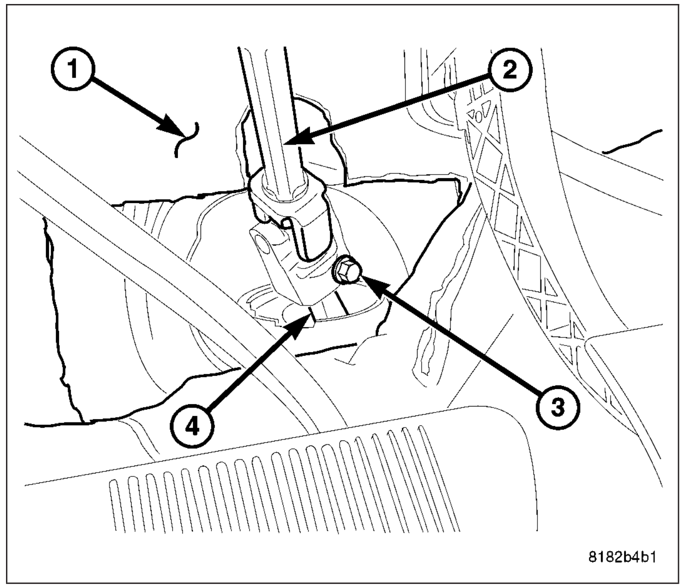
CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Damage will occur.

DIAGNOSIS AND TESTING

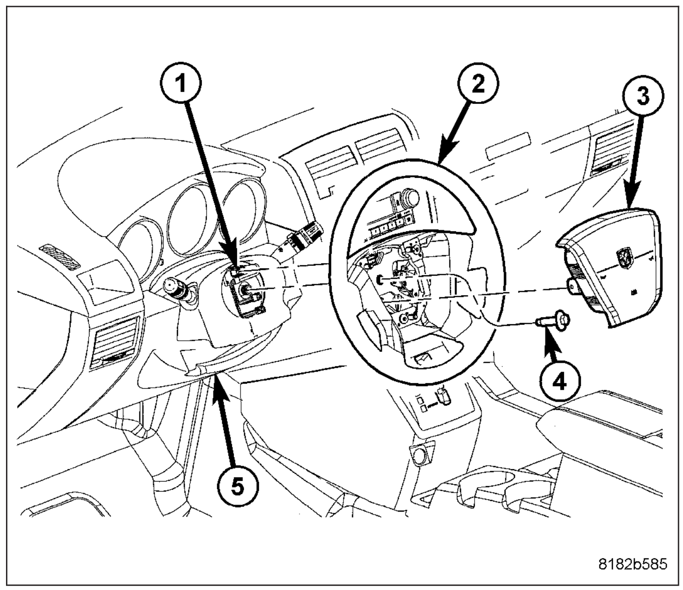
STEERING COLUMN

For diagnosis of conditions relating to the steering column, (Refer to 19 - STEERING - DIAGNOSIS AND TESTING).



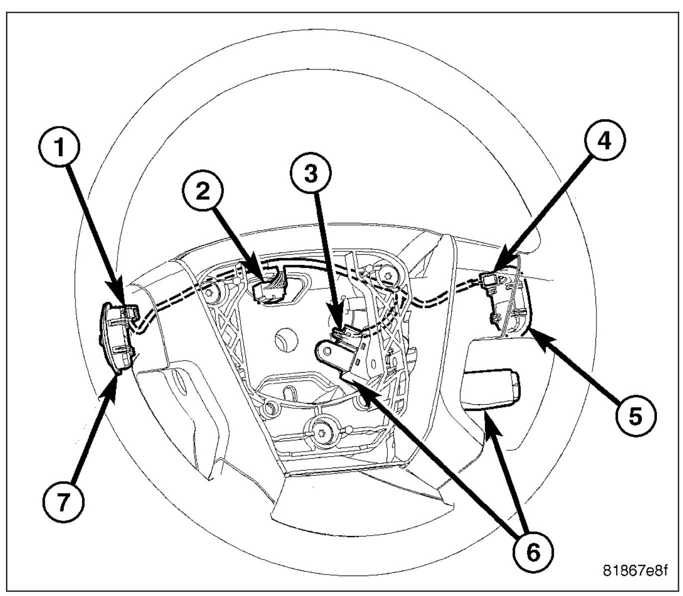
REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING/COLUMN - WARNING).

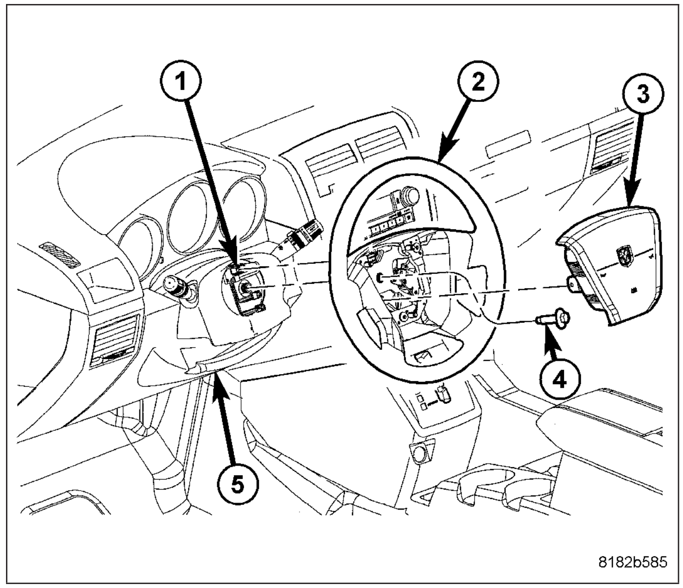


WARNING: When an undeployed airbag module is to be removed from the vehicle, first disconnect the battery ground cable and isolate it. Allow the system capacitor to discharge for a minimum of two minutes before starting any removal.

1. Disconnect the negative (-) cable from the battery and isolate the cable.

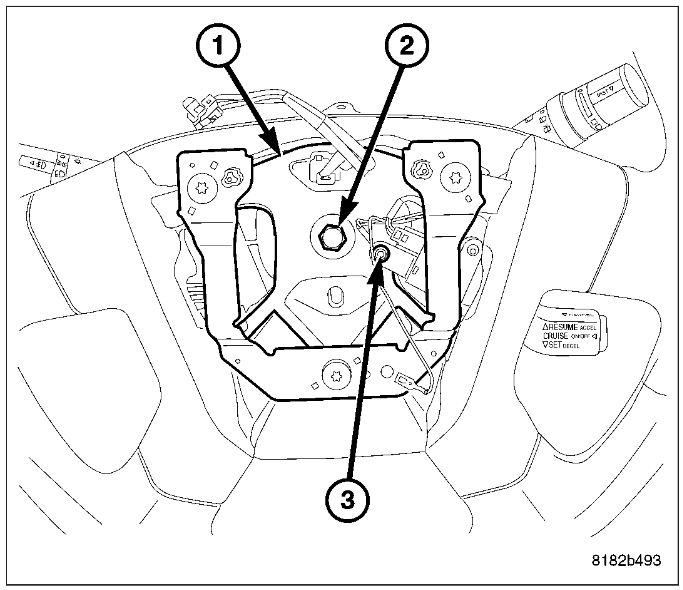


2. Reposition the floor carpeting to access the steering column coupling at the base of the column.
3. Position the front wheels of vehicle in the STRAIGHT-AHEAD position, then turn the steering wheel to the right until the pinch bolt (3) at the base of the column can be accessed.
4. Remove the pinch bolt (3). **Do not separate the intermediate shaft (2) from the steering gear pinion shaft (4) at this time.**
5. Return the front wheels of vehicle (and steering wheel) to the STRAIGHT-AHEAD position.



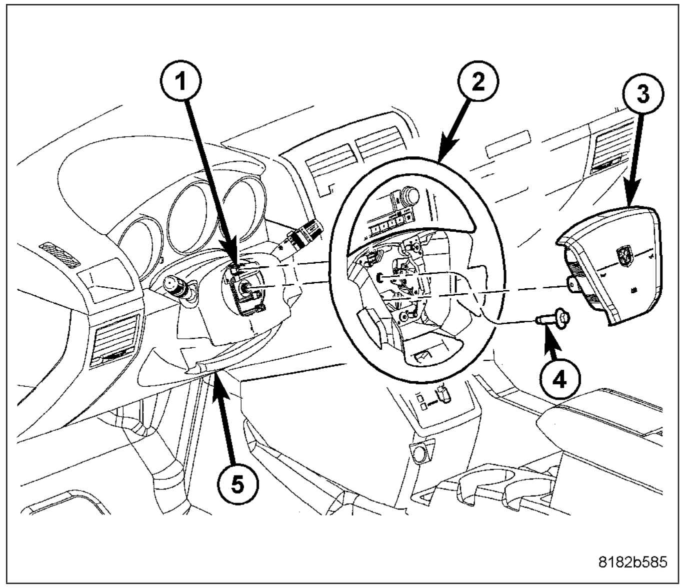
6. Remove the driver airbag (3). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL)

7. Disconnect the wiring connector (2) at the clockspring.

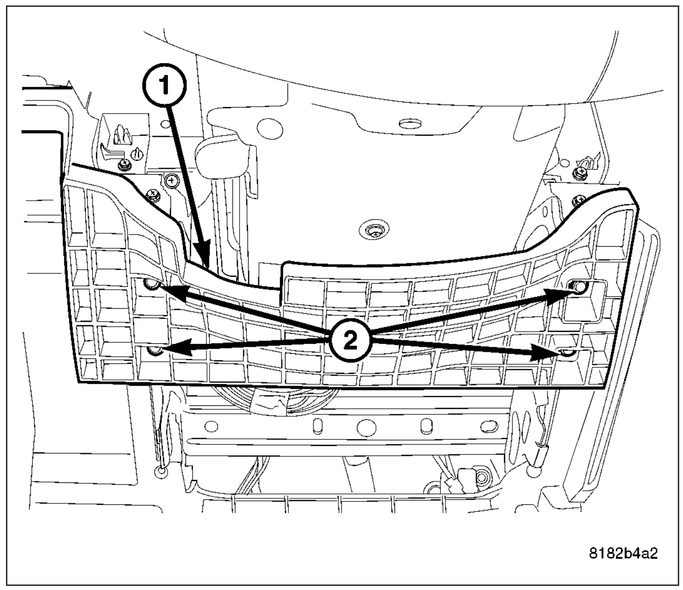


8. Holding the steering wheel firmly in place, remove the steering wheel retaining bolt (4) from the steering column shaft.

CAUTION: Threading the retaining bolt (2) back in the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt allows a safe reaction surface for the puller to work against.

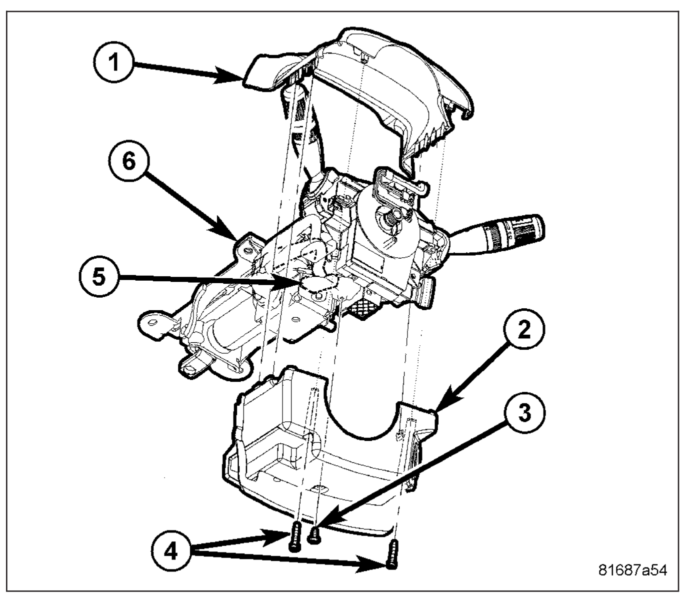


9. Thread the steering wheel retaining bolt (2) back into the end of the steering shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt.
10. Remove the speed control screw (3) in order to install the steering wheel puller.
11. Install an appropriate wheel puller on the steering wheel over the steering shaft (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).

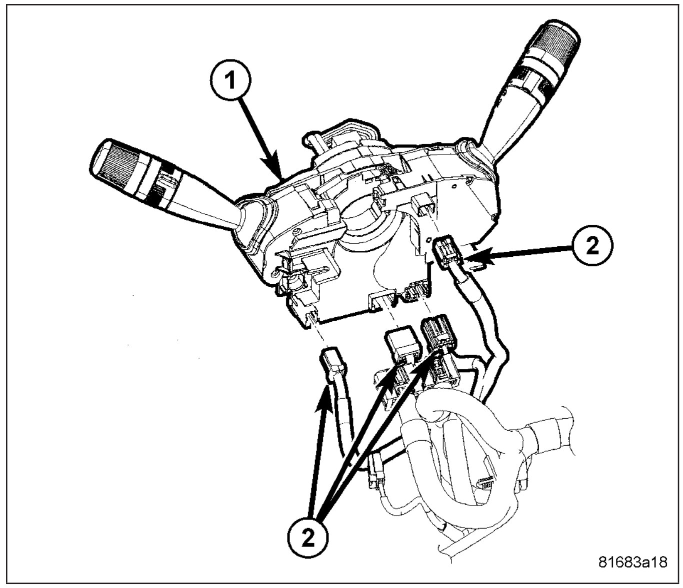


CAUTION: Do not bump or hammer on the steering wheel or steering column shaft when removing the steering wheel.

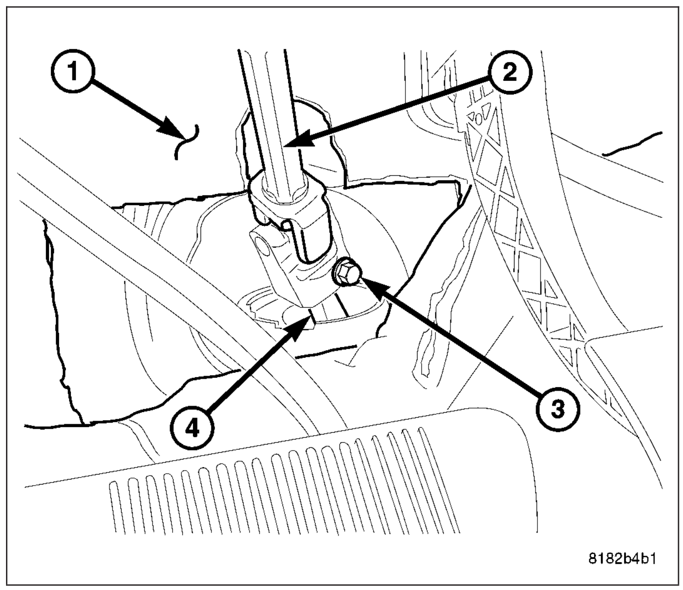
12. Holding the steering wheel firmly in the STRAIGHT-AHEAD position, release the steering wheel from the steering column shaft splines using the puller. Remove the wheel retainer bolt (2) and the steering wheel from the column.



13. Position the column tilt at the full-upward position.
14. Remove the IP side trim (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).
15. Remove the steering column opening cover (5) (Refer to 23 - BODY/INSTRUMENT PANEL/ STEERING COLUMN OPENING COVER - REMOVAL).

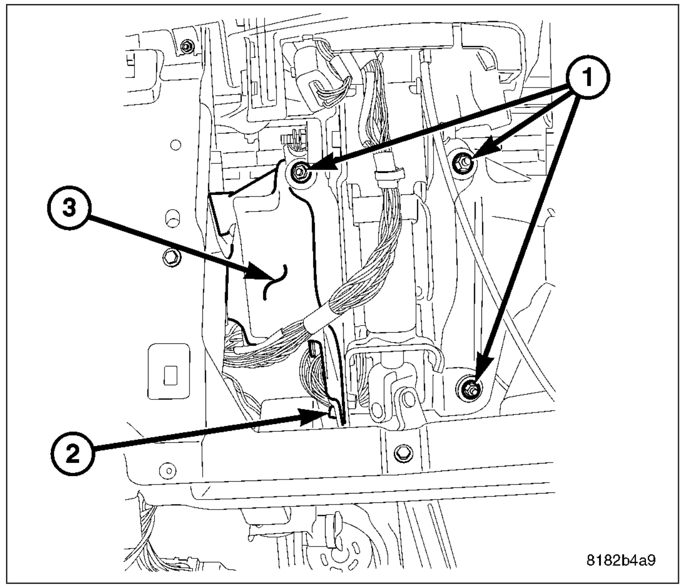


16. Remove the steering column cover reinforcement panel (1) four screws (2).



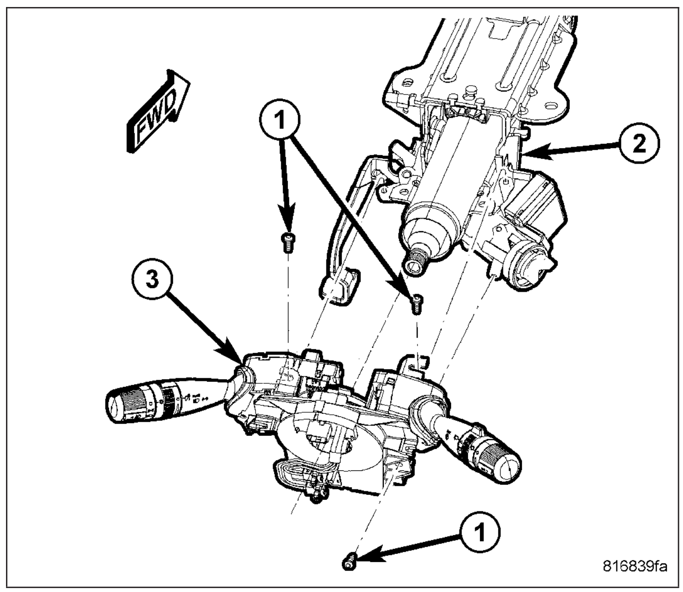
17. Remove the two screws (4) attaching the upper shroud (1) to the lower shroud (2). After removing the screws, unclip the shrouds from each other by applying hand pressure along the seams where the shrouds connect on the sides, then remove the upper shroud.
18. Push the tilt lever (5) downward.
19. Remove the screw (3) attaching the lower shroud (2) to the steering column (6). Remove the lower shroud.
20. Push the tilt lever (5) upward, locking it in place.

21. Disconnect the wiring harness connectors (2) at the Steering Column Control Module (SCCM) (1).
22. Disconnect all other wiring harness connectors at column components.



23. If the vehicle is equipped with an automatic transaxle, disconnect the ignition shift interlock cable at the steering column.
24. Separate the intermediate shaft (2) at the base of the column from the steering gear pinion shaft (2).

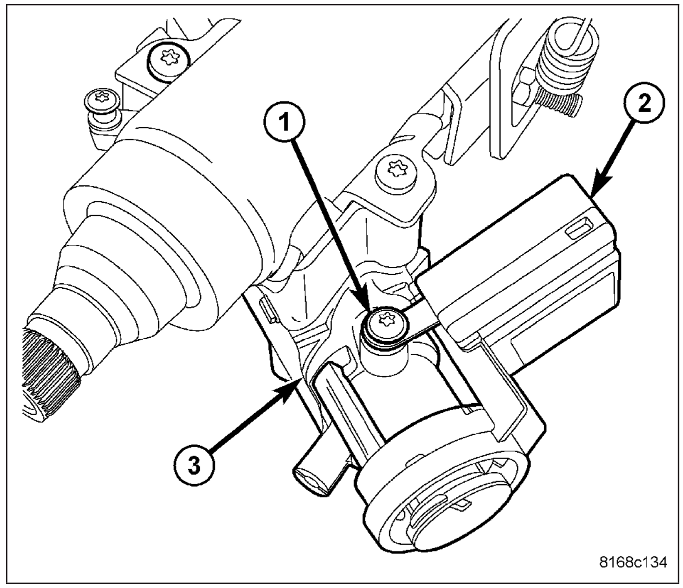
NOTE: If the same steering column is to be reinstalled, clamp the tilt lever to lock the column in place so that it can be easily reinstalled in the same orientation.



25. Remove the three mounting nuts (1) attaching the steering column to the instrument panel (3).
26. Remove the one mounting bolt (left lower) (2) attaching the steering column to the instrument panel (3).
27. Remove the steering column from the vehicle.
28. To remove remaining components from the column, (Refer to 19 - STEERING/COLUMN - DISASSEMBLY).

DISASSEMBLY

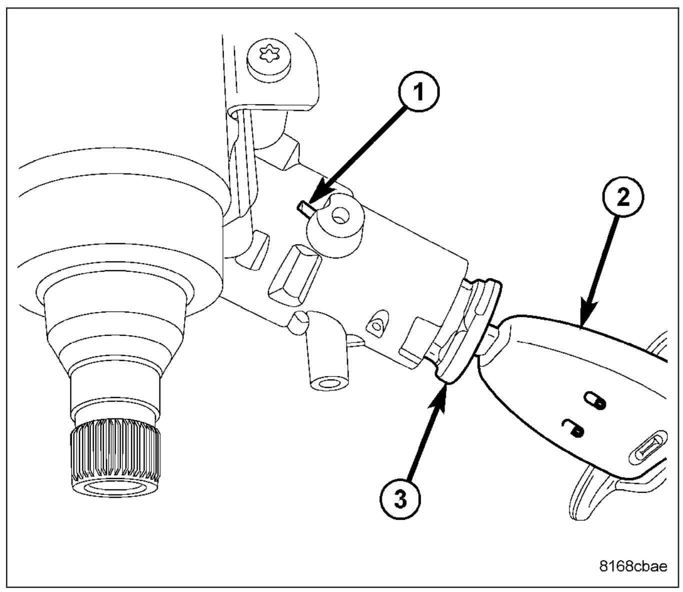
STEERING COLUMN CONTROL MODULE



1. Remove the screws (1) attaching the Steering Column Control Module (SCCM) (with switch stalks) (3) to the steering column (2).
2. Slide the SCCM (with switch stalks) (3) off the steering column (2).

SKREEM/WCM (IF EQUIPPED)

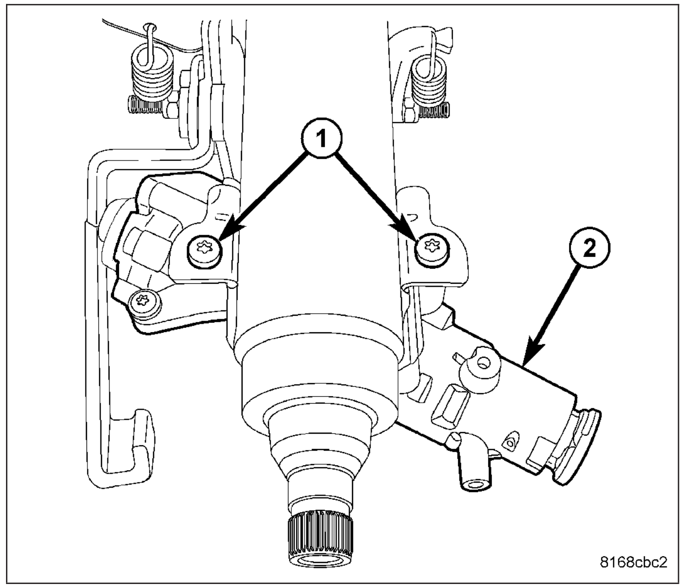
NOTE: SCCM previously removed.



1. Remove the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3).
2. Unhook the SKREEM/WCM (2) retainer fingers from the lock cylinder housing (3) and remove it from the housing.

KEY CYLINDER

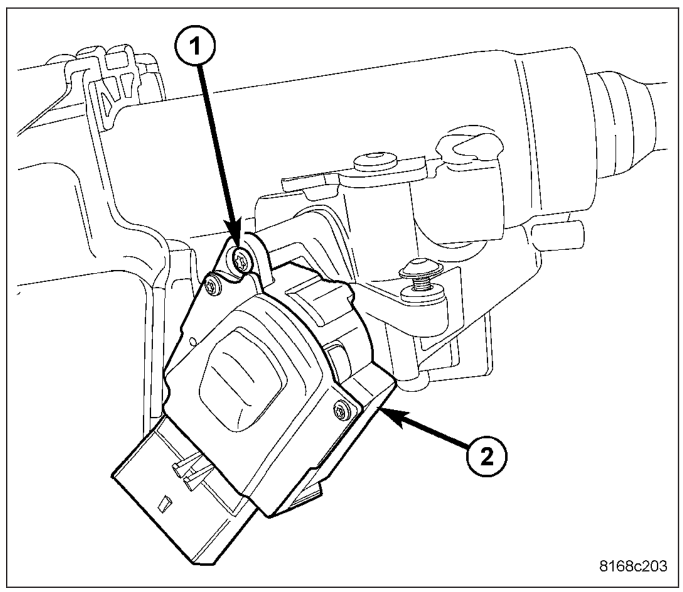
NOTE: SCCM and SKREEM/WCM previously removed.



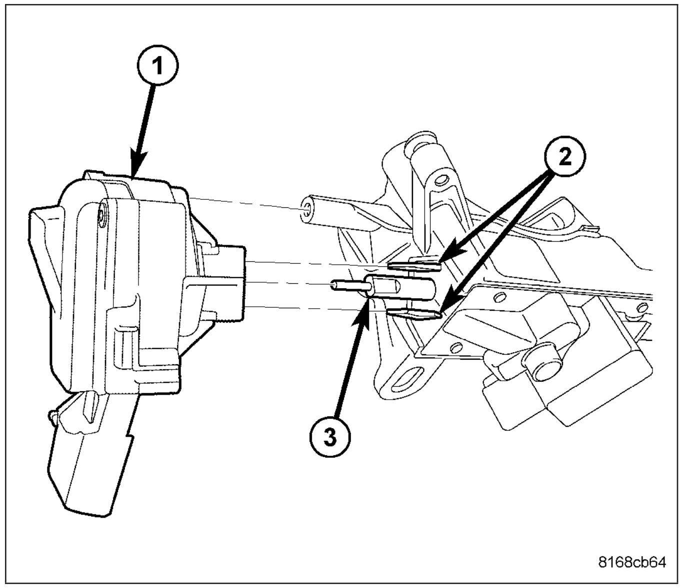
1. Insert the key (2) and turn the key cylinder (3) to the RUN position.
2. Insert an appropriate tool into the slot (1) formed into the lock cylinder housing depressing the key cylinder retaining tab.
3. Pull the key cylinder and key straight out of the lock cylinder housing as one unit.

LOCK CYLINDER HOUSING

NOTE: SCCM previously removed.



1. Using Tamper-Proof Torx® Plus (five point) 30 bit, remove the two screws (1) fastening the lock cylinder housing (2) to the column.
2. Remove the lock cylinder housing from the steering column.



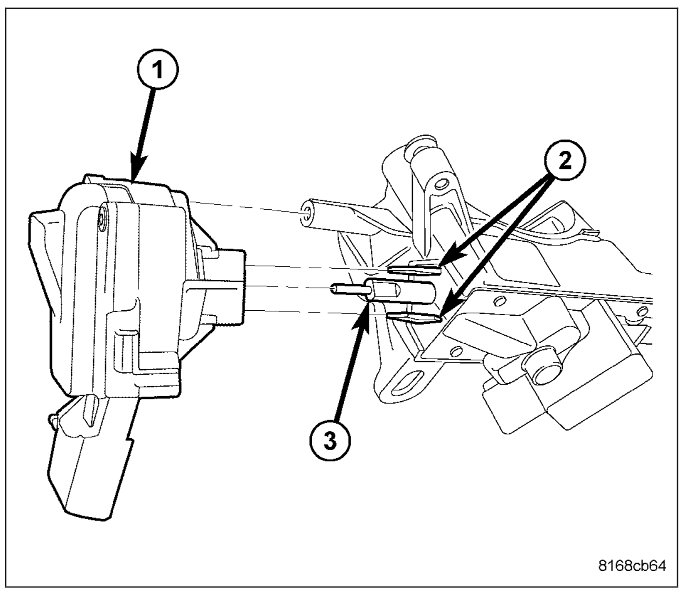
IGNITION SWITCH

NOTE: Lock cylinder housing previously removed.

1. Lower the column tilt lever to the full-downward position.
2. Remove the ignition switch (2) mounting screw (1).

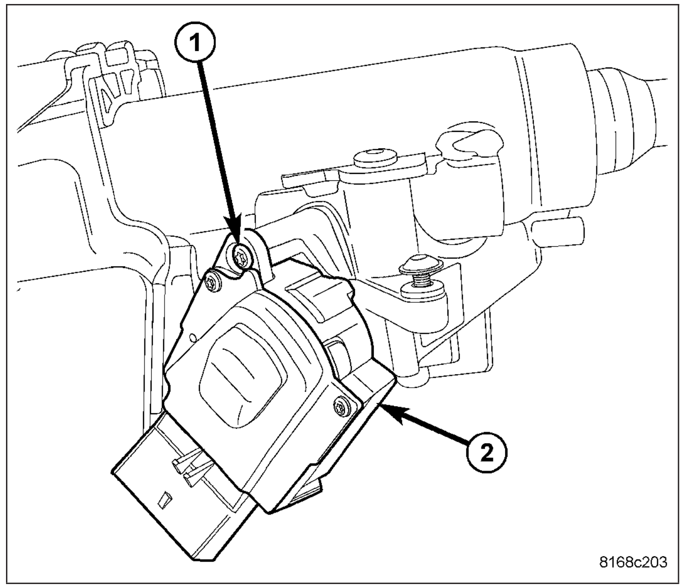
3. Pull the switch (1) straight out and off the retaining tabs (2) located on the lock cylinder housing.

INSPECTION



Replace the steering column if the driver airbag has deployed, regardless of the extent of damage to the vehicle.

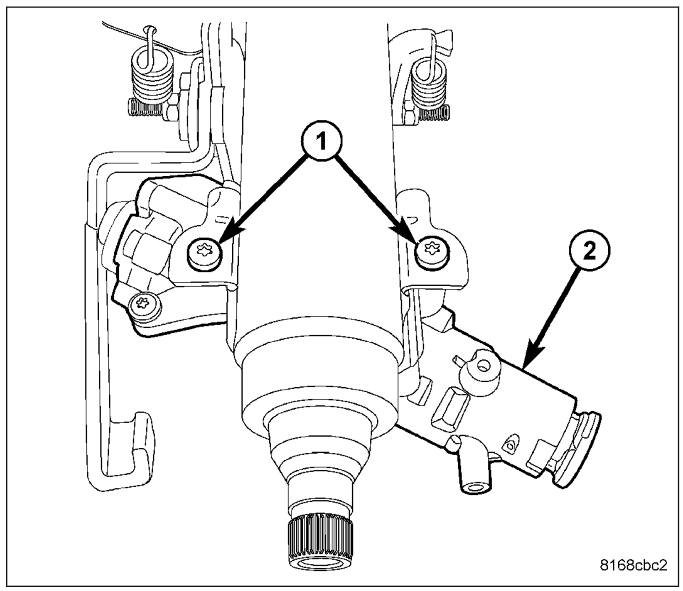
ASSEMBLY



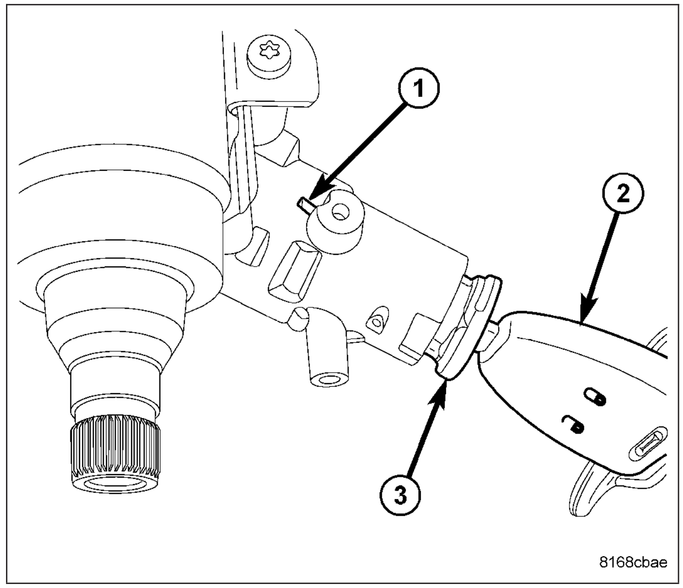
NOTE: Assemble the column components in the order shown to ensure proper installation of all components.

IGNITION SWITCH

1. Ensure the ignition switch is in the RUN position and the actuator shaft in the lock housing is in the RUN position.
2. Align the ignition switch with the pin (3), actuator shaft and retaining tabs (2) located on the lock cylinder housing. Carefully install the switch snapping it into place over the retaining tabs.

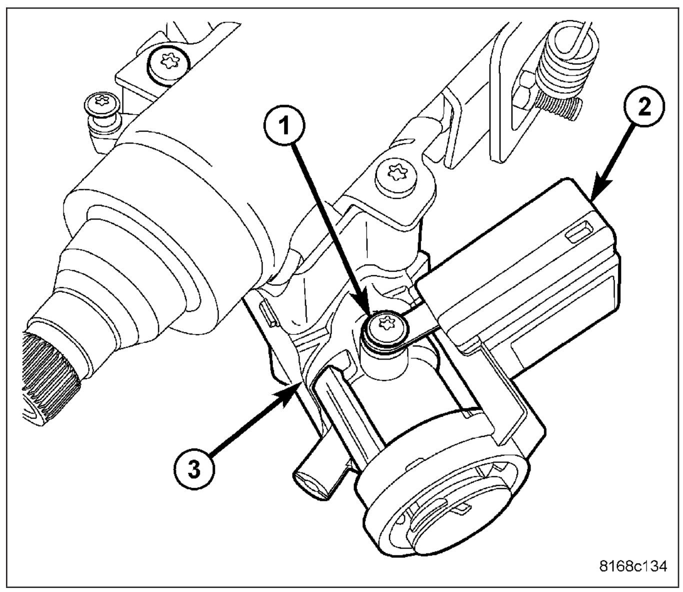


3. Install the ignition switch (2) mounting screw (1). Tighten the screw to 2 N·m (18 in. lbs.).



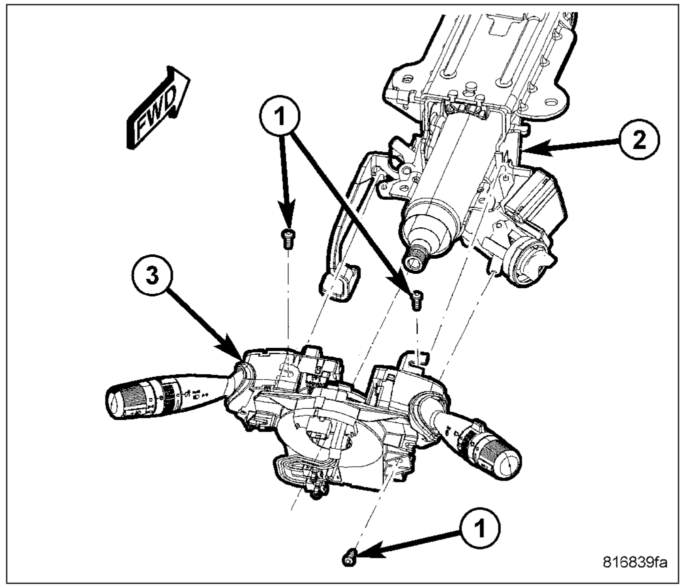
LOCK CYLINDER HOUSING

1. Position the lock cylinder housing in the RUN position.
2. Align the lock cylinder housing (2) with the steering column.
3. Install the two screws (1) fastening the lock cylinder housing (2) to the column. Tighten the screws to 12 N·m (110 in. lbs.).



KEY CYLINDER

1. Place the actuator in the lock cylinder housing to the RUN position (if not already there).
2. Insert the key into the key cylinder and turn the key cylinder to the RUN position.
3. Align the retaining tab on the key cylinder with the slot in the top of the lock cylinder housing.
4. Slide the key cylinder into the lock cylinder housing until the key cylinder retaining tab locks the cylinder into place.
5. Rotate the key back and forth, then remove and reinstall it, making sure the key cylinder and lock cylinder housing operate properly.

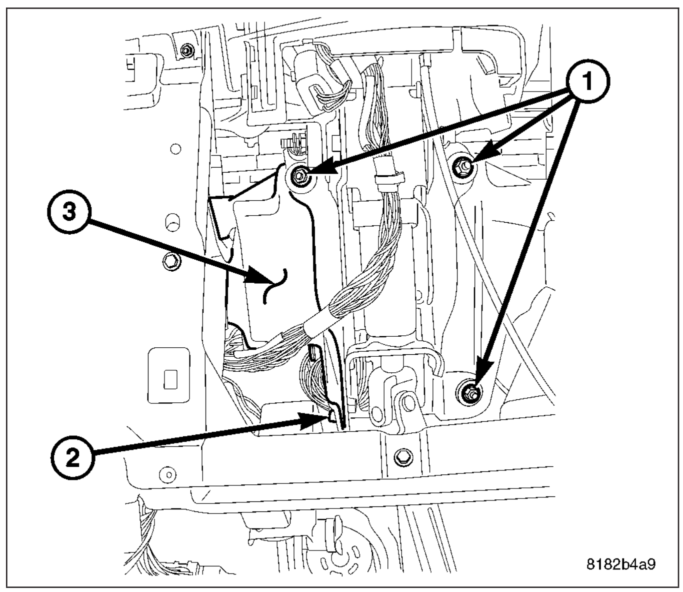


SKREEM/WCM (IF EQUIPPED)

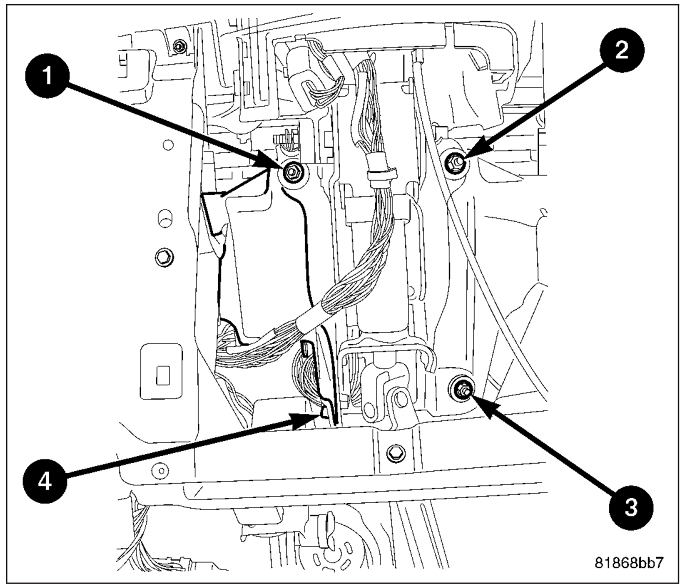
1. Slide the ring of the SKREEM/WCM (2) over the lock cylinder housing (3) and engage the retainer fingers in the recesses formed on the lock cylinder housing.
2. Install the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3). Tighten the screw to 2.5 N·m (22 in. lbs.).

STEERING COLUMN CONTROL MODULE

1. Slide the Steering Column Control Module (SCCM) (with switch stalks) (3) onto the steering column (2).
2. Install the screws (1) attaching the SCCM (with switch stalks) (3) to the steering column (2). Tighten the screws to 3 N·m (25 in. lbs.).

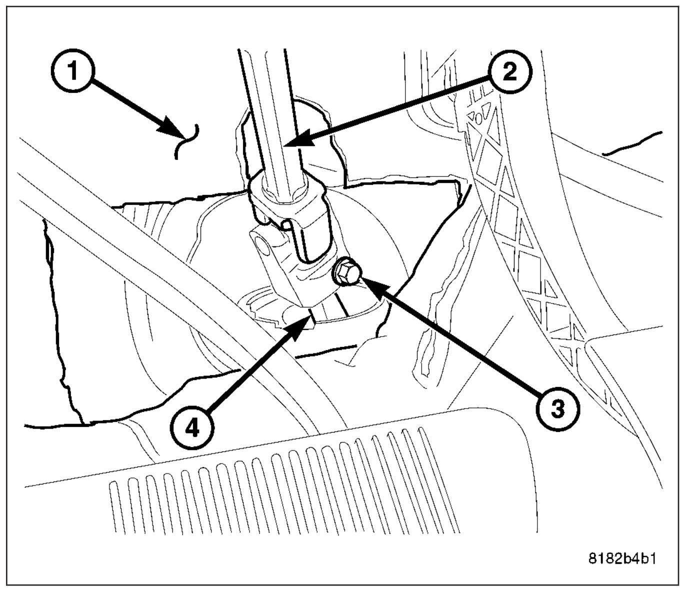


INSTALLATION



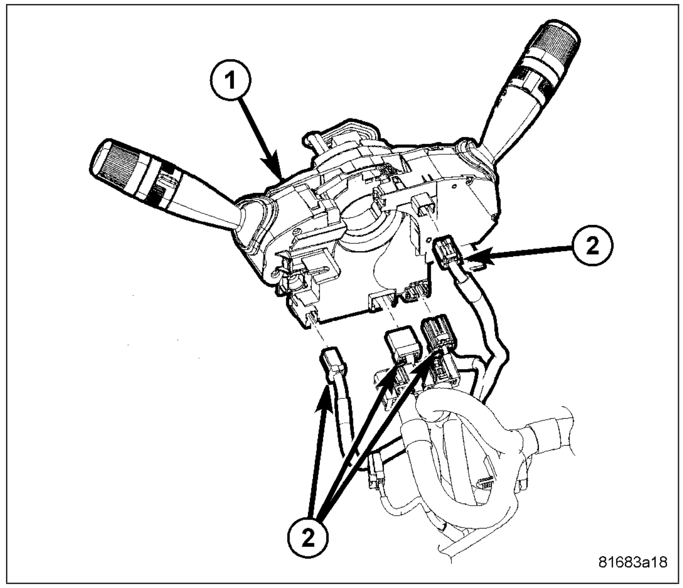
1. If the steering column is being replaced, assemble components on the steering column as necessary before column installation. (Refer to 19 - STEERING/COLUMN - ASSEMBLY)

NOTE: When installing a tilt column, do not release the tilt lever from the locked position until after the column is installed on the instrument panel.

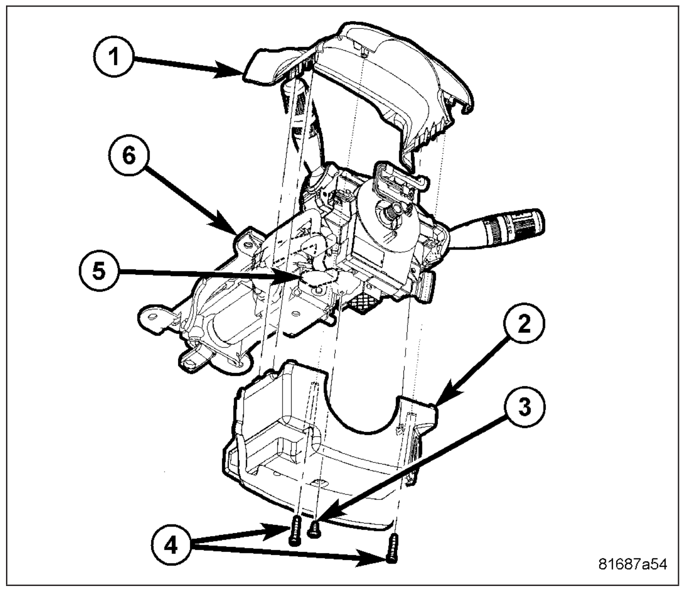


2. Install the steering column through the steering column opening.
3. Raise the column onto the mounting studs and install the three mounting nuts (1) on the studs and the 1 bolt (2).

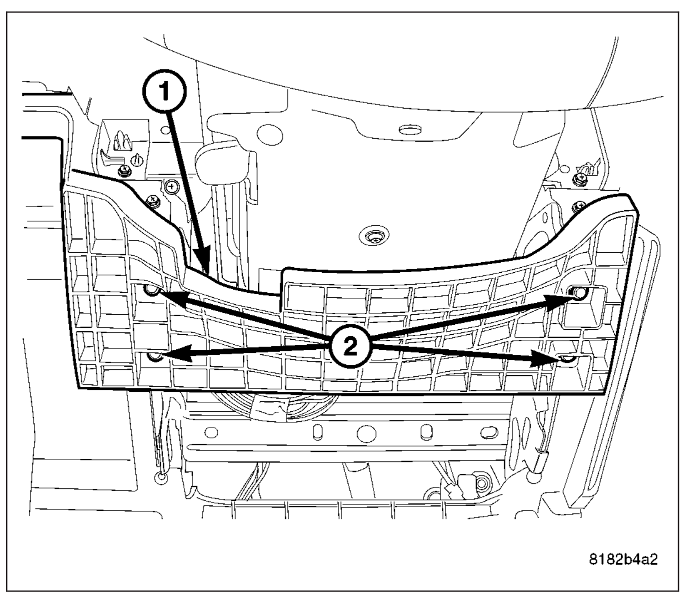
4. Starting with the left upper nut and proceeding in a clockwise tightening sequence ending at the bolt (left lower) (2), Tighten all four mounting fasteners to 28 N·m (21 ft. lbs.).



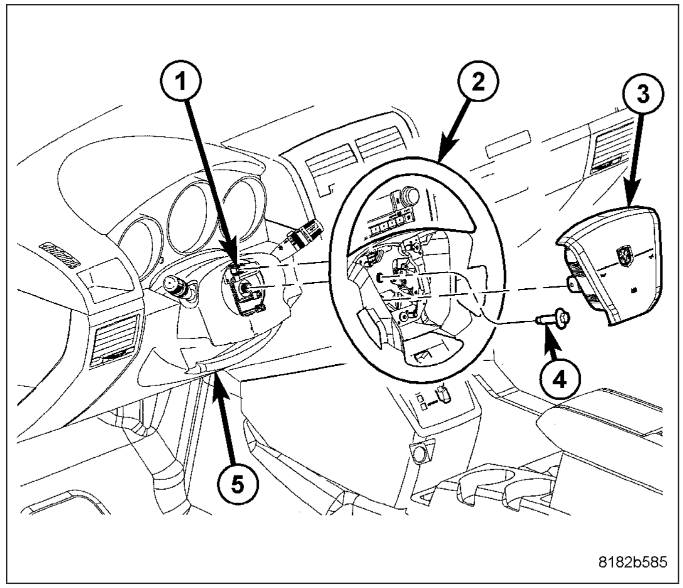
5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Collapse the intermediate shaft (2). Center it over the steering gear pinion shaft (4), lining up the ends, then slide the intermediate shaft onto the steering gear pinion shaft. **Do not install the pinch bolt (3) at this time. The pinch bolt can be more easily installed in a later step.**



7. If the vehicle is equipped with an automatic transaxle, connect the ignition shift interlock cable to the steering column.

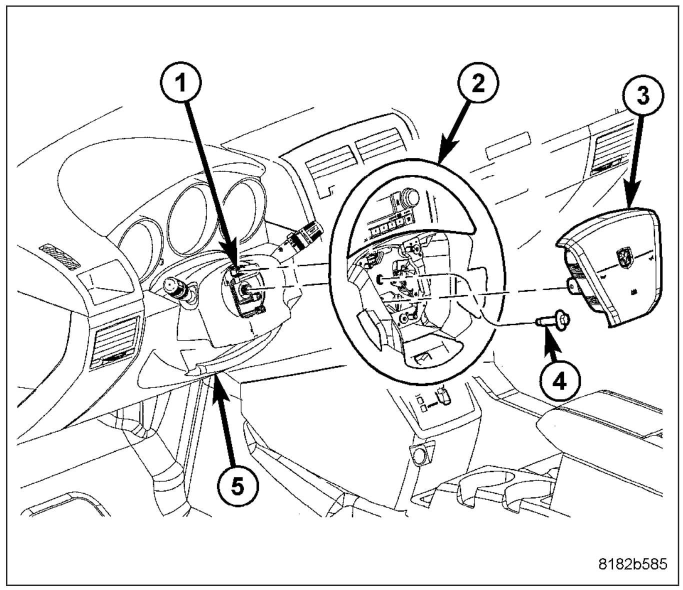


8. Connect the wiring harness connectors (2) to the Steering Column Control Module (SCCM) (1).
9. Connect any other the wiring harness connectors.

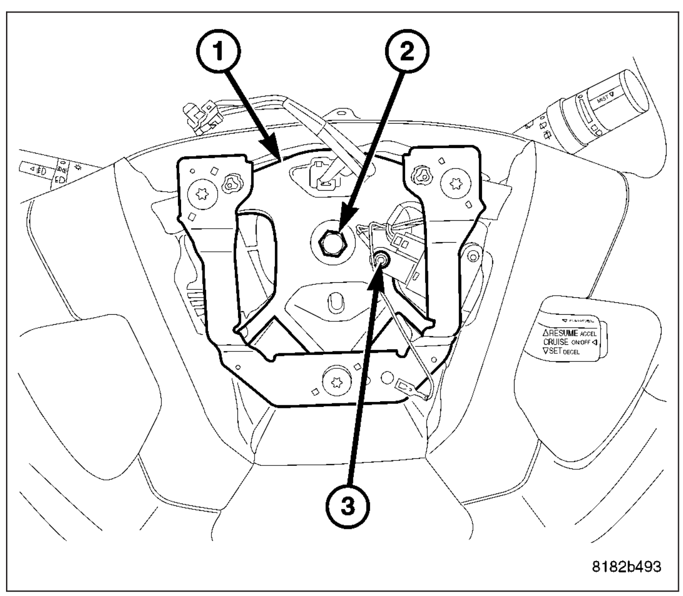


10. Push the tilt lever (5) downward.
11. Install the lower shroud (2) over the tilt lever and onto the column.
12. Position the column tilt (5) at the full-upward position.
13. Push the tilt lever (5) upward, locking it in place.
14. Install the screw (3) attaching the lower shroud (2) to the steering column (6).
15. Position the column tilt at the full-downward position and lock it in place.
16. Install the upper shroud over the lower shroud, clipping the shrouds to one another.
17. Install the two screws (4) attaching the upper shroud (1) to the lower shroud (2).

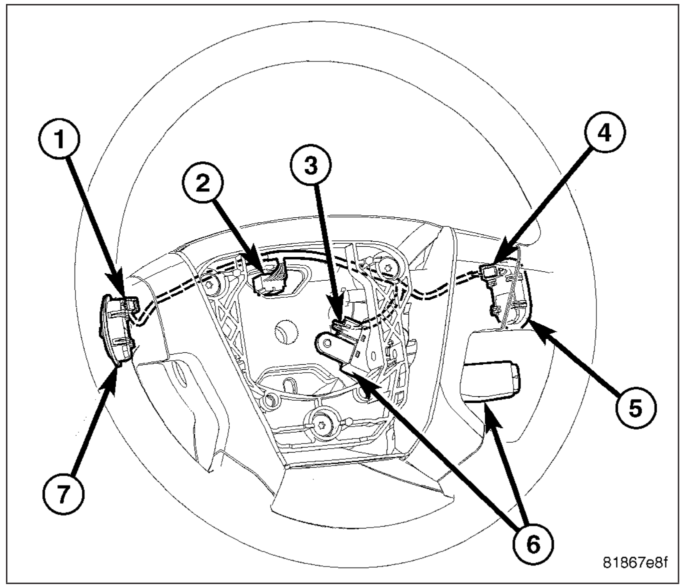
18. Position the column tilt at the full-upward position.
19. Install the steering column reinforcement panel (1) and four screws (2).



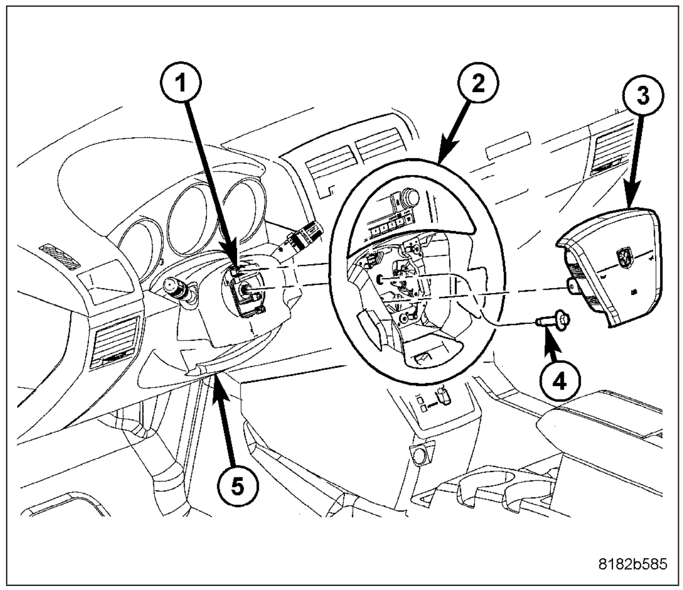
20. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
21. Install the IP side trim (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).



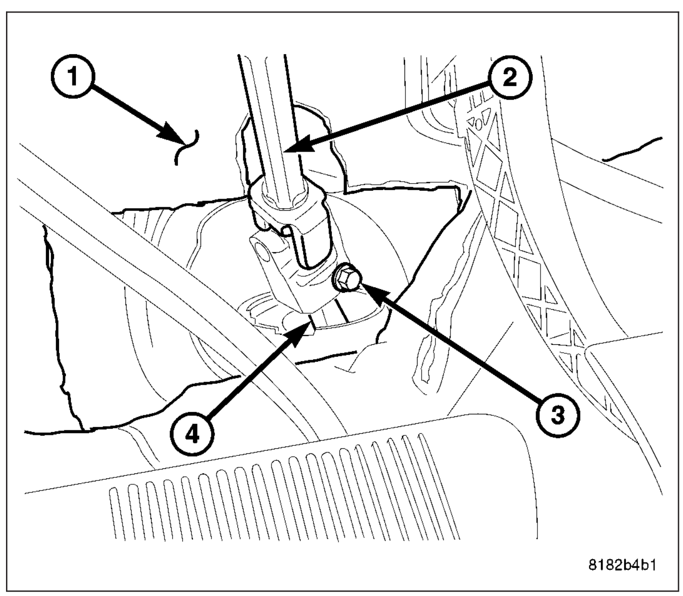
CAUTION: When installing the steering wheel, the clockspring must be centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should be in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before proceeding. (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE)



22. Install the steering wheel (2) and the retaining bolt (4). Tighten the steering wheel retaining bolt to 43 N·m (32 ft. lbs.) (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION).



23. Install the speed control switch mounting screw (3).



24. Connect the wiring connector (2) at the clockspring.

25. Install the driver airbag (3). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION)

26. From center, rotate the steering wheel to the right approximately 90° or until the shaft coupling pinch bolt (3) can be easily installed.
27. Install the pinch bolt (3). Tighten the pinch bolt to 28 N·m (21 ft. lbs.).
28. Reposition the floor carpet (1) in place.
29. Straighten the steering wheel to STRAIGHT-AHEAD position.

WARNING: Do not connect the battery ground cable without following the proper procedure as indicated in the following step. Personal injury or death may result if the Airbag System Test is not performed first.

30. Reconnect the battery ground terminal following the Airbag System Test found in Restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING)
31. Test the operation of the all column mounted components. If applicable, reset the radio and the clock as necessary.
32. Road test the vehicle to ensure proper operation of the steering system.

SPECIFICATIONS

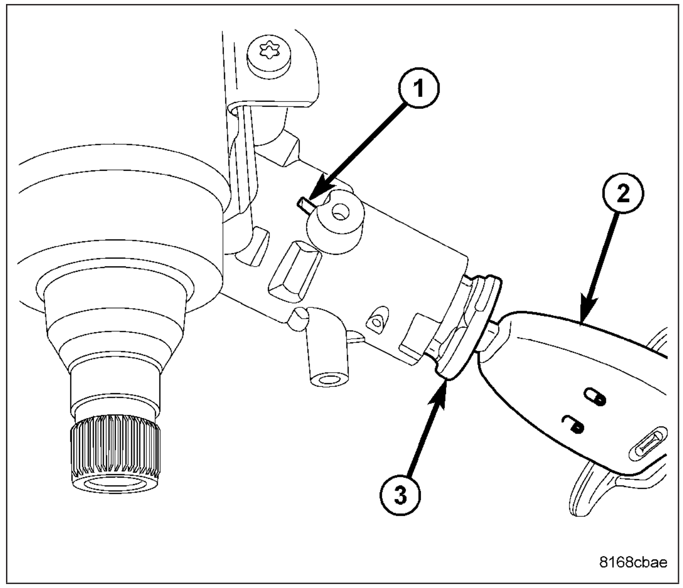
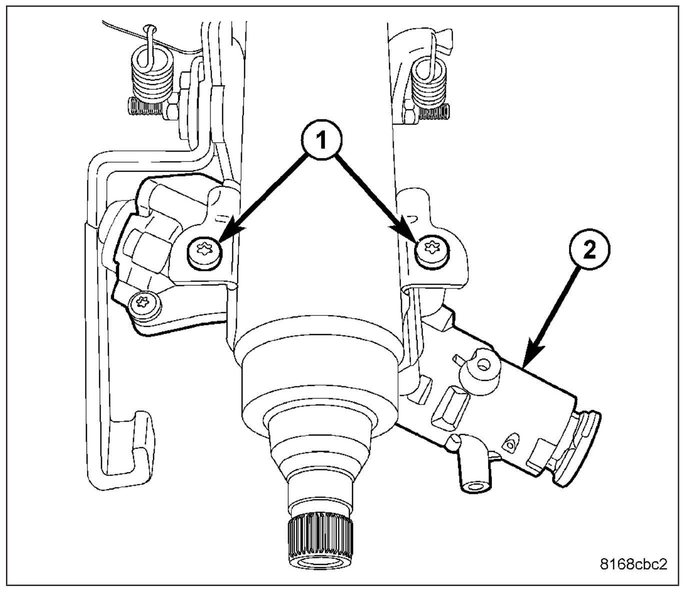
HOUSING-LOCK CYLINDER

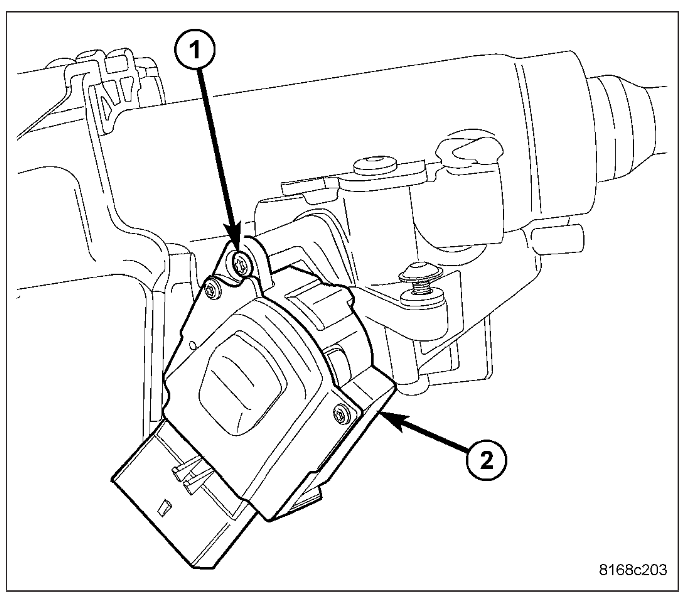
REMOVAL



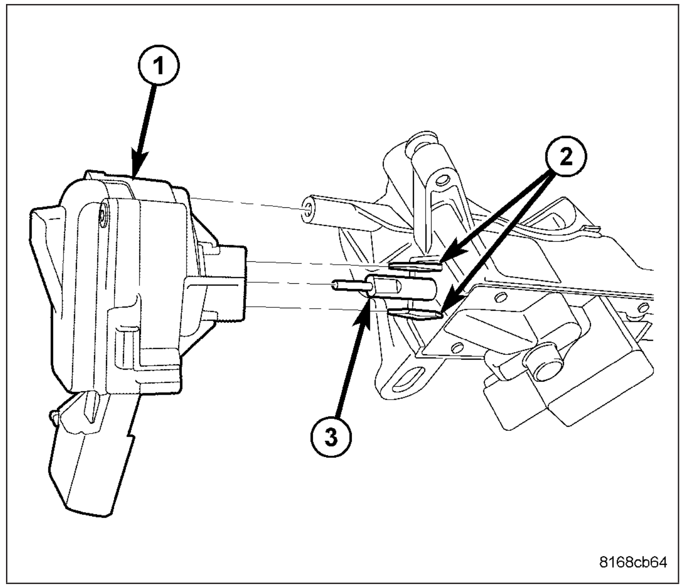
1. Access and remove the Steering Column Control Module (SCCM) (3) from the steering column (2). (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - REMOVAL)



2. Remove the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3).
3. Unhook the SKREEM/WCM (2) retainer fingers from the lock cylinder housing (3) and remove it.

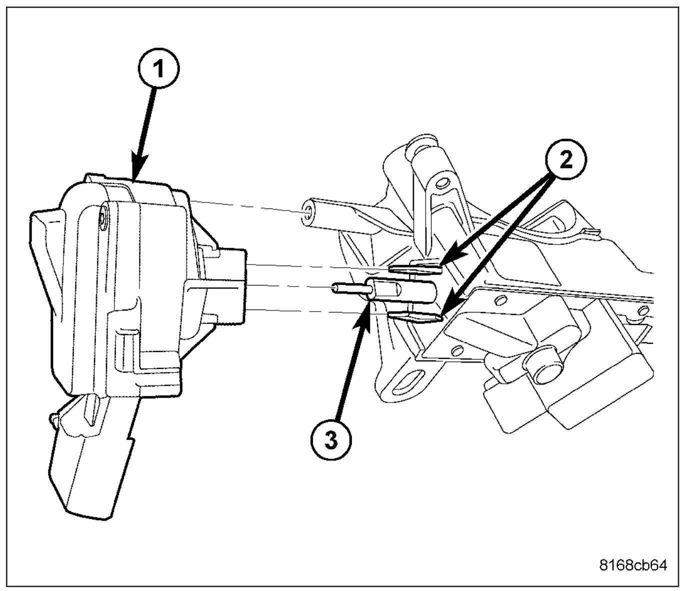


4. Insert the key (2) and turn the key cylinder (3) to the RUN position.
5. Insert an appropriate tool into the slot (1) formed into the lock cylinder housing depressing the key cylinder retaining tab.
6. Pull the key cylinder and key straight out of the lock cylinder housing as one unit.

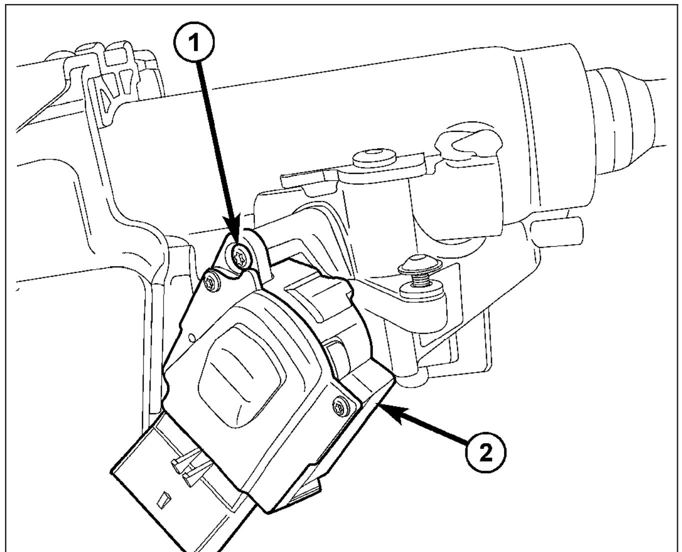


7. Using a Tamper-Proof Torx® Plus (five point) 30 bit, remove the two screws (1) fastening the lock cylinder housing (2) to the column.
8. Remove the lock cylinder housing from the steering column.

9. Remove the ignition switch (2) mounting screw (1).



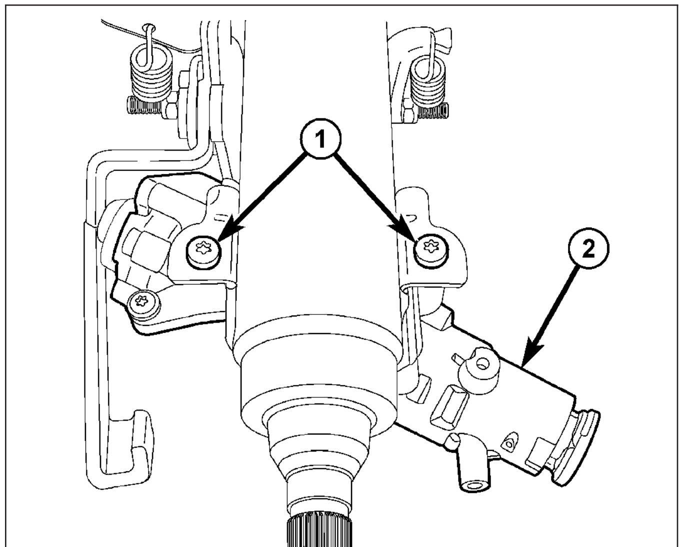
10. Pull the switch (1) straight out and off the retaining tabs (2) located on the lock cylinder housing.



INSTALLATION

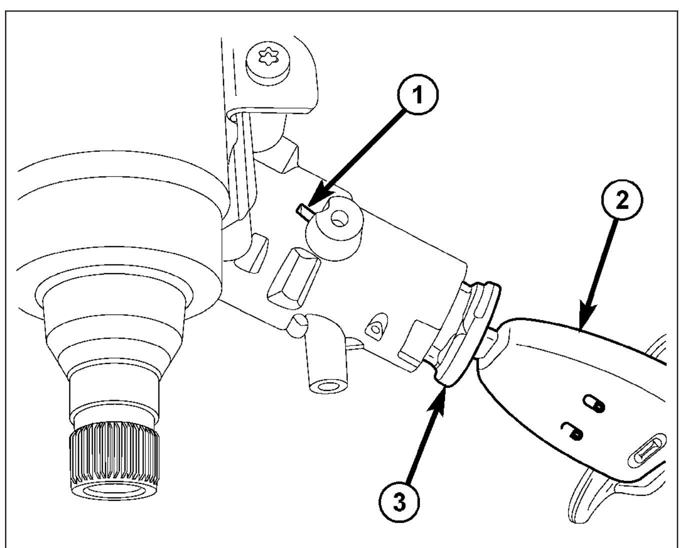
NOTE: Ignition switch must be installed prior to lock housing installation on column. Otherwise, the tilt lever will obstruct installation of ignition switch.

1. Ensure the ignition switch is in the RUN position and the actuator shaft in the lock housing is in the RUN position.
2. Align the ignition switch with the pin (3), actuator shaft and retaining tabs (2) located on the lock cylinder housing. Carefully install the switch, snapping it into place over the retaining tabs.



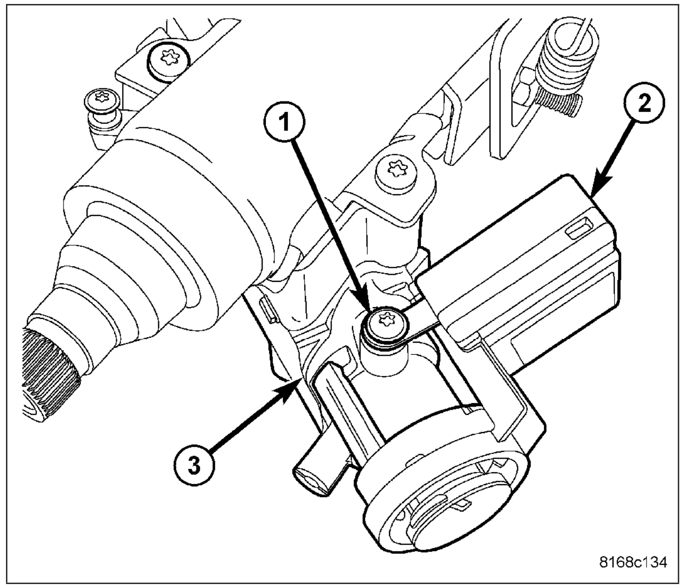
3. Install the ignition switch (2) mounting screw (1). Tighten the screw to 2 N·m (18 in. lbs.).

8168c203



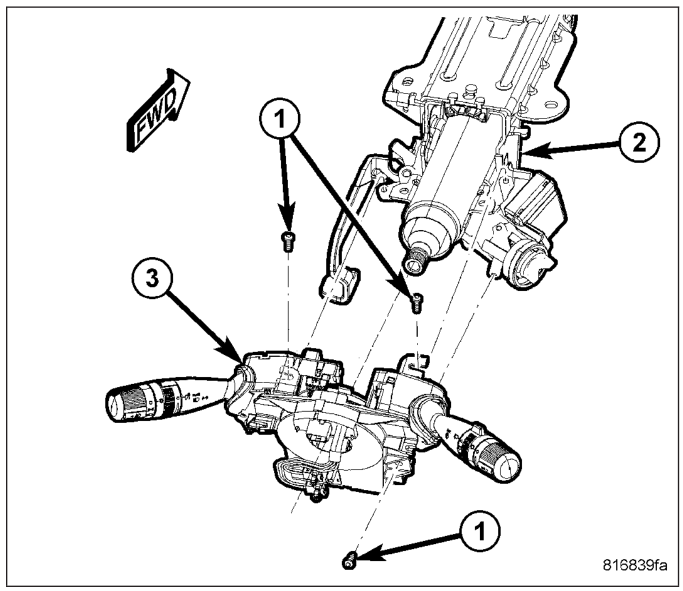
NOTE: Ignition switch needs to be installed on lock cylinder housing before housing installation to clear tilt lever.

4. Position the lock cylinder housing in the RUN position.
5. Align the lock cylinder housing (2) with the steering column.
6. Install the two screws (1) fastening the lock cylinder housing (2) to the column. Tighten the screws to 12 N·m (110 in. lbs.).



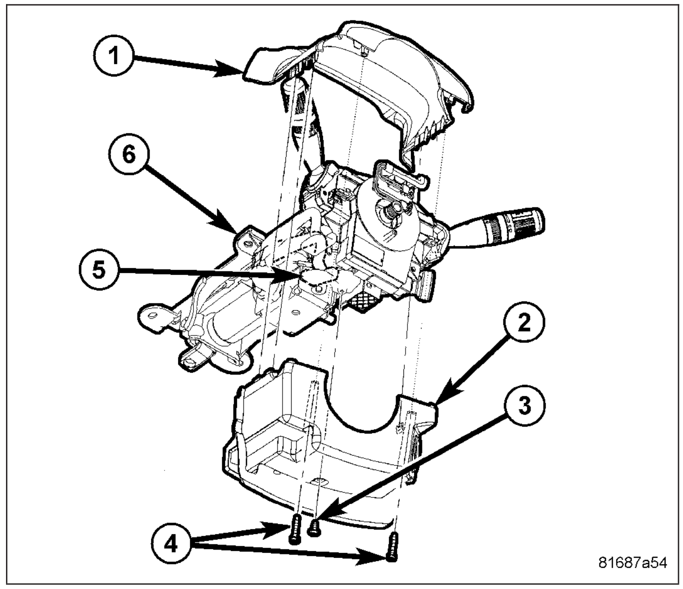
8168cbc2

7. Place the actuator in the lock cylinder housing to the RUN position (if not already there).
8. Insert the key into the key cylinder and turn the key cylinder to the RUN position.
9. Align the retaining tab on the key cylinder with the slot in the top of the lock cylinder housing.
10. Slide the key cylinder into the lock cylinder housing until the key cylinder retaining tab locks the cylinder into place.
11. Rotate the key back and forth (OFF to START), then remove and reinstall it, making sure the key cylinder and lock cylinder housing operate properly.



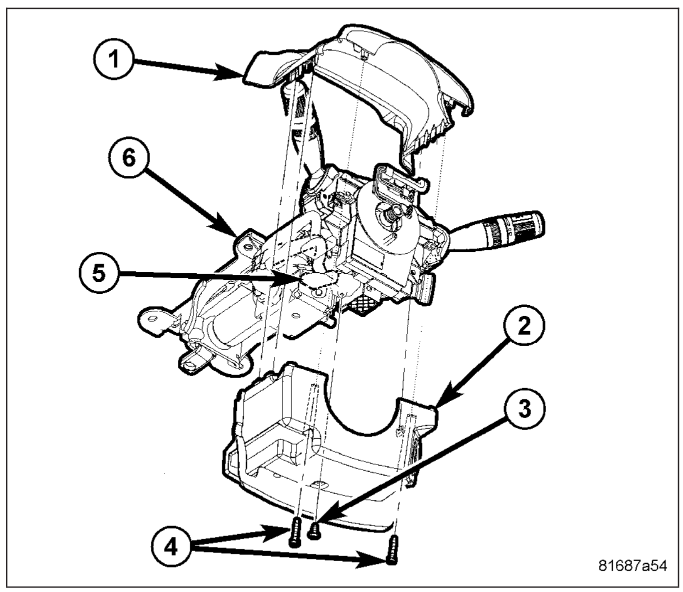
8168cbae

12. Slide the ring of the SKREEM/WCM (2) over the lock cylinder housing (3) and engage the retainer fingers in the recesses formed on the lock cylinder housing.
13. Install the screw (1) fastening the SKREEM/WCM (2) to the lock cylinder housing (3). Tighten the screw to 2.5 N·m (22 in. lbs.).



14. Install the Steering Column Control Module (SCCM) (3) and all components removed to access it. (Refer to 19 - STEERING/COLUMN/ STEERING COLUMN CONTROL MODULE - INSTALLATION)
15. Check operation of all steering column mounted components.

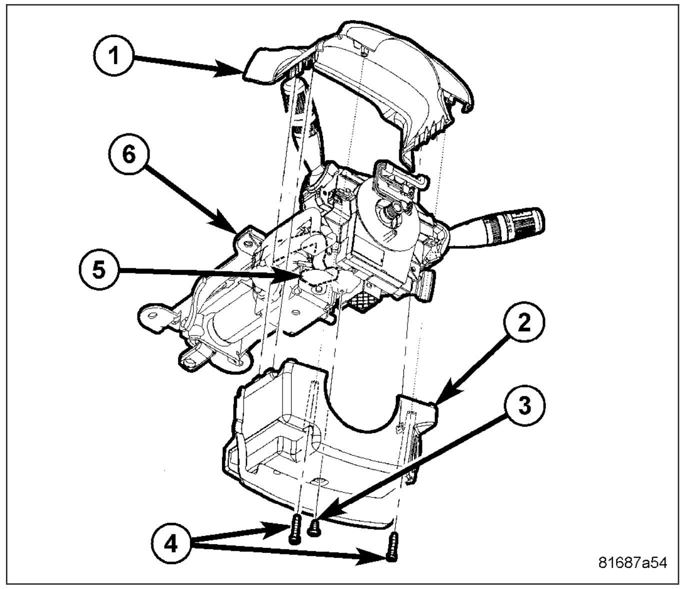
SHROUD-LOWER



REMOVAL

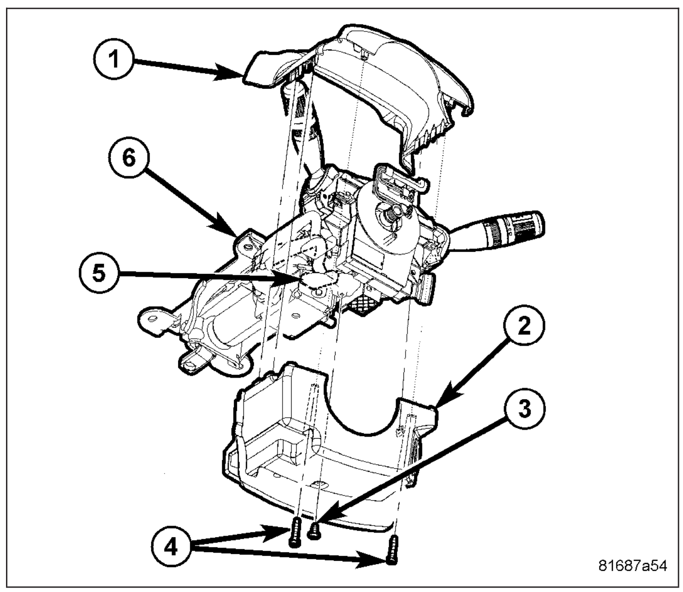
1. Position the column tilt at the full-downward position.
2. Remove the two screws (4) attaching the upper shroud (1) to the lower shroud (2). After removing the screws, unclip the shrouds from each other by applying hand pressure along the seams where the shrouds connect on the sides, then remove the upper shroud.
3. Push the tilt lever (5) downward.
4. Remove the screw (3) attaching the lower shroud (2) to the steering column (6). Remove the lower shroud.

INSTALLATION



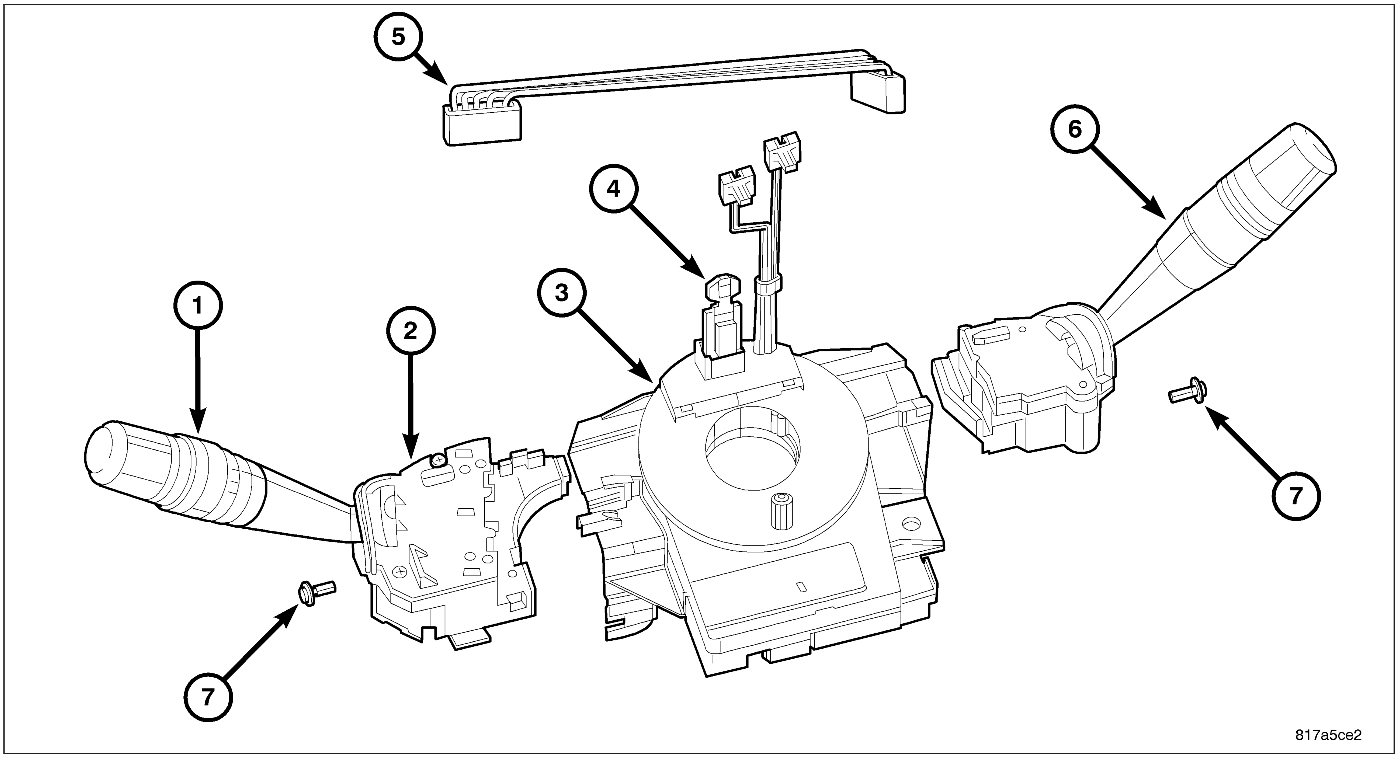
1. Push the tilt lever (5) downward.
2. Install the lower shroud (2) over the tilt lever and onto the column.
3. Position the column tilt (5) at the full-upward position.
4. Push the tilt lever (5) upward, locking it in place.
5. Install the screw (3) attaching the lower shroud (2) to the steering column (6).
6. Position the column tilt at the full-downward position and lock it in place.
7. Install the upper shroud over the lower shroud, clipping the shrouds to one another.
8. Install the two screws (4) attaching the upper shroud (1) to the lower shroud (2).

SHROUD-UPPER



REMOVAL

1. Position the column tilt at the full-downward position.
2. Remove the two screws (4) attaching the upper shroud (1) to the lower shroud (2). After removing the screws, unclip the shrouds from each other by applying hand pressure along the seams where the shrouds connect on the sides, then remove the upper shroud.



INSTALLATION

1. Position the column tilt at the full-downward position and lock it in place.
2. Install the upper shroud over the lower shroud, clipping the shrouds to one another.
3. Install the two screws (4) attaching the upper shroud (1) to the lower shroud (2).

STEERING COLUMN CONTROL MODULE

DESCRIPTION

This vehicle is equipped with a Steering Column Control Module (SCCM) The SCCM is secured near the top of the steering column below the steering wheel and is completely concealed beneath the steering column shrouds. It is installed as a modular unit that supports the left (lighting) multi-function switch (1) and right (wiper) multi-function switch (6). The controls for each of these switches extend through appropriate clearance holes provided in the steering column shrouds.

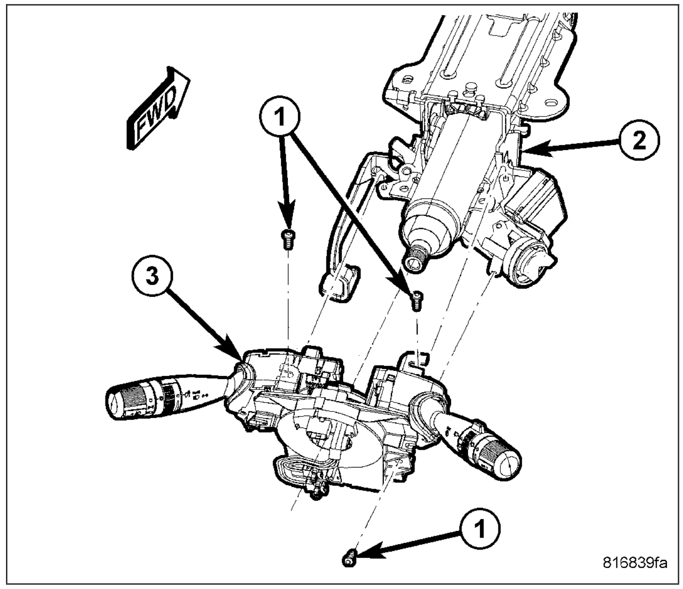
The microprocessor-based Steering Control Module (SCM) (2) utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard wired analog and multiplexed inputs to monitor both the right and left multi-function switches. The SCCM uses a Local Interconnect Network (LIN) data bus for exterior lighting and wiper functions. The LIN data is sent to the Cab Compartment Node (CCN) and the CCN then sends it out on the CAN data bus (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION - CAN BUS). The SCCM is available for service replacement as a unit or each individual component:

- Clockspring (with integral Steering Angle Sensor if equipped)
- Left Multi-Function Switch
- Right Multi-Function Switch

OPERATION

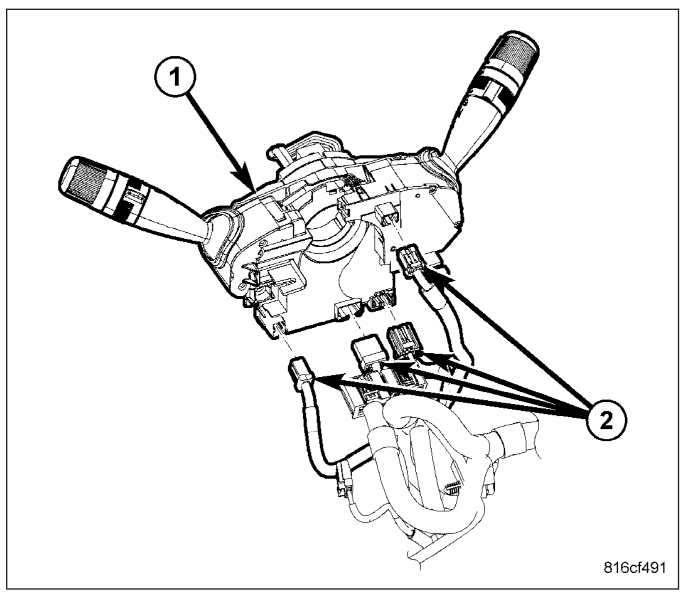
The Steering Control Module (SCM) communicates over the Local Interconnect Network (LIN) data bus with other electronic modules in the vehicle and/or a diagnostic scan tool. The horn switch circuits pass through the clockspring to the Cab Compartment Node (CCN) and the CCN sends a CAN message to the Totally Integrated Power Module (TIPM) to control the horn. The CCN stores Diagnostic Trouble Codes (DTC’s) for the SCM. The right (wiper) multi-function switch has several inputs to the CCN.

The SCM is connected to a fused B(+) circuit and receives a path to ground at all times. These connections allow it to remain functional regardless of the ignition switch position. The driver airbag squib circuits of the clockspring, the horn, and the speed control switch circuits pass through the SCM, but the SCM does not monitor, and has no control outputs related to these circuits. Any other input to the SCM that would cause a vehicle system to function but does not require that the ignition switch be in the On position, such as turning on the lights or sounding the horn, prompts the SCM to wake up and transmit on the CAN data bus.



The most reliable, efficient, and accurate means to diagnose the SCM, the CAN data bus, the hard wired inputs or the electronic communication related to SCM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

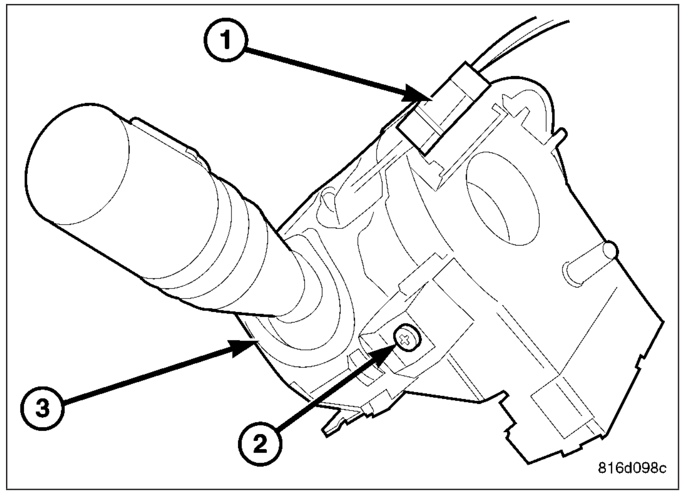
The integral SCM is not available for separate service replacement. If found inoperative or defective, the entire left (lighting) multi-function switch must be replaced (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LEFT MULTI-FUNCTION SWITCH - REMOVAL).



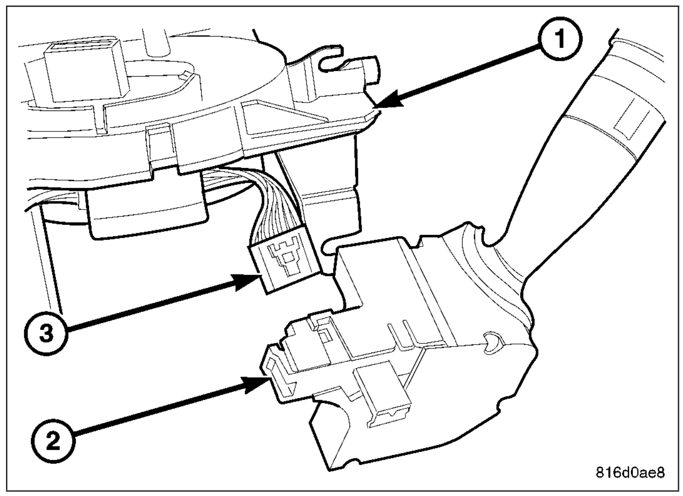
REMOVAL

1. Place the front road wheels in the straight-ahead position.
2. Open hood.
3. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

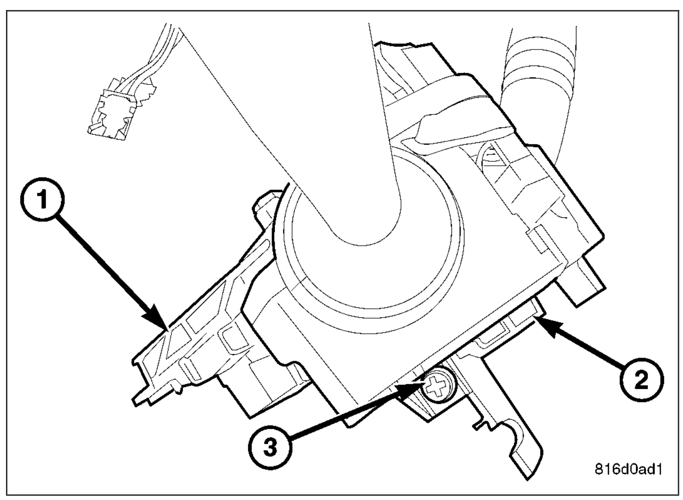


4. Remove steering wheel (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - REMOVAL).
5. Remove upper and lower steering column shrouds to gain access to the Steering Control Module (SCCM) (Refer to 19 - STEERING/COLUMN/UPPER SHROUD - REMOVAL).
6. Lock the clockspring rotor in the center position as follows: Insert a grenade pin through the hole in the rotor at the 10 o'clock position.
7. Remove the three screws (1) to the Steering Column Control Module (SCCM) (3).
8. Disconnect the electrical connectors (2) between the SCCM (1) and the instrument panel wiring harness at the base of the SCCM and remove from column.

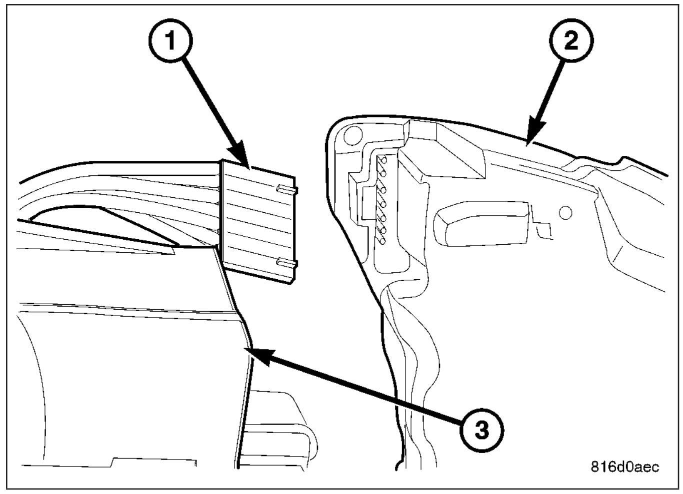


NOTE: If only removing the SCCM from column, there is no need to continue to next step.

DISASSEMBLY



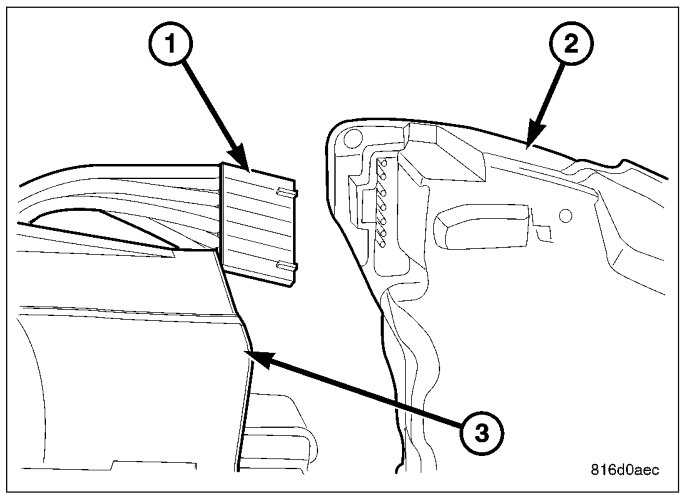
1. Remove the left multi-function switch stalk retaining screw (2).
2. Pull the left stalk out of the SCCM.



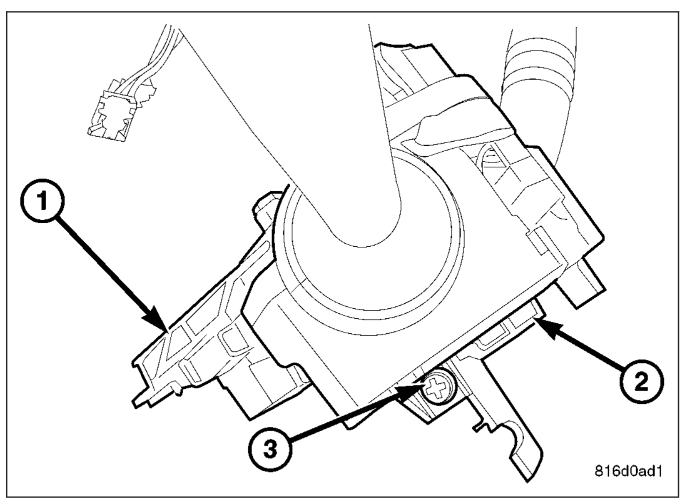
3. Disconnect the left stalk electrical connector.
4. Separate the left switch from the SCCM.

5. Remove the one right multi-function switch retaining screw.
6. Pull right switch out of SCCM.

7. Disconnect the right switch electrical connector.

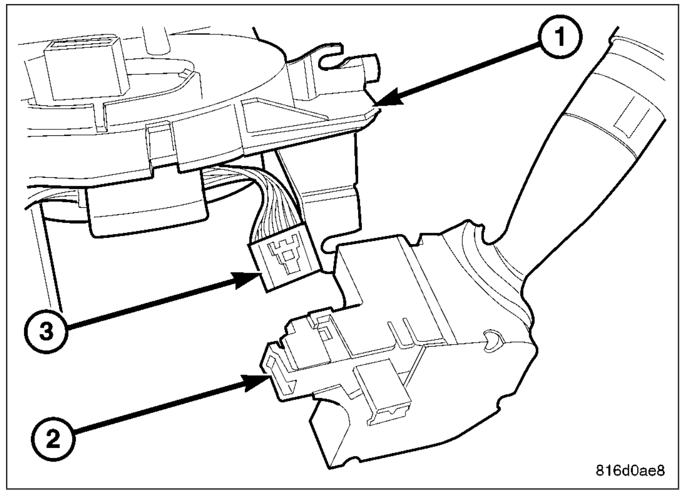


INSTALLATION

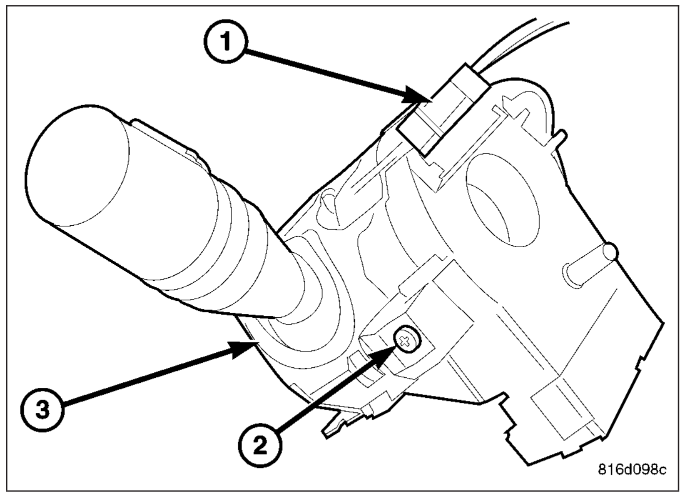


NOTE: If only installing the SCCM, go to Step 1

ASSEMBLY

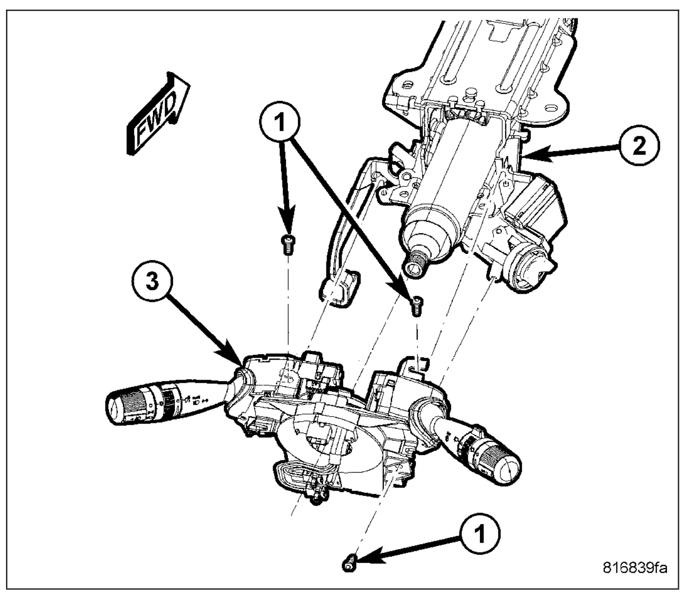


1. Connect the right stalk electrical connector.

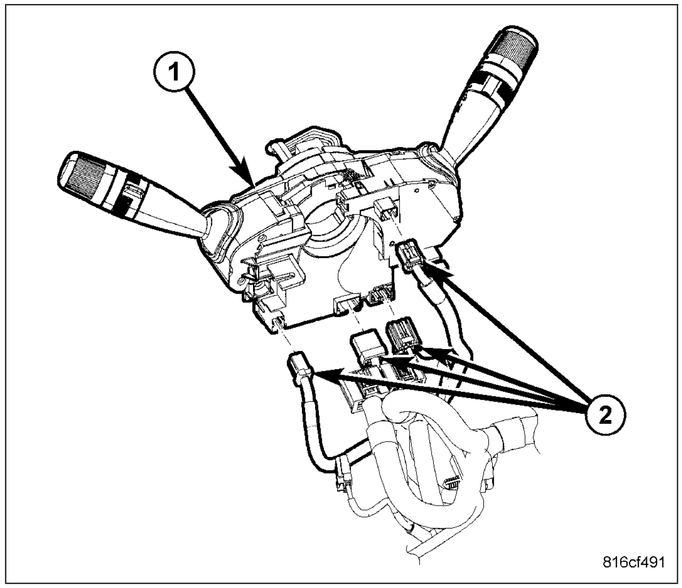


2. Slide the right stalk into the groove and install the one retaining screw.

3. Connect the left stalk switch electrical connector.



4. Install the left stalk switch retaining screw.



INSTALLATION

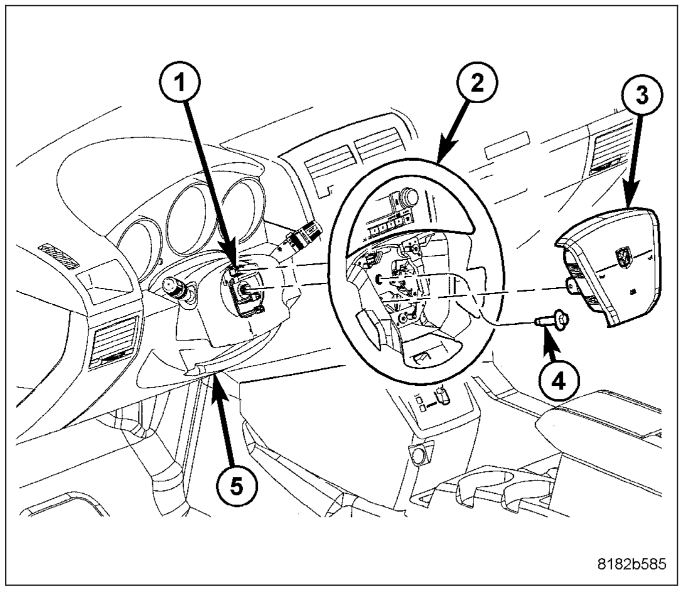
1. Position the SCCM (3) over the steering column shaft (2).
2. Install the three screws (1).

3. Connect the electrical connectors (2) to the instrument panel harness, ensure wiring is properly routed. Then check that the connectors, locking tabs are properly engaged.
4. Install steering column shrouds (Refer to 19 - STEERING/COLUMN/UPPER SHROUD - INSTALLATION). Be sure all wires are inside of shrouds.
5. Install steering wheel ensuring the flats on hub align with the clockspring (Refer to 19 - STEERING/COLUMN/STEERING WHEEL - INSTALLATION). Pull the airbag leads through the larger slot. Ensure leads do not get pinched under the steering wheel.

NOTE: There is a small wire harness in the steering wheel and it contains the horn circuits and speed control circuits.

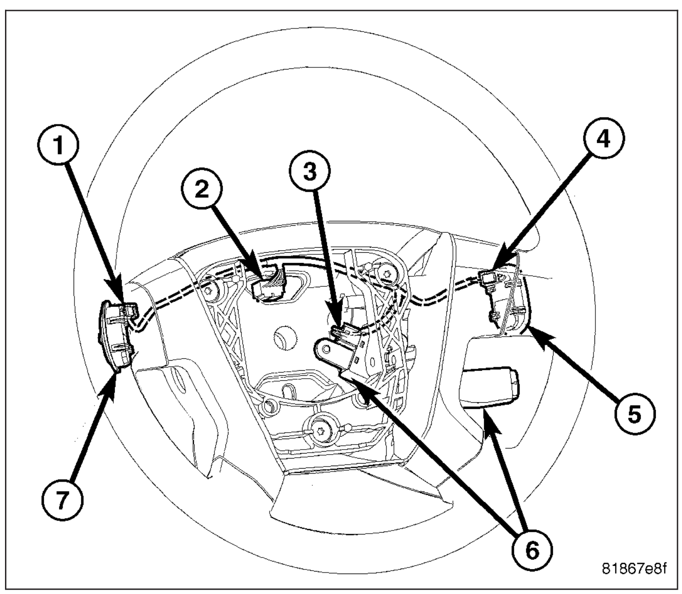
6. Connect the speed control and horn wire connector into the clockspring.
7. Pull the grenade pin out of the clockspring.
8. Install the driver airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION)

WARNING: Do not connect the battery negative cable (REFER TO 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.



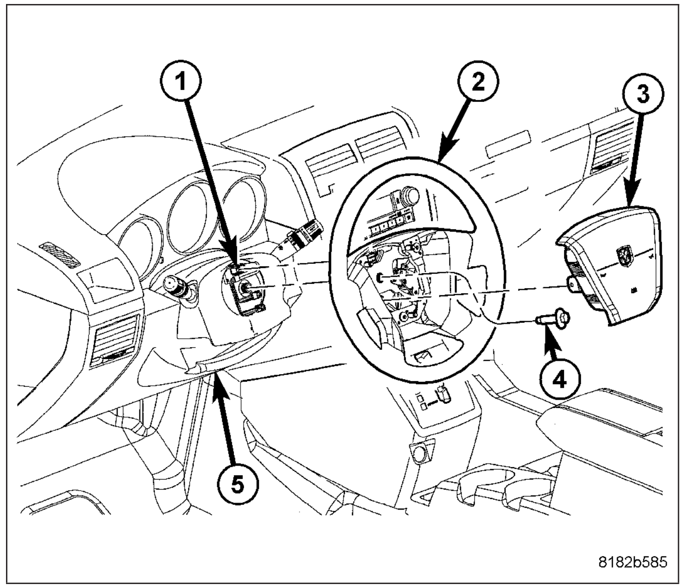
STEERING WHEEL

REMOVAL

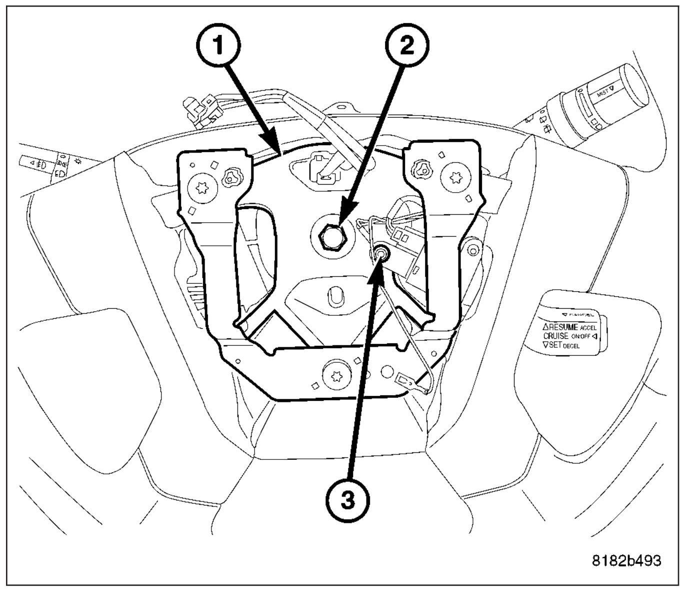


WARNING:

- **Do not place a non-deployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed, and could result in serious or fatal injury.**
- **Disconnect and isolate the battery negative (ground) cable before beginning steering wheel removal or installation. This will disable the airbag system. Failure to disconnect the battery could result in accidental airbag deployment and possible personal injury.**
- **Allow the airbag system capacitor to discharge for two minutes before removing the steering wheel or any airbag system component.**



1. Adjust the steering wheel so that the tires are in the STRAIGHT-AHEAD position.
2. Disconnect and isolate the battery negative cable.
3. Remove the driver airbag (3). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).



4. Disconnect the wiring connector (2) at the clockspring.

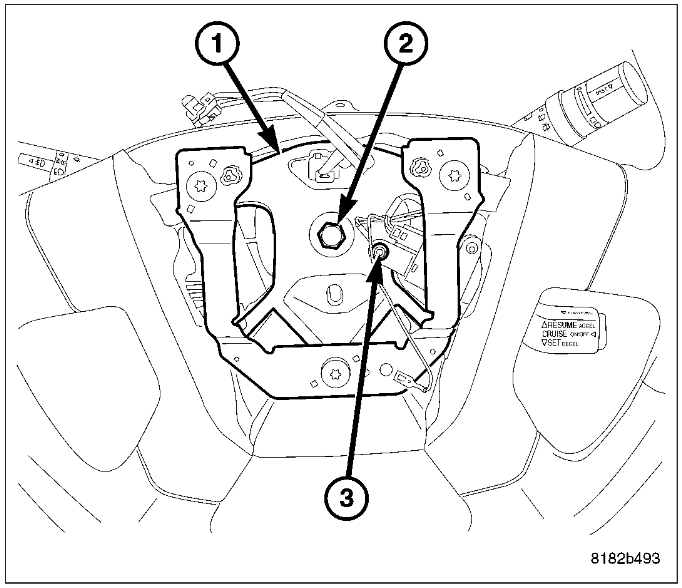
5. While holding the steering wheel firmly in place, remove the retaining bolt (2) securing the steering wheel to the steering column shaft.

CAUTION: When installing a wheel puller on the steering wheel, be sure the puller jaws are fully seated around the steering wheel base (1). If the jaws are not fully seated the jaws may slipped off the steering wheel when attempting to remove the steering wheel.
Also, threading the retaining bolt (2) back in the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt allows a safe reaction surface for the puller to work against.

6. Thread the wheel retaining bolt (2) back into the end of the shaft until approximately 13 mm (0.5 in.) of thread is showing between the wheel and the head of the bolt.
7. Remove the screw for the speed control switch (3) in order to install the steering wheel puller tool.
8. Install a steering wheel puller on the steering wheel.

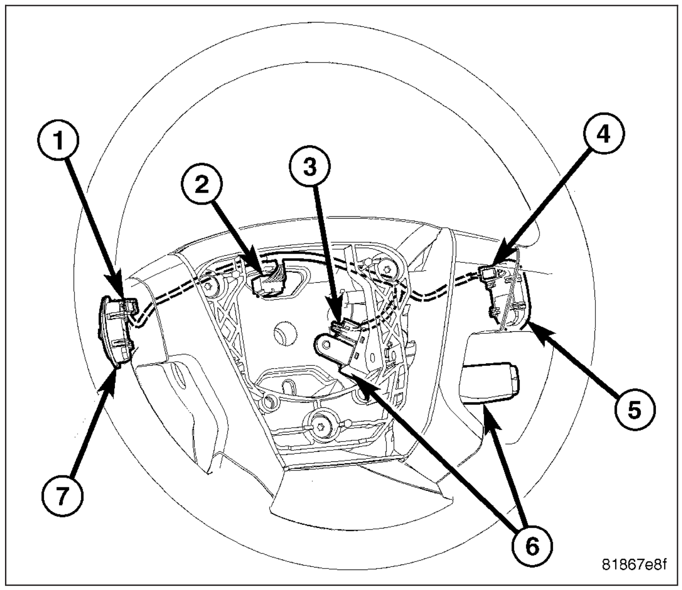
CAUTION: Do not bump or hammer on steering wheel or steering column shaft when removing steering wheel from steering column.

9. While holding the steering wheel firmly in the STRAIGHT-AHEAD position, remove steering wheel from the steering column shaft using the puller.
10. Remove the wheel retaining bolt (2) and the steering wheel.



INSTALLATION

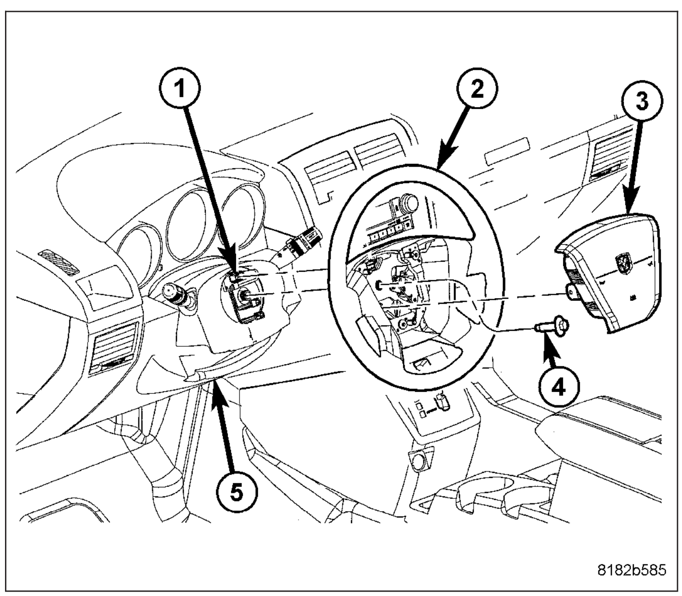
1. Confirm that:
   a. The front wheels are in the STRAIGHT-AHEAD position.
   b. The turn signal stalk is in the neutral position.



CAUTION: Do not install the steering wheel onto the shaft of the steering column by driving it onto the shaft.

2. Align the steering wheel's wide mounting spline with the steering column shaft missing spline area and push the wheel onto the shaft. Make sure the clockspring lines up with the back of the wheel and does not bind.

3. Install the steering wheel retaining bolt (2) and tighten it until the steering wheel is fully installed on shaft. Tighten the steering wheel retaining bolt to 43 N·m (32 ft. lbs.).
4. Install the speed control screw (3) that was removed for the puller.



5. Connect the wiring connector (2) at the clockspring.

6. Install the driver airbag (3). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION)

WARNING: Do not connect battery negative cable yet. Refer first to airbag system test. (refer to 8 - electrical/restraints - diagnosis and testing)

7. Reconnect the battery using the Airbag System Test procedure in Restraints. (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING)
8. Verify vehicle and system operation.

GEAR

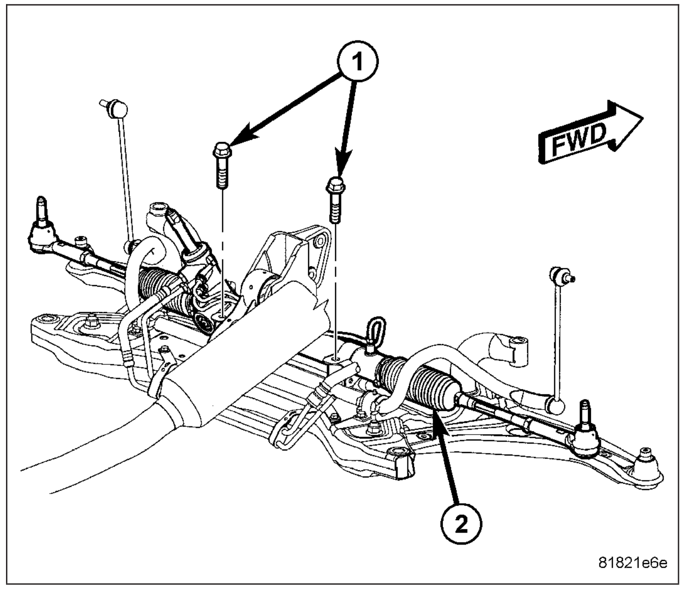


TABLE OF CONTENTS

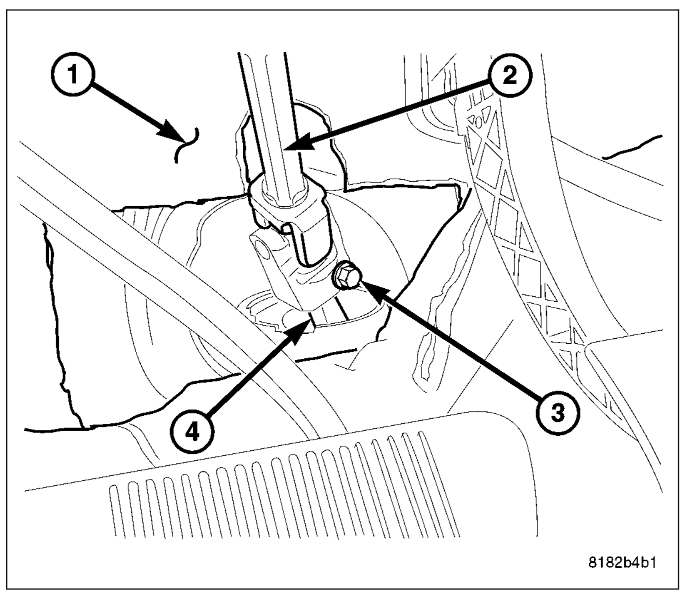
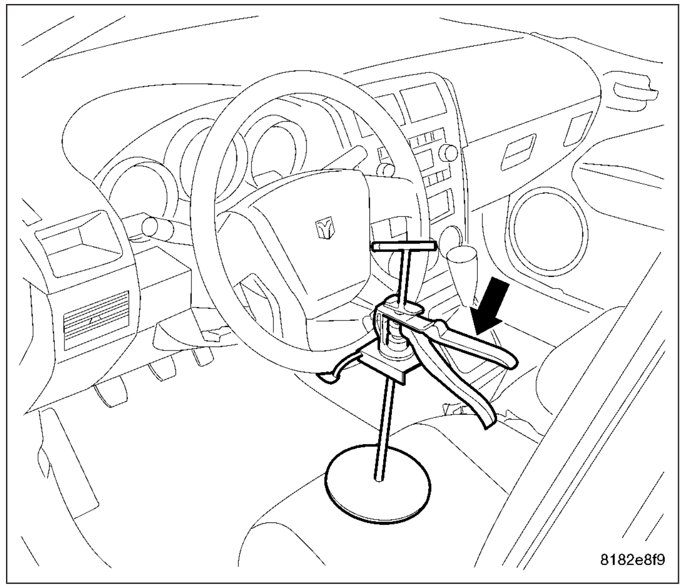
GEAR

DESCRIPTION

The steering gear used is the rack-and-pinion type with power assist. It is mounted on the front suspension crossmember . The outer ends of the outer tie rods attach to the steering knuckles.

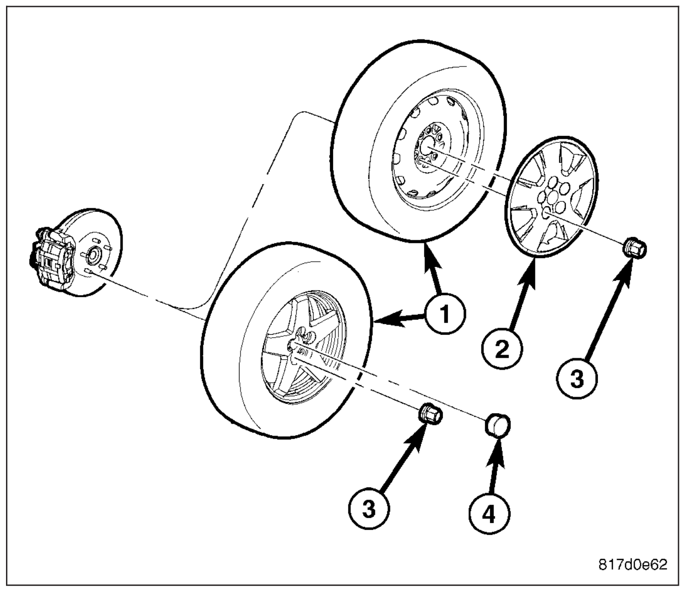


NOTE: The power steering gear should not be serviced or adjusted. If a malfunction or oil leak occurs with the steering gear, the complete steering gear needs to be replaced.

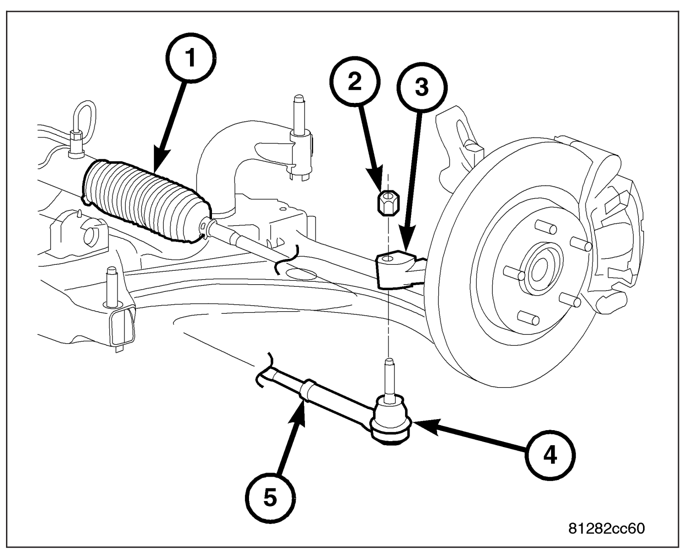


REMOVAL

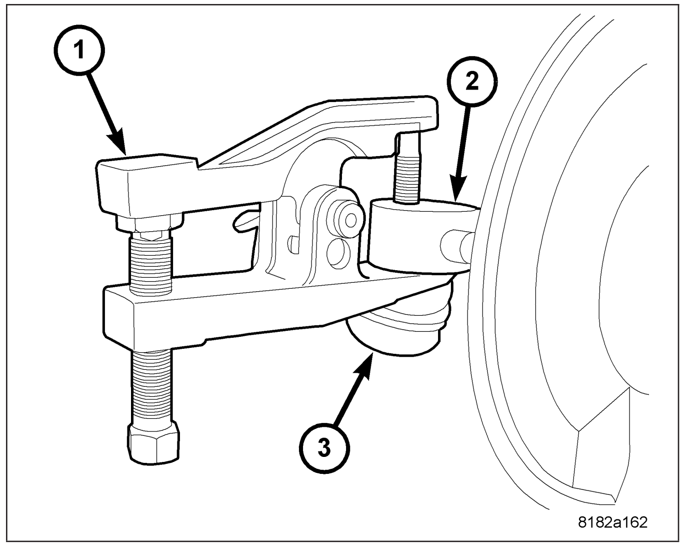
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).



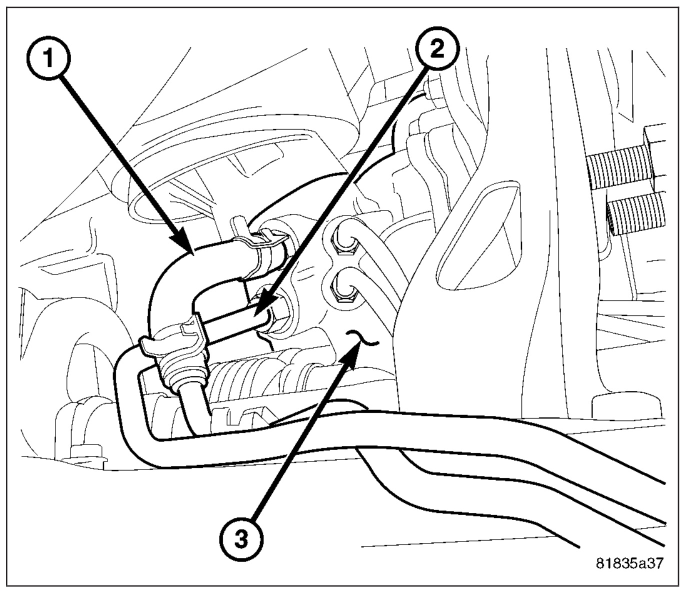
1. Siphon out as much power steering fluid as possible from the pump.
2. Reposition the floor carpeting to access the steering column coupling at the base of the column.
3. Position the front wheels of vehicle in the STRAIGHT-AHEAD position, then turn the steering wheel to the right until the pinch bolt (3) at the base of the column can be accessed.
4. Remove the pinch bolt (3). **Do not separate the intermediate shaft (2) from the steering gear pinion shaft (4) at this time.**



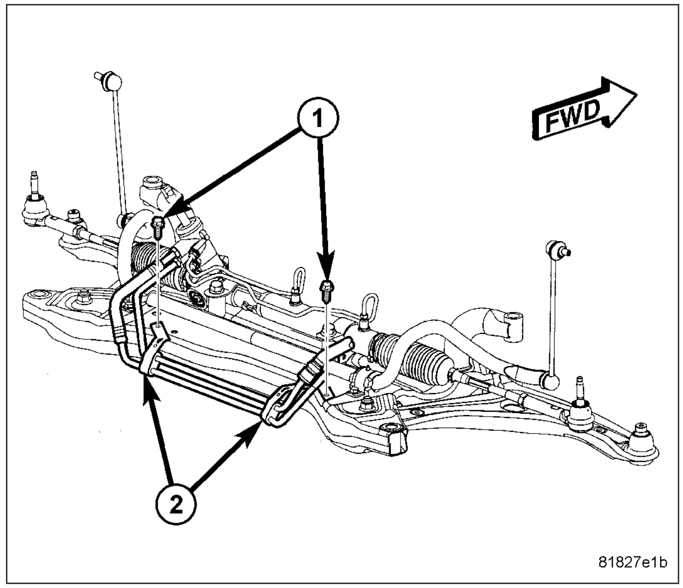
5. Return the front wheels of vehicle (and steering wheel) to the STRAIGHT-AHEAD position. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This keeps the clock-spring in the proper orientation.



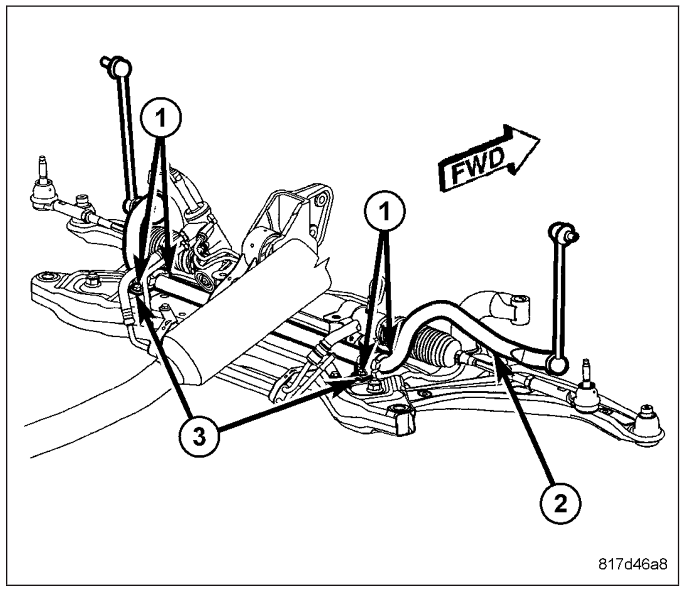
6. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
7. Remove the wheel mounting nuts (3), then the tire and wheel assembly (1).



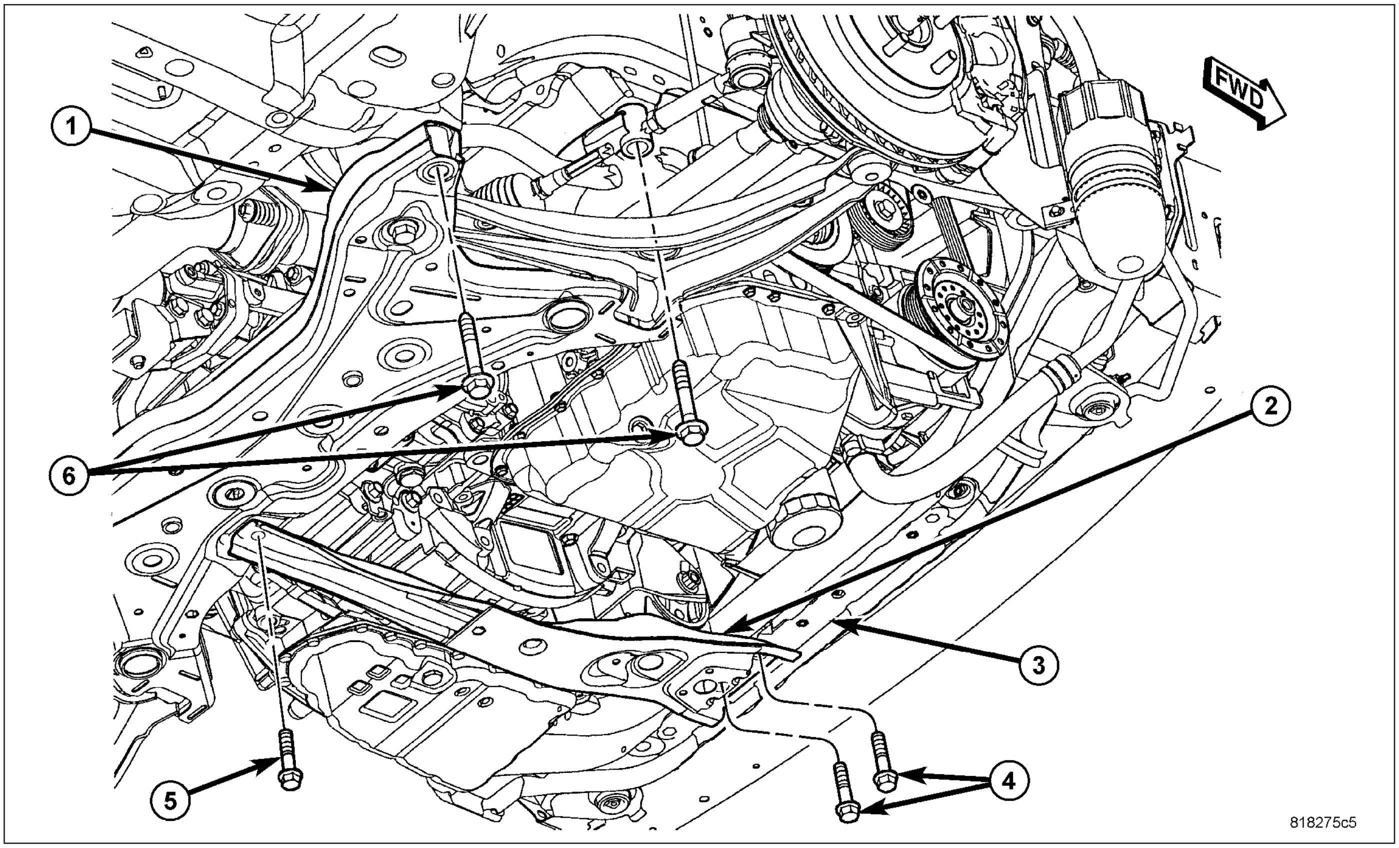
8. On each side of the gear, remove the nut (2) from the out tie rod end (4) at the knuckle (3).



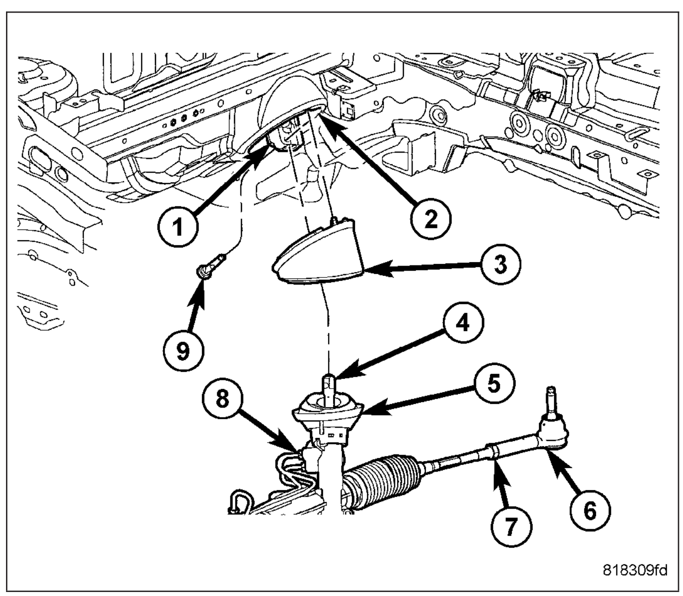
9. On each side of the gear, separate the tie rod end (3) from the knuckle (2) using Remover (1), Special Tool 9360.



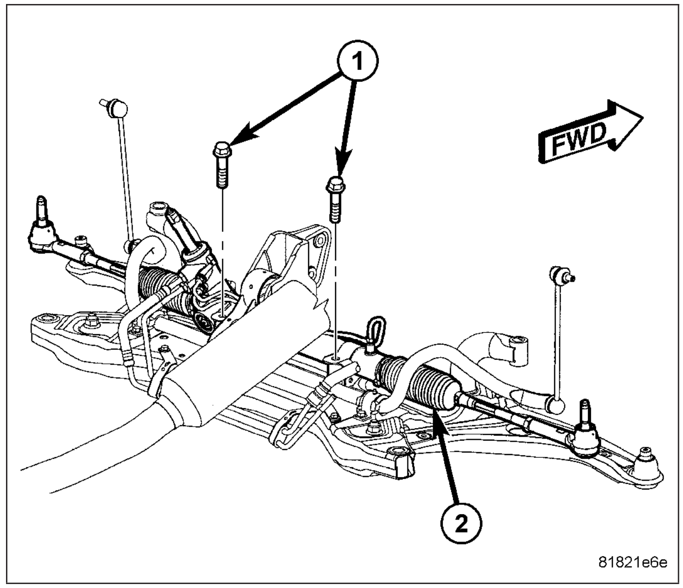
10. If equipped, remove the engine belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)
11. Remove the rear engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - REMOVAL)
12. Remove the front engine mount through-bolt.
13. Remove the return hose (1) at the steering gear (3).
14. Remove the pressure hose (2) at the steering gear (3).



15. Remove the screws (1) securing the power steering hose routing clamps (2) to the crossmember.

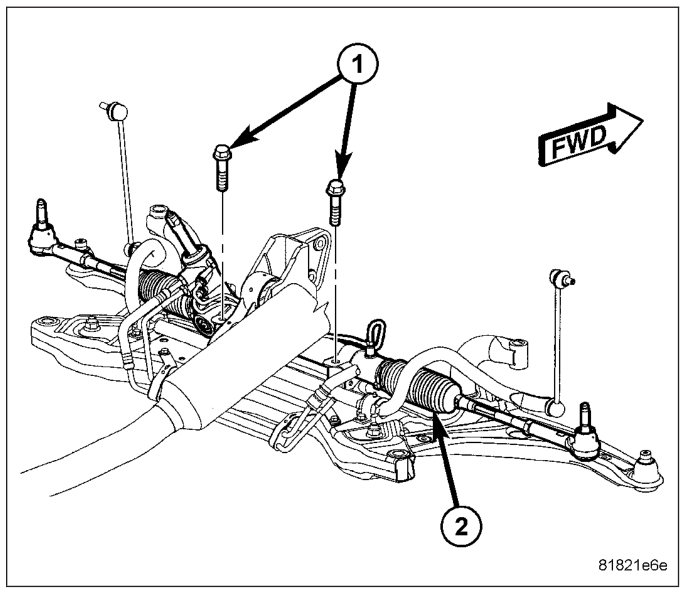


16. Remove the screws (1) securing the stabilizer bushing retainers (3) to the crossmember.
17. Remove the two stabilizer bushing retainers.

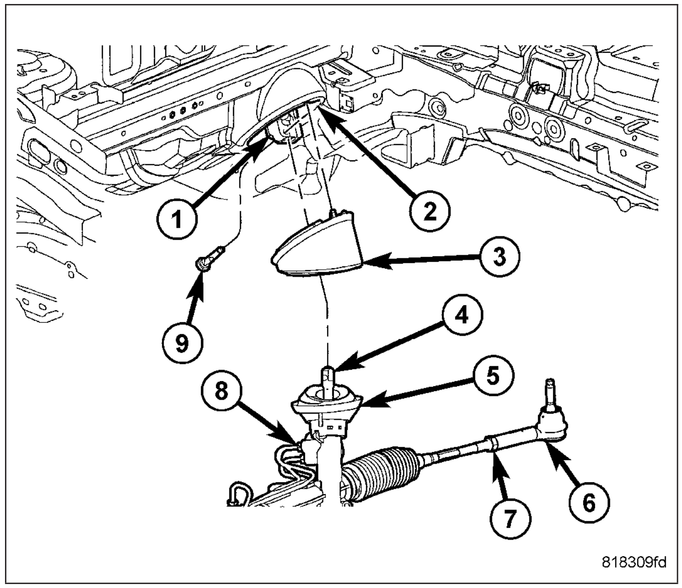


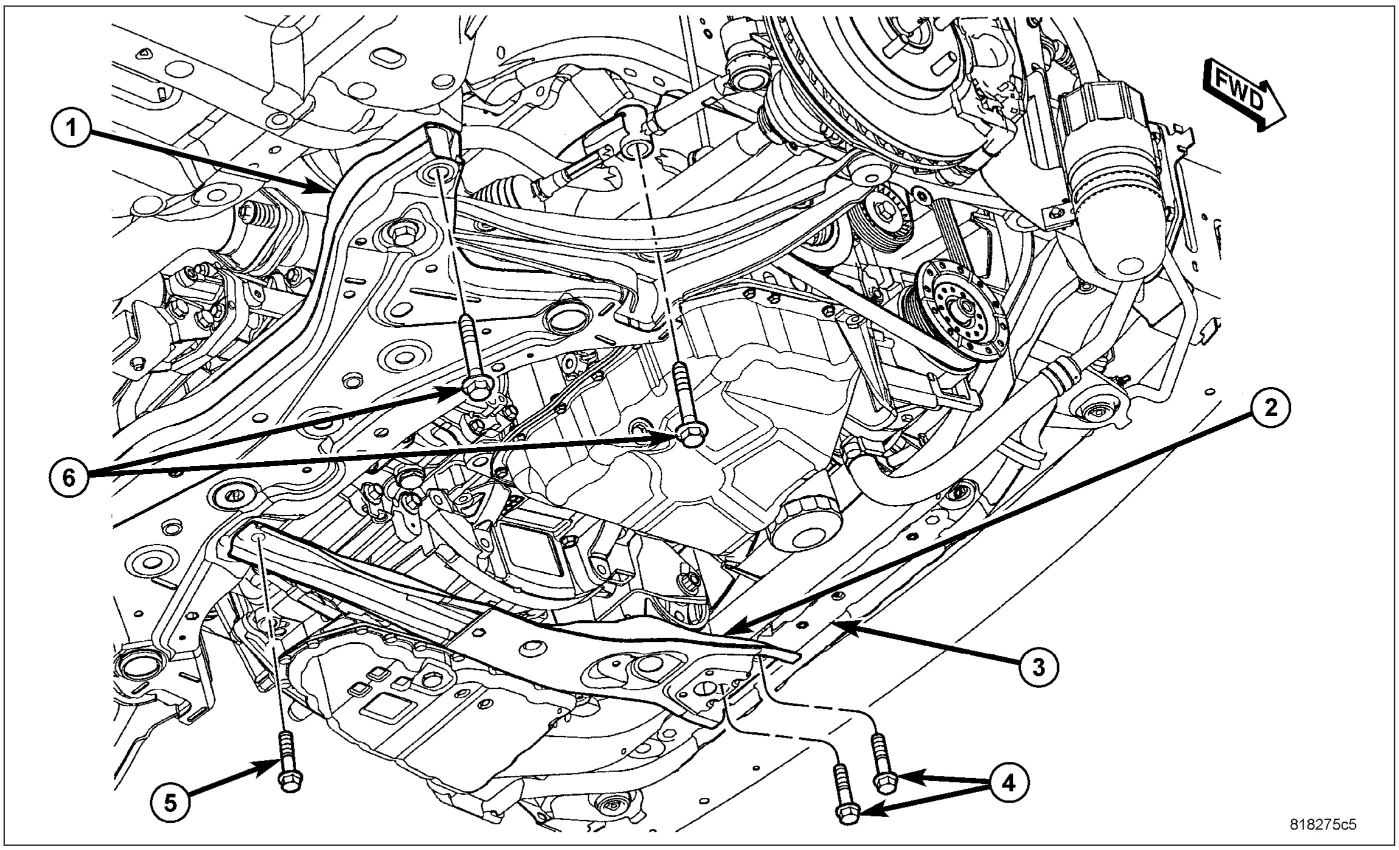
NOTE: Before removing the front suspension crossmember from the vehicle, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.

18. Mark the location of the front crossmember on the body near each mounting bolt using a marker or crayon. **Do not use a scratch awl or other tool that can penetrate the protective coating on the body.**
19. Support the front crossmember with a transmission jack.
20. Remove the four mounting bolts (6) securing the front crossmember (1) to the body.
21. Lower the crossmember enough to access the intermediate shaft coupling (1) at the steering gear pinion shaft (4). Slide the coupling off the pinion shaft.
22. Remove the dash seals (3, 5) as necessary.



23. Remove the two bolts (1) securing the steering gear (2) to the crossmember.
24. Rotate the stabilizer bar up in order to remove the steering gear from the vehicle.
25. Remove the steering gear from the crossmember.

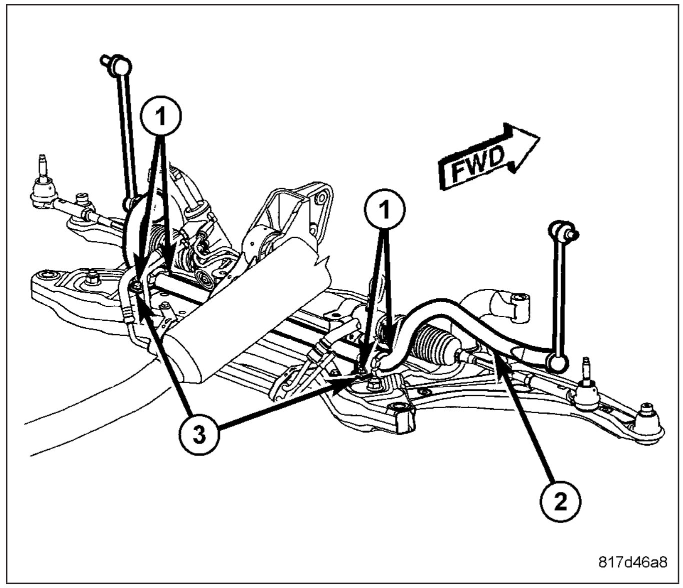




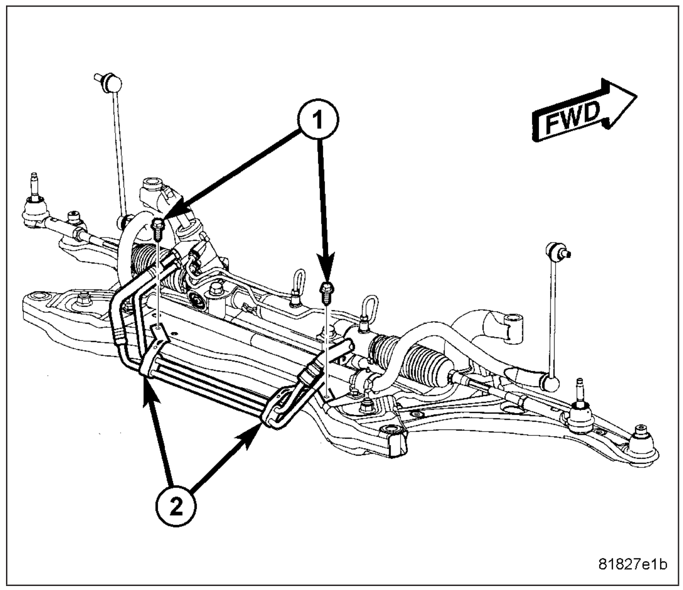
INSTALLATION

1. Rotate the stabilizer bar up and install the steering gear on the crossmember.
2. Install the two bolts (1) securing the steering gear (2) to the crossmember. Tighten the steering gear mounting bolts to 70 N·m (52 ft. lbs.).

3. Install the dash seals (3, 5) as necessary.

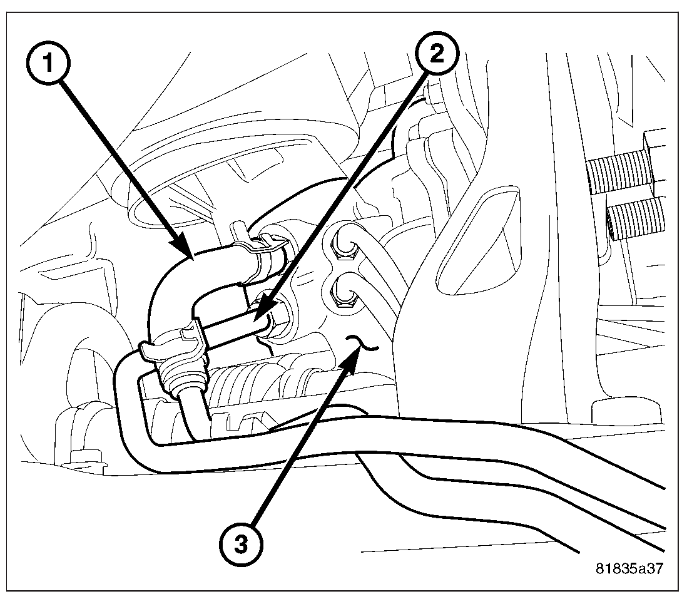


4. Center the power steering gear rack in its travel as necessary.

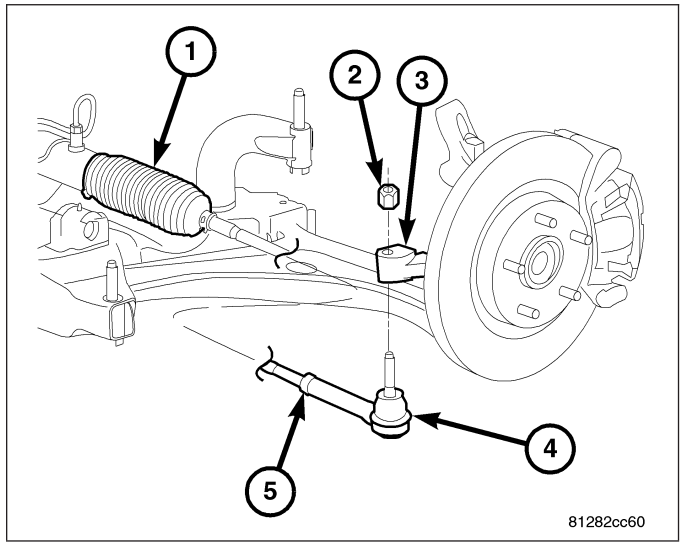


NOTE: When installing the front suspension crossmember (1) back in the vehicle, it is very important that the crossmember be attached to the body in exactly the same spot as when it was removed. Otherwise, the vehicle's wheel alignment settings (caster and camber) will be lost.

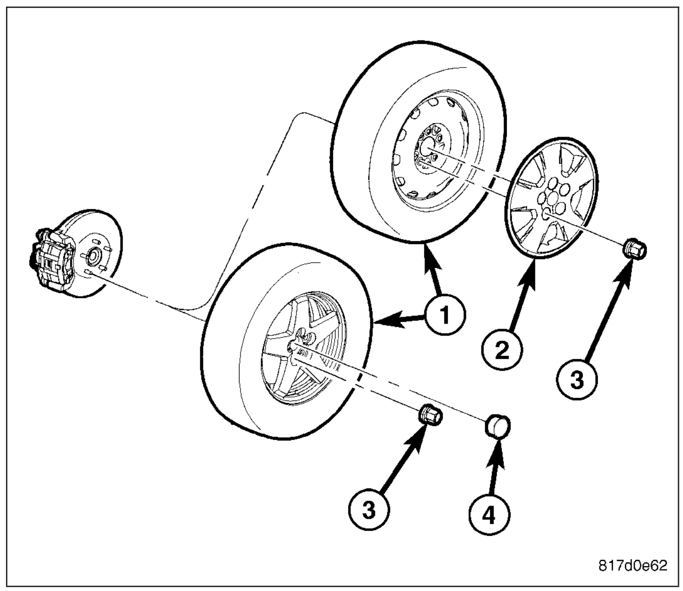
5. Slowly raise the crossmember (1) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal.
6. Check the positioning of the seals at the dash panel and adjust as necessary.
7. Install the four mounting bolts (6) securing the front crossmember (1) to the body. Tighten the crossmember mounting bolts to 190 N·m (140 ft. lbs.).
8. Remove the transmission jack.



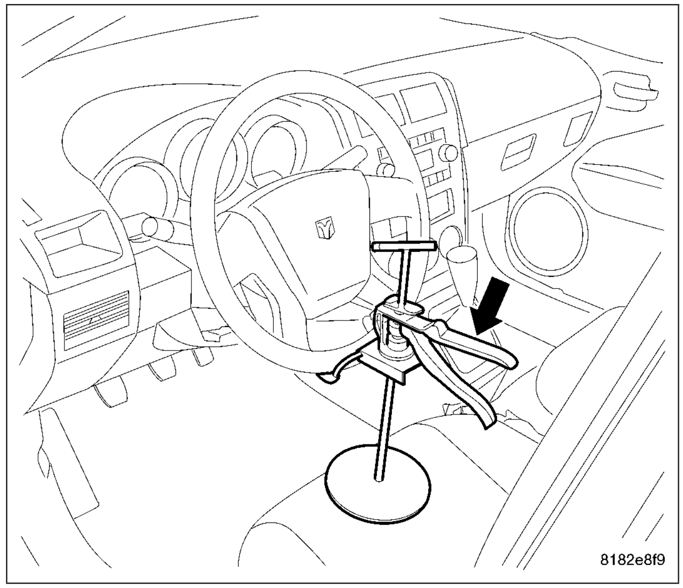
9. Install the retainers (3) over the stabilizer bar cushions. Install all four stabilizer bar cushion retainer screws (1) and tighten them to 30 N·m (22 ft. lbs.).



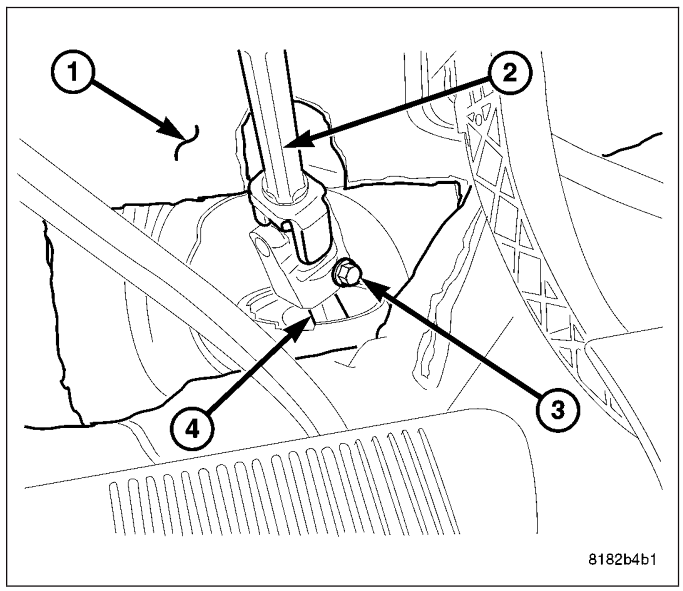
10. Install the screws (1) securing the power steering hose routing clamps (2) to the crossmember. Tighten the screws to 8 N·m (71 in. lbs.).



11. Install the Pressure hose at the gear. Tighten the tube nut to 32 N·m (24 ft. lbs.).
12. Install the return hose at the gear.



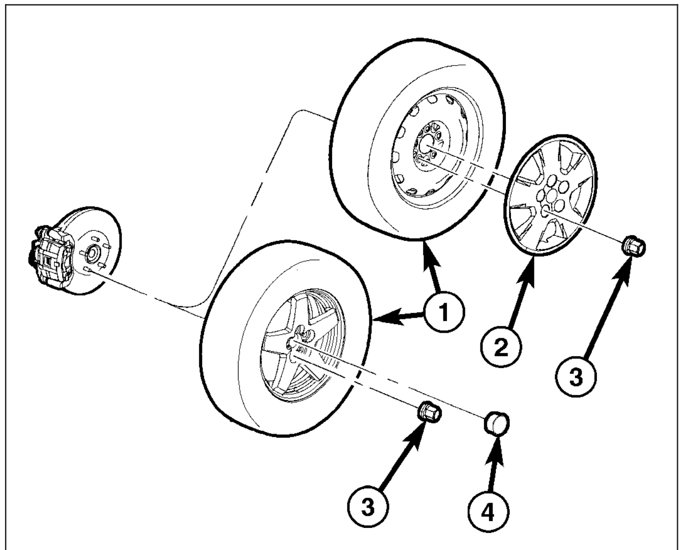
13. Install the front engine mount through-bolt.
14. Install the rear engine mount. (Refer to 9 - ENGINE/ENGINE MOUNTING/REAR MOUNT - REMOVAL)
15. If equipped, install the engine belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)
16. On each side of the gear, install the outer tie rod end (4) into the hole in the knuckle arm (3). Start the tie rod mounting nut (2) onto the stud. While holding the tie rod end stud with a wrench, tighten the nut with a wrench or crowfoot wrench. Tighten the nut to 54 N·m (40 ft. lbs.).



17. On each side of the vehicle, install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
18. Lower the vehicle.

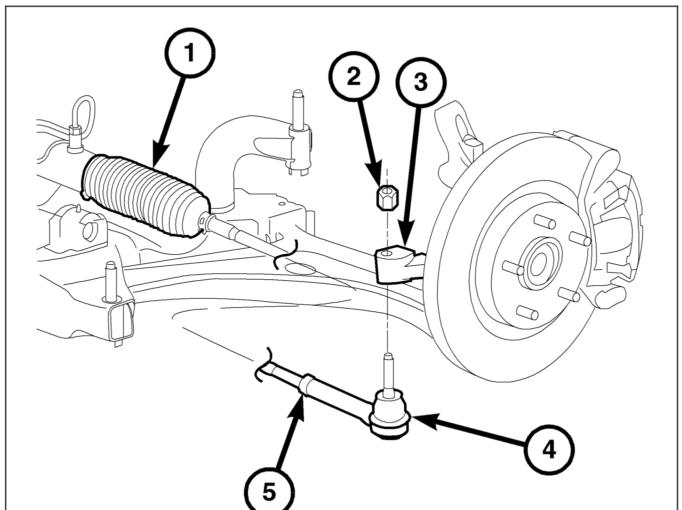
19. Remove the steering wheel holder.

20. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
21. Center the intermediate shaft (2) over the steering gear pinion shaft (4), lining up the ends, then slide the intermediate shaft onto the steering gear pinion shaft.
22. From center, rotate the steering wheel to the right approximately 90° or until the shaft coupling pinch bolt (3) can be easily installed.
23. Install the pinch bolt (3). Tighten the pinch bolt to 28 N·m (21 ft. lbs.).
24. Reposition the floor carpet (1) in place.
25. Straighten the steering wheel to STRAIGHT-AHEAD position.



26. Fill and bleed the power steering system. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
27. Check for fluid leaks.
28. Adjust front wheel toe as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

TIE ROD-OUTER

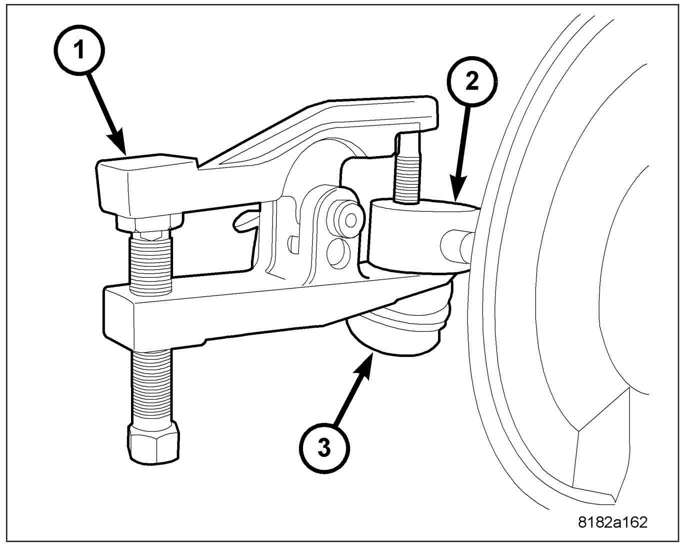


REMOVAL

1. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove the wheel mounting nuts (3) , then the tire and wheel assembly (1).

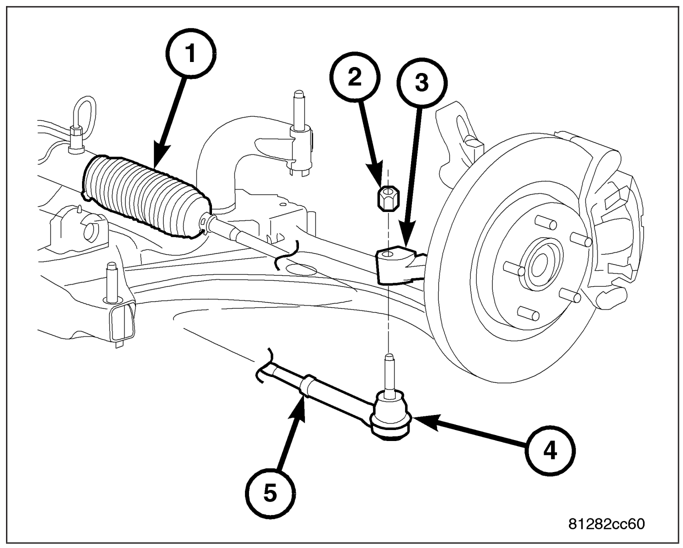
817d0e62

3. Loosen the tie rod jam nut (5).
4. Remove the nut (2) attaching the outer tie rod (4) to the knuckle (3). To do this, hold the tie rod end stud with a wrench while loosening and removing the nut with a standard wrench or crowfoot wrench.



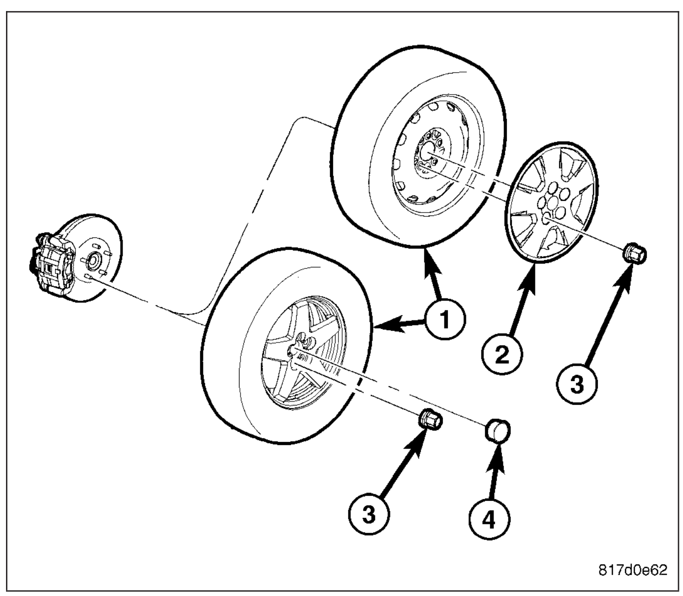
81282cc60

5. Release the tie rod end (3) from the knuckle (2) using Remover, Special Tool 9360 (1)
6. Remove the outer tie rod (3) from the knuckle (2).



NOTE: When unscrewing the outer tie rod from inner, count the number of revolutions to take it off. This action will aid in installation, getting the toe close to where it needs to be when setting the wheel alignment.

7. Remove the outer tie rod from the inner tie rod.



INSTALLATION

1. If it is not already installed, install the jam nut (5) on the inner tie rod threads.
2. Thread the outer tie rod (4) onto the inner tie rod approximately the same amount of revolutions as the original was installed.
3. Thread the jam nut (5) down the inner tie rod far enough to hold the outer tie rod. Do not tighten the jam nut at this time.
4. Install the outer tie rod ball stud into the hole in the knuckle arm (3). Start the tie rod mounting nut (2) onto the stud. While holding the tie rod end stud with a wrench, tighten the nut with a wrench or crowfoot wrench. Tighten the nut to 54 N·m (40 ft. lbs.).

5. Install the tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Install and tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
6. Lower the vehicle.
7. Adjust the front wheel toe setting. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).
8. Tighten the tie rod jam nut to 75 N·m (55 ft. lbs.) once wheel toe is set.

PUMP

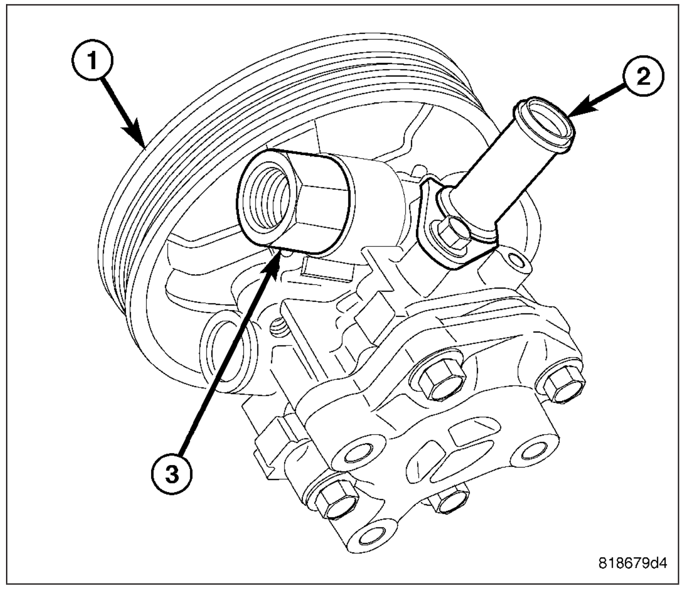


TABLE OF CONTENTS

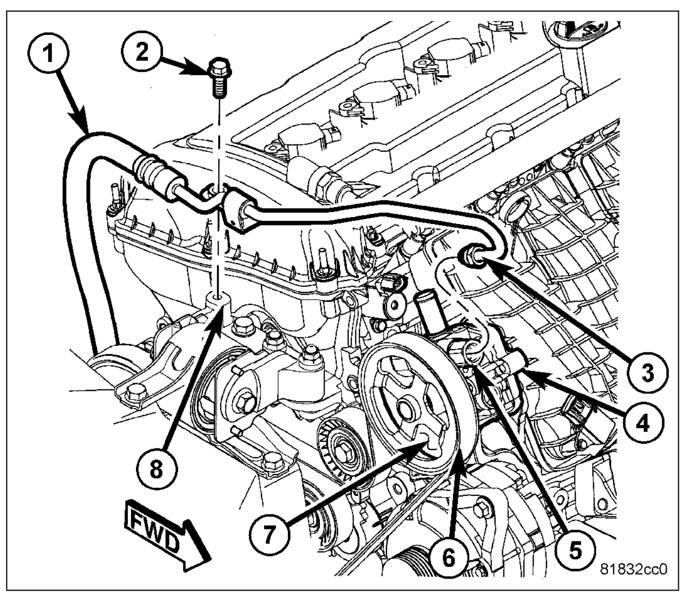
PUMP

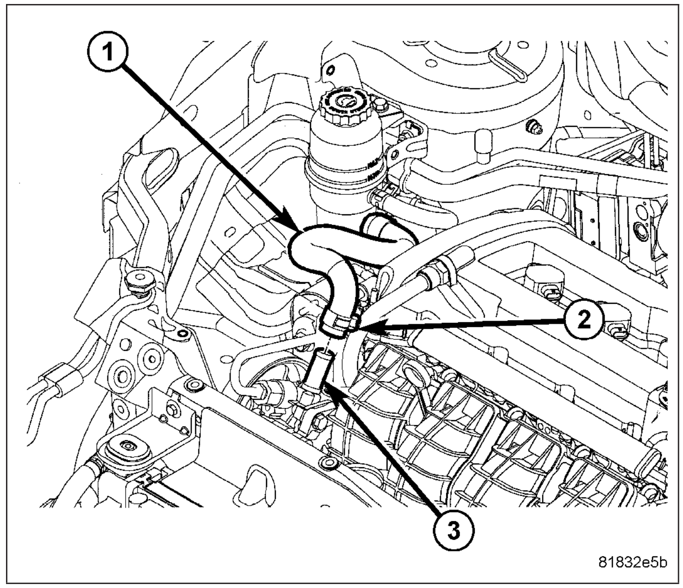
DESCRIPTION

Hydraulic pressure for operation of the power steering gear is provided by a constant flow rate and displacement vane-type power steering pump.

The power steering pump is belt driven. The pulley (1) cannot be serviced separately. The power steering pump is serviced as a complete assembly.

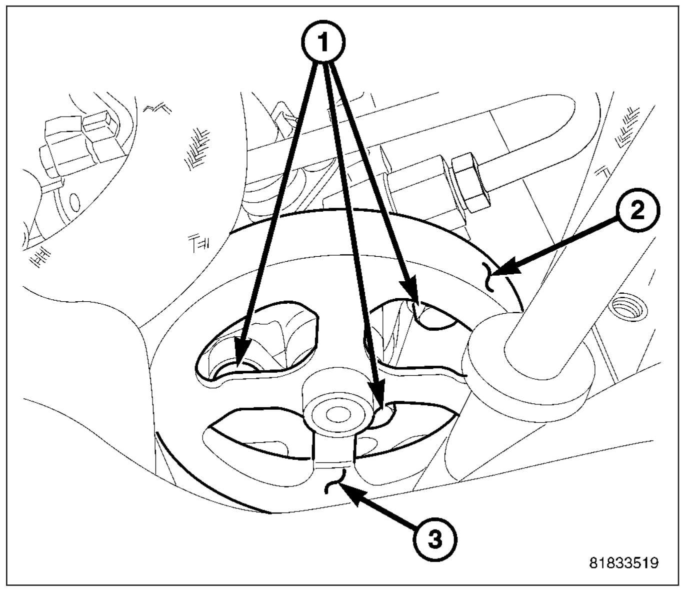


REMOVAL



GAS ENGINE

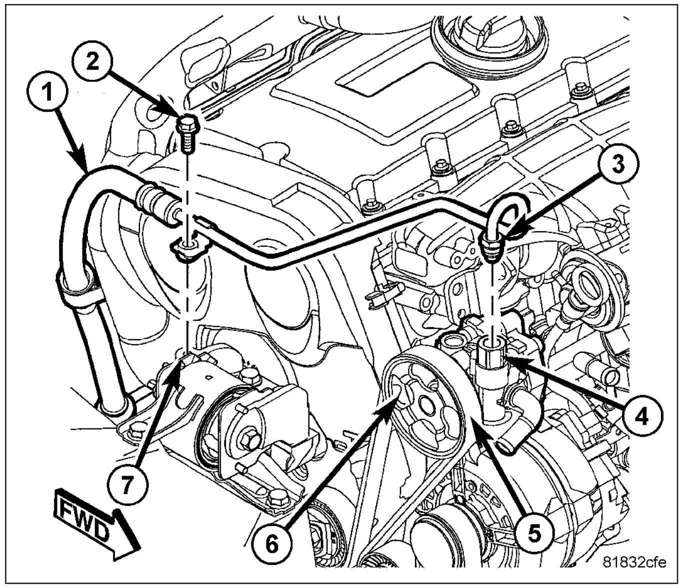
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).



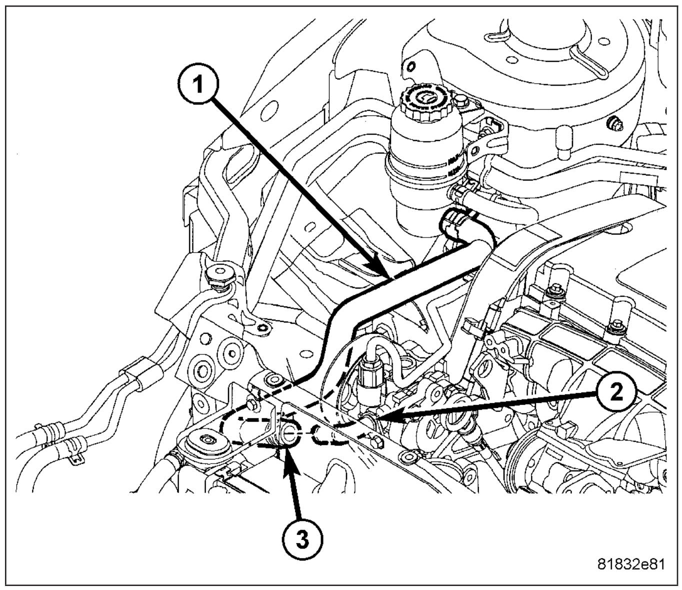
1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the engine appearance cover.
3. Remove the pressure hose routing bracket bolt (2) at the upper mount (8).
4. Remove the pressure hose (3) at the pump pressure port (5).

5. Remove the hose clamp (2) securing the supply hose (1) at the pump.
6. Remove the supply hose (1) from the pump (3).

7. Remove the drive belt (2). (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
8. Remove the three pump mounting bolts (1) through the pulley (3) openings.
9. Remove the power steering pump.

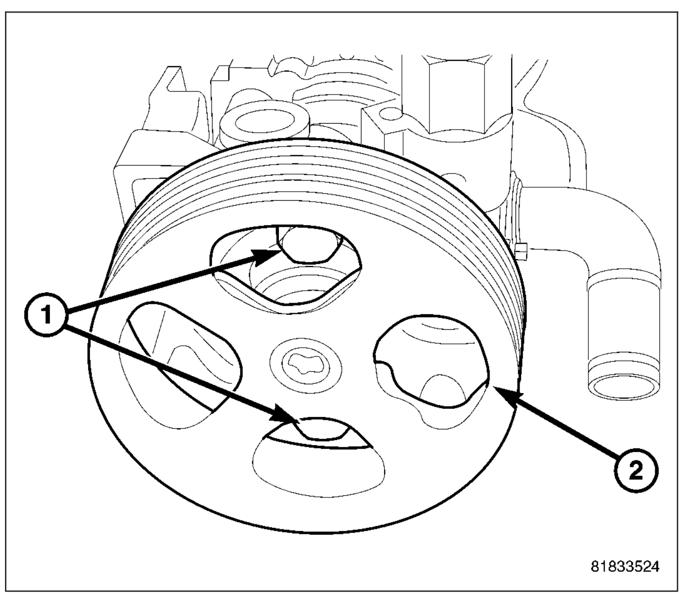


DIESEL ENGINE

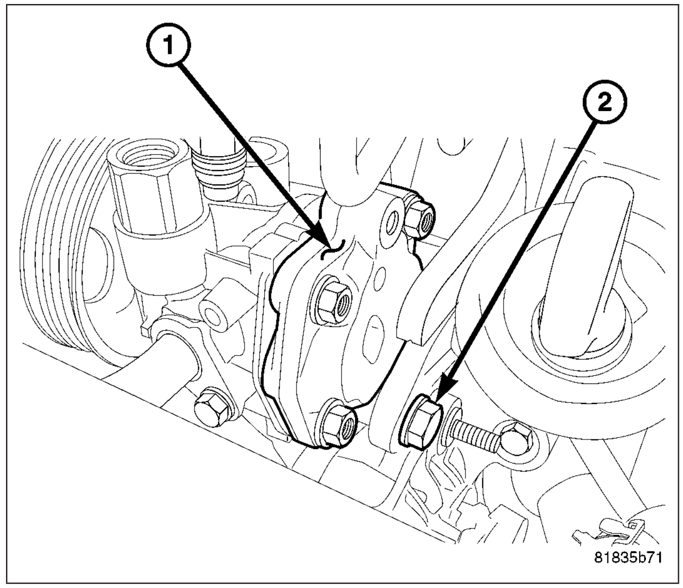


NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the engine appearance cover.

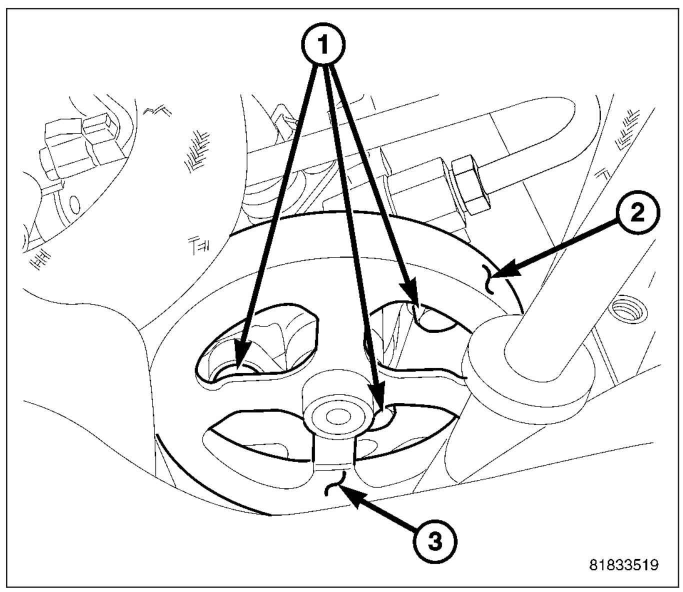


3. Remove the pressure hose routing bracket bolt (2) to the upper mount (7).
4. Remove the pressure hose (3) at the pump pressure port (4).

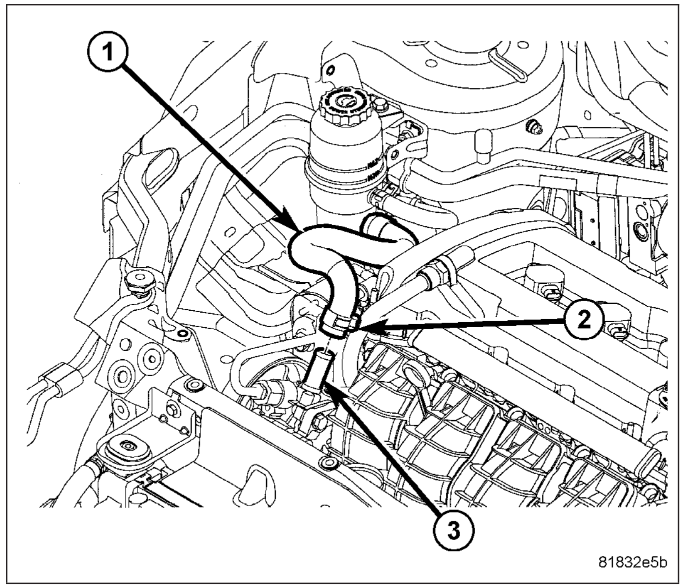


5. Remove the hose clamp (3) securing the supply hose (1) at the pump.
6. Remove the supply hose (1) from the pump (2).

7. Remove the drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
8. Remove the two pump mounting bolts (1) through the pulley (2) openings.

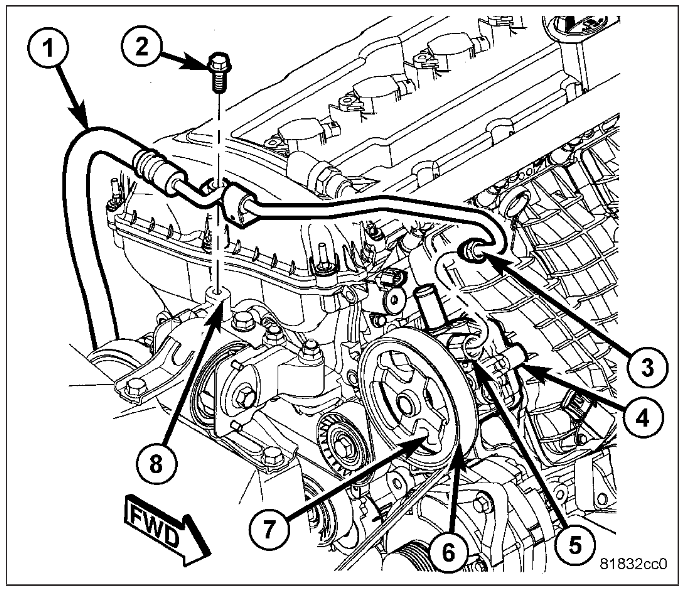


9. Remove the rear pump mounting bolt (2) behind the pump (1).
10. Remove the power steering pump (1).



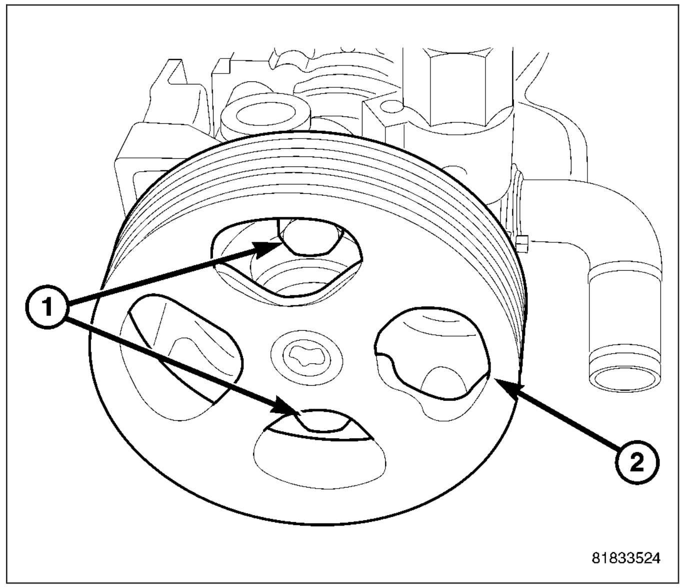
INSTALLATION

GAS ENGINE

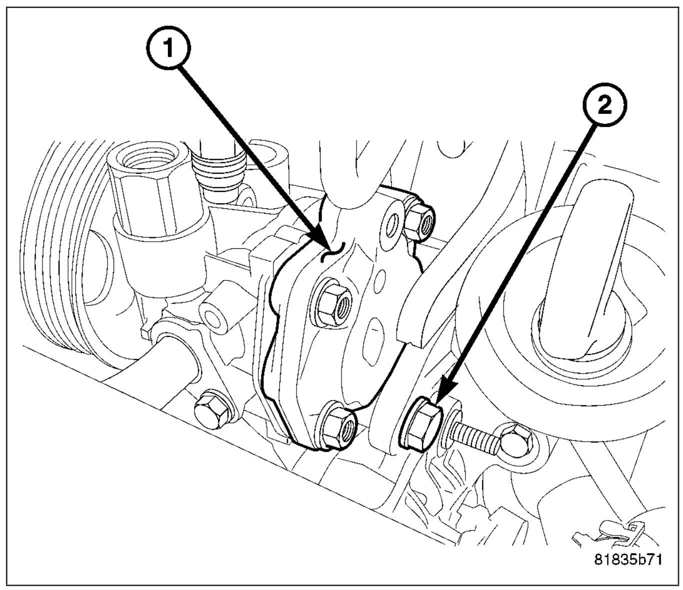


1. Using a lint free towel, wipe clean the open power steering pressure hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with clean power steering fluid.
2. Place the pump in mounting position. Install the three bolts (1) through the pulley (3) openings. Tighten the mounting bolts (1) to 20 N·m (177 in. lbs.).
3. Install the drive belt (2). (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

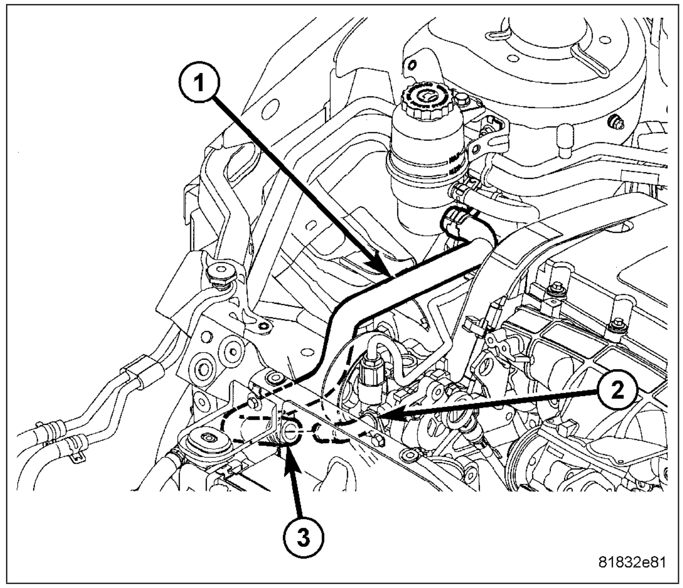
4. Install the supply hose (1) at the pump (3).
5. Clamp the hose clamp (2) securing the supply hose (1) to the pump.



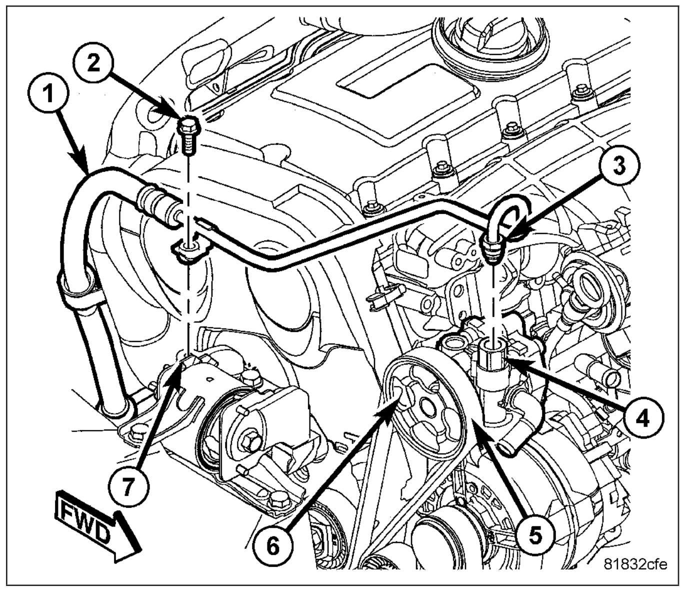
6. Install the pressure hose (3) at the pump pressure port (5). Tighten the tube nut to 32 N·m (24 ft. lbs.).
7. Install the pressure hose routing bracket bolt (2) to the upper mount (8).
8. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
9. Check for leaks.
10. Install the engine appearance cover.



DIESEL ENGINE



1. Using a lint free towel, wipe clean the open power steering pressure hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with clean power steering fluid.
2. Place the pump in mounting position. Install the two mounting bolts (1) through the pulley (2) openings. Tighten the mounting bolts to 26 N·m (230 in. lbs.).



3. Install the rear mounting bolt (2) securing the rear of the pump (1). Tighten the mounting bolt to 26 N·m (230 in. lbs.).
4. Install the drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

5. Install the supply hose (1) at the pump (2).
6. Clamp the hose clamp (3) securing the supply hose (1) to the pump.

7. Install the pressure hose (3) at the pump pressure port (4). Tighten the tube nut to 32 N·m (24 ft. lbs.).
8. Install the pressure hose routing bracket bolt (2) to the upper mount (7).
9. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
10. Check for leaks.
11. Install the engine appearance cover.

FLUID

DESCRIPTION

The recommended fluid for the power steering system is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both Fluids have the same material standard specifications (MS-9602).

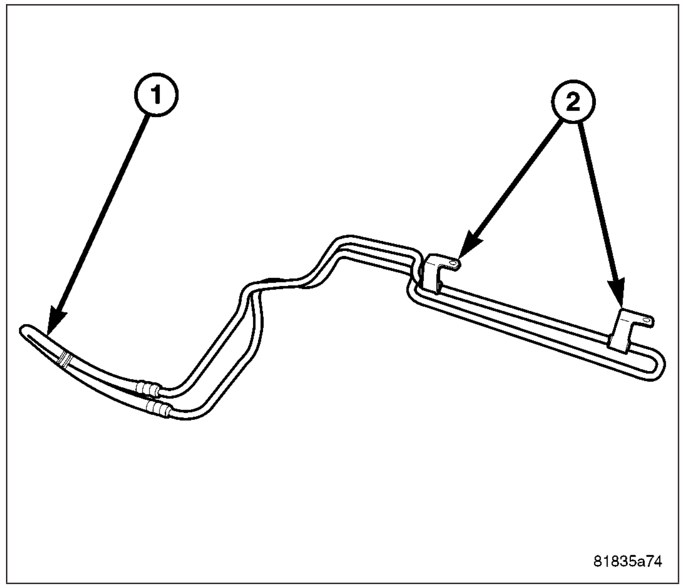
Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

STANDARD PROCEDURE

POWER STEERING FLUID LEVEL CHECKING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

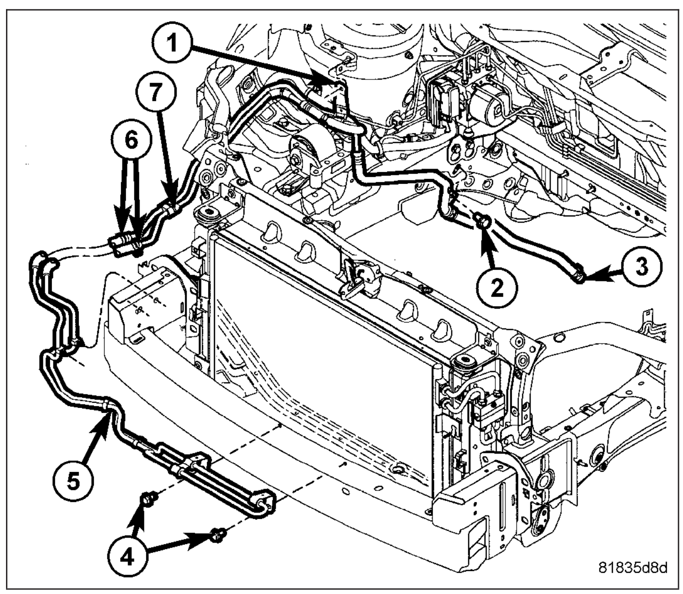


NOTE: Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.

The power steering fluid level can be viewed through the side of the power steering fluid reservoir. Compare the fluid level to the markings on the side of the reservoir. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the MAX. COLD and MIN. COLD markings. When the fluid is hot, fluid level is allowed to read up to the highest end of the MAX. HOT range.

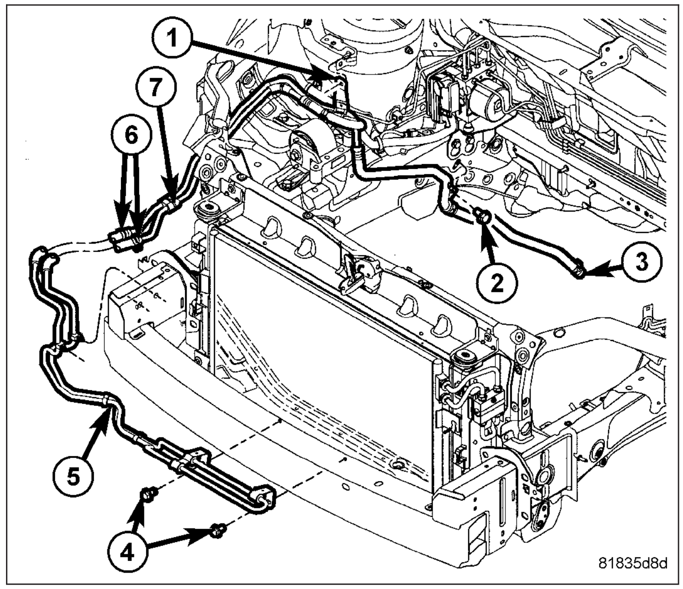
FLUID COOLER

DESCRIPTION



The cooler is placed in series with the power steering fluid return hose, between the steering gear fluid outlet port and the fluid return hose leading to the power steering fluid reservoir.

REMOVAL



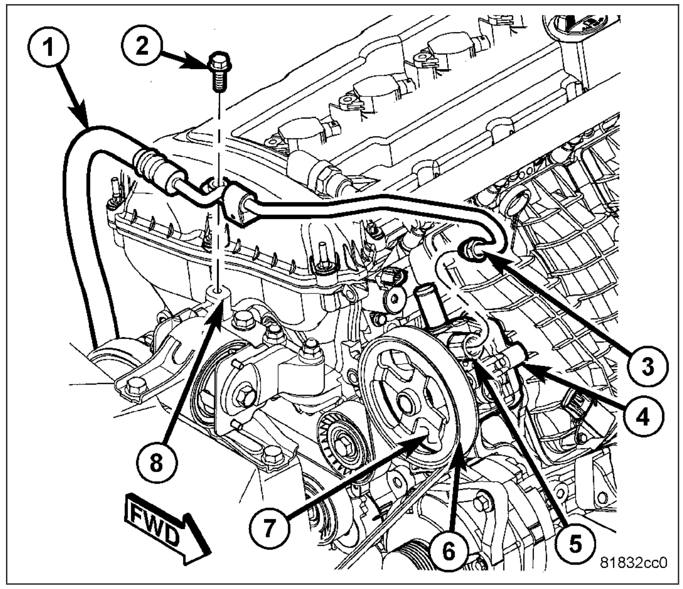
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
3. Remove the front fascia.
4. Remove the hose clamps (6) attaching the fluid return hose (7) to the power steering fluid cooler line. Separate the return hose from the cooler line (5).
5. Remove the two cooler mounting screws (4).
6. Remove the cooler tubes from the clips on the side of the frame rail.
7. Remove the cooler lines (5) from the vehicle.

INSTALLATION

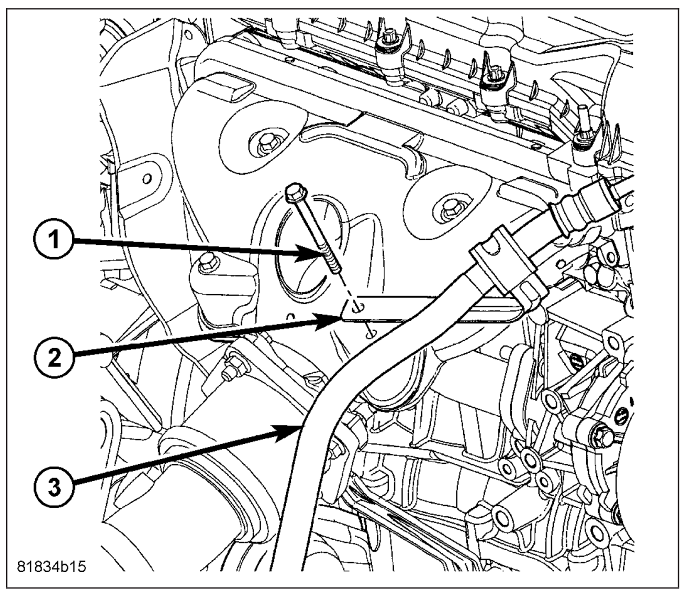
1. Install the cooler tubes in the clips on the side of the frame rail.
2. Install the fluid cooler mounting screws (4) to the support. Tighten the screws to 8 N·m (71 in. lbs.).
3. Install the fluid return hose (7) on the power steering fluid cooler lines (5). Install the hose clamp (6) on the hose past the bead formed into the end of the cooler tube and secure in place.

4. Install the front fascia.
5. Lower the vehicle.
6. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
7. Check for leaks.



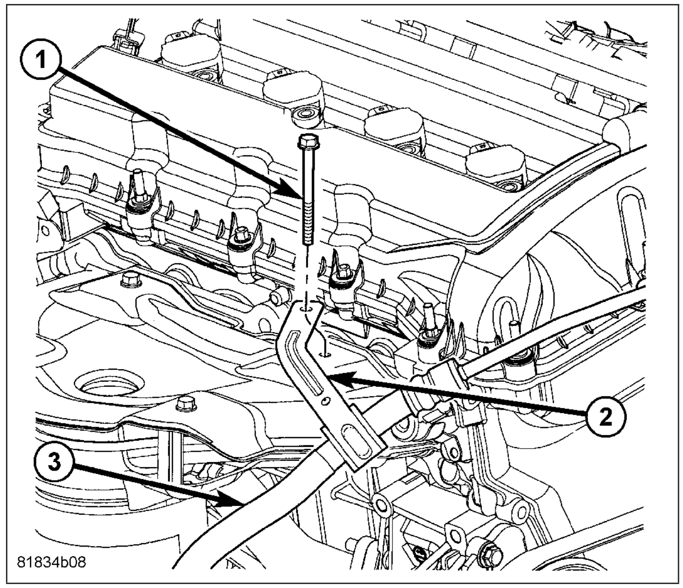
HOSE-PRESSURE

REMOVAL

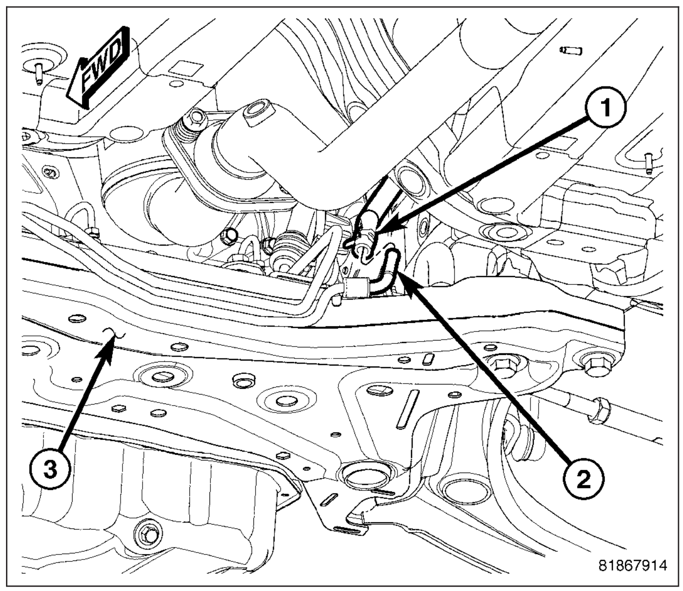


GAS ENGINE

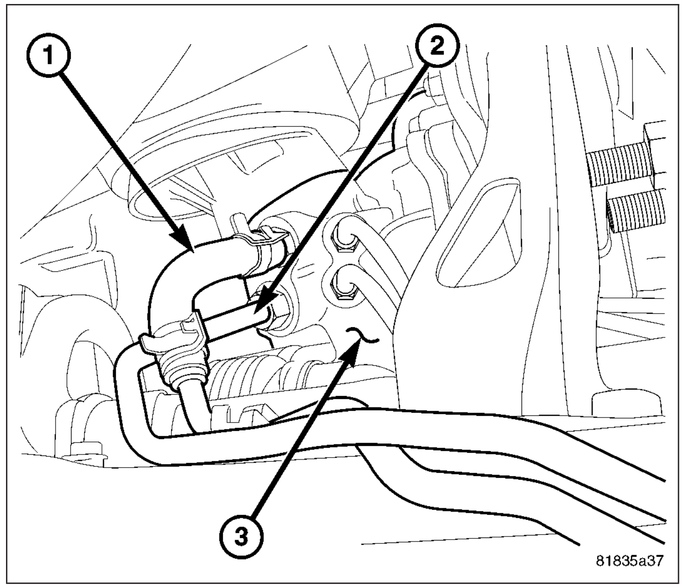
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).



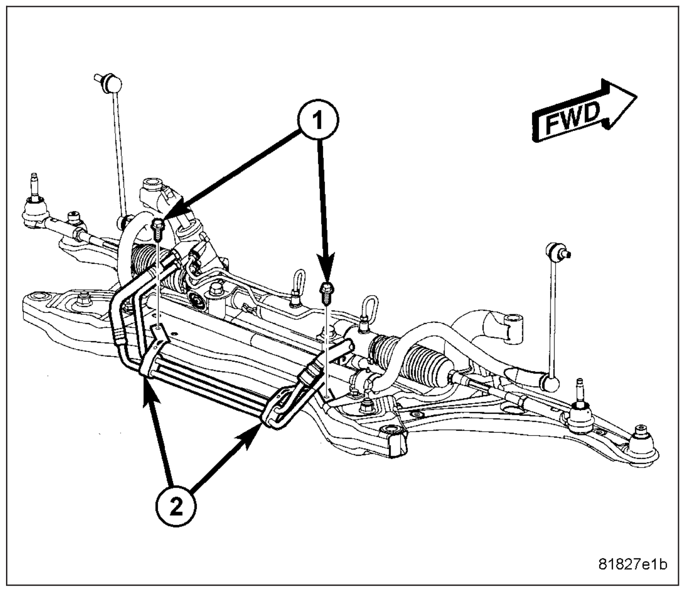
1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the engine appearance cover.
3. Remove the pressure Hose (3) at the pump pressure port (5).
4. Remove the pressure hose routing bracket bolt (2) at the upper mount (8).



5. 2.0L Engine - Remove the pressure hose routing clamp bolt (1) at the exhaust manifold.



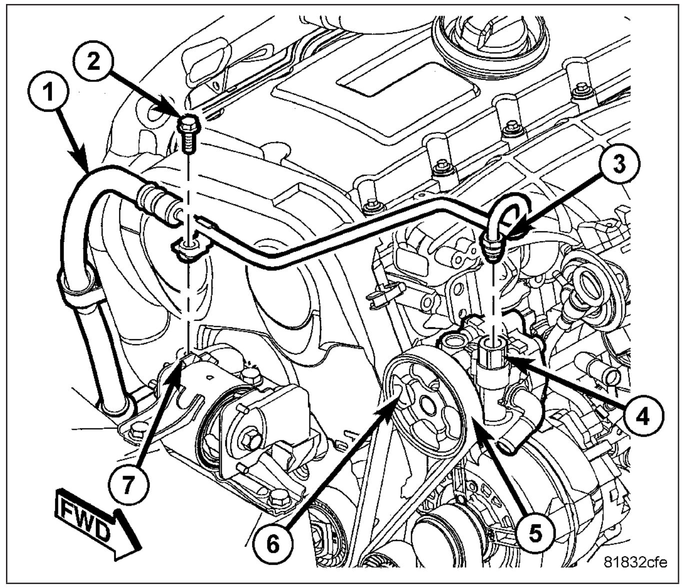
6. 2.4L Engine - Remove the pressure hose routing clamp bolt (1) at the exhaust manifold.



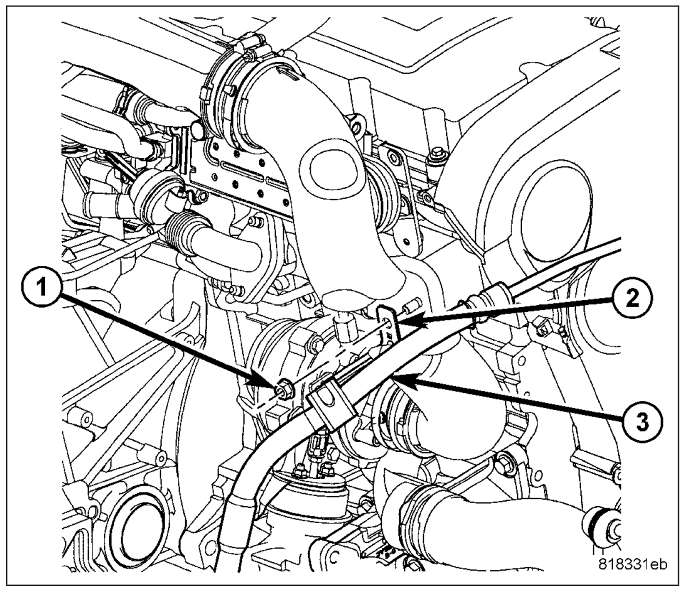
7. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
8. Remove the return hose (1) at the return tube (2).

9. Remove the return hose (1) at the steering gear (3).
10. Remove the pressure hose (2) at the steering gear (3).

11. Remove the screws (1) securing the power steering hose routing clamps (2) to the crossmember.
12. Remove the power steering pressure line (2) from the vehicle.



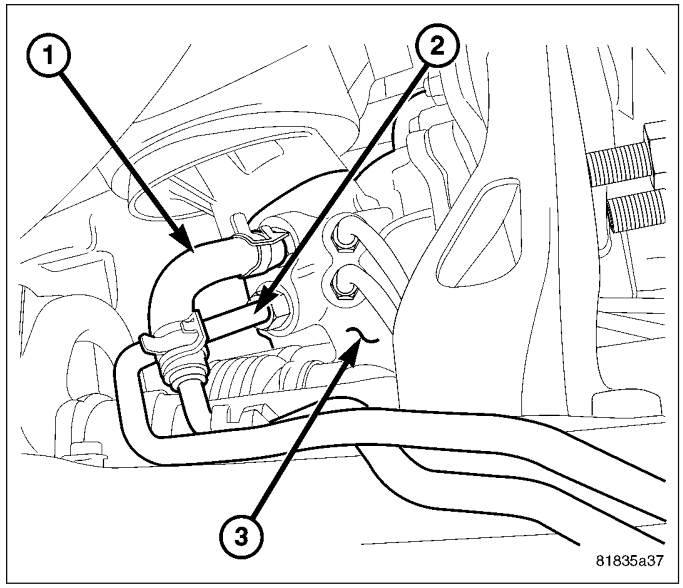
DIESEL ENGINE



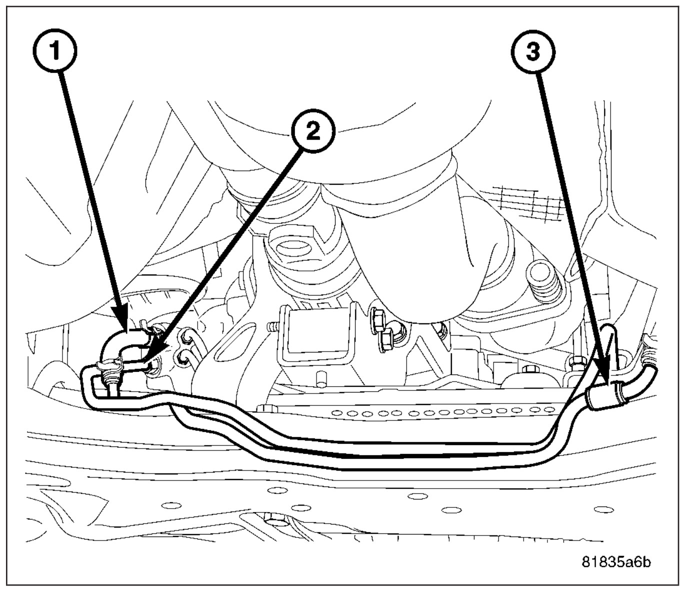
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Siphon as much fluid as possible from power steering fluid reservoir.
2. Remove the engine appearance cover.

3. Remove the pressure line (3) at the pump (4).
4. Remove the pressure line routing bracket bolt (2) at the upper mount (7).



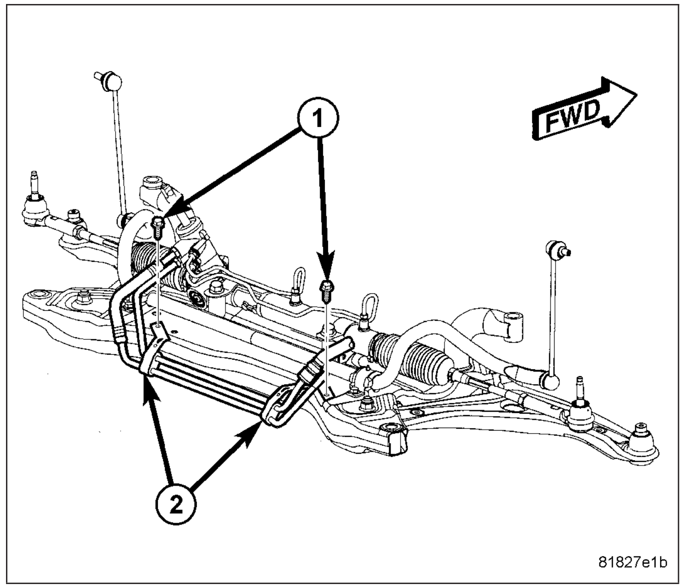
5. Remove the pressure line routing bracket bolt (1) at the back of the engine (2).



6. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

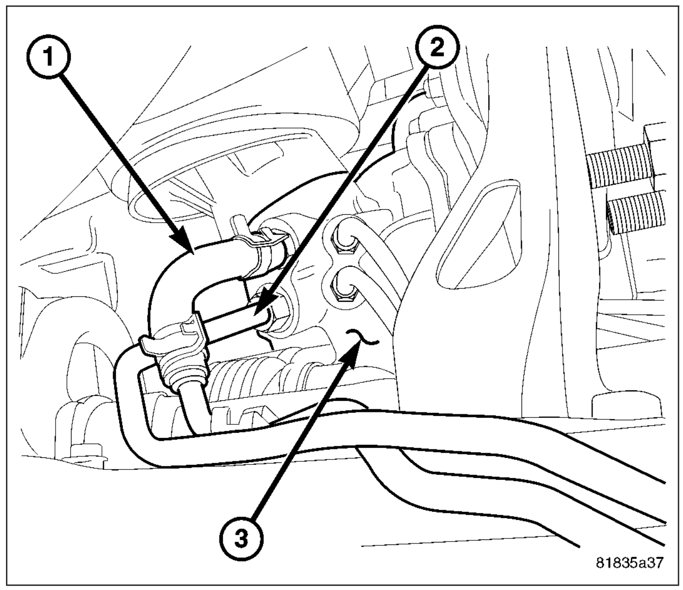
7. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
8. Remove the pressure line (2) at the steering gear (3).

9. Remove the power steering pressure line (2) from the vehicle.



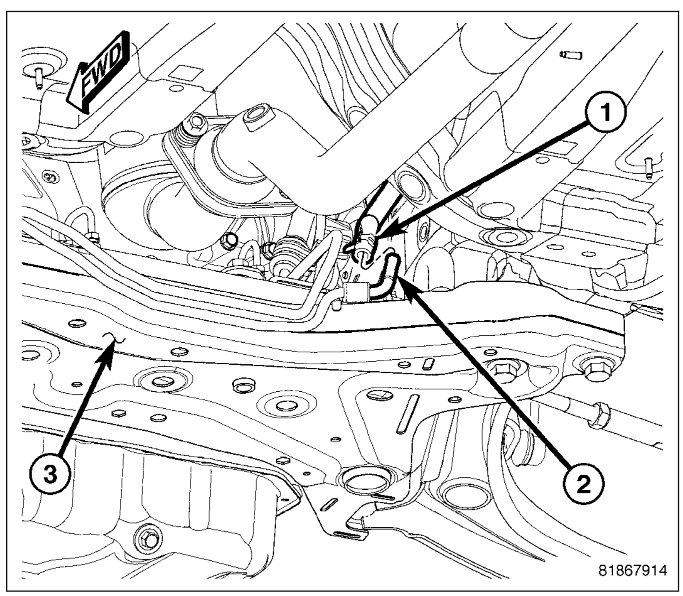
INSTALLATION

GAS ENGINE

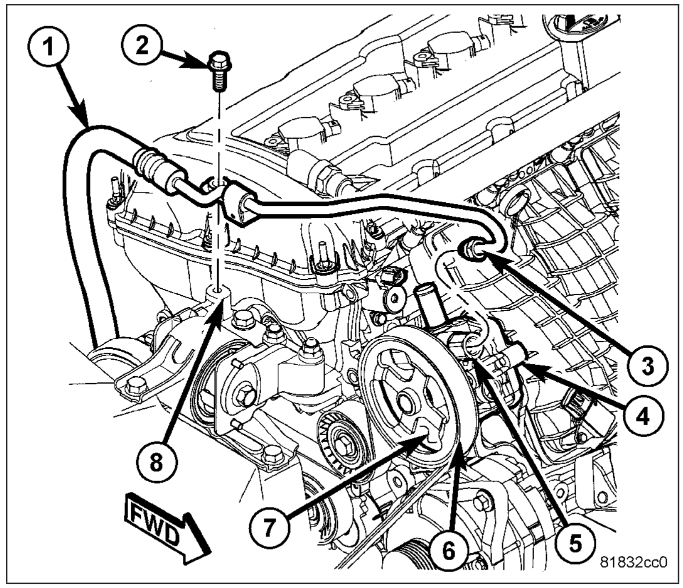


CAUTION: Power steering fluid hoses must remain away from the exhaust system, driveshafts, vehicle components and any unfriendly surface that can possibly damage the hoses.

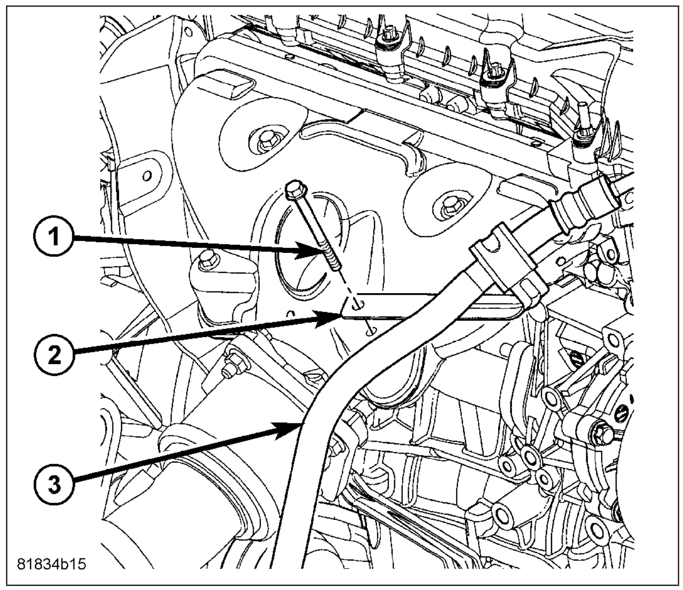
1. Using a lint free towel, wipe clean the open power steering hose end and the power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with power steering fluid.



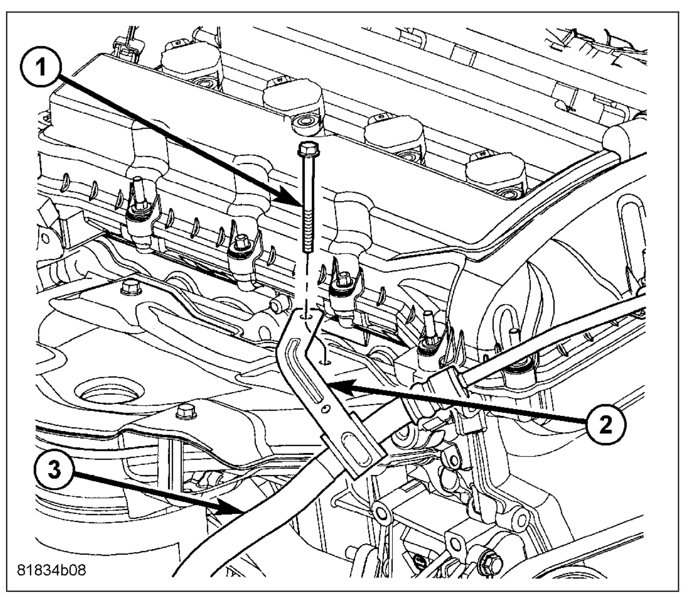
2. Install the power steering pressure hose into the engine compartment from below.
3. Install the screws (1) securing the power steering hose routing clamps (2) to the crossmember. Tighten the screws to 8 N·m (71 in. lbs.).



4. Install the Pressure hose at the gear. Tighten the tube nut to 32 N·m (24 ft. lbs.).
5. Install the return hose at the gear.



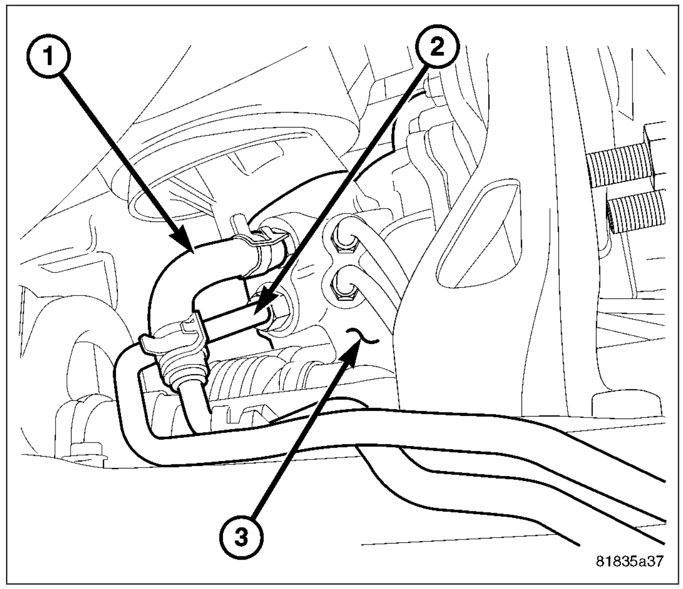
6. Install the return hose (1) at the return tube (2).
7. Lower the vehicle.



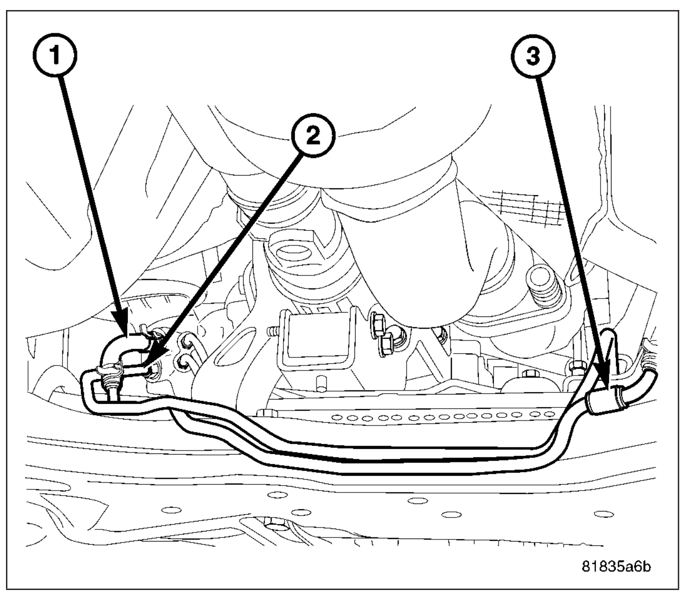
8. Install the pressure hose (3) at the pump pressure port (5). Tighten the tube nut to 32 N·m (24 ft. lbs.).
9. Install the pressure hose routing bracket bolt (2) to the upper mount (8).

10. 2.0L Engine - Position the pressure hose routing clamp (2) at the exhaust manifold and install the mounting bolt (1). Tighten the bolt to 9 N·m (80 in. lbs.).

11. 2.4L Engine - Position the pressure hose routing clamp (2) at the exhaust manifold and install the mounting bolt (1). Tighten the bolt to 9 N·m (80 in. lbs.).

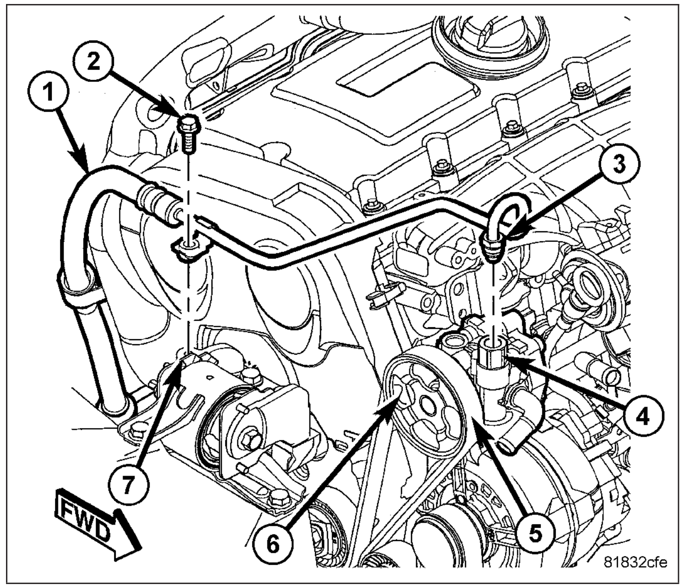


12. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
13. Check for leaks.
14. Install the engine appearance cover.

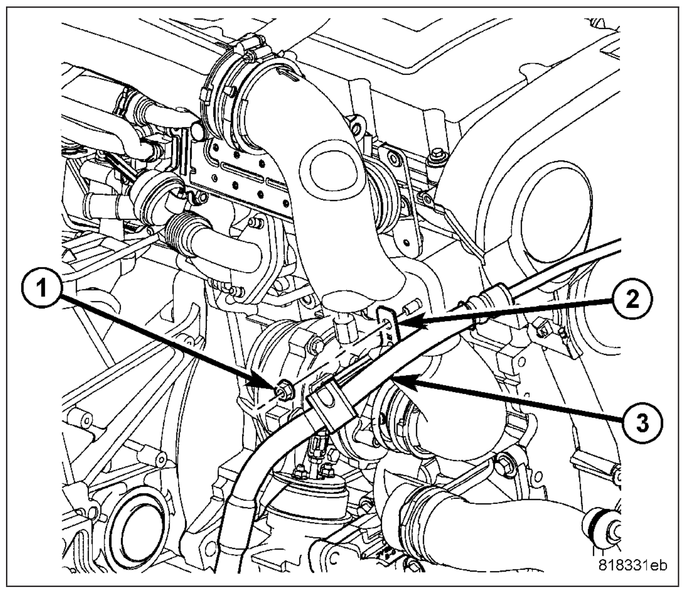


DIESEL ENGINE

CAUTION: Power steering fluid hoses must remain away from the exhaust system, driveshafts, vehicle components and any unfriendly surface that can possibly damage hoses.



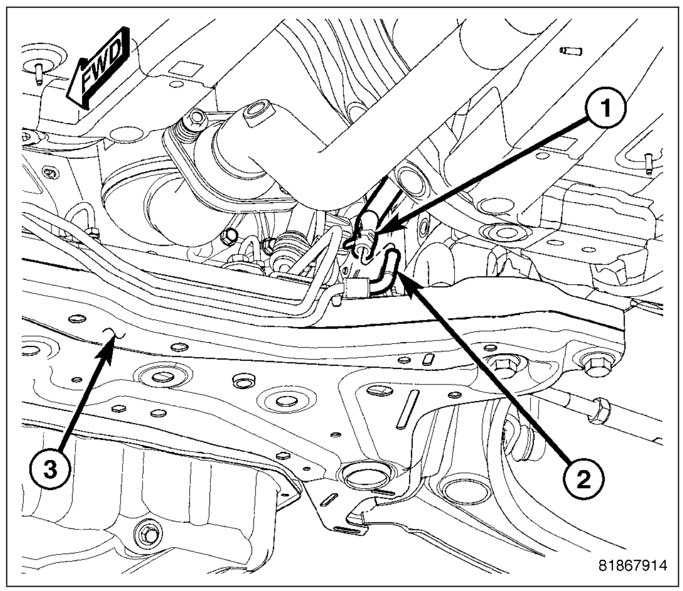
1. Using a lint free towel, wipe clean the open power steering hose end and power steering pump port. Replace any used O-rings with new. Lubricate the O-ring with fresh power steering fluid.
2. Install the power steering pressure hose into the engine compartment.
3. Install the pressure line (2) at the gear (3).



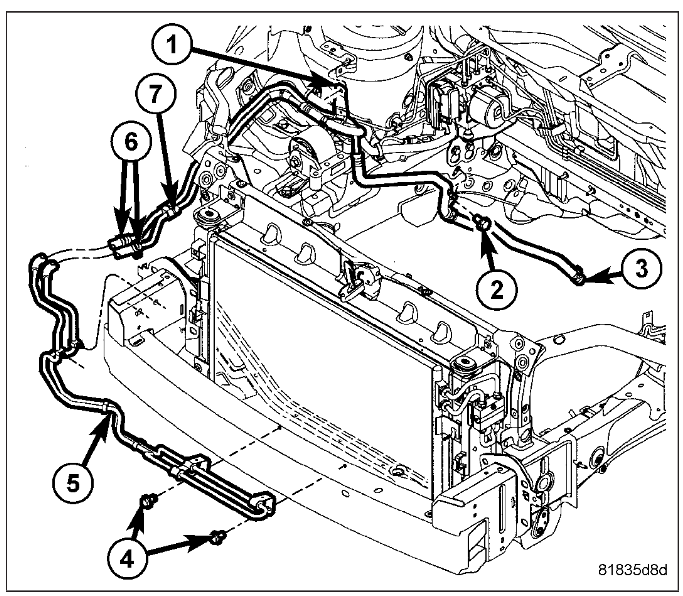
4. Install the pressure line (2) in place at the cross-member.
5. Lower the vehicle.

6. Install the pressure line (3) at the pump pressure port (4). Tighten the tube nut to 32 N·m (24 ft. lbs.).
7. Install the pressure line routing bracket bolt (2) to the upper mount (7).

8. Install the mounting bolt (1) for the pressure line bracket (2) to the rear of the engine. Tighten the nut to 24 N·m (18 ft. lbs.).
9. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
10. Check for leaks.
11. Install the engine appearance cover.



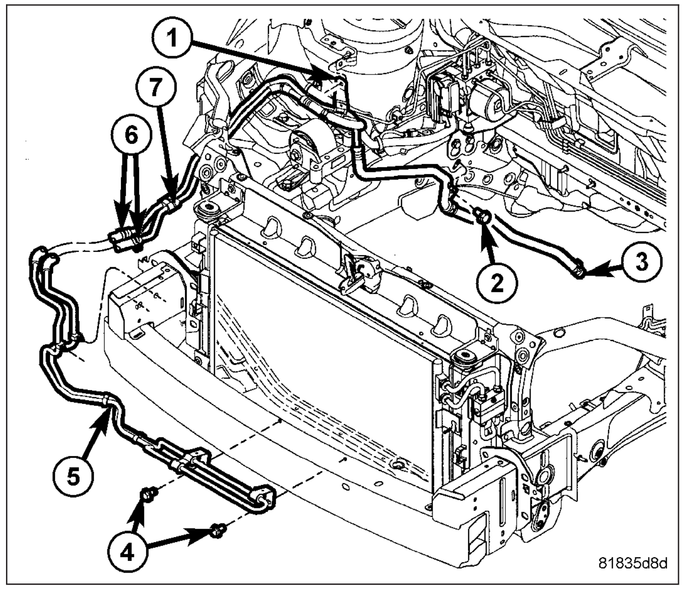
HOSE-RETURN



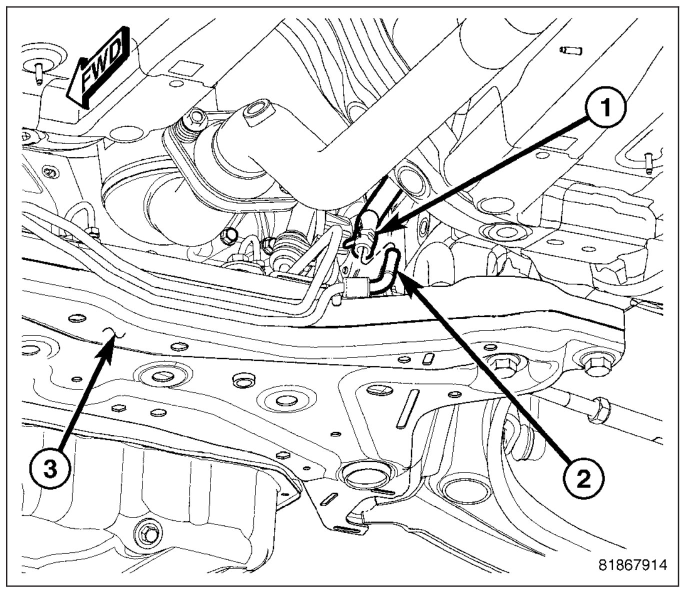
REMOVAL

NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Remove the engine appearance cover.
2. Remove the coolant recovery bottle. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL)
3. Siphon as much fluid as possible from the power steering fluid reservoir.
4. Remove the power steering fluid reservoir. (Refer to 19 - STEERING/PUMP/RESERVOIR - REMOVAL)
5. Remove the windshield washer reservoir. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL)
6. Remove the front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)
7. Remove the right headlamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT LAMP UNIT - REMOVAL)
8. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
9. Remove the return hose (1) at the return tube (2).



10. Remove the return hose routing clamp pushpin (2) securing the return hose (7) to the frame rail.
11. Lower the vehicle.
12. Remove the return hose routing clamp screw (1) securing the return hose (7) to the strut tower.
13. Remove the hose clamps (6) securing the return hose to the power steering reservoir and cooler. Slide the hose off the end of the cooler tube.
14. Remove the return hose from the vehicle.

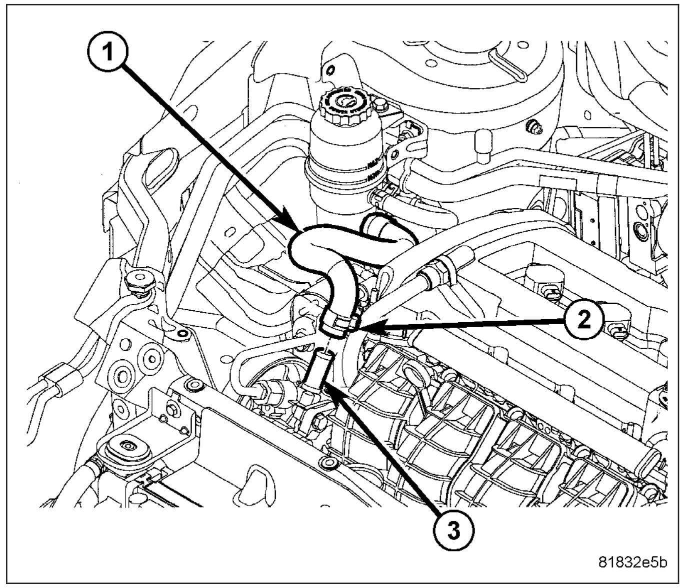


INSTALLATION

1. Install the power steering return hose (7) into the engine compartment.
2. Install the return hose routing clamp screw (1) securing the return hose (7) to the strut tower.
3. Install the return hose onto the cooler tubes (5) and install the hose clamps (6).
4. Raise and support the vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
5. Install the pushpin (2) securing the return hose to the frame rail.

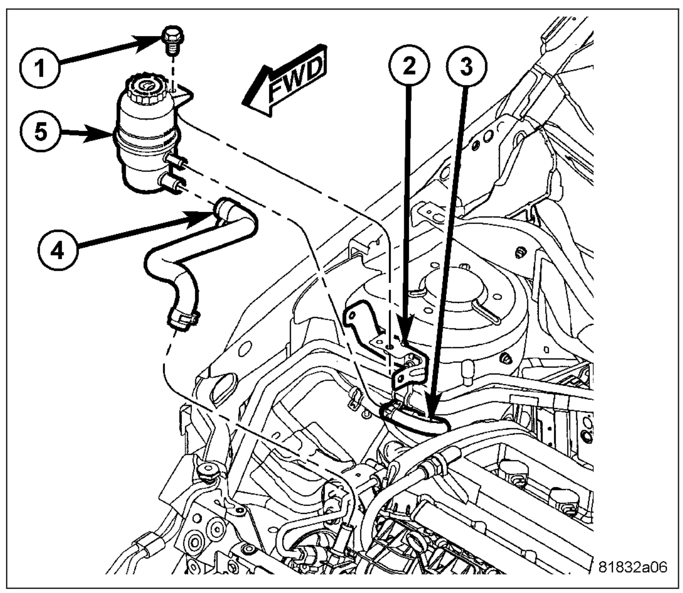
6. Install the return hose (1) at the return tube (2).
7. Lower the vehicle.

8. Install the right headlamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/FRONT LAMP UNIT - INSTALLATION)
9. Install the front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION)
10. Install the windshield washer reservoir. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION)
11. Install the power steering fluid reservoir. (Refer to 19 - STEERING/PUMP/RESERVOIR - INSTALLATION)
12. Install the coolant recovery bottle. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION)
13. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
14. Check for leaks.
15. Install the engine appearance cover.



HOSE-SUPPLY

REMOVAL

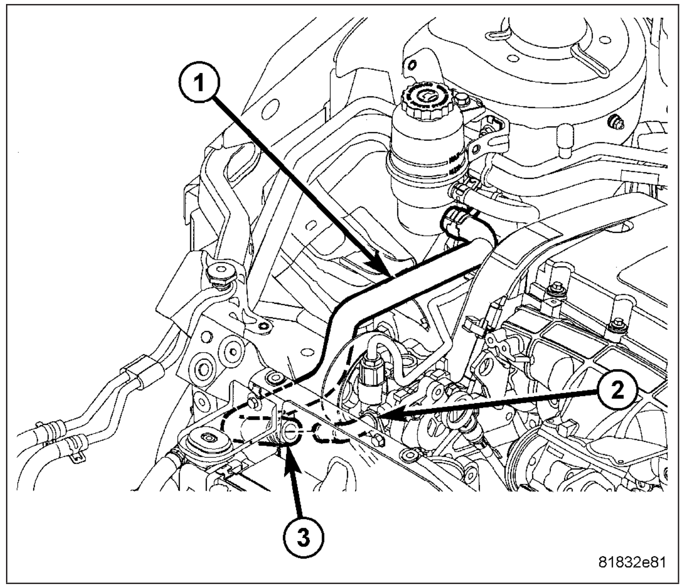


GAS ENGINE

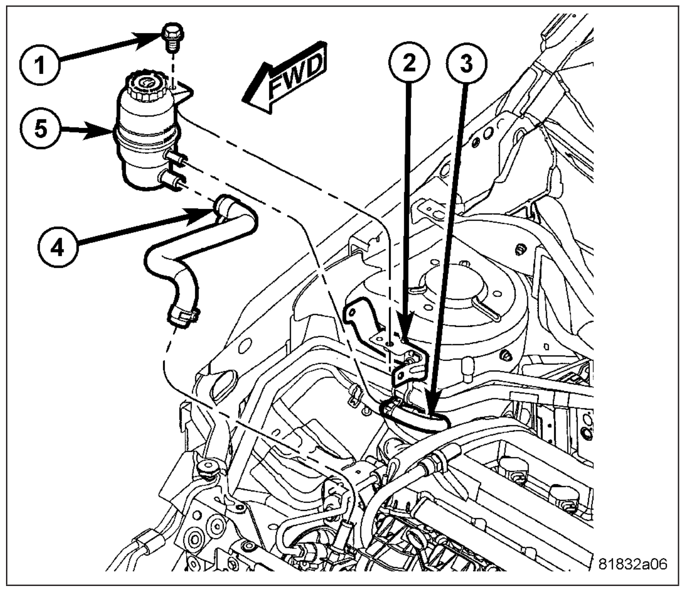
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Siphon as much fluid as possible from the power steering fluid reservoir.
2. Remove the clamp (2) securing the supply hose to the power steering pump (3) supply fitting, then remove the hose from the supply fitting.

3. Remove the hose clamp securing the supply hose (4) to the power steering fluid reservoir (5). Slide the hose off the end of the reservoir fitting and remove from vehicle.



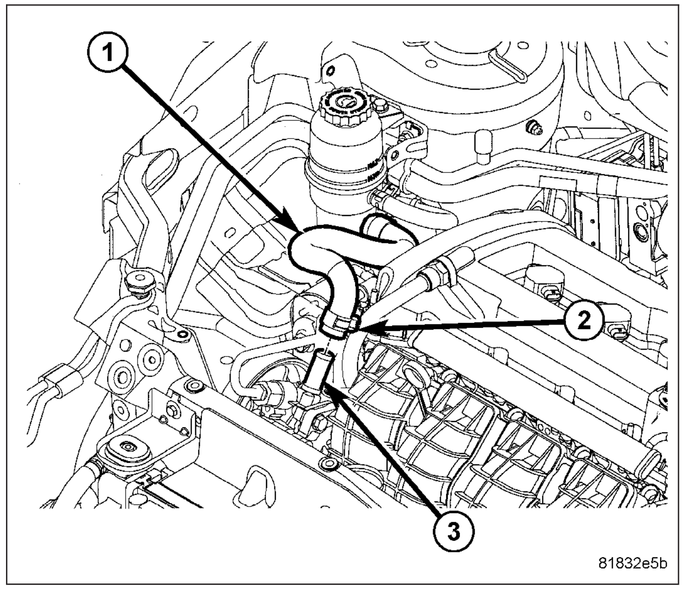
DIESEL ENGINE



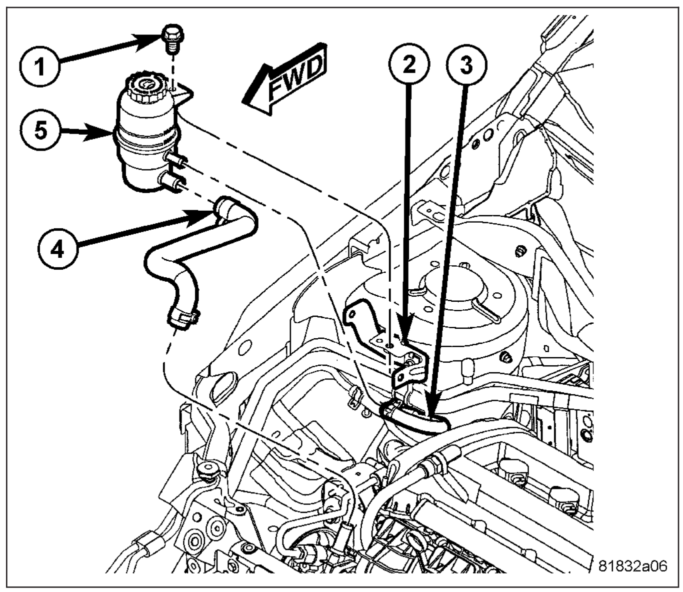
NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Remove the engine top appearance cover.
2. Siphon as much fluid as possible from power steering fluid reservoir.

3. Remove the clamp securing the supply hose (3) to the power steering pump supply fitting (2), then remove the hose from the fitting (1).



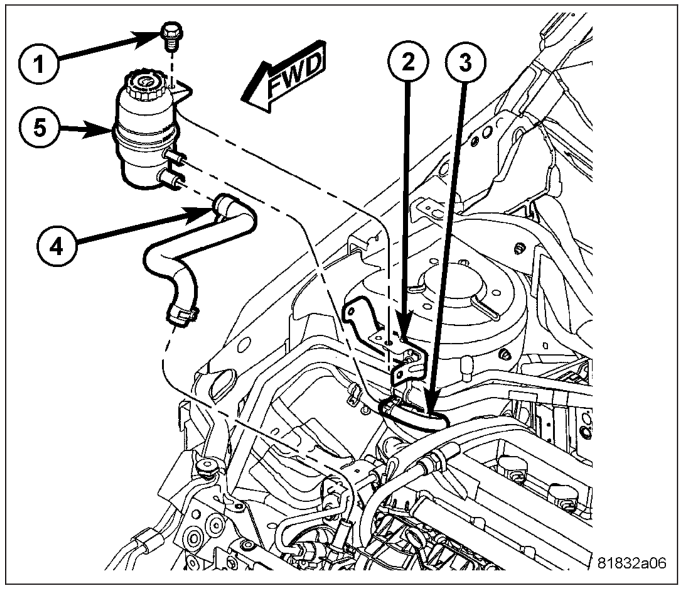
4. Remove the hose clamp (4) securing supply hose to the power steering fluid reservoir (5). Slide the hose off the end of the reservoir fitting and remove from vehicle.



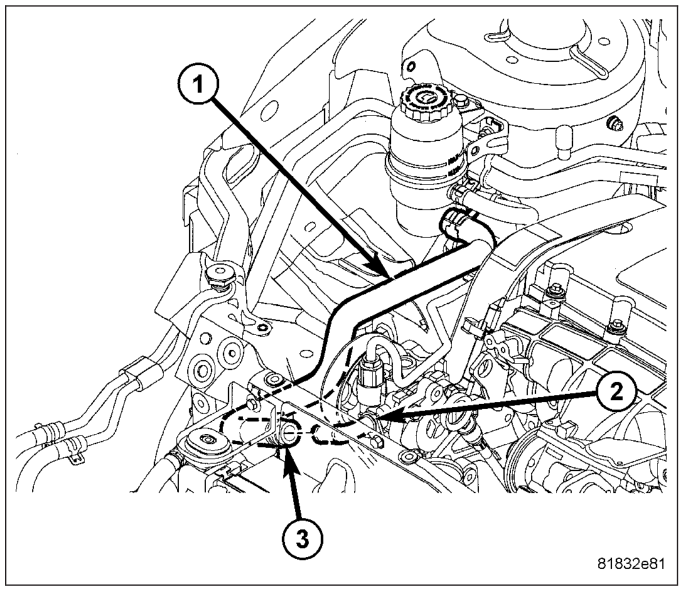
INSTALLATION

GAS ENGINE

1. Slide hose clamps (2) onto both ends of the power steering fluid supply hose (1) far enough to clear the fittings on the reservoir and pump once the hose is installed.
2. Place the pump end of the supply hose (1) onto the pump (3) supply fitting. Expand the hose clamp (2) and slide it over the hose and pump supply fitting. Secure the clamp once it is past the bead formed into the fluid supply fitting.

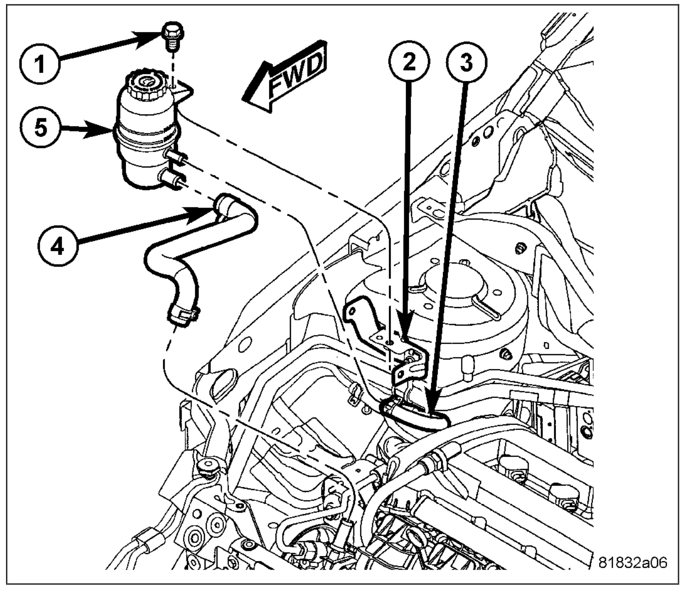


3. Expand the hose clamp (4) at the fluid reservoir (5) and slide it over the hose and fitting. Secure the clamp once it is past the bead formed into the fluid reservoir fitting.
4. Perform the POWER STEERING PUMP BLEED PROCEDURE. (Refer to 19 - STEERING - STANDARD PROCEDURE)
5. Check for leaks at all hose connections.



DIESEL ENGINE

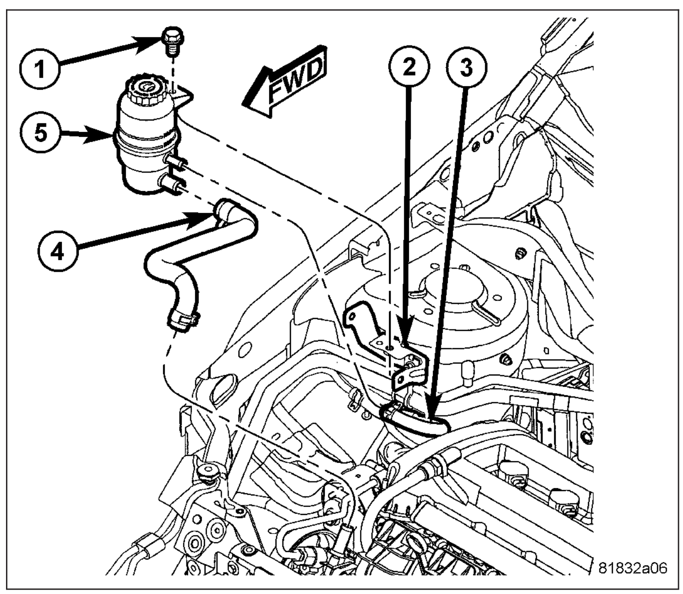
1. Slide hose clamps onto both ends of the power steering fluid supply hose far enough to clear the fittings on the reservoir and pump once hose is installed.
2. Expand the hose clamp (4) at the fluid reservoir end (5) and slide it over the hose and fitting. Secure the clamp once it is past the bead formed into the fluid reservoir fitting.



3. Place the pump end of the supply hose (1) onto the pump supply fitting (2). Expand the hose clamp and slide it over the hose and pump supply fitting. Secure the clamp (3) once it is past the bead formed into the fluid supply fitting.
4. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
5. Check for leaks.
6. Install the engine appearance cover.

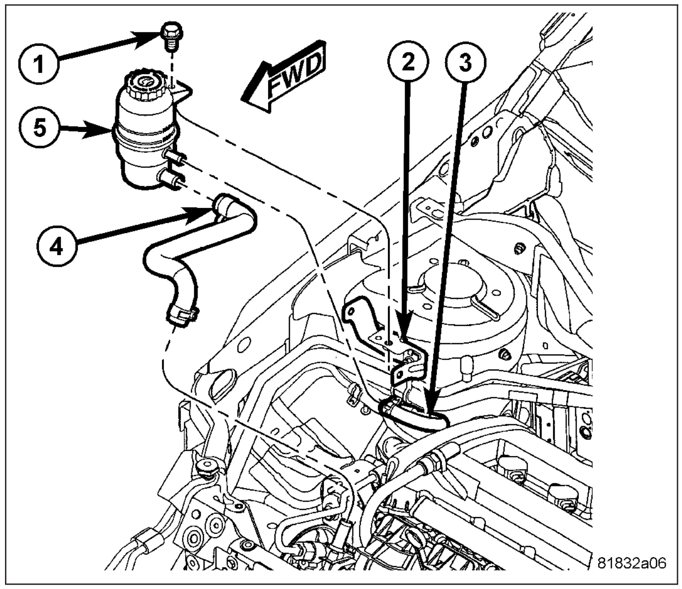
RESERVOIR

DESCRIPTION



The power steering fluid reservoir (5) is mounted above the right front inner fender well to a bracket (2).

REMOVAL



NOTE: Before proceeding, (Refer to 19 - STEERING - WARNING).

1. Remove engine appearance cover.
2. Remove the fasteners securing the coolant recovery bottle to its mounts and move it away from the power steering fluid reservoir. It is not necessary to disconnect the coolant recovery bottle fluid lines. (Refer to 7 - COOLING/ ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL)
3. Siphon as much fluid as possible from the power steering fluid reservoir (5).
4. Remove hose clamp securing cooler return hose (3) to fluid reservoir fitting. Slide the hose off the end of the reservoir fitting.
5. Remove hose clamp securing pump supply hose (4) to the fluid reservoir fitting. Slide the hose off the end of the reservoir fitting.
6. Remove the reservoir mounting screw (1) used to secure the reservoir in place.
7. Remove the reservoir (5).

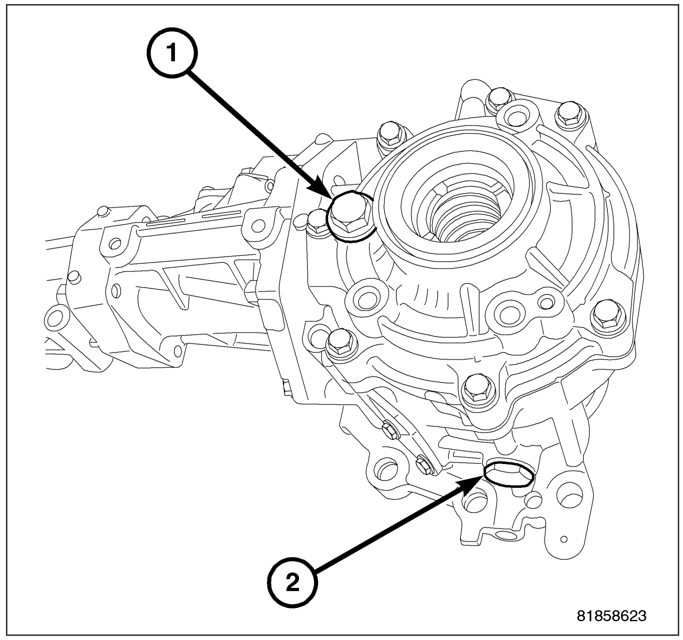
INSTALLATION

1. Attach the reservoir (5) to the strut tower bracket (2) using the mounting screw (1). Tighten mounting screw (1) to 12 N·m (106 in. lbs.).
2. Slide the pump supply hose (4) onto reservoir fitting. Expand hose clamp and slide it over hose on reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.
3. Slide cooler return hose (3) onto reservoir fitting. Expand hose clamp and slide it over hose on reservoir fitting. Secure clamp once it is past bead formed into fluid reservoir fitting.

4. Install the coolant recovery bottle. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION)
5. Fill and bleed the power steering system. (Refer to 19 - STEERING - STANDARD PROCEDURE)
6. Check for leaks.
7. Install the engine appearance cover.

TRANSAXLE

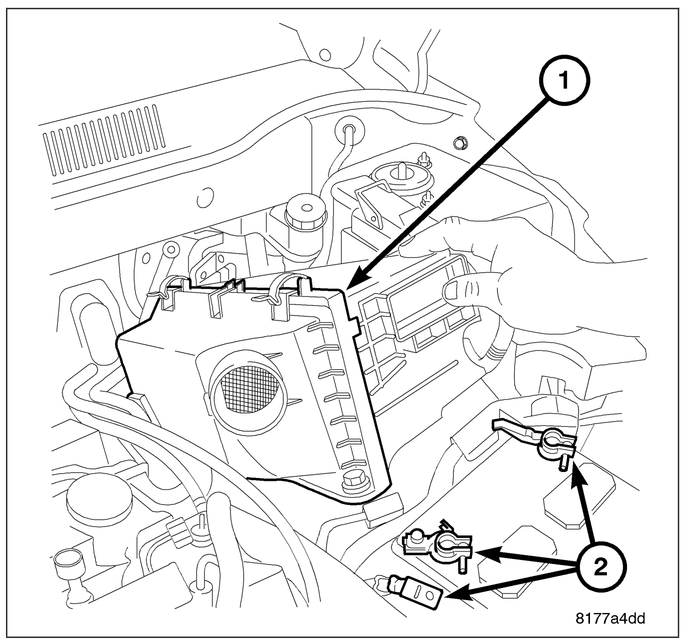
TABLE OF CONTENTS



POWER TRANSFER UNIT

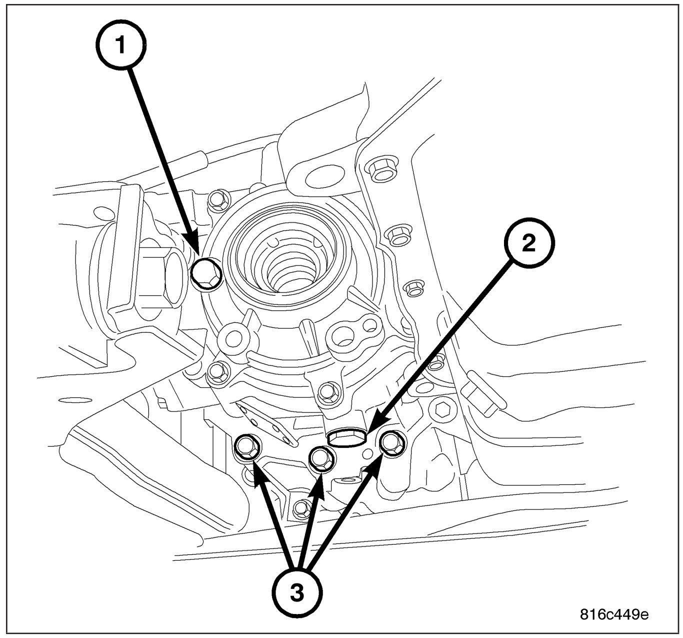
TABLE OF CONTENTS

POWER TRANSFER UNIT

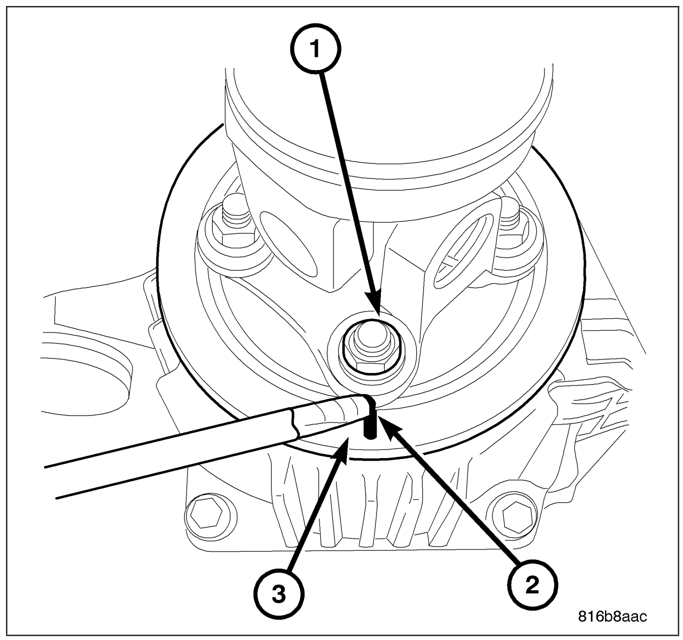


STANDARD PROCEDURE -

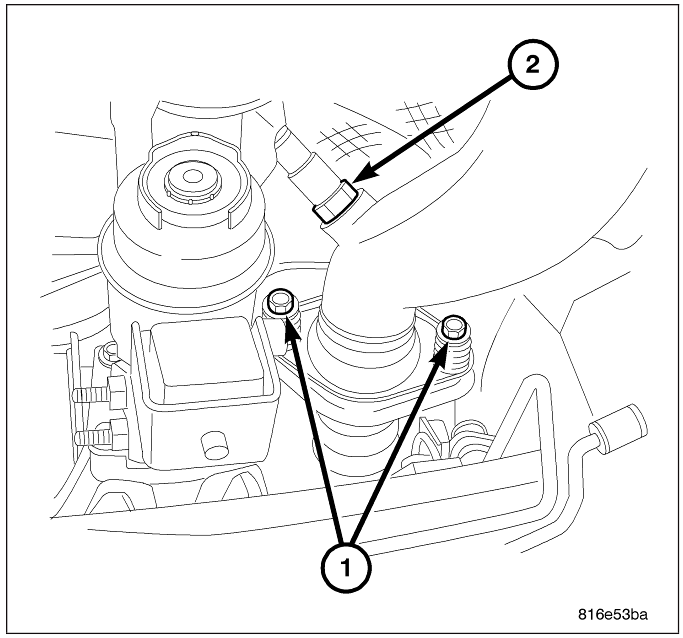
1. If fluid level is low or fluid change is required fill with PN 4874468 Mopar MS9020 SAE80W90 Gear Lube until to bottom of fill plug.
2. Torque fill plug (1) to 32 N-m (24 lbf-ft).
3. Torque drain plug (2) to 32 N-m (24 lbf-ft).



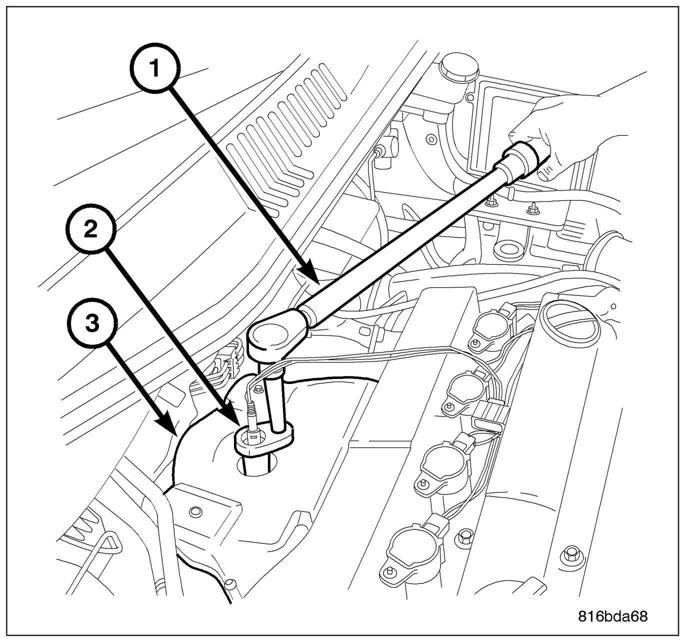
REMOVAL



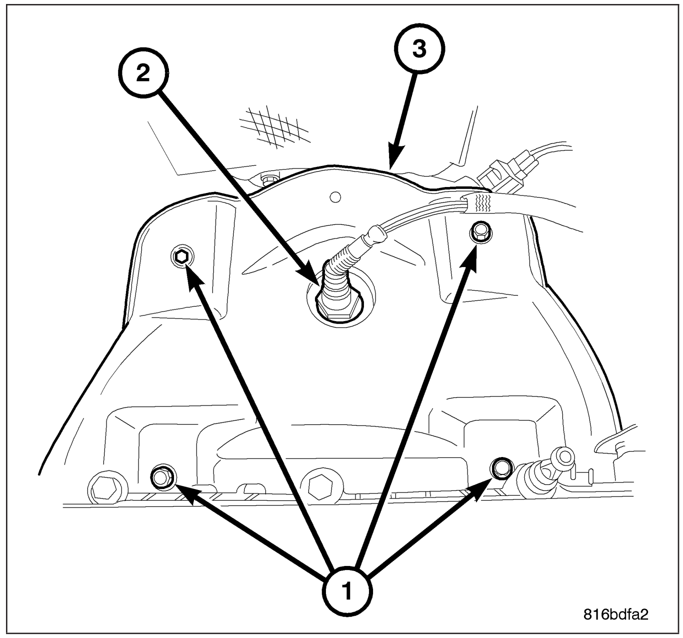
1. Disconnect negative battery cable (2).
2. Remove the engine trim cover.
3. Remove air cleaner assembly (1).
4. Remove Power Distribution Center (PDC) from bracket.
5. Raise the vehicle on the hoist.
6. Remove front halfshafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).



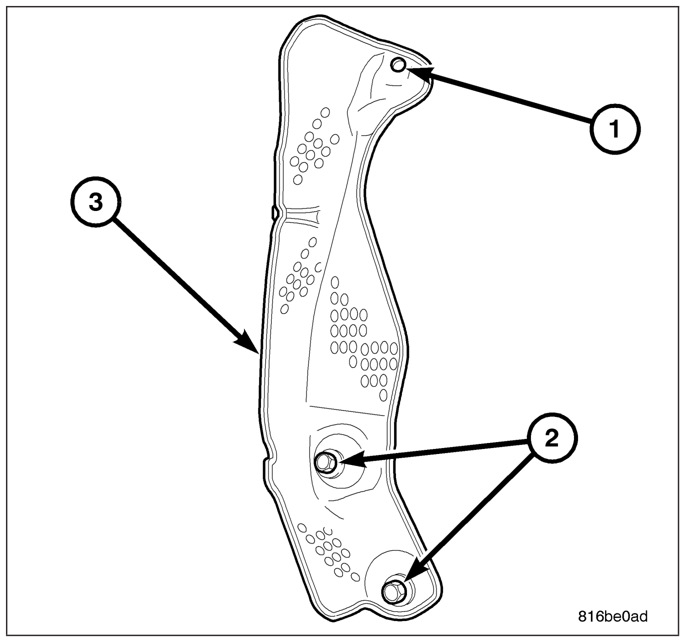
7. Remove drain plug (2) at PTU and allow fluid to drain.
8. Reinstall drain plug.



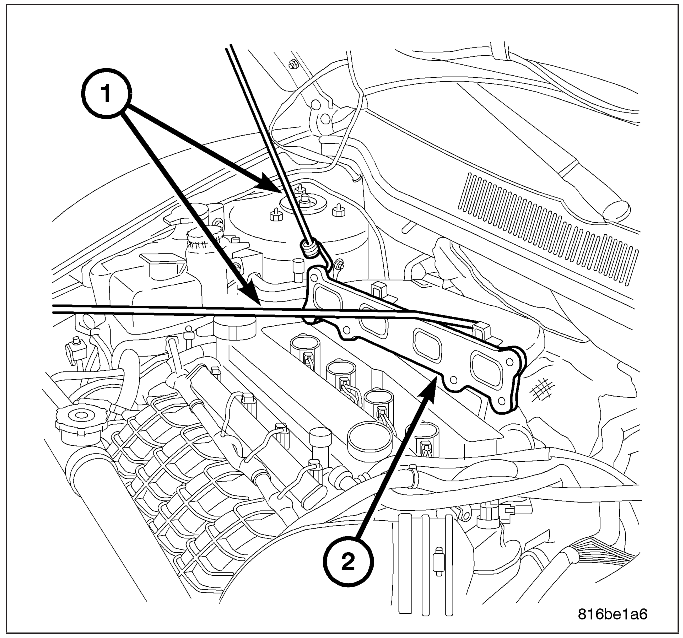
9. Mark (2) prop shaft and differential (3) for proper installation (if equipped).
10. Remove the rear prop shaft (if equipped) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).



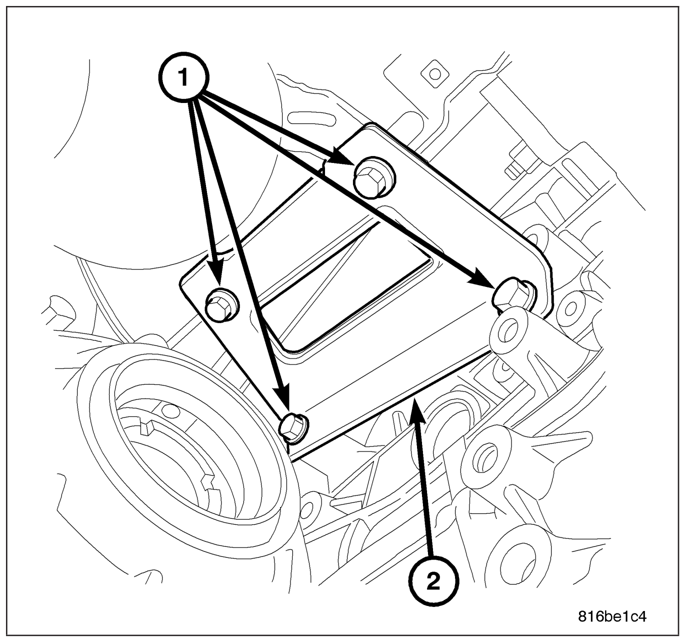
11. Remove the two exhaust to maniverter (exhaust manifold with catalytic converter) bolts (1).
12. Unplug the downstream O2 sensor connector.
13. Remove the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
14. Lower the vehicle on the hoist.
15. Unplug the upstream O2 sensor connector.



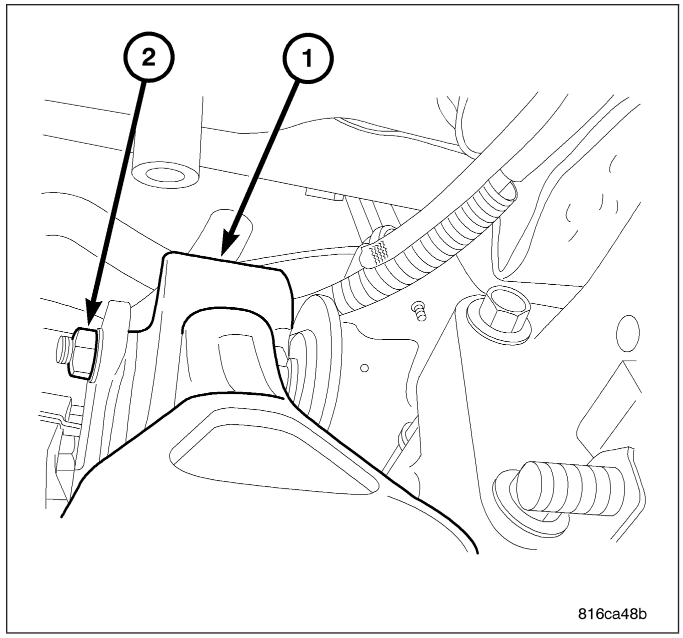
16. Remove upstream O2 sensor from the maniverter (exhaust manifold with catalytic converter) using 02 sensor socket 8439 (2).



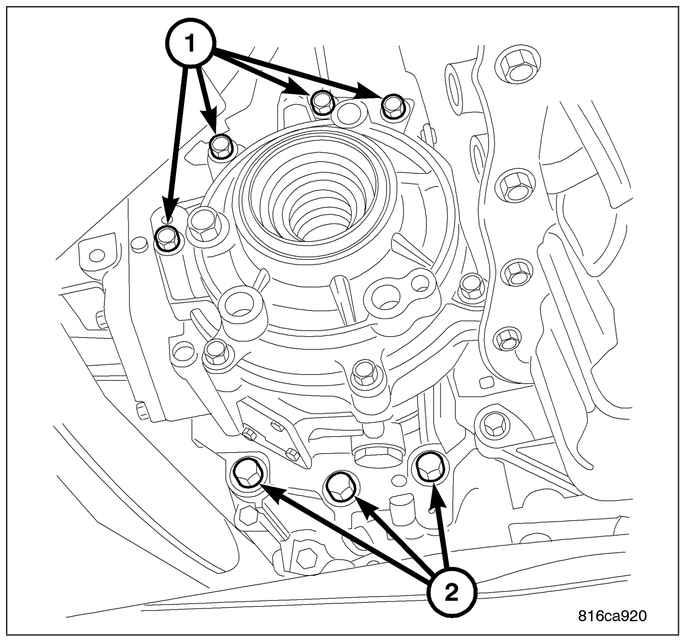
17. Remove the four maniverter heat shield bolts (1).



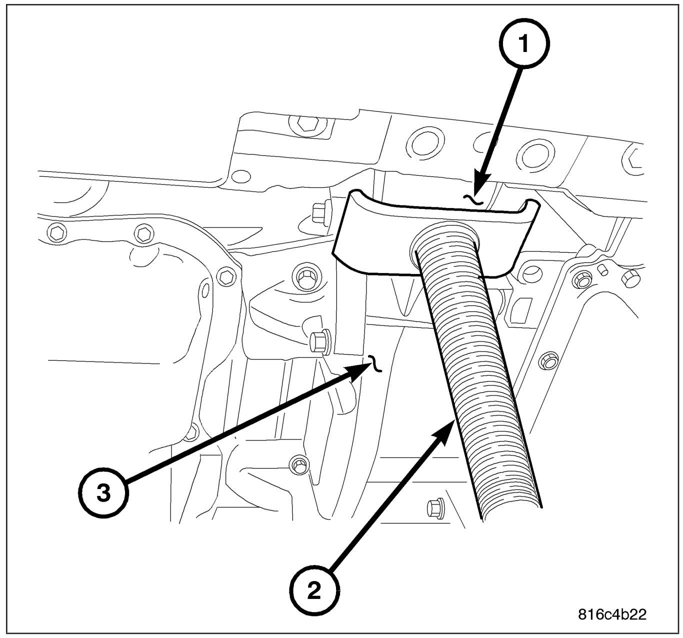
18. Remove the two retaining bolts (2) and one nut (1) from the maniverter side heat shield (3).



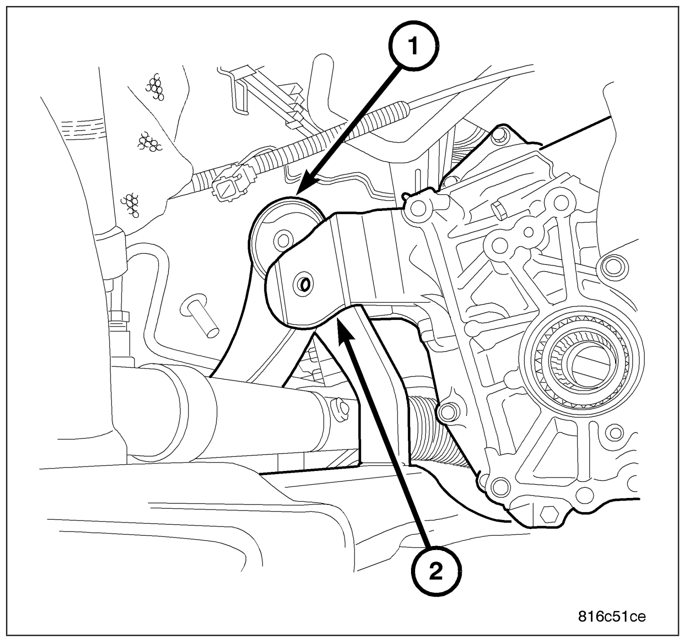
19. Remove the seven maniverter to head retaining bolts.
20. Slide the maniverter up and to the right, The support the maniverter (1) with the help of a bungie cord.



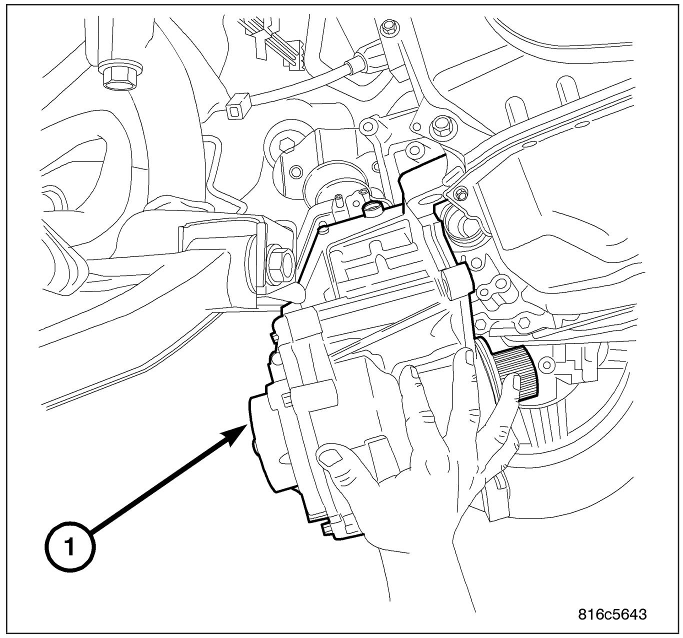
21. Raise the vehicle on the hoist.
22. Remove the four (1) engine to maniverter bracket bolts.



23. Remove the rear engine mount through bolt (2).
24. Remove the three front engine mount to frame bolts and the mount through bolt.

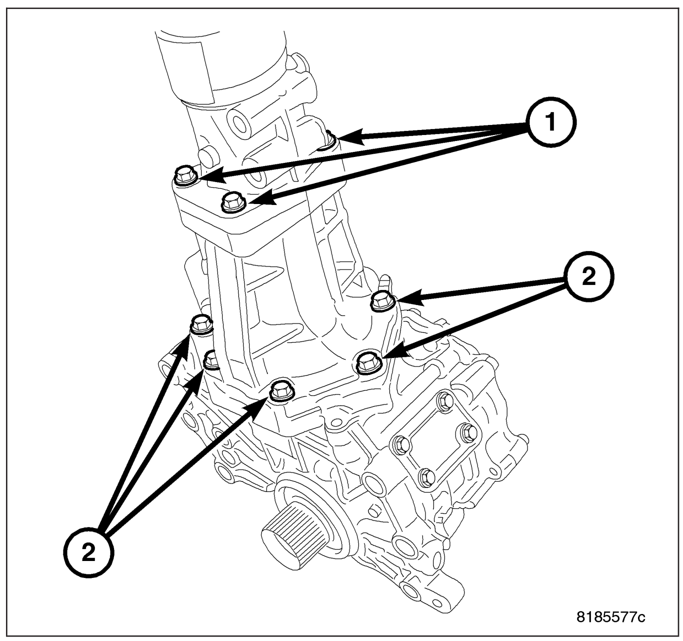


25. Remove the PTU mounting bolts.

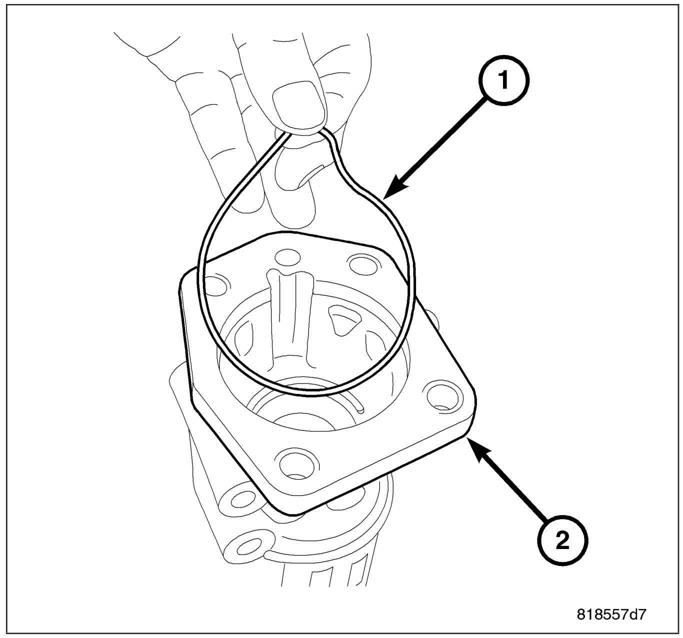


26. Install a screw jack (2)on front engine mount bracket (1).

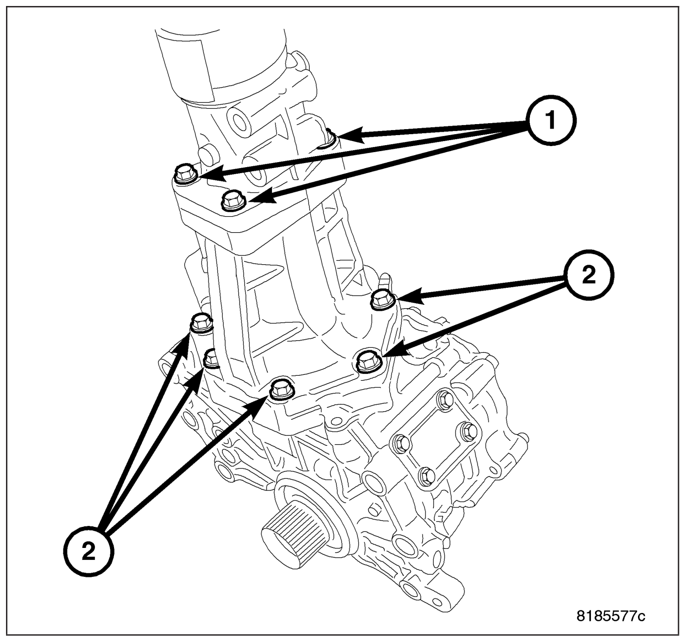
27. Raise the front of the engine until the rear mount has dropped (1,2).
28. Separate the PTU from the transaxle.
29. Remove and discard old O-ring between Transmission and PTU



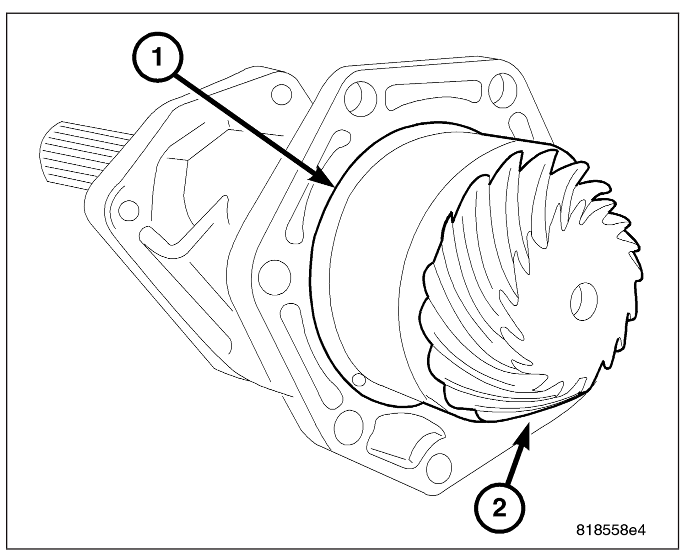
30. Roll the PTU (1) forward and down to remove.



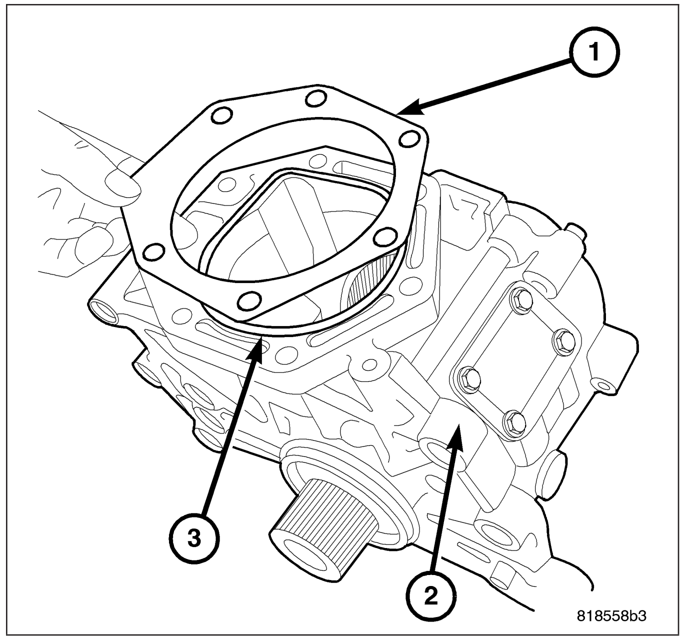
DISASSEMBLY



1. Remove extension housing bolts.

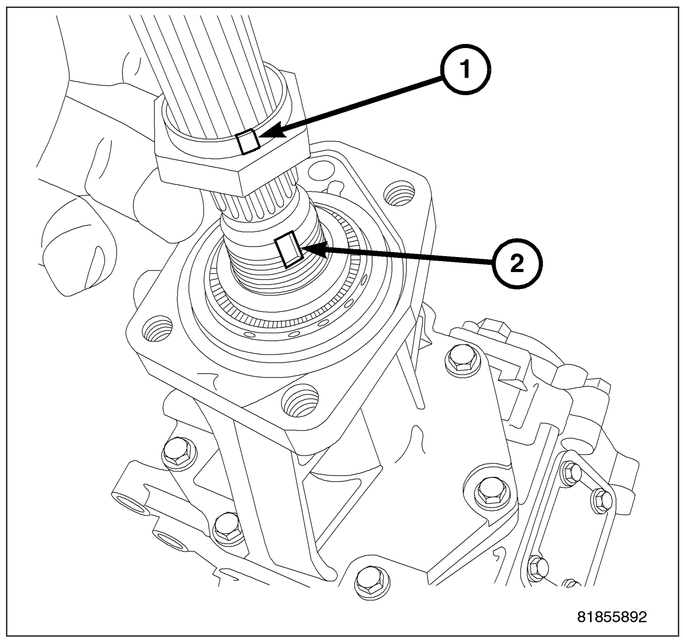


2. Remove the extension housing.
3. Remove the extension housing O-ring.

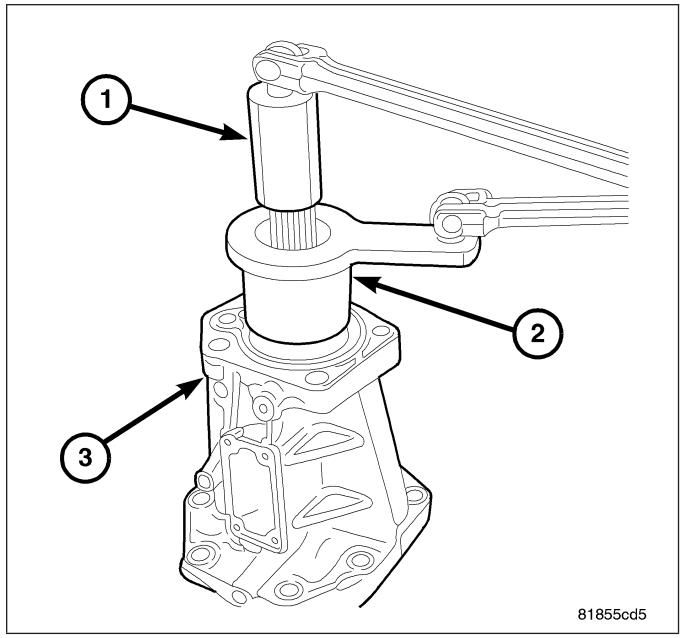


4. Remove the pinion housing bolts.

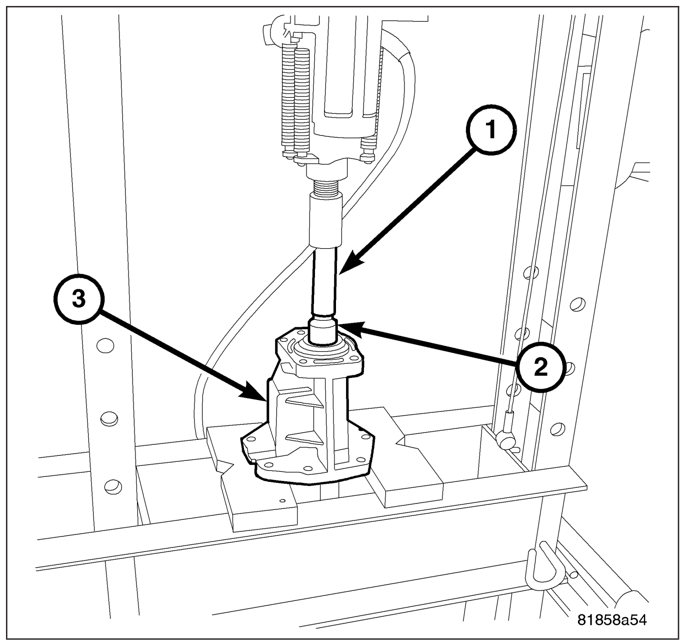
5. Remove the pinion housing.



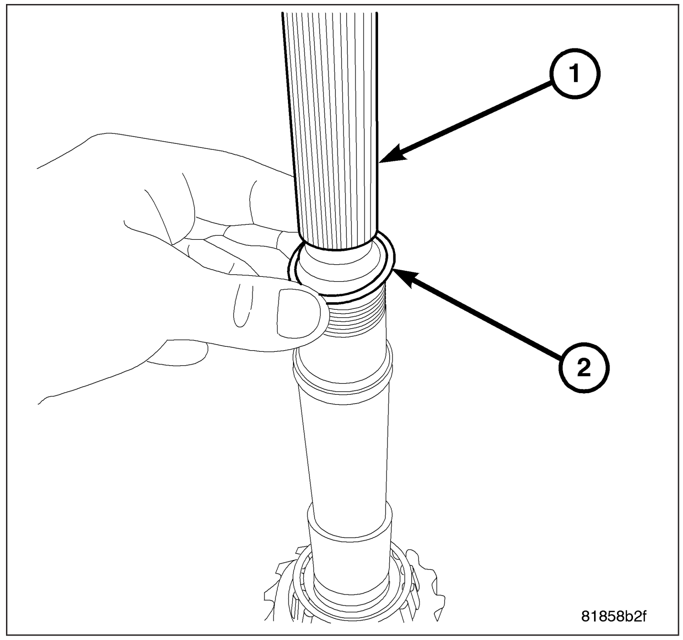
6. Remove the pinion housing shim.
7. Remove the pinion housing O-ring



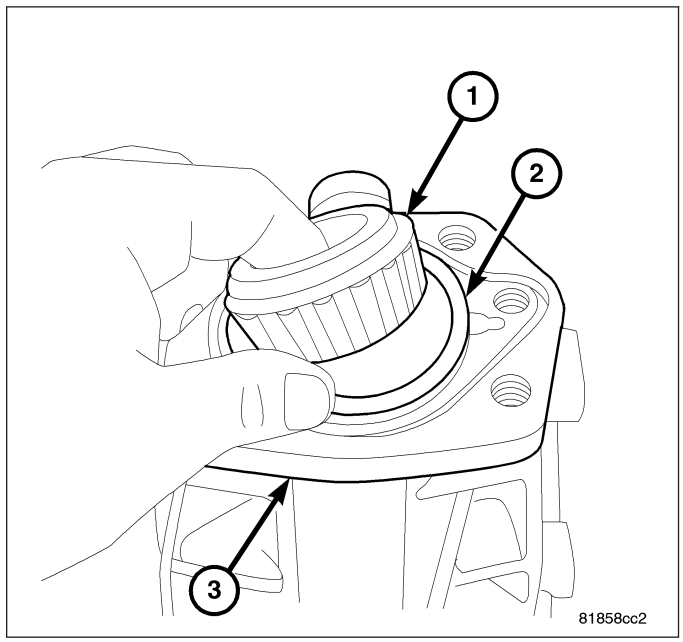
NOTE: The pinion nut is a staked type nut



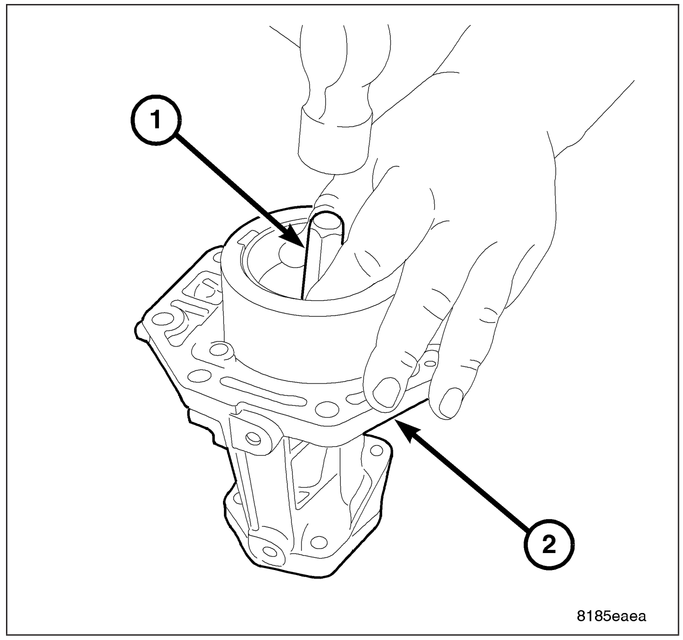
8. Using a punch, remove the staked depression in the pinion nut.



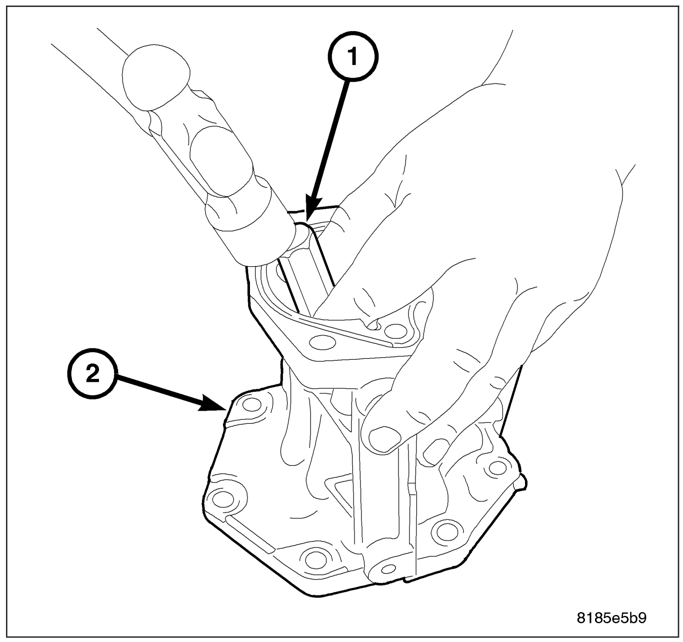
9. Remove the output shaft nut, using the Pinion Nut Socket 9921 and Spline Socket 9922.



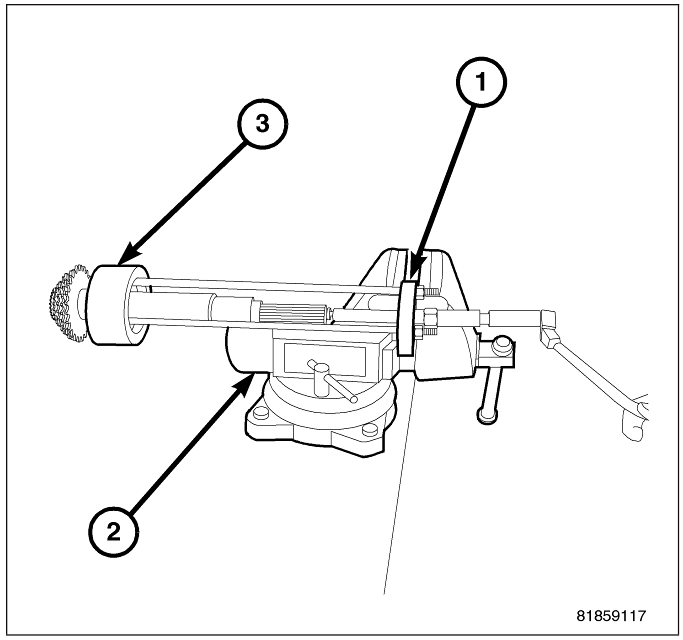
10. Press the output shaft from the housing using a press.



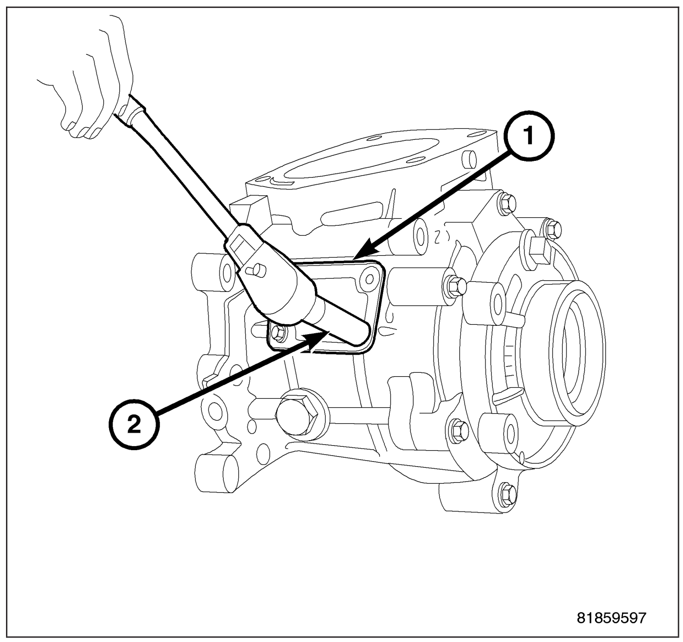
11. Remove the output shaft spacer.



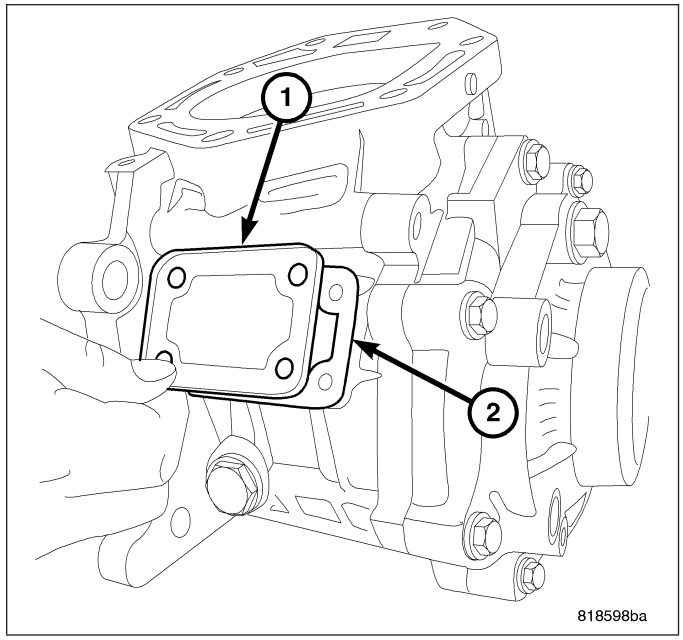
12. Remove the output shaft bearing.



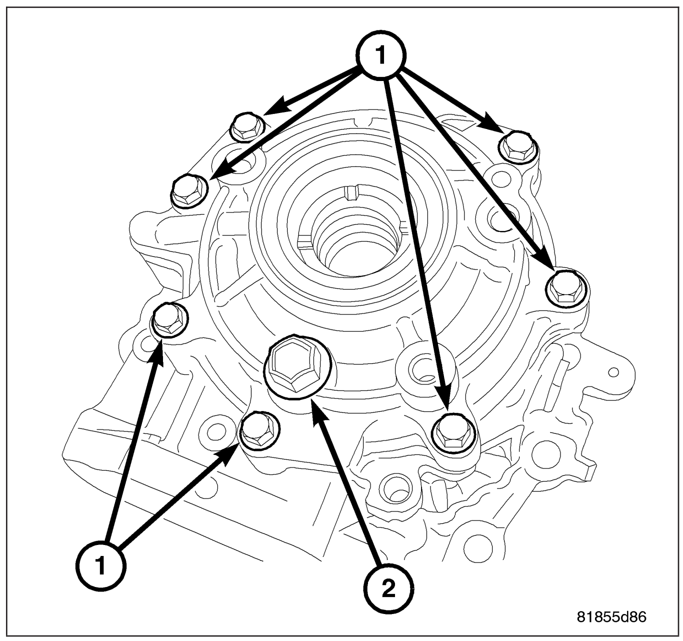
13. Remove the output shaft housing small side bearing cup using a brass drift.



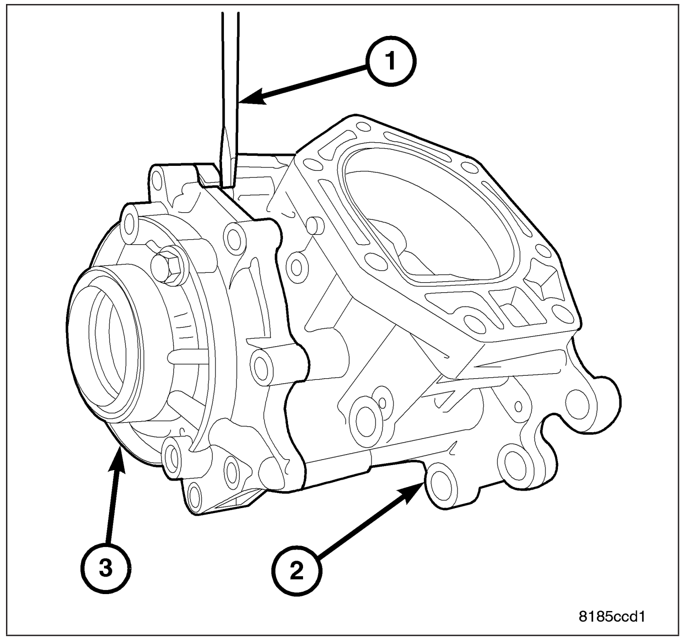
14. Remove the output shaft housing large side bearing cup using a brass drift.



15. Install Puller 6444 and Jaws 6451 onto output shaft head bearing.
16. Place Puller in a vice and remove the bearing.

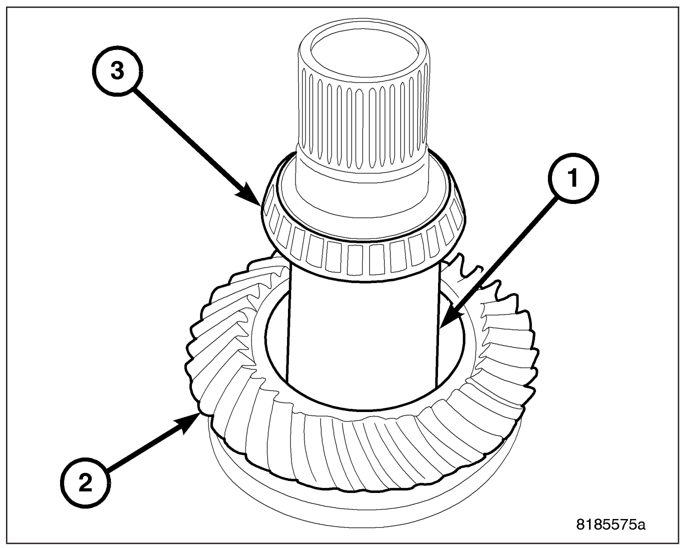


17. Remove the inspection cover bolts (1).

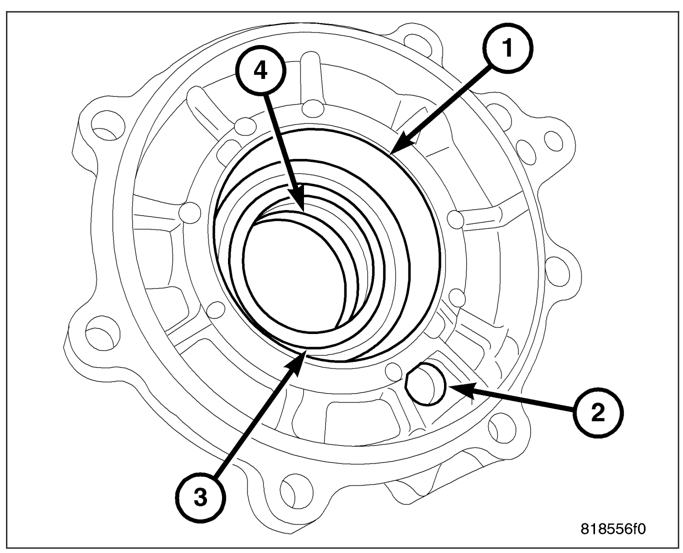


18. Remove the inspection cover.

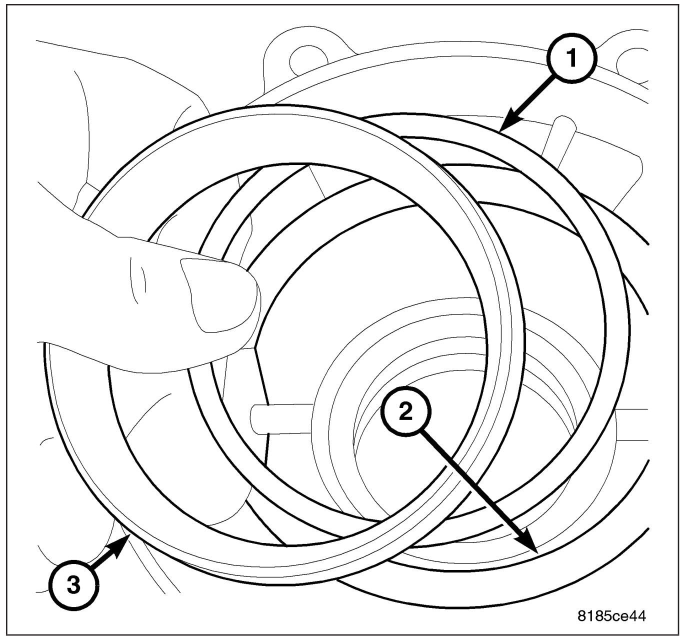
19. Remove the side cover bolts (1).



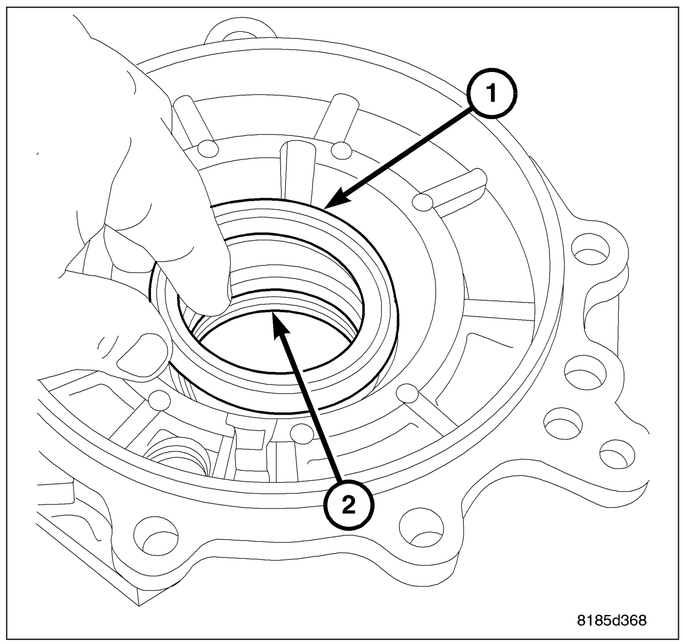
20. Remove the side cover from case.



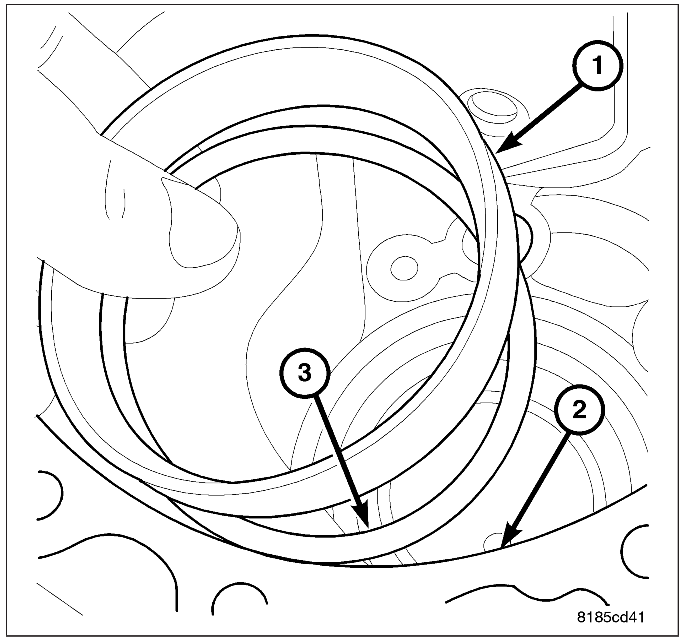
21. Remove the carrier assembly.



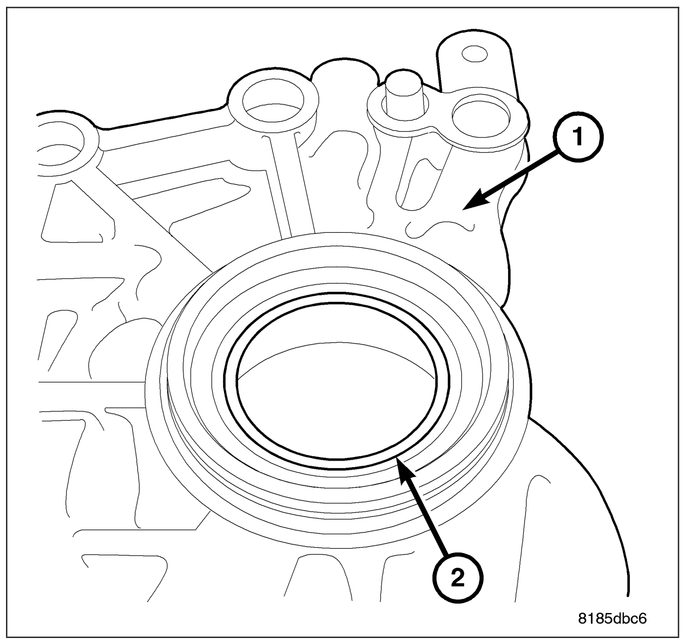
NOTE: Bearing cup is a slip fit



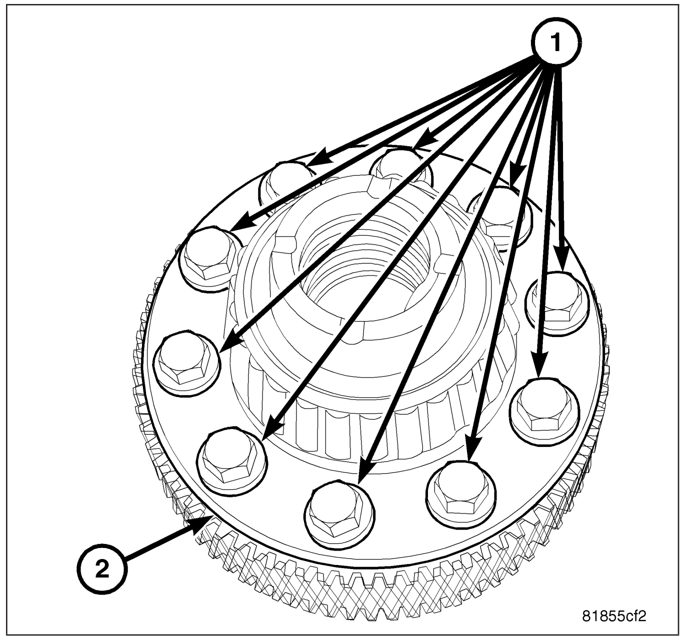
22. Remove bearing cup by hand (1) or by using a pick.



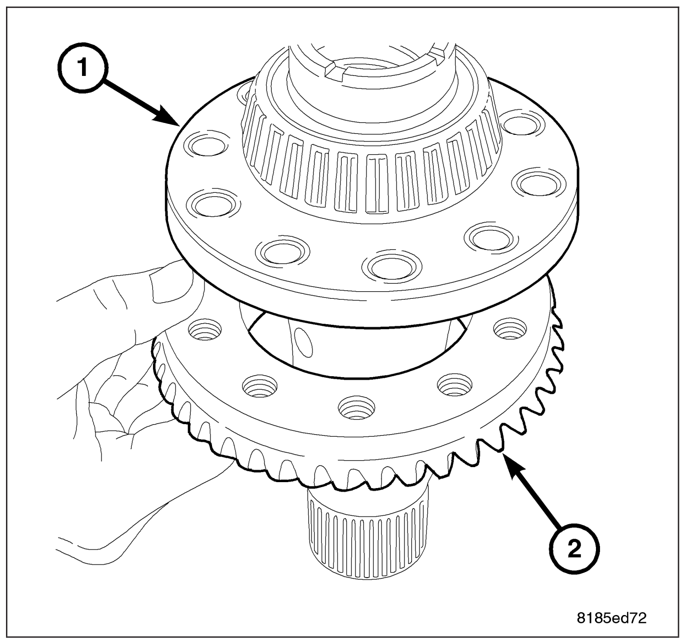
23. Remove the shim (1) under the bearing cup (3) measure and record the size of the shim.



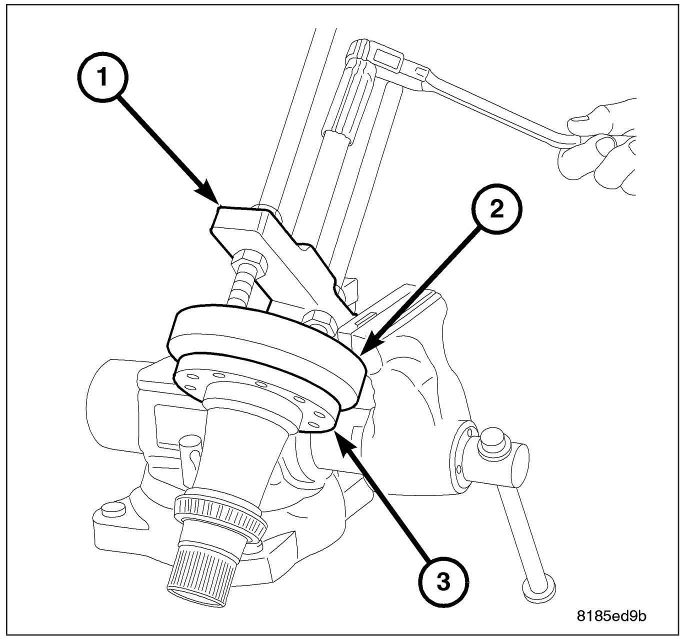
24. Remove the inner seal from the PTU cover.
25. Remove the outer seal from the PTU cover.



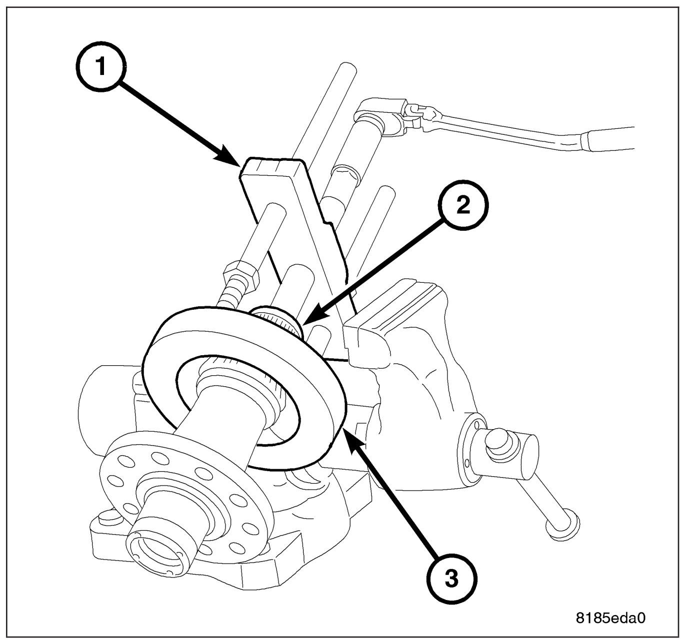
26. Remove bearing cup by hand (1) or by using a pick.
27. Remove the shim (3) under the bearing cup (1) measure and record the size of the shim.



28. Remove the carrier case seal.

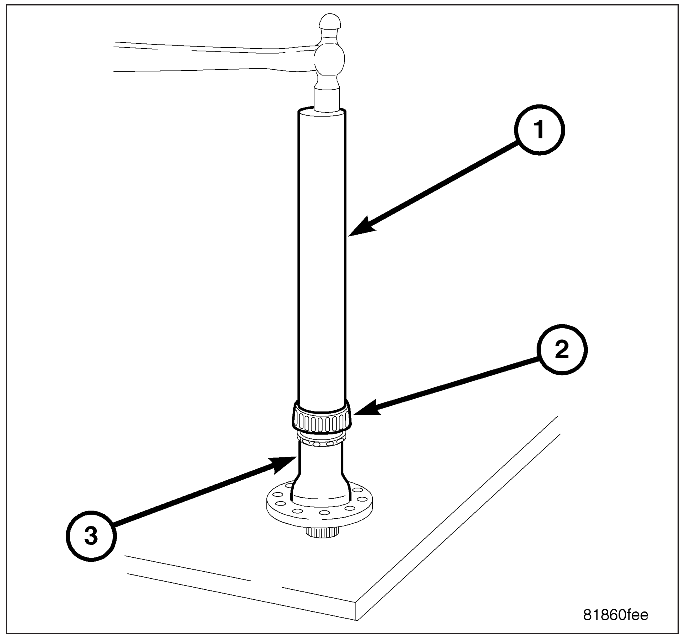


29. Remove the ring gear bolts.

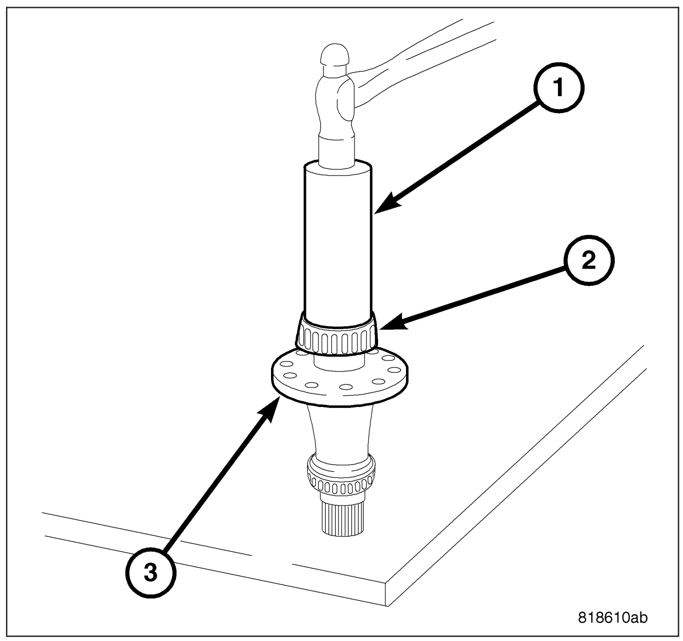


30. Remove the ring gear.

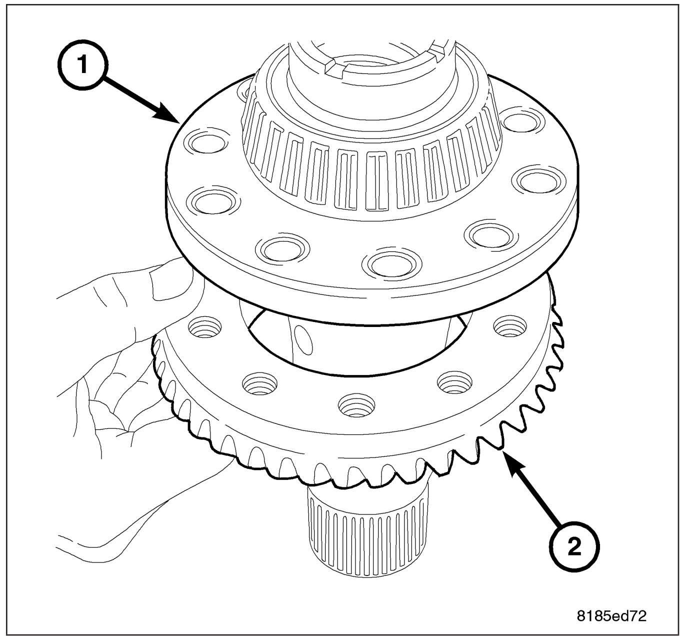
31. Remove ring gear side bearing using Puller C-293–PA, Inserts C-293-37 and Insert C-4487–1.



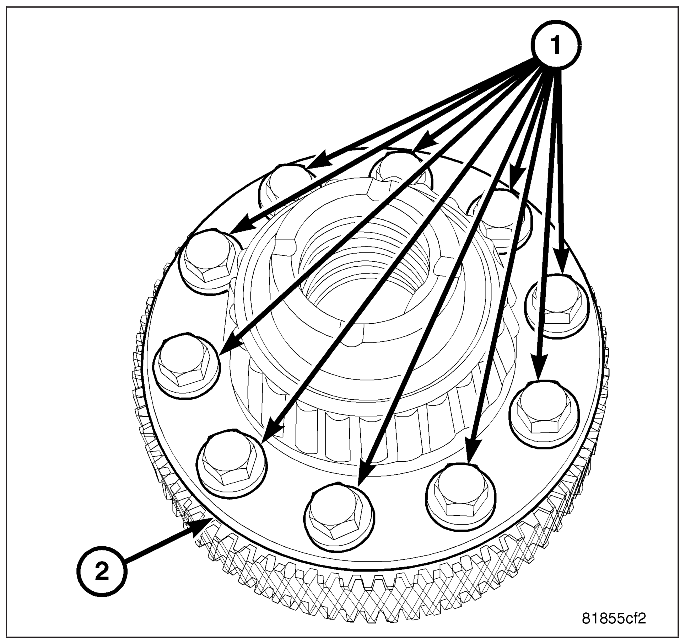
32. Remove output side bearing using Puller C-293–PA, Inserts C-293-37 and Insert C-4487–1.



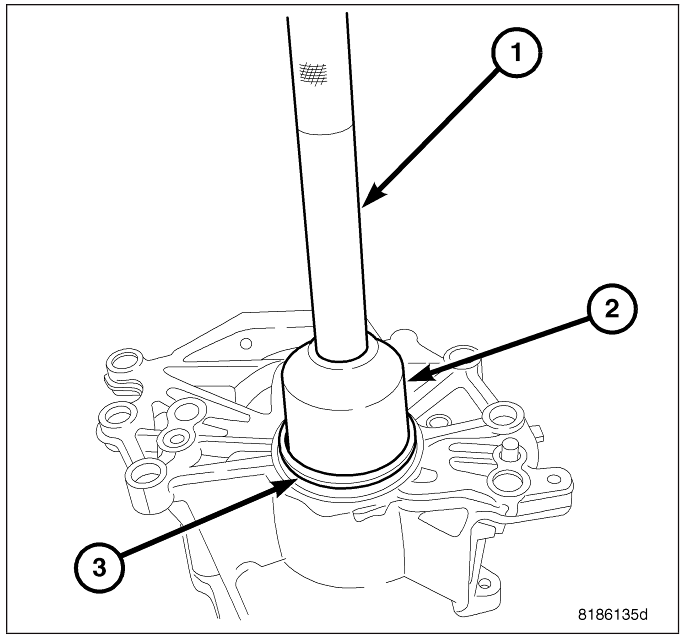
ASSEMBLY



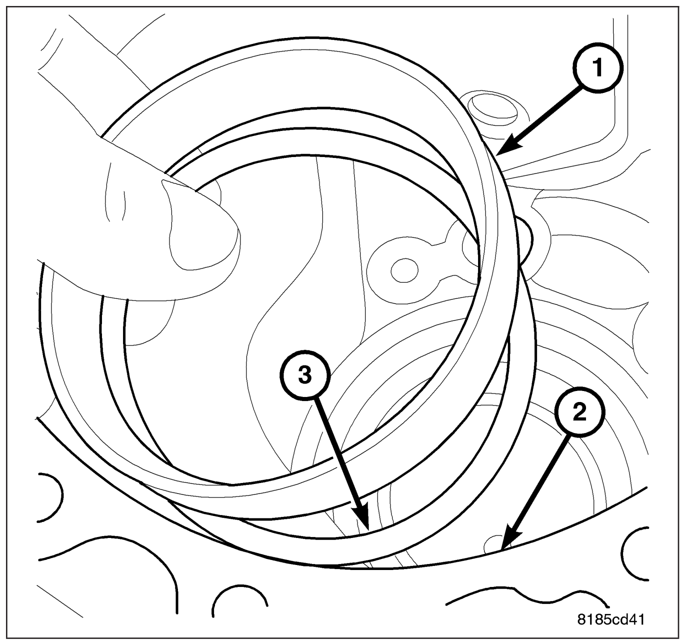
1. Install output side spool shaft bearing using Installer C-3095-A.



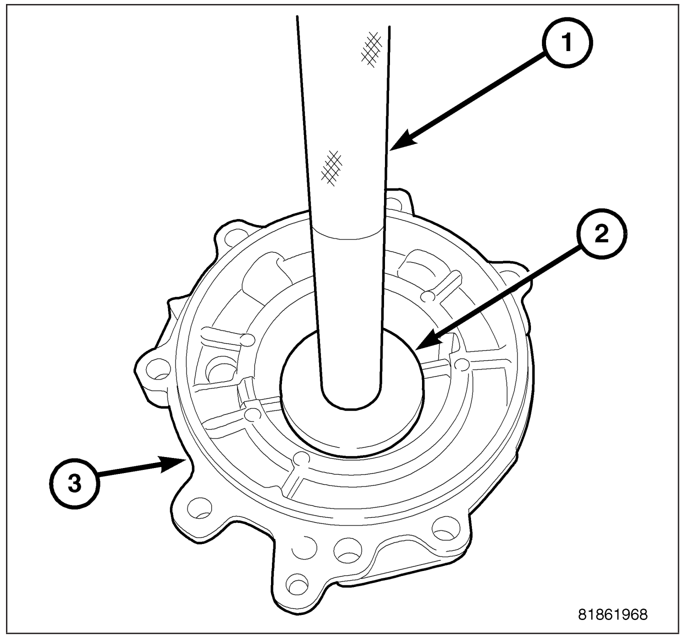
2. Install ring gear side bearing using Installer 8148.



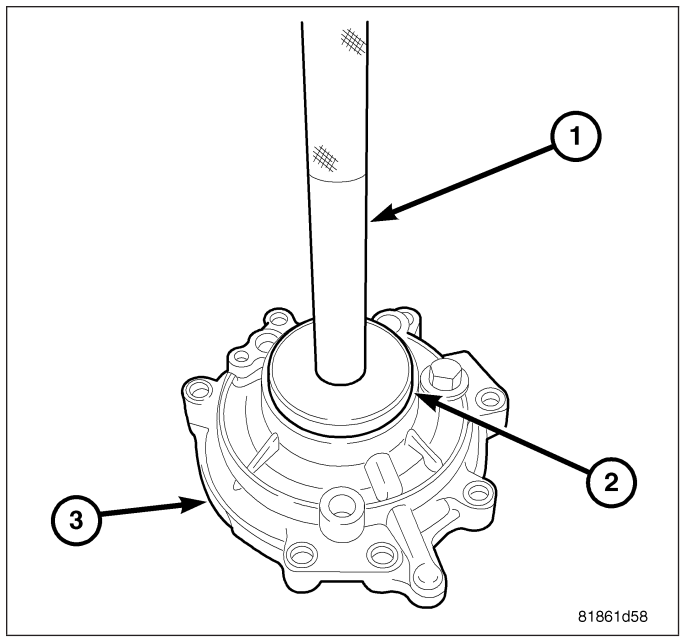
3. Install the ring gear.



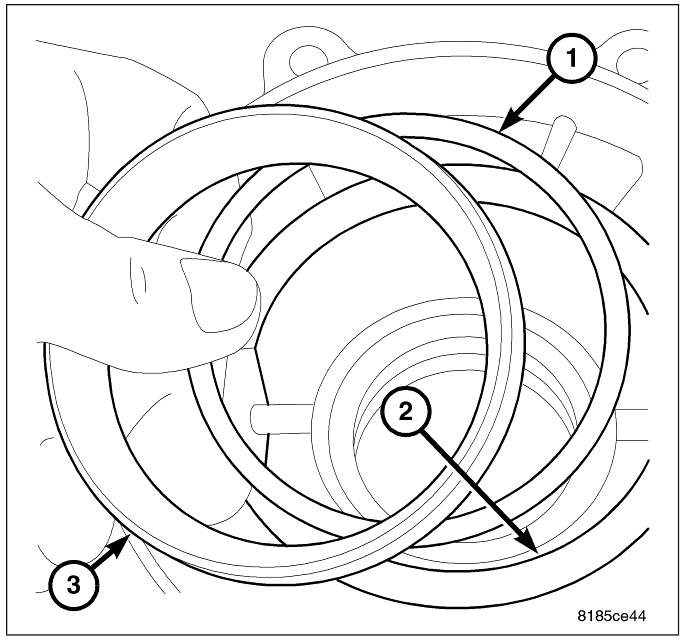
4. Install the ring gear Bolts and torque to 74 N·m (55 ft. lbs.).



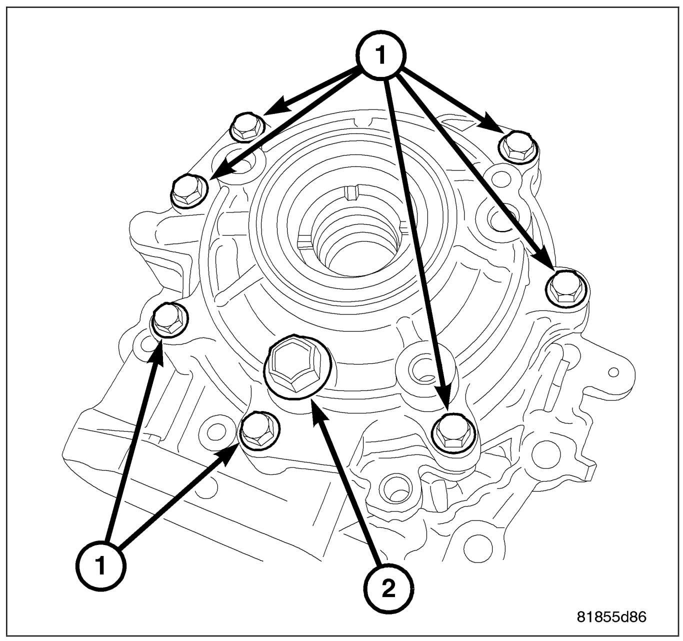
5. Install the carrier case seal using Installer 9851 and Handle C- 4171.



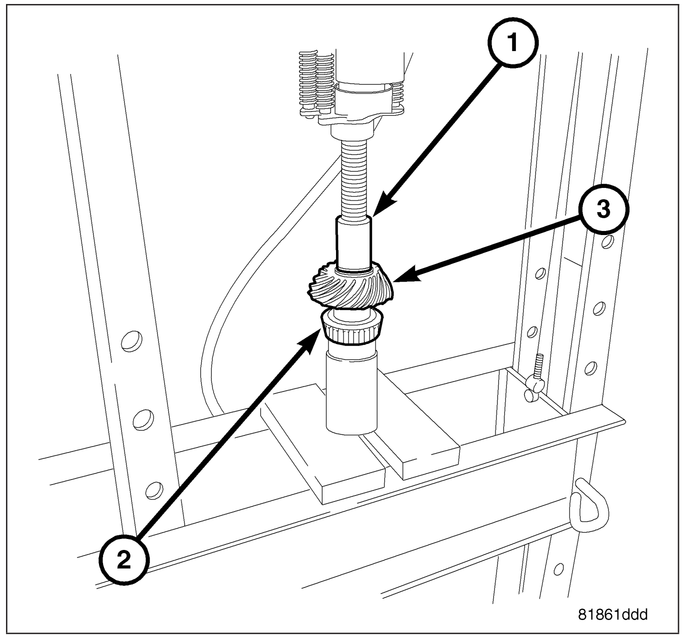
6. Install the shim (3) under the bearing cup (1) in the case side.
7. Install the bearing cup by hand.



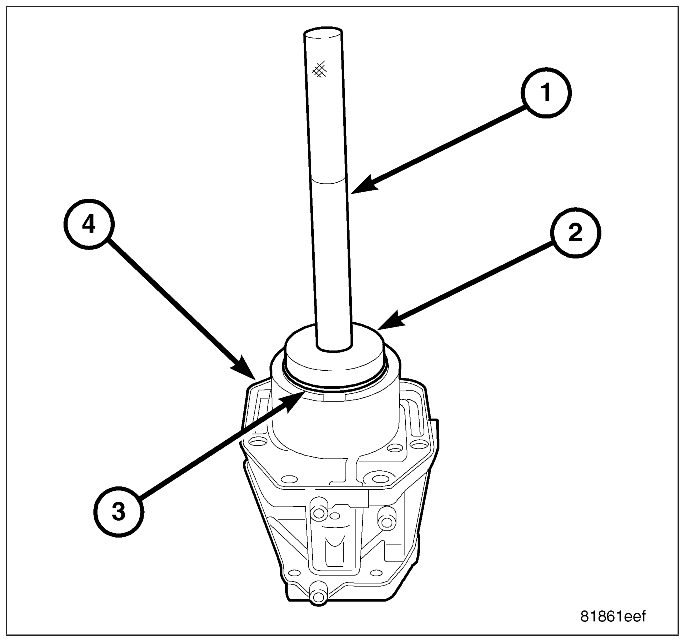
8. Install the inner seal into the PTU cover using Installer 9852 and Handle C-4171.



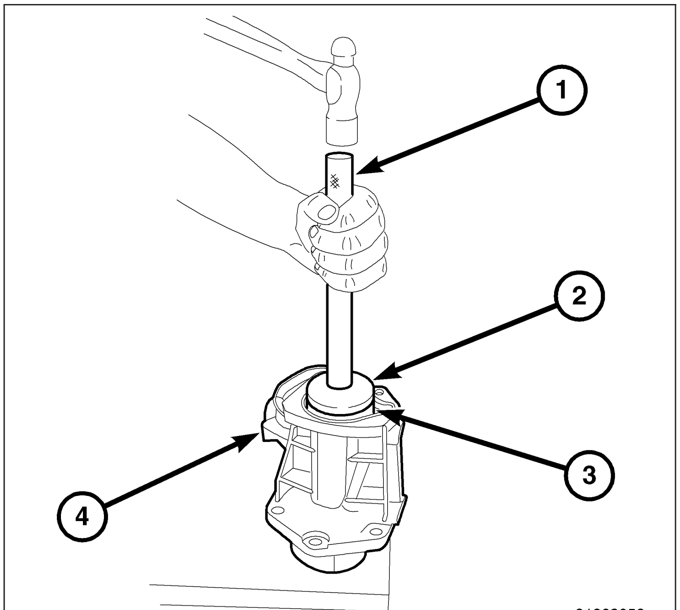
9. Install the outer seal into the PTU cover using Installer 9853 and Handle C-4171.



10. Install the shim (1) under the bearing cup (3).
11. Install bearing cup by hand (1).

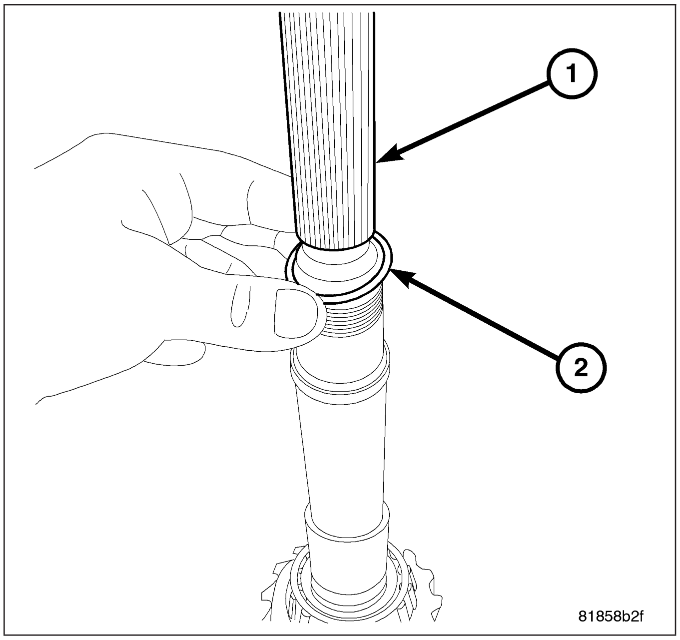


12. Install the carrier assembly into the case
13. Install the side cover
14. Torque side cover bolts (1) to 23 N·m (17 ft. lbs.).

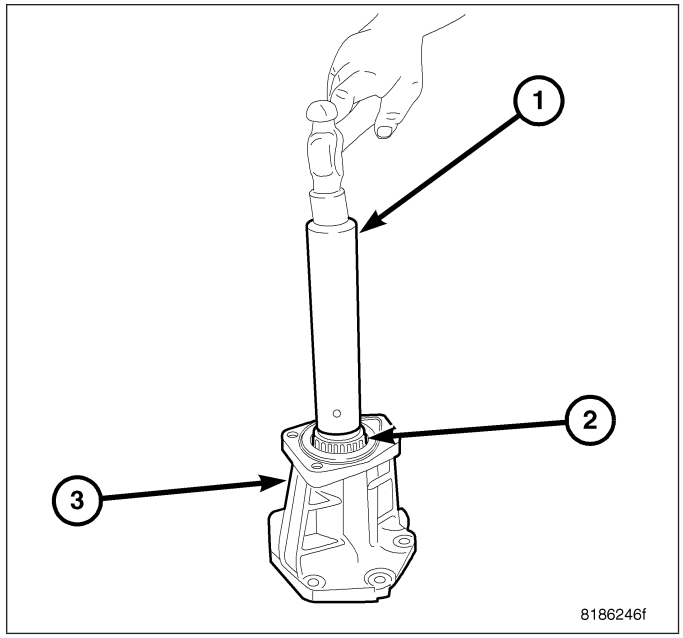


15. Install the output shaft head bearing on to the pinion shaft using Installer 9714 and a Press.

16. Install the output shaft head bearing cup using Installer 6061 and Handle C-4171

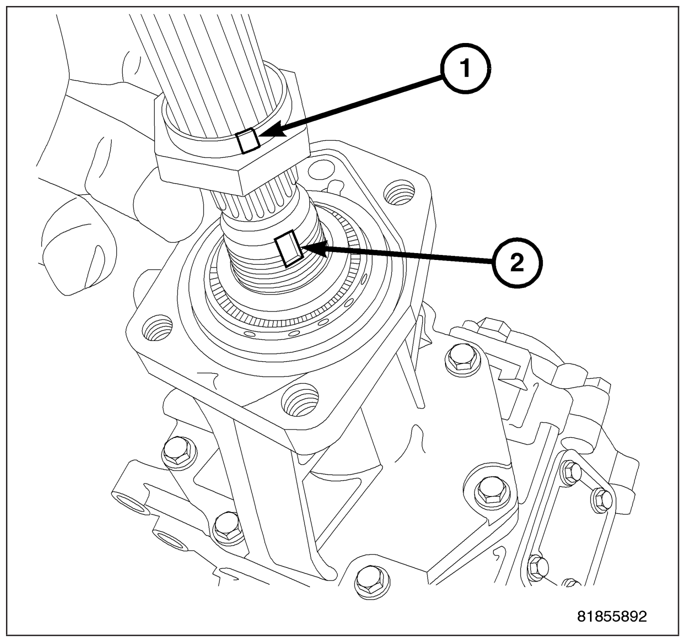


17. Install the output shaft tail bearing cup using Installer 9855 and Handle C-4171.



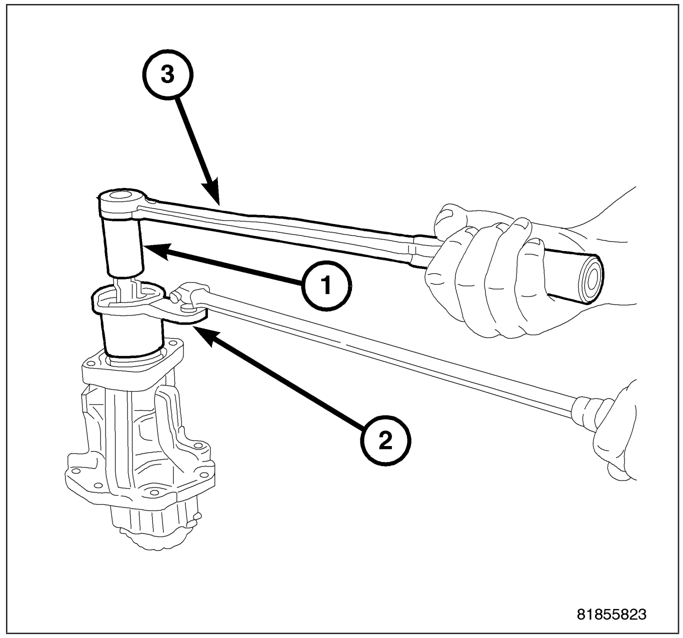
81862059

18. Install the output shaft spacer onto the output shaft.

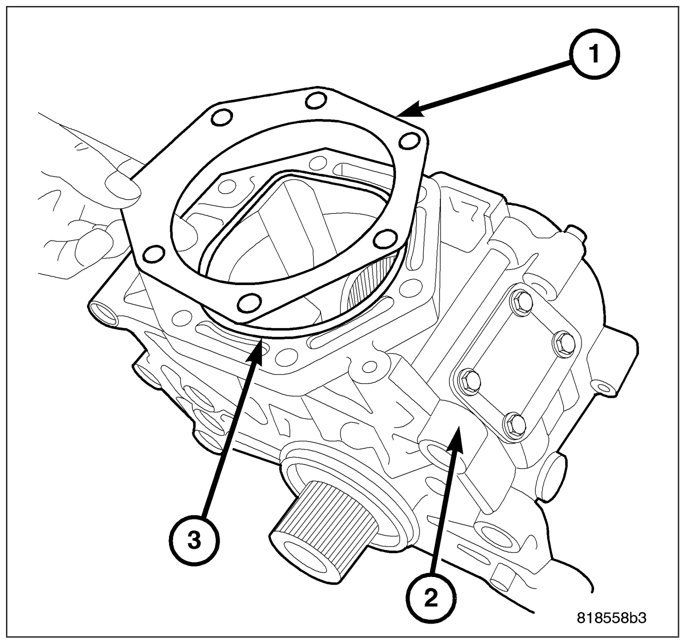


81858b2f

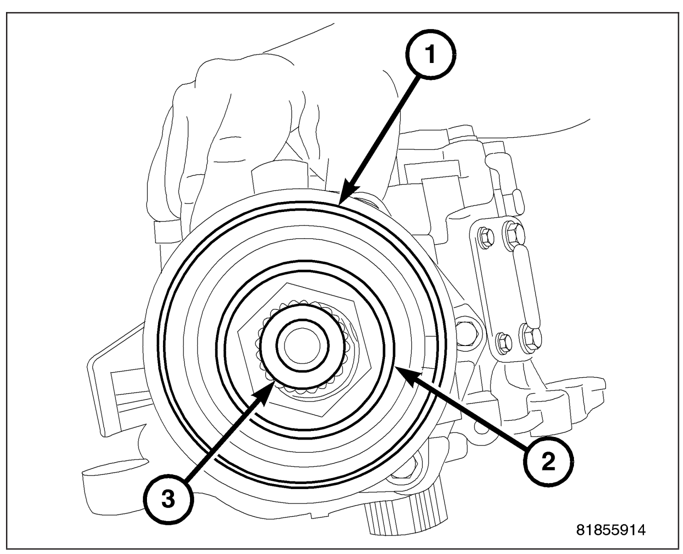
19. Install output shaft into output shaft housing.
20. Install output shaft tail bearing on to out put shaft using Installer L-4411.



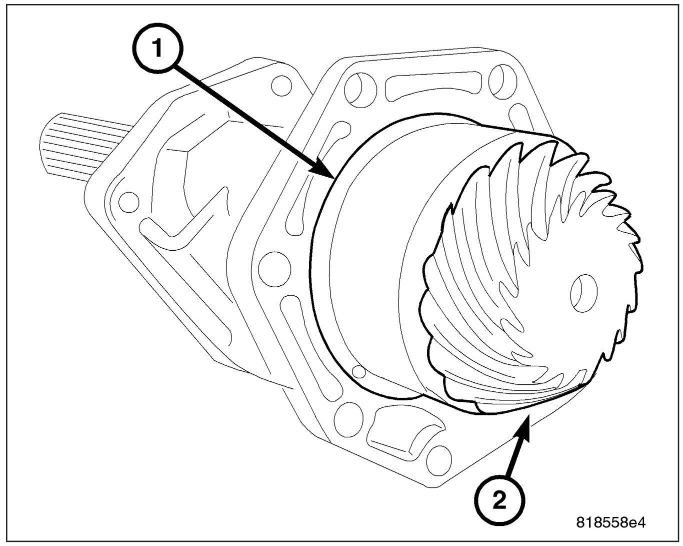
NOTE: The output shaft nut is a staked type nut



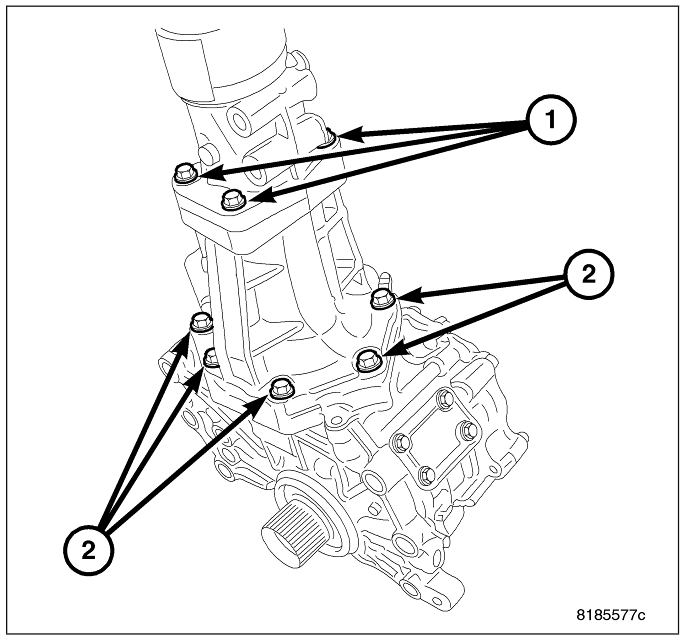
21. Install the output shaft nut (1) onto the output shaft (2).



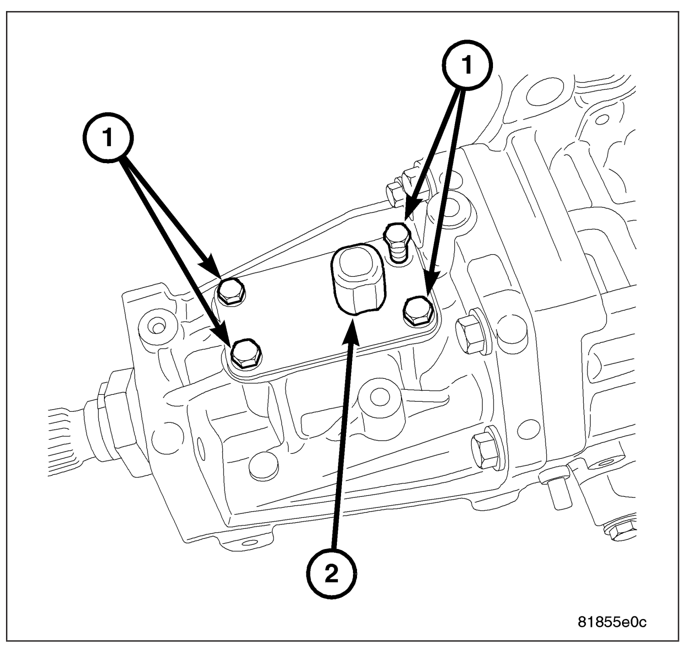
22. Torque the output shaft nut using Pinion Nut Socket 9921 to 150 N·m (111 ft. lbs.)..
23. Using a punch stake the out put shaft nut.



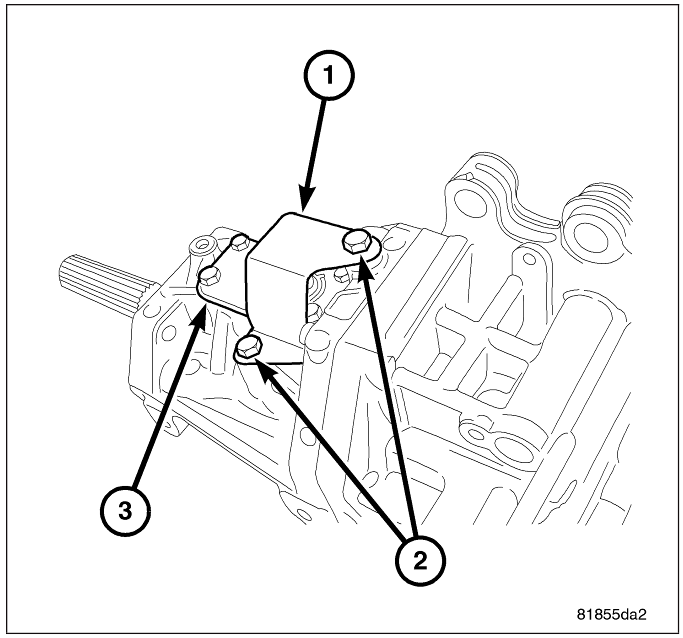
24. Install the pinion housing O-ring (3).
25. Install the pinion housing shim (1).



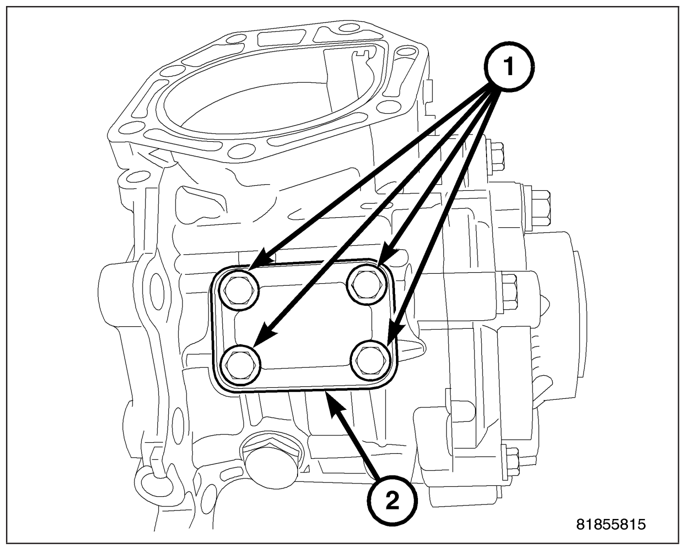
26. Install the output shaft seal using Installer 9851 and Handle C-4171.



27. Install the output shaft housing and bolts onto the carrier housing.

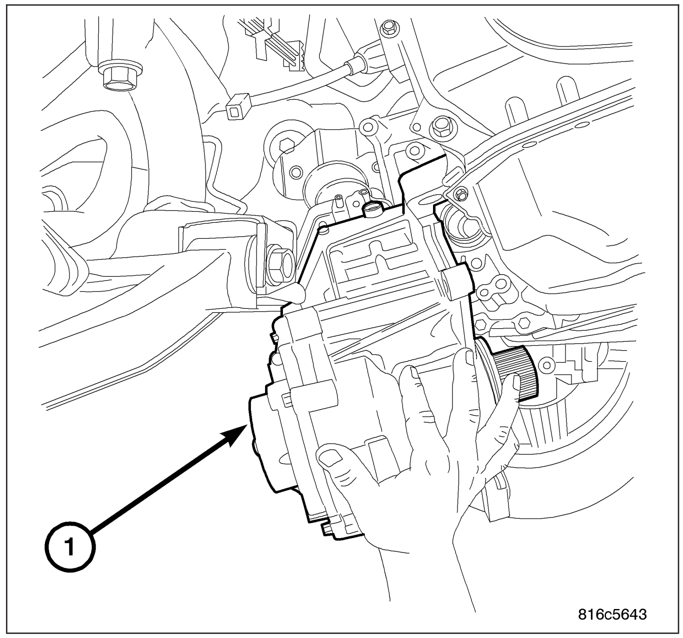


28. Install the extension housing and bolts.
29. Torque output shaft housing bolts to 38 N·m (28 ft. lbs.).
30. Torque the extension housing bolts to 38 N·m (28 ft. lbs.).

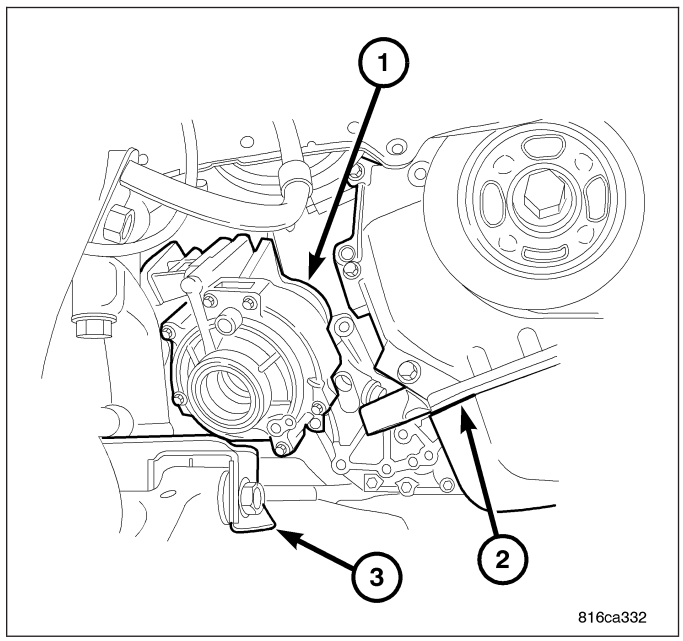


31. Install the vent and bolts, torque the bolts to 23 N·m (17 ft. lbs.).

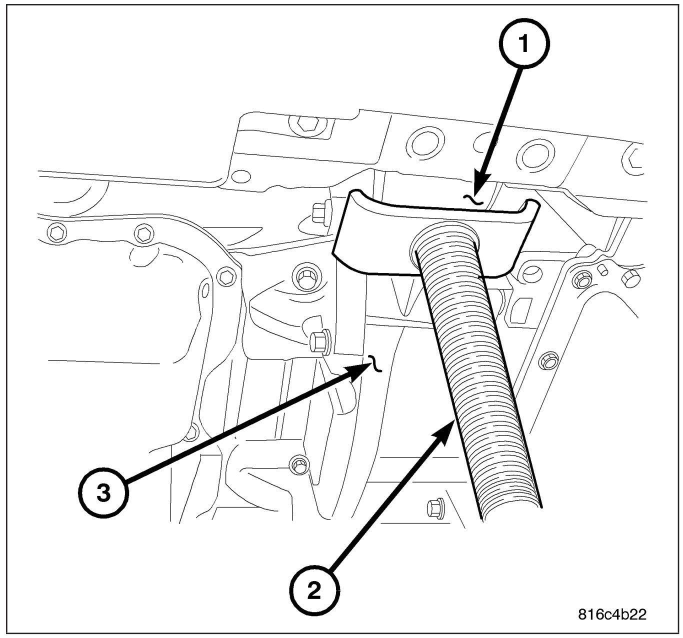
32. Install the vent shield and bolts, Torque the bolts to 23 N·m (17 ft. lbs.).



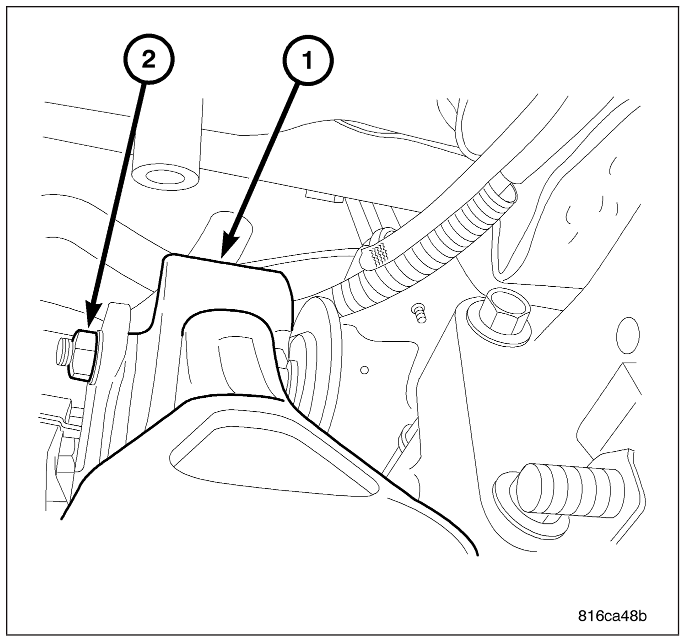
33. Install the inspection cover and bolts , Torque the bolts to 23 N·m (17 ft. lbs.).
34. Fill the PTU (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).



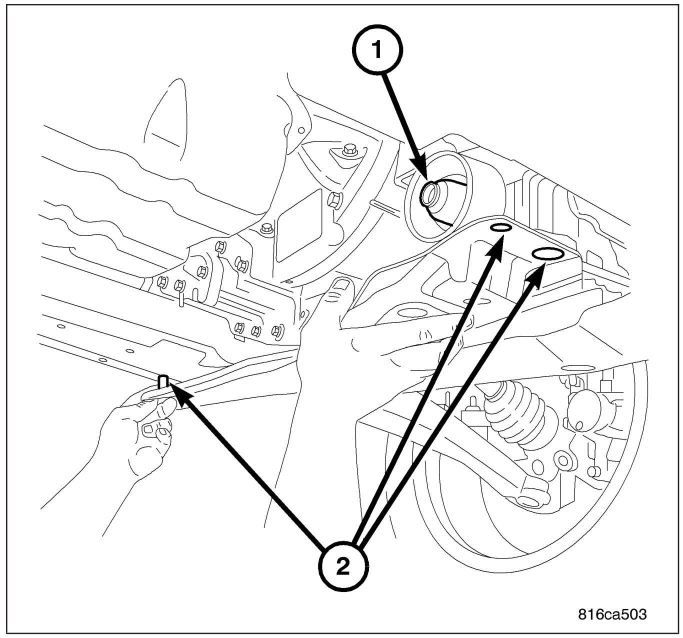
INSTALLATION



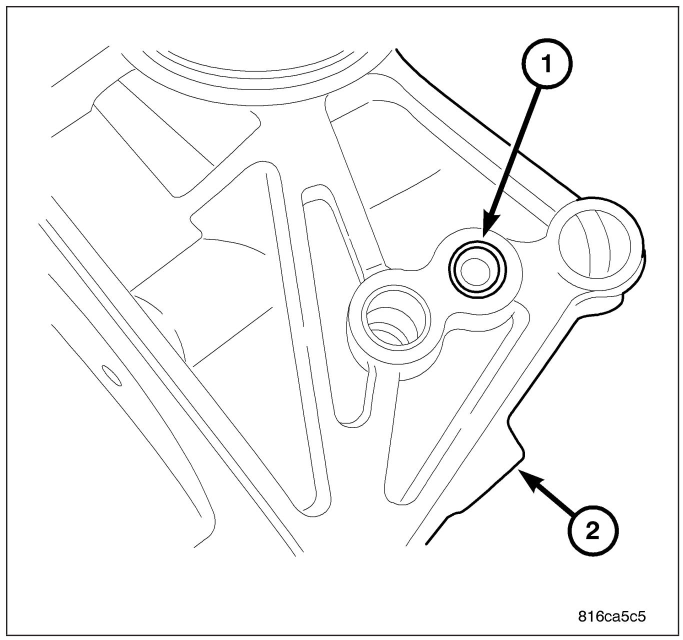
1. Roll the PTU in moving from front to back (1).



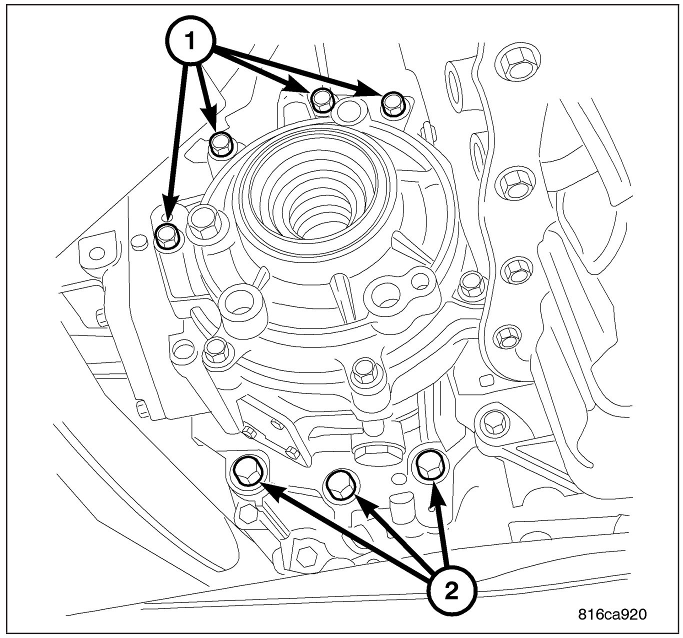
2. Rest the PTU (1) on the frame (3) while the engine and transaxle (2) are raised back into position.



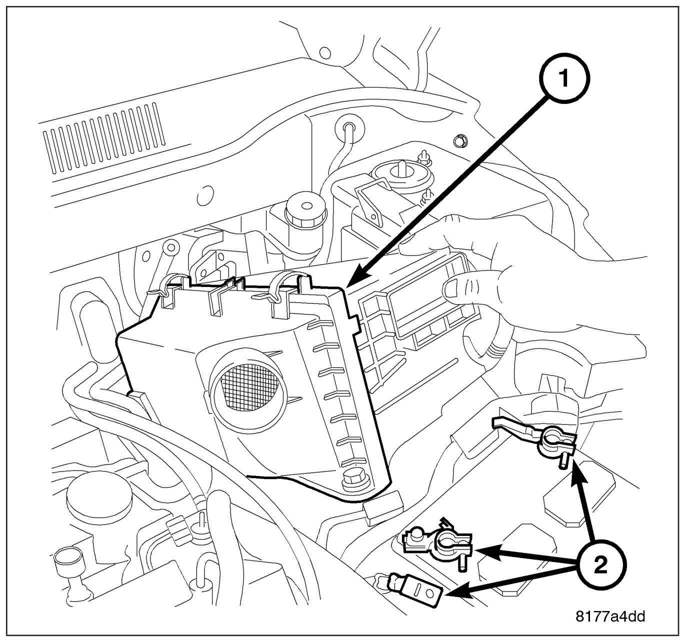
3. Lower screw jack (2) until rear mount through bolt can be installed.



4. Install rear mount through bolt (2) and torque bolt to 75 Nm (55 ft. lbs.).



5. Install the transmission crossmember and bolts, (2) torque to 75 Nm (55 ft. lbs.).
6. Install the through bolt at the front transmission mount (1) and torque to 75 Nm (55 ft. lbs.).



7. Insure that the O-ring (1)between the PTU and transaxle is in place.

8. Slide the PTU into place.
9. Install and torque PTU mounting bolts (1,2)to 58 N-m (43 lbf-ft).
10. Lower the hoist.
11. Install the maniverter (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).

12. Install the air box (1).
13. Install engine trim cover.
14. Raise the vehicle on the hoist.
15. Install the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
16. Install the Prop shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
17. Install the axle shafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
18. Fill PTU (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).
19. lower hoist.
20. Connect battery cables (2).
21. Top off the fluids (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).

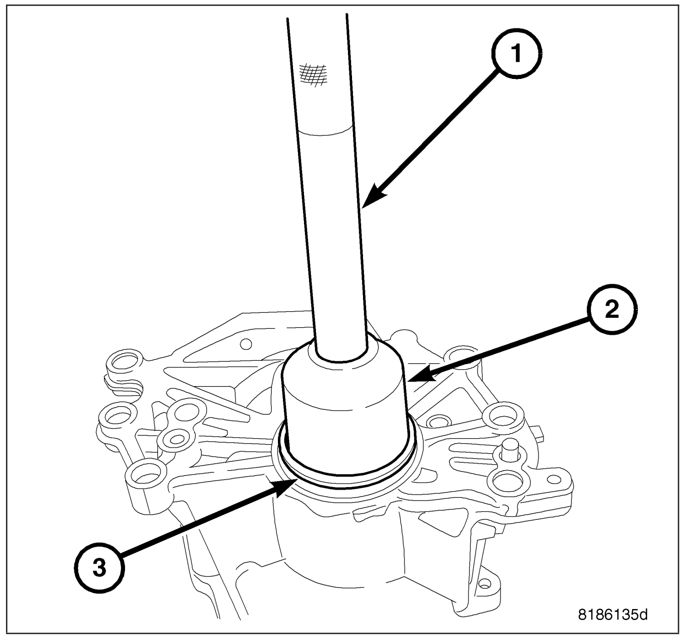
OUTPUT SHAFT NUT SOCKET 9921



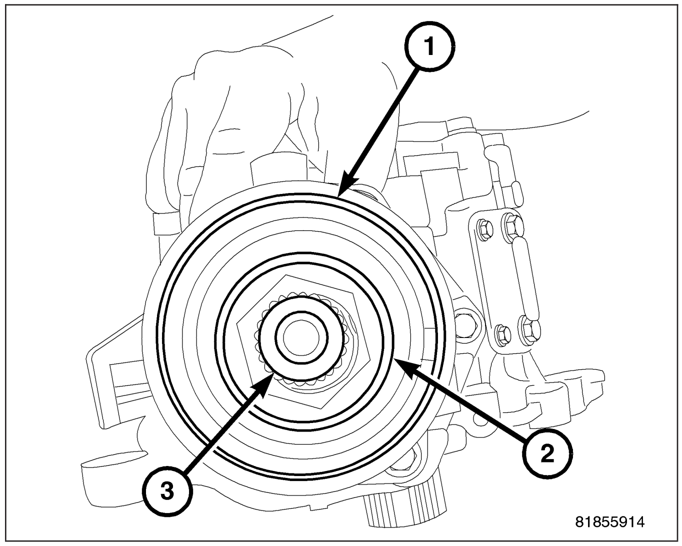
SEAL-DIFFERENTIAL CARRIER

REMOVAL

1. Remove PTU from transaxle (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).
2. Use a screw mounted in a slide hammer to remove seal. Be careful not to damage seal journal when removing seal.

INSTALLATION

1. Install the carrier case seal using Installer 9851 and Handle C- 4171.
2. Install the PTU (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).

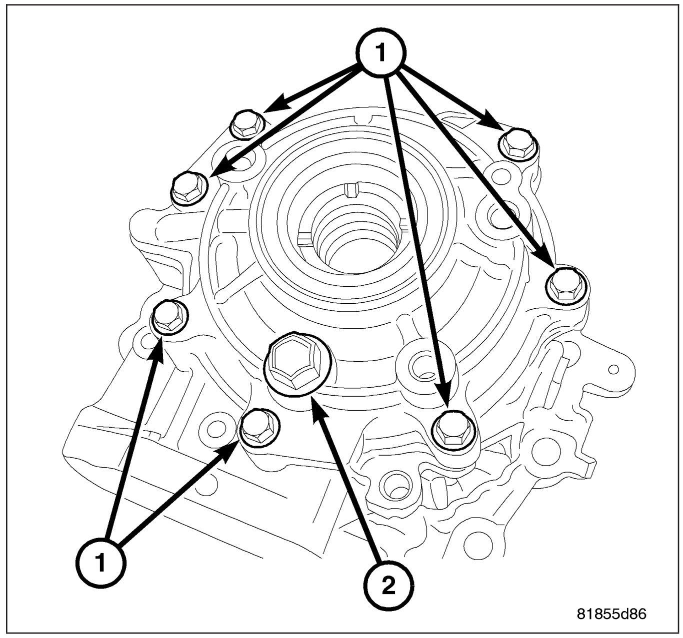


SEAL-OUTPUT FLANGE

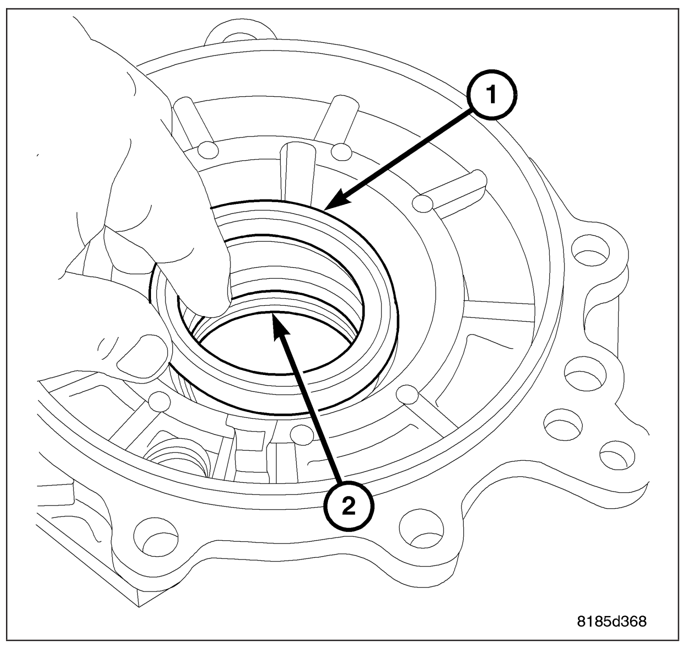
REMOVAL

1. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
2. Using a screwdriver remove the output seal.

INSTALLATION



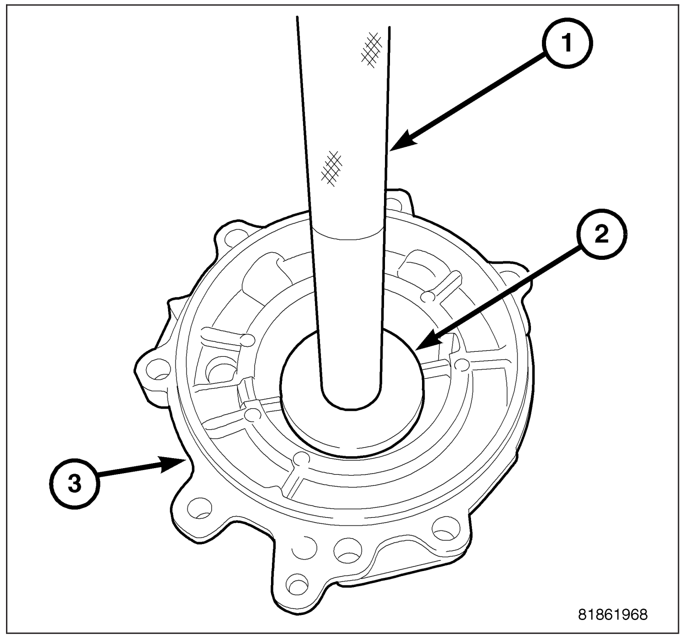
1. Install the output shaft seal using Installer 9851 and Handle C-4171.
2. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).



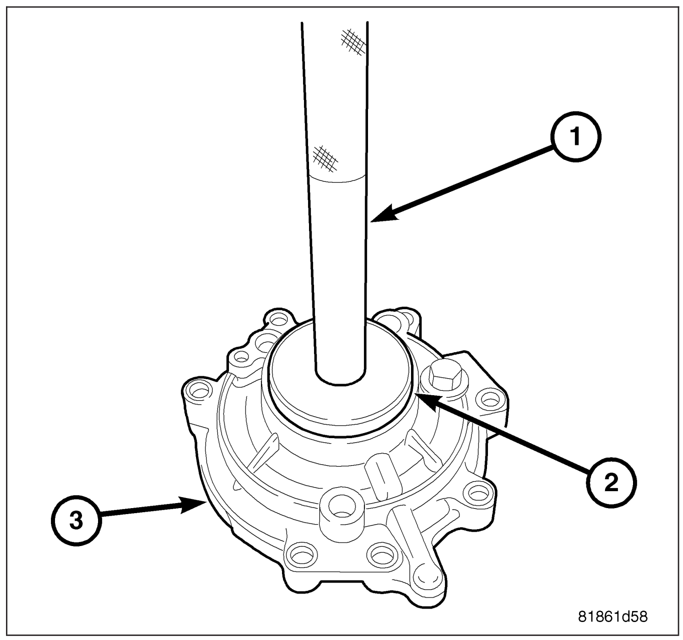
SEALS-END COVER

REMOVAL

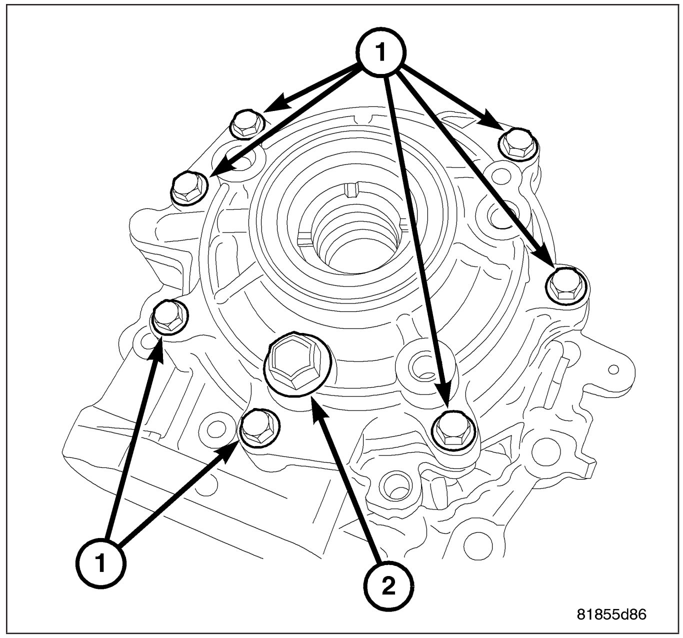
1. Remove the right halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
2. Remove the side cover bolts.
3. Remove the side cover.



4. Using a drift remove both inner and outer seals.



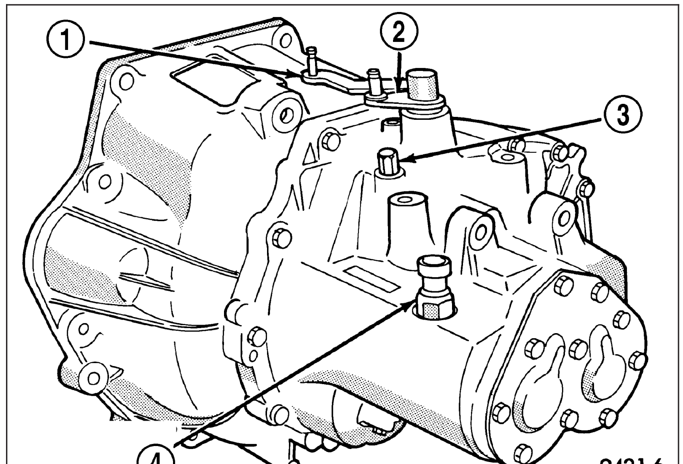
INSTALLATION



1. Install the inner seal into the PTU cover using Installer 9852 and Handle C-4171.

2. Install the outer seal into the PTU cover using Installer 9853 and Handle C-4171.

3. Install the side cover
4. Torque side cover bolts (1) to 23 N·m (17 ft. lbs.).
5. Install the right halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)



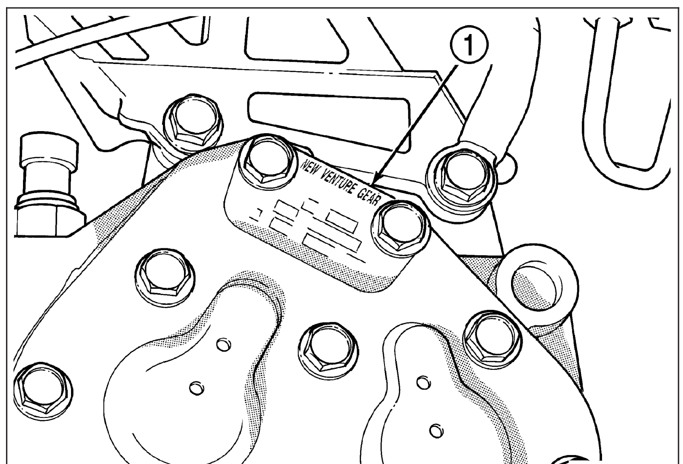
T355 MANUAL TRANSAXLE

TABLE OF CONTENTS

T355 MANUAL TRANSAXLE

DESCRIPTION

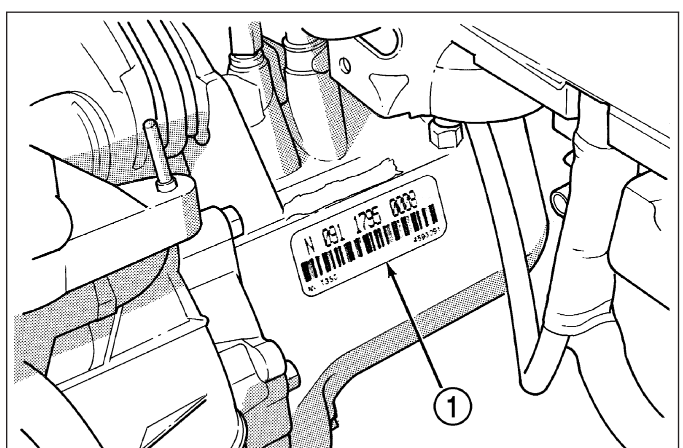
This five speed is a constant-mesh manual transaxle. All gear ranges, except reverse, are synchronized. The reverse gear utilizes a reverse brake for shifting ease. The reverse idler gear is supported on a sliding spindle idler shaft. The transaxle case is aluminum with a steel end-plate bearing cover. It is housed in a die-cast aluminum case featuring a two-piece, middle split design.



9421-6

The T355 transaxle internal components can be serviced only by separating the gear case from the bell-housing case.

CAUTION: The transaxle output shaft is serviced as a unit. No disassembly and reassembly is possible. Damage to the transaxle may result.



TRANSAXLE IDENTIFICATION

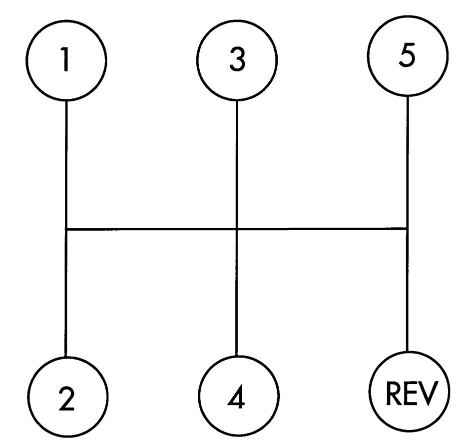
The transaxle model, assembly number, and build date are on a metal I.D. tag (1) that is attached to the end cover of the transaxle.

9521-234

This information is also shown on a bar code label (1) that is attached to the front of the transaxle.

9521-233

GEAR RATIOS



GEAR	
1st	3.77
2nd	2.16
3rd	1.41
4th	1.026
5th	0.81
REVERSE	3.4
FINAL DRIVE RATIO	4.12
REVERSE BRAKE	YES
CLUTCH RELEASE SYSTEM	HYDRAULIC

CAUTION: All gears and shafts must not be interchanged with other transaxles; they will not function correctly.

The differential is a conventional arrangement of gears that is supported by tapered roller bearings. The final output gear turns the ring gear and differential assembly, thereby turning the drive axle shafts.

GEARSHIFT PATTERN

The T355 transaxle shift pattern is a modified H–pattern. Overdrive fifth and reverse gears are in-line and outboard of the first through fourth gear positions.

FJ9521-110

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

The majority of transaxle malfunctions are a result of:

- Insufficient lubrication
- Incorrect lubricant
- Mis-assembled or damaged internal components
- Improper operation

HARD SHIFTING

Hard shifting may be caused by a mis-adjusted crossover cable. If hard shifting is accompanied by gear clash, synchronizer clutch and stop rings or gear teeth may be worn or damaged.

Mis-assembled synchronizer components also cause shifting problems. Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.

Worn, damaged, mis-assembled or leaking hydraulic clutch release system/components can also cause difficult shifting or gear clash.

NOISY OPERATION

Transaxle noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to the internal components is frequently the end result of insufficient lubricant.

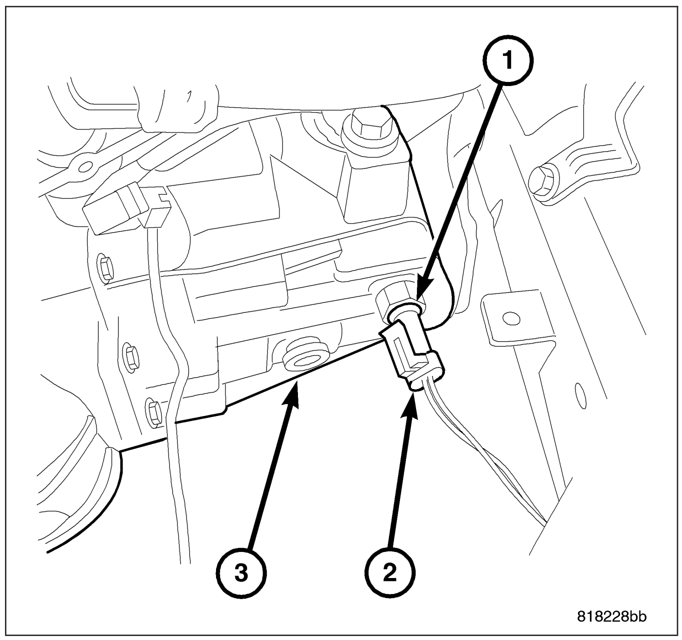
SLIPS OUT OF GEAR

Transaxle disengagement may be caused by misaligned or damaged shift components, or worn teeth on the drive gears or synchronizer components. Incorrect assembly also causes gear disengagement.

LOW LUBRICANT LEVEL

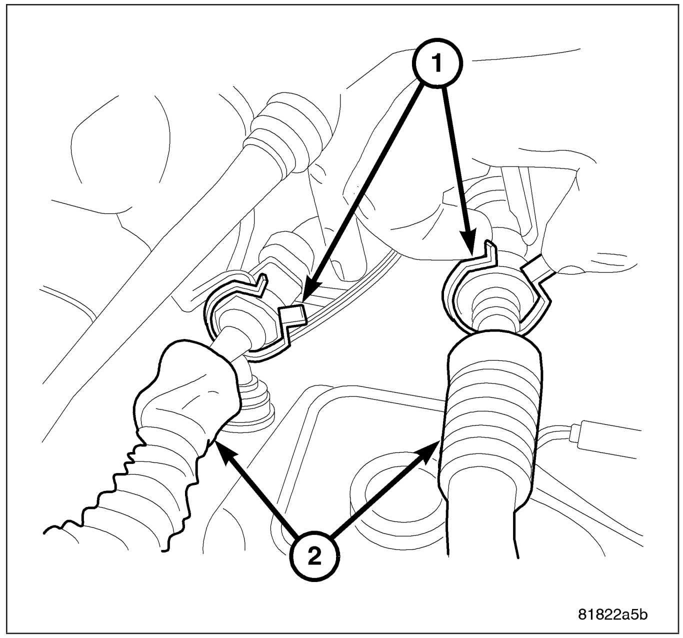
Insufficient transaxle lubricant is usually the result of leaks, or inaccurate fluid level check or refill method. **Vehicle must be level to accurately check fluid level.** Leakage is evident by the presence of oil around the leak point. If leakage is not evident, the condition is probably the result of an underfill.

If air–powered lubrication equipment is used to fill a transaxle, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.



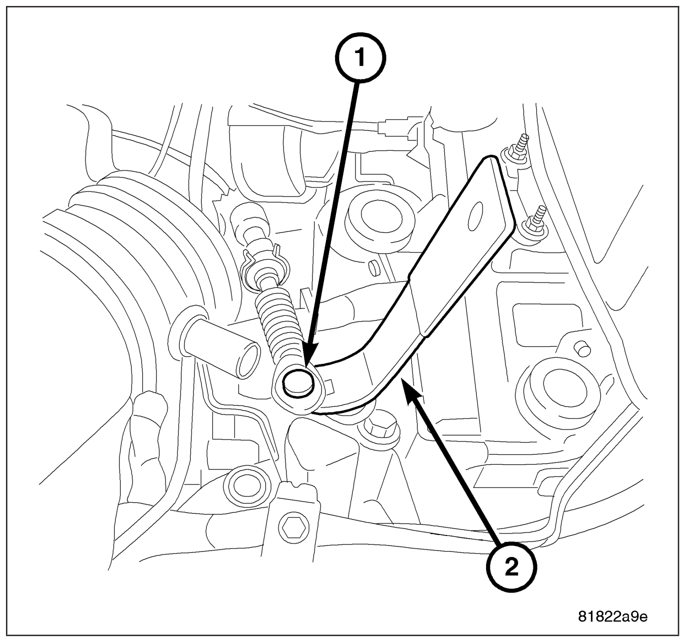
CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash, and noise.

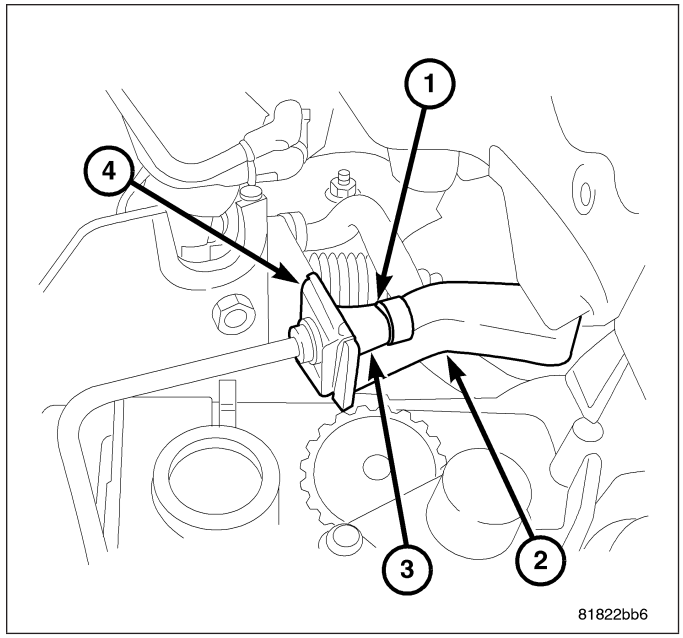


A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

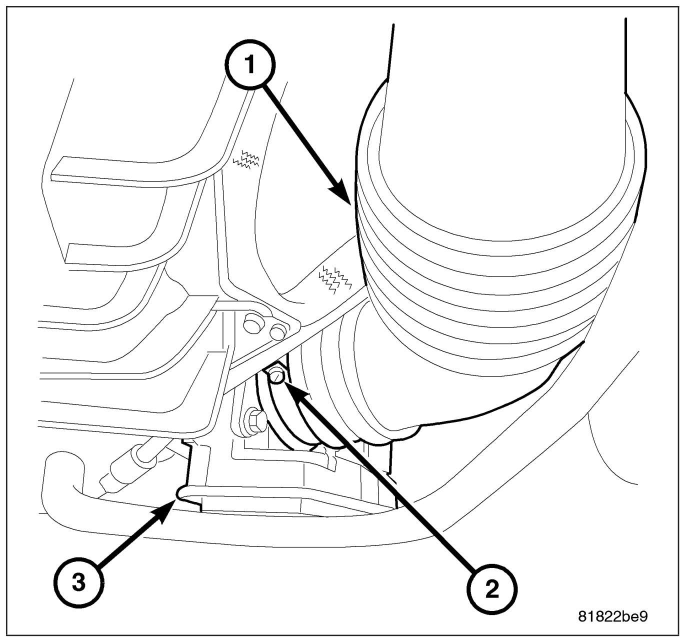
REMOVAL



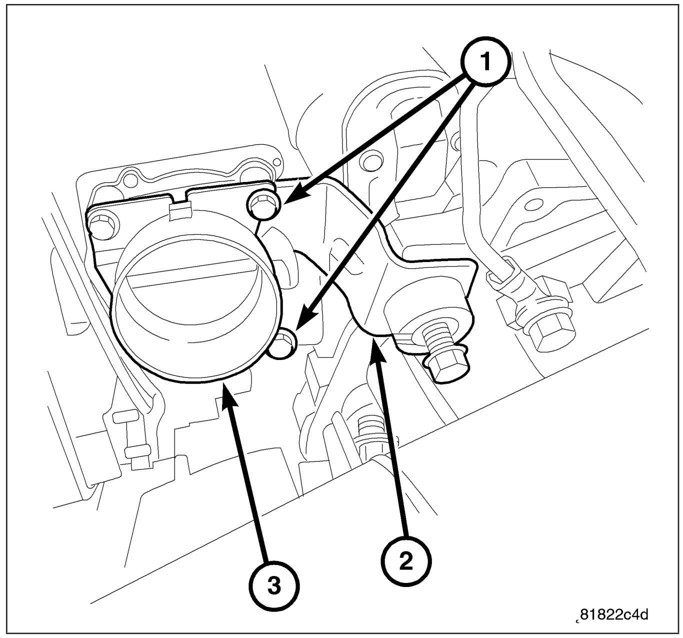
1. Raise hood.
2. Remove the resonator.
3. Remove engine cover.
4. Remove air cleaner assembly.
5. Disconnect both battery cables. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL)
6. Remove battery hold down clamp and bolt, and remove battery.
7. Remove battery tray. (Refer to 8 - ELECTRICAL/ BATTERY SYSTEM/TRAY - REMOVAL)
8. Unplug the speed sensor connector (if equipped).
9. Disconnect back-up lamp switch connector (2).



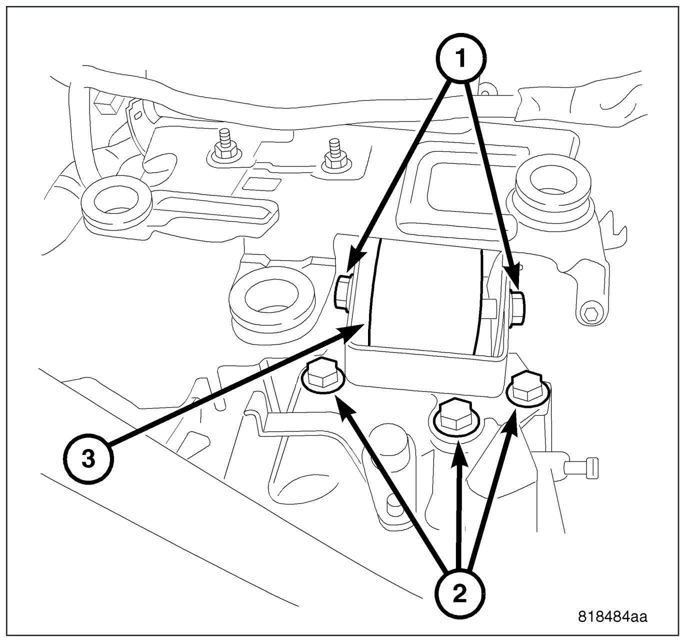
10. Remove shift cable-to-bracket clips (1).



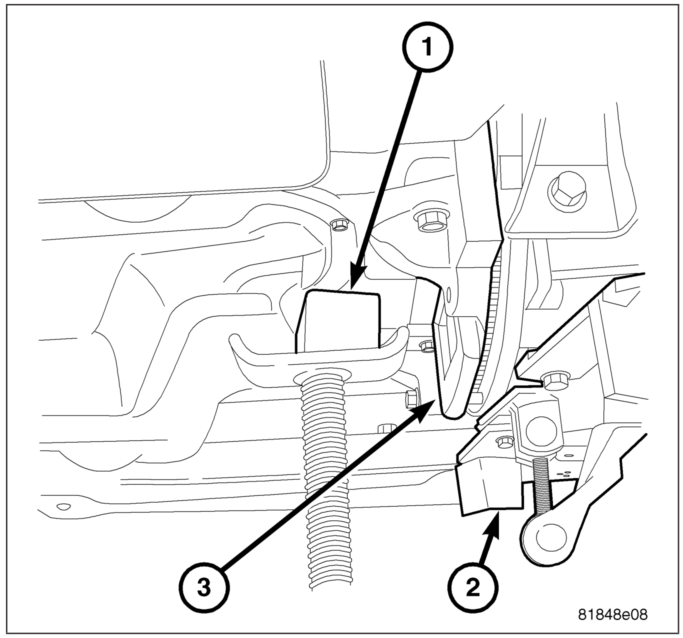
11. Disconnect shift selector and crossover cable (1) from levers. Remove cables and secure out of the way.



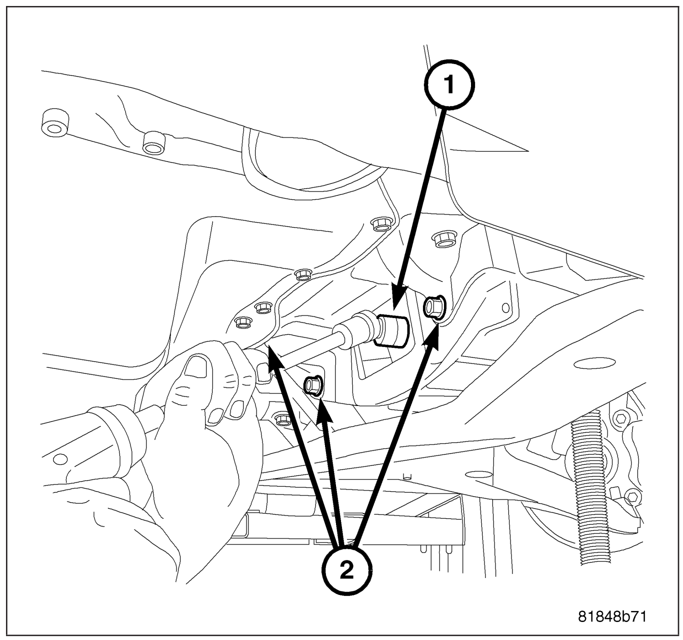
12. Remove the slave cylinder hose (1) at bracket (2).



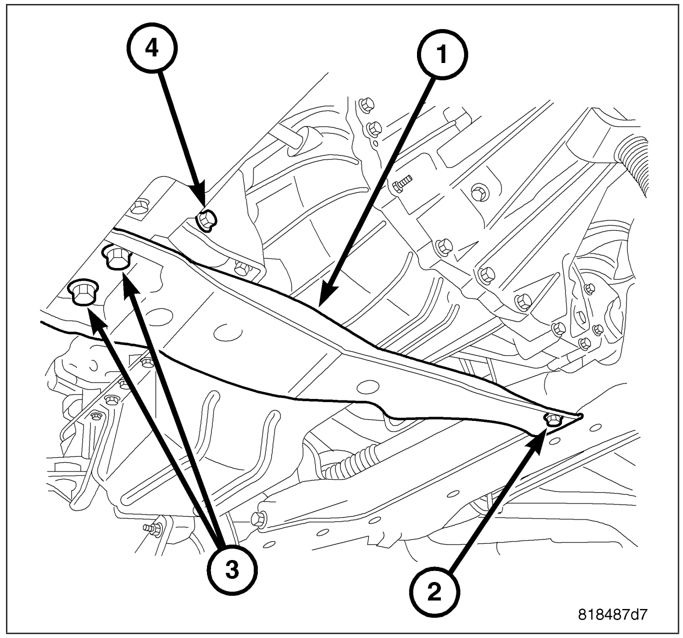
13. Remove the air inlet tube (1) by loosing the screw (2) at the throttle body (3).



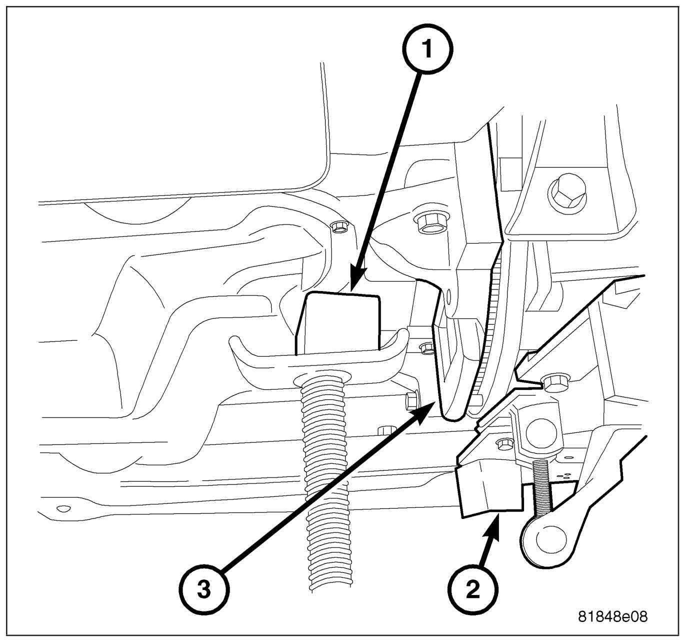
14. Remove the throttle body support bracket bolts (1).
15. Remove the throttle body support bracket (2).
16. Remove upper bell housing bolts.
17. Remove the starter bolts and slide the starter back. (Refer to 8 - ELECTRICAL/STARTING/ STARTER MOTOR - REMOVAL)



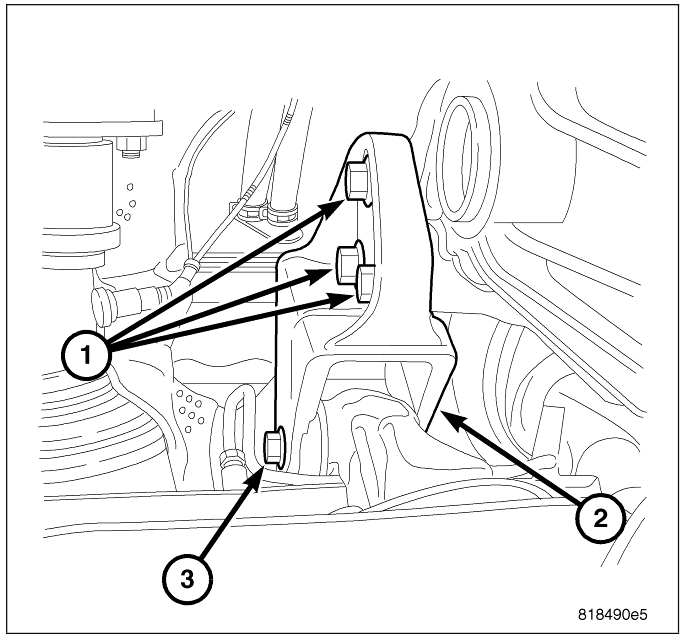
18. Support transmission and remove the upper transmission mount through bolt (1).
19. Raise vehicle on hoist.
20. Unplug the backup switch electrical connector (2).
21. Remove transaxle oil drain plug (3) and drain oil into a suitable container. Reinstall drain plug and torque to 14 N·m (120 in. lbs.) torque.
22. Remove both axle halfshafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).



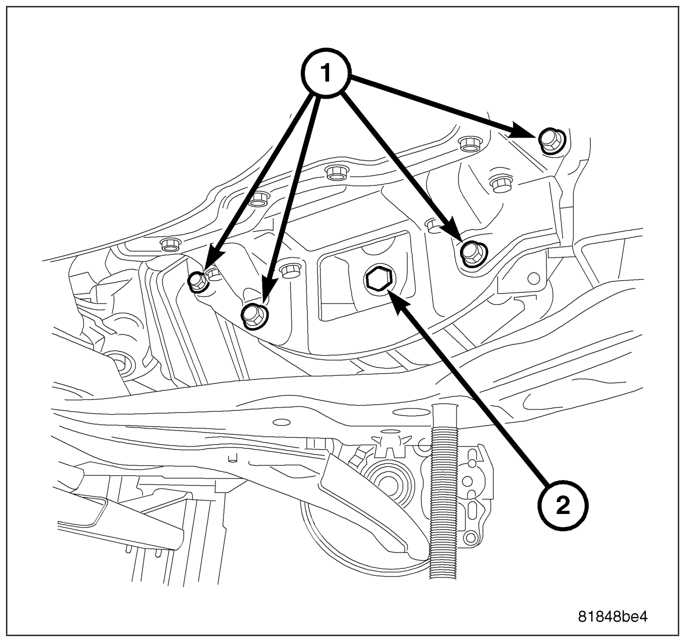
23. Support the engine with a screw jack (1).
24. Remove bell housing dust cover (3).



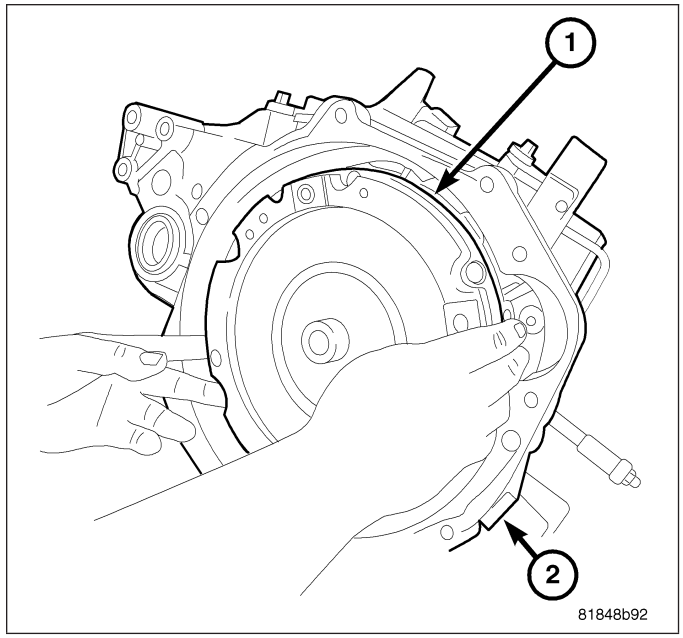
25. Remove four modular clutch-to-drive plate bolts (1). While removing bolts, one tight-tolerance (slotted) drive plate hole will be encountered. When this bolt is removed, mark drive plate and modular clutch assembly at this location, and be sure to align marks upon reassembly.



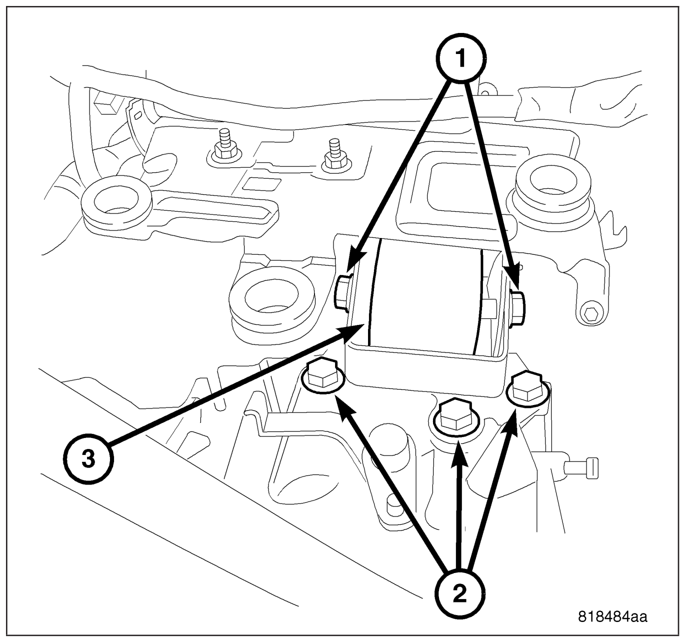
26. Remove the front transmission mount through bolt (4).
27. Remove the transmission cross member mounting bolts (2, 3).
28. Remove the transmission cross member (1).



29. Install a transmission jack (2).



30. Remove the rear transmission through bolt (3).
31. Remove the rear transmission mount bolts (1) and mount (2).

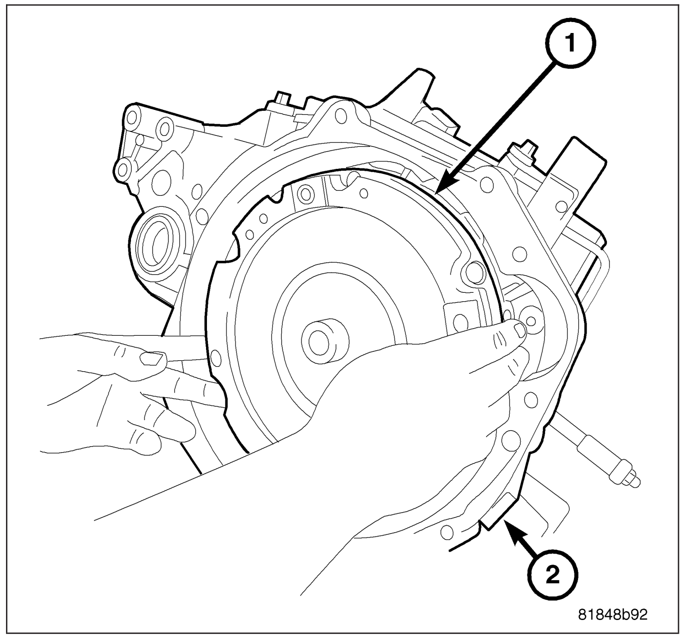


32. Remove the remaining transmission bell housing bolts (1).
33. Carefully lower engine and transaxle on screw jack and transmission jack until proper removal clearance is obtained.
34. Obtain a helper to assist in holding transaxle while removing transaxle-to-engine mounting bolts.
35. Remove transaxle from vehicle.

36. Remove clutch module from transaxle input shaft (1).

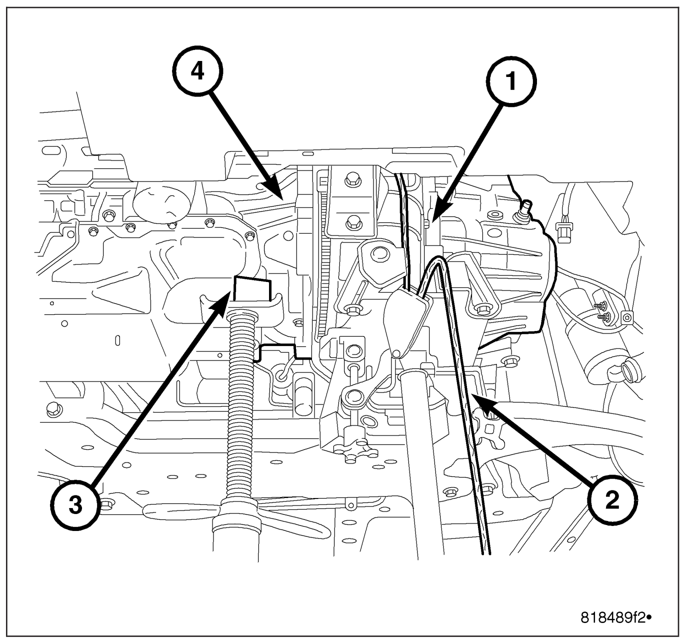
37. If installing a new or replacement transaxle, remove the upper mount (3), transfer to the replacement unit and torque all bolts (2) to 62 N·m (45 ft. lbs.) torque.

CLEANING



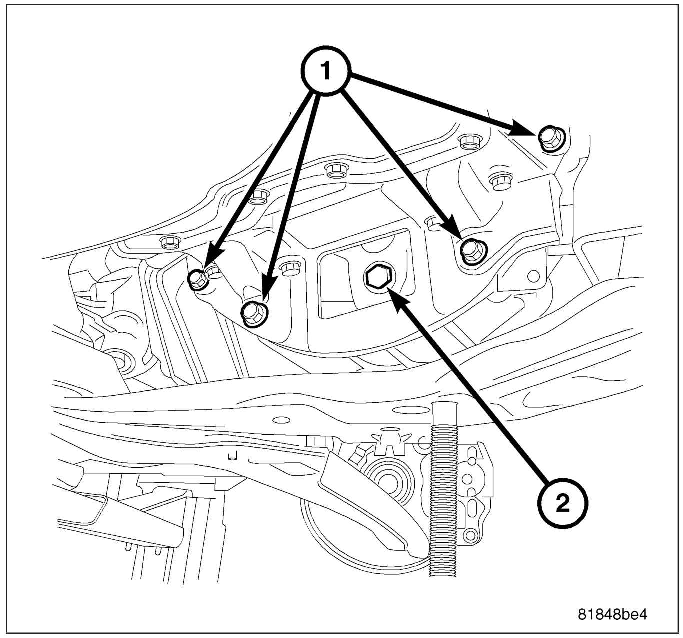
Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bell-housing with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

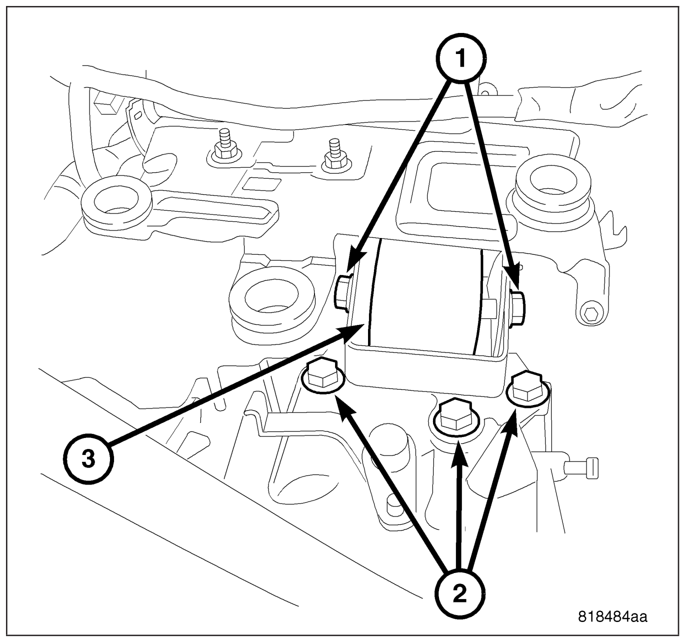


Inspect the gears, bearings, shafts and thrust washers. Replace the bearings and cups if the rollers are worn, chipped, cracked, flat spotted, or brinnelled, or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped, or worn. Replace the gears if the teeth are chipped, cracked, or worn thin. Inspect the synchronizers. Replace the sleeve if worn or damaged in any way. Replace the stop rings if the friction material is burned, flaking off, or worn. Check the condition of the synchro keys and springs. Replace these parts if worn, cracked, or distorted.

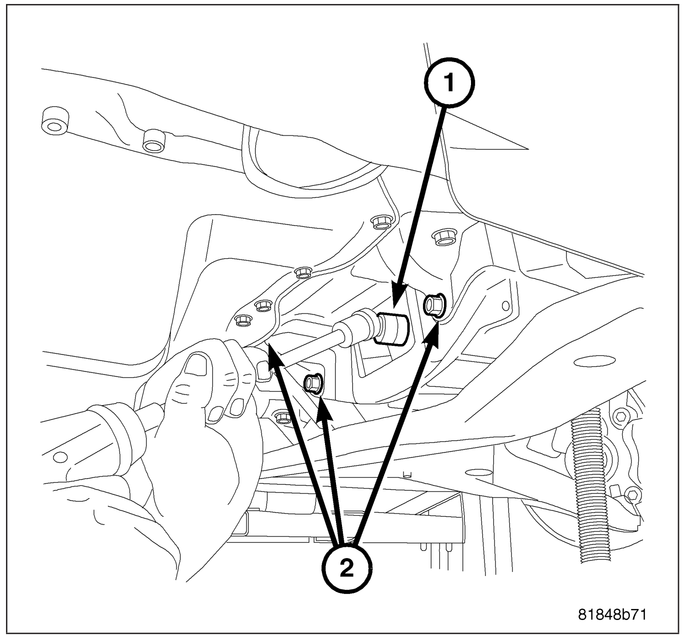
INSTALLATION



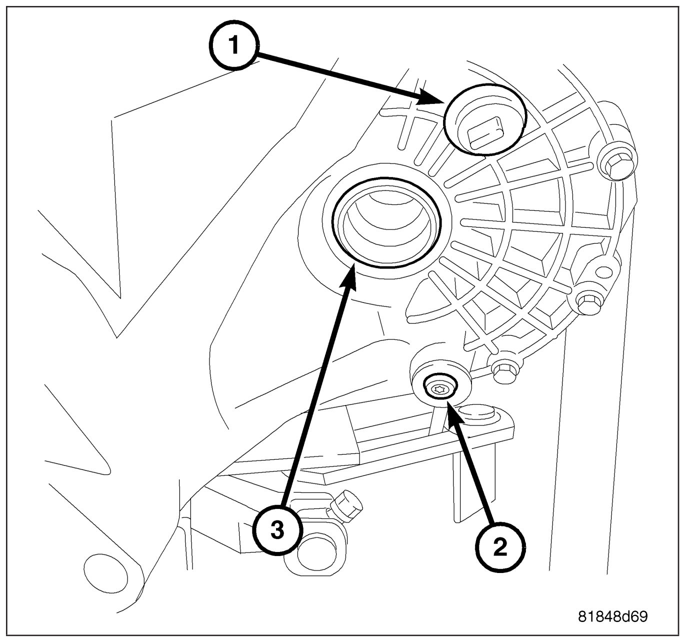
1. Install clutch module (1) (if equipped) onto input shaft.



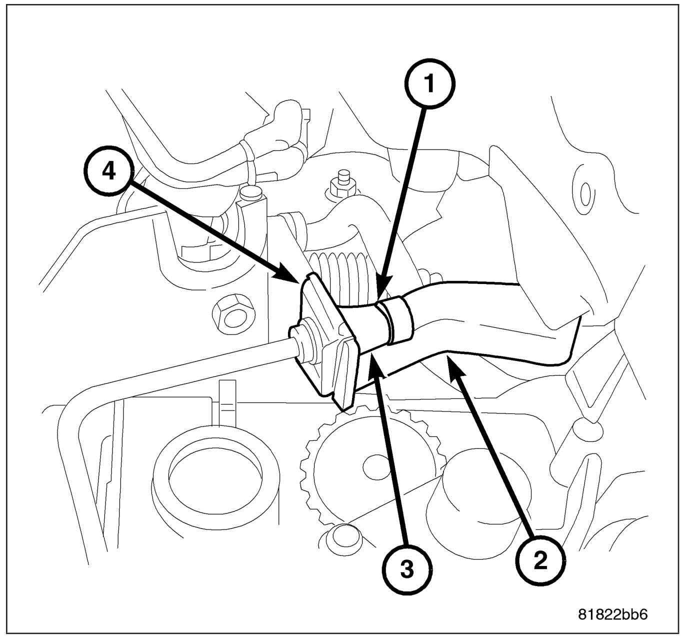
2. Install transaxle (1) into position.



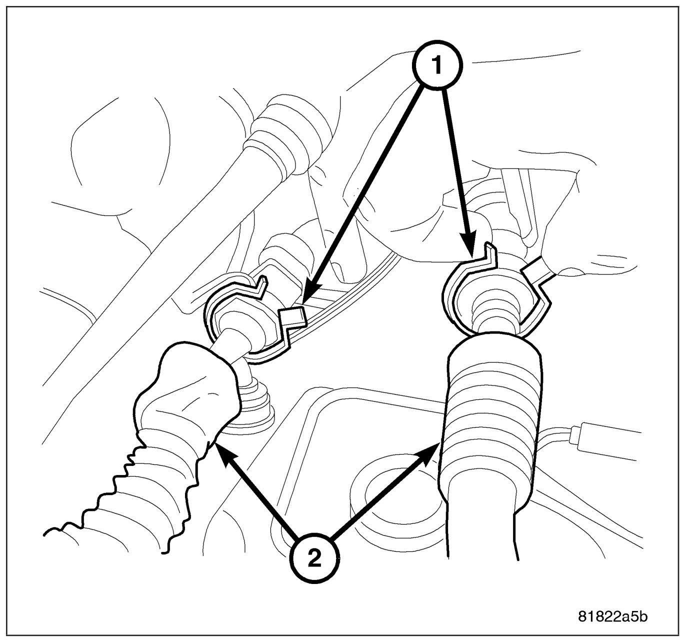
3. Install transaxle-to-engine mounting bolts and tighten to 108 N·m (80 ft. lbs.) torque.



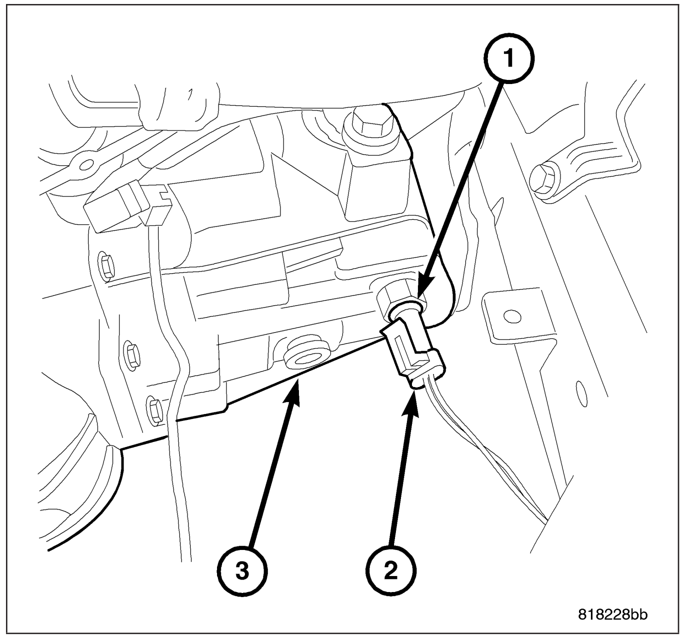
4. Raise engine and transaxle (2) with screw jack and transmission jack until upper mount bracket aligns with upper mount. Install mount bolts (1) and tighten to 68 N·m (50 ft. lbs.) torque.
5. Remove screw jack.



6. Install four (4) modular clutch-to-driveplate bolts (4). Align drive plate and modular clutch alignment marks placed upon disassembly. Start with tight-tolerance (slotted) hole, install and torque bolts to 88 N·m (65 ft. lbs.) torque.
7. Install starter motor and tighten bolts to 54 N·m (40 ft. lbs.) torque. Make sure to fasten ground cable to upper starter bolt. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)
8. Install bell housing dust cover.
9. Install both front axle driveshafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).



10. Fill transaxle with suitable amount of fluid.
11. Lower the vehicle.
12. Install the remaining bell housing bolts.



13. Connect the hydraulic clutch slave cylinder (1). An audible click should be heard. Verify connection by pushing and pulling quick connect.

14. Connect shift crossover and selector cables (2) to shift lever. Install cables to bracket (1).

15. Connect back-up lamp switch connector (1).
16. Connect the vehicle speed sensor connector if equipped.
17. Install battery tray.
18. Install battery and tighten hold down clamp to secure battery.
19. Install the air cleaner assembly.
20. Connect the battery cables.
21. Road test vehicle and inspect for leaks.

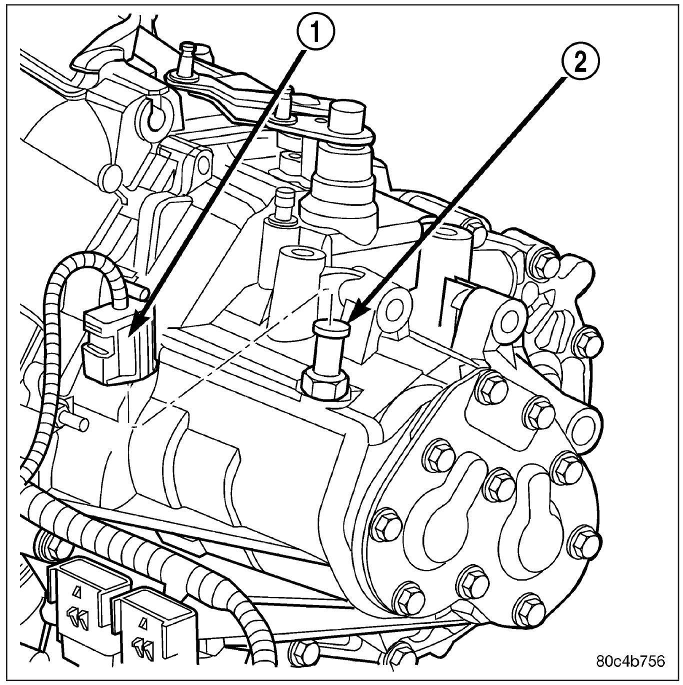
SEALS-AXLE SHAFT

REMOVAL

1. Remove axle shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
2. Insert a flat–blade pry tool (2) at outer edge of axle shaft seal (1).
3. Tap on the pry tool (2) with a small hammer and remove axle shaft seal (1).

FJ9521-99



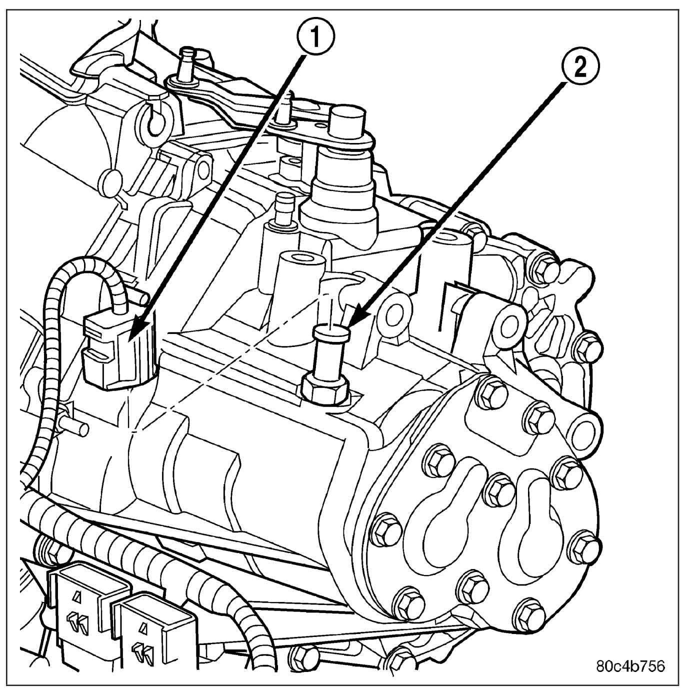
INSTALLATION

1. Clean axle shaft seal bore of any excess sealant.
2. Align axle shaft seal with axle shaft seal bore.
3. Install axle seal on Seal Installer 9928 and Handle C-4171 and insert into axle shaft seal bore.
4. Tap seal into position until seated against transaxle case.
5. Install axle shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)
6. Check transaxle fluid level and adjust as necessary.

SWITCH-BACK-UP LAMP

REMOVAL

1. Lift vehicle on hoist.
2. From bottom side of vehicle, disconnect back-up lamp switch connector (1).
3. Unscrew switch (2) from transaxle.



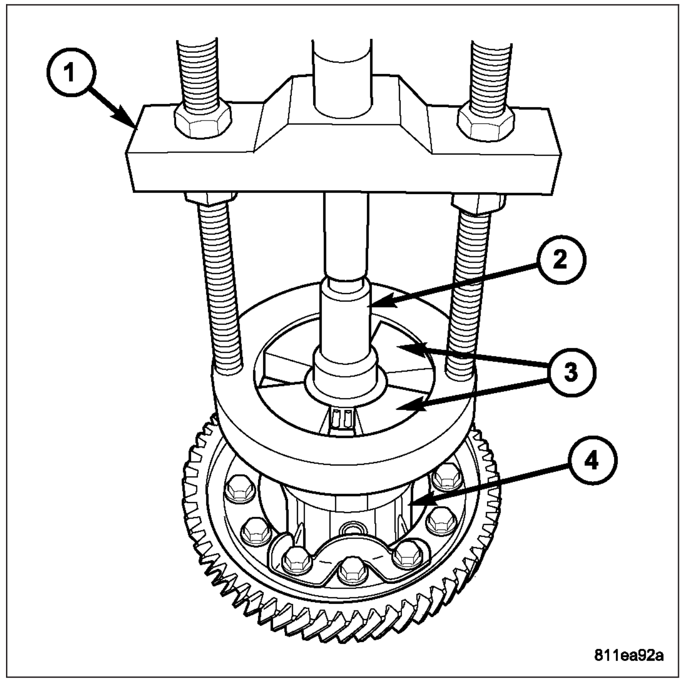
80c4b756

INSTALLATION

Install back-up lamp switch (2). Teflon tape or equivalent must be used on switch threads. Tighten switch to 24 N·m (18 ft. lbs.) torque.

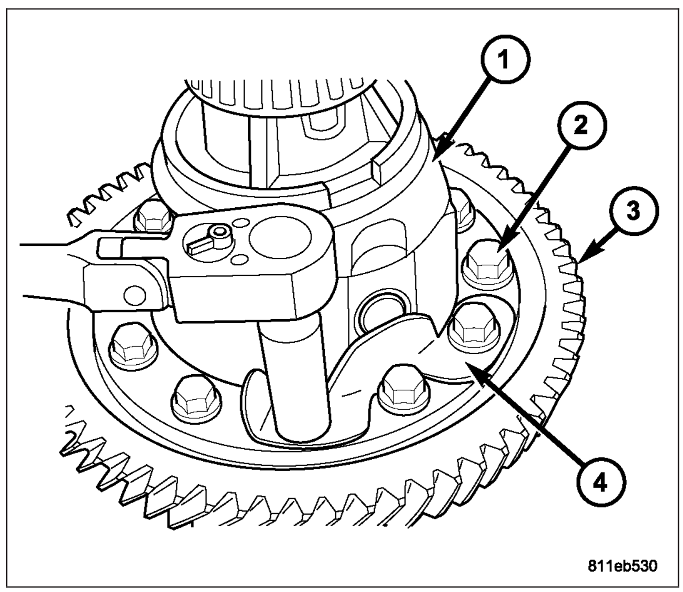
CAUTION: Do not overtighten switch.

1. Connect back-up lamp switch connector (1).
2. Lower vehicle.
3. Verify back-up lamp operation.



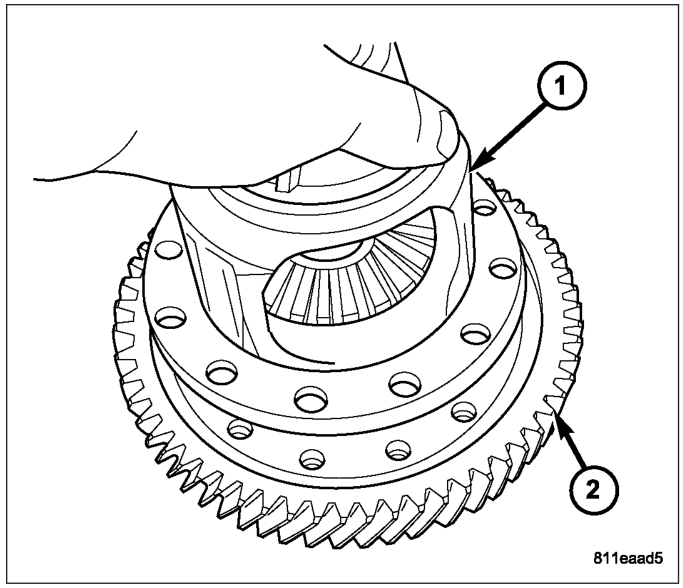
80c4b756

DIFFERENTIAL

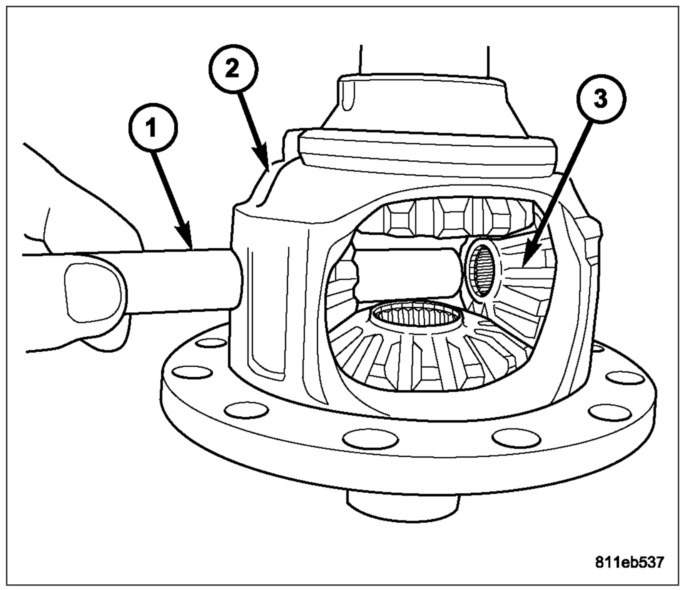


DISASSEMBLY

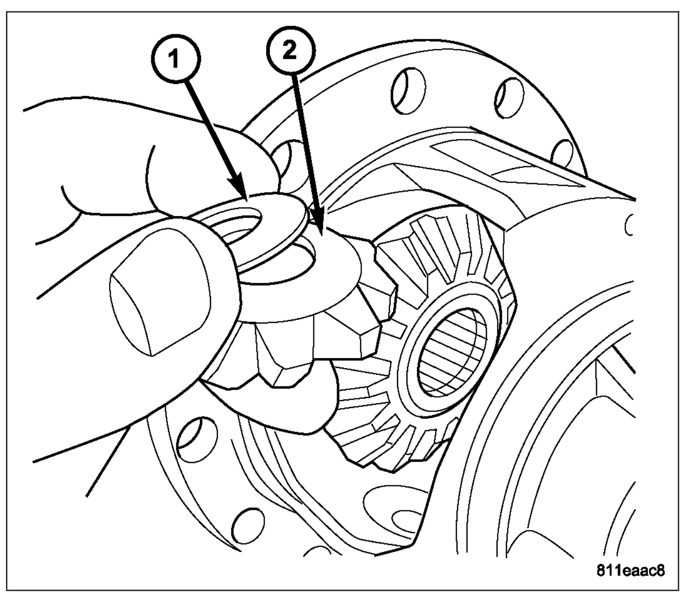
1. Remove differential bearing cones (ring gear and differential case side) using Puller Press C-293 (1), Adapter Blocks C-293-45 (3), and Adaptor 4996 (2)



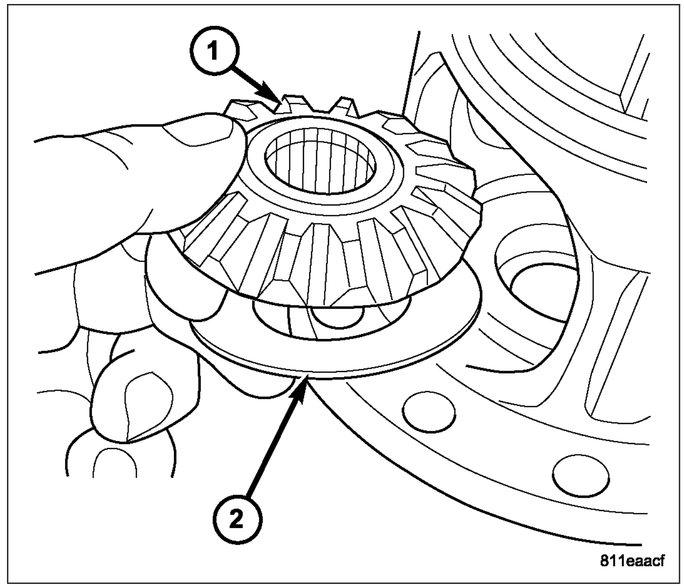
.



2. Remove the bolts holding the pinion shaft retainer (4) to the ring gear (3) and differential case (1).

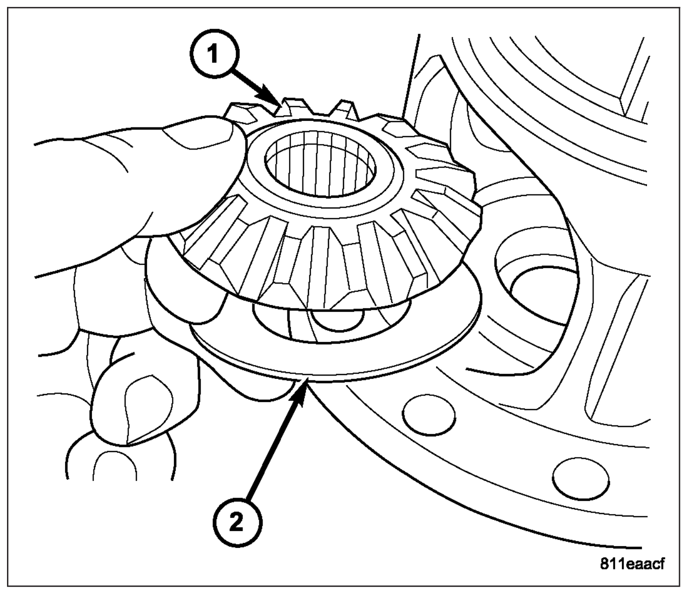


3. If servicing ring gear (2) as well, remove remaining ring gear-to-case bolts and remove ring gear (2) from case (1).

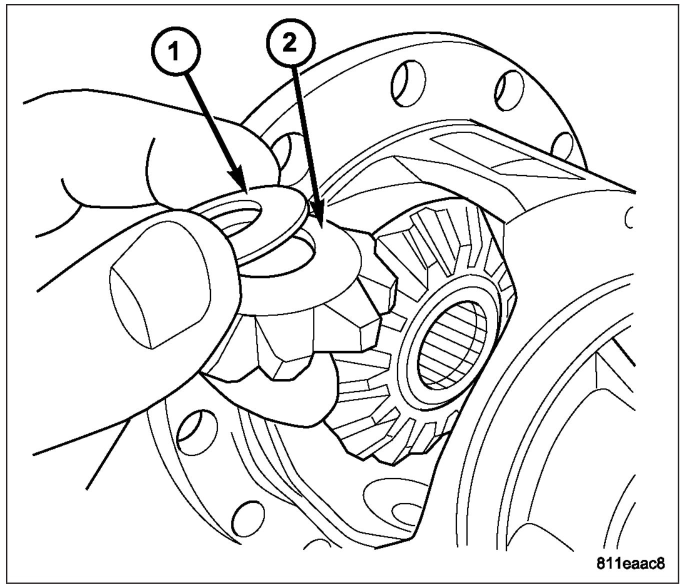


4. Remove pinion shaft (1).

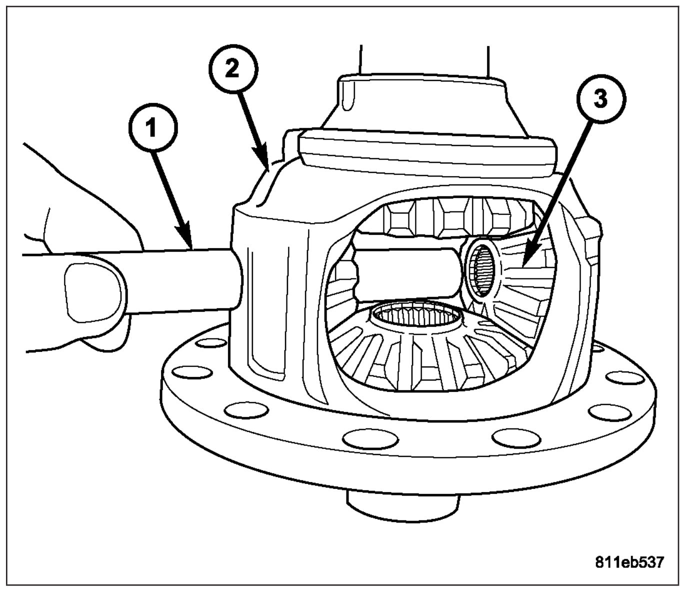
5. Remove pinion gear (2) and thrust washers (1).



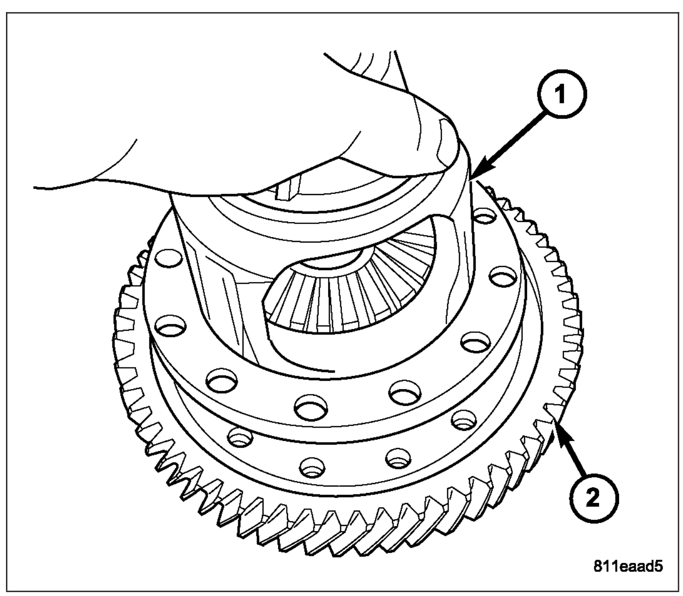
6. Remove side gears (1) and thrust washers.



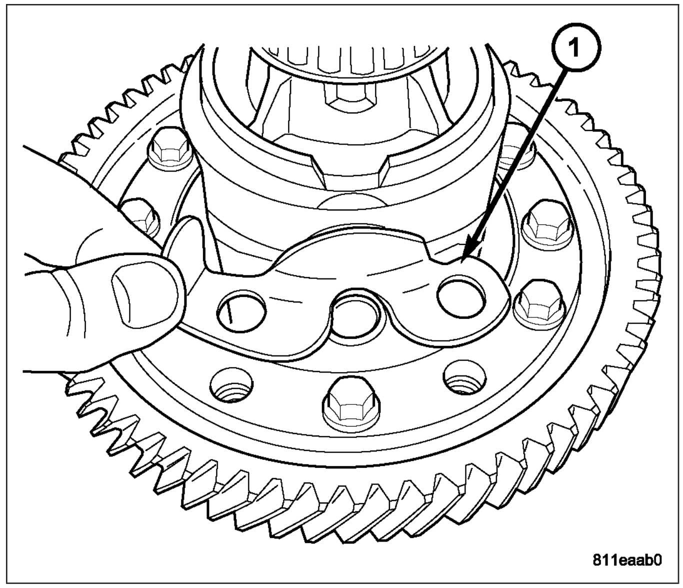
ASSEMBLY



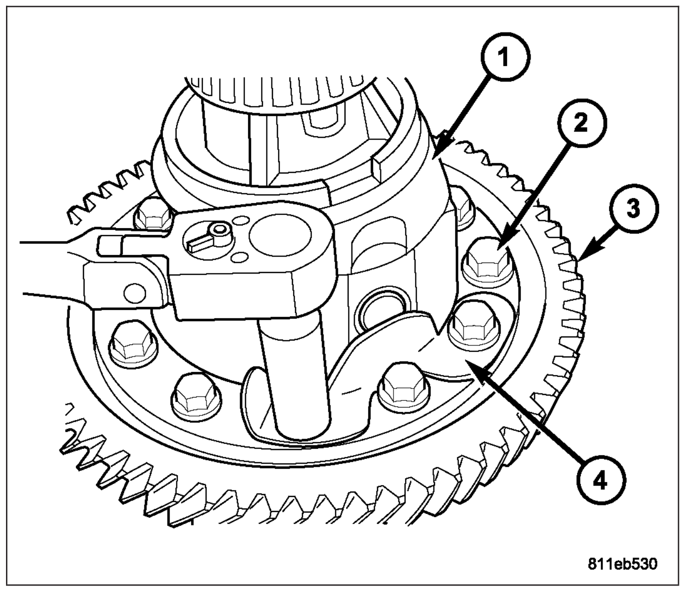
1. Install side gears (1) and thrust washers (2) into case through opening and rotating into position.



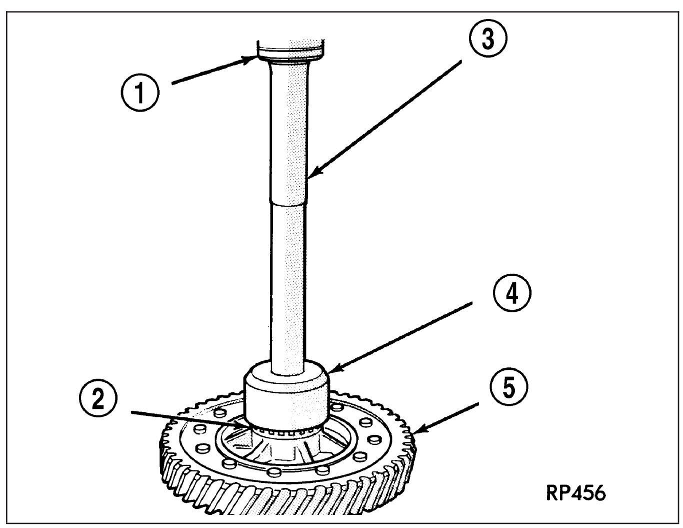
2. Install pinion gears (2) and thrust washers (1) into case through opening and rotating into position.



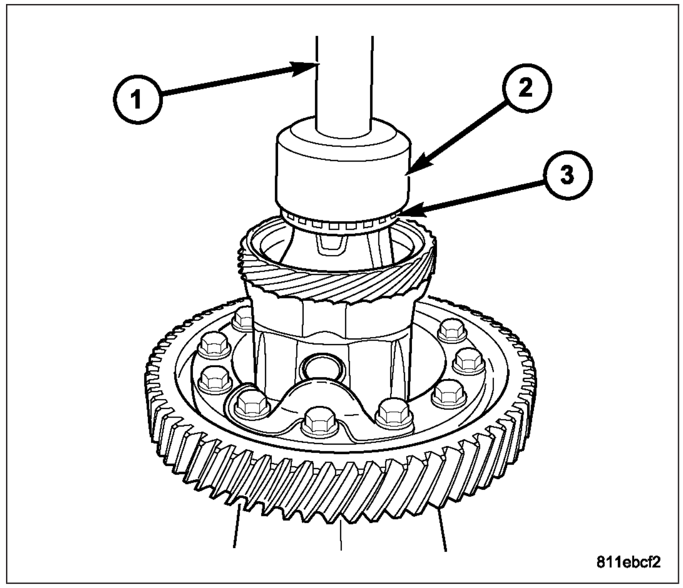
3. Install pinion shaft (1).



4. If previously removed, install ring gear to differential case (1).

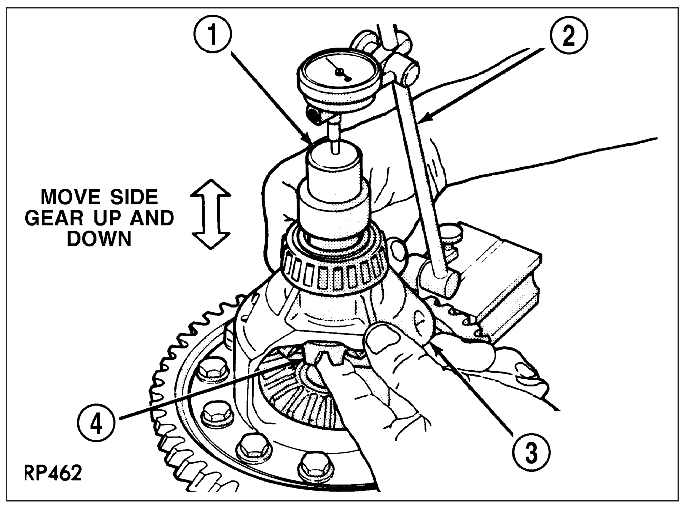


5. Install pinion shaft retainer (1).

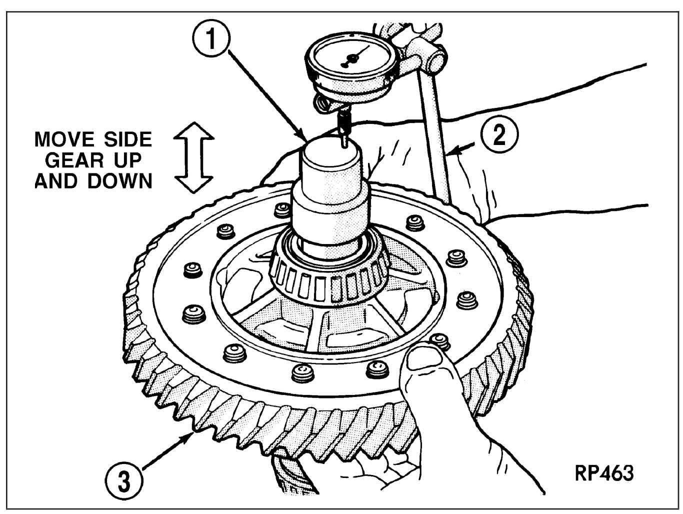


6. Install **NEW** ring gear-to-case bolts (2) and torque to 81 N·m (60 ft. lbs.) torque.

7. Using an arbor press (1), Handle C-4171(3), and Installer L-4410 (4), install differential side bearings to ring gear side.



8. Using an arbor press, Handle C-4171 (1), and Installer L-4410 (2), install differential side bearings (3) to case side.

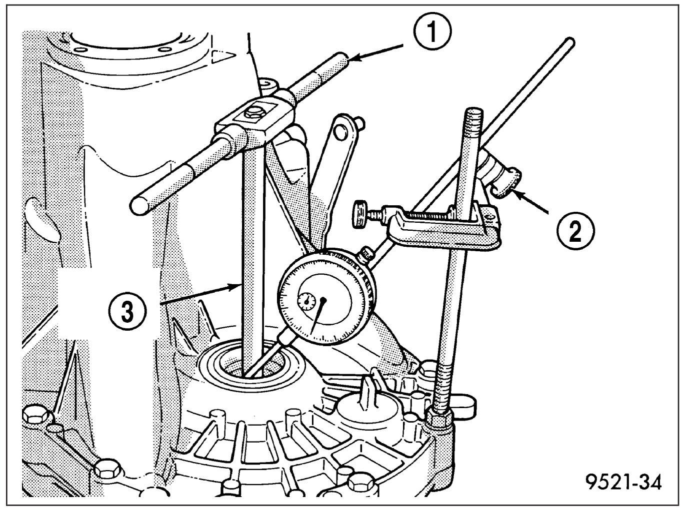


Measure and Adjust Side Gear End-Play

1. Rotate the assembly (3) two full revolutions both clockwise and counterclockwise. Set up dial indicator (2) and record end play.

2. Rotate side gear 90 degrees and take another measurement (2). Again, rotate side gear 90 degrees and record a final measurement.
3. Using the smallest end play recorded, shim that side gear to within 0.001 to 0.013 inch. The other side gear should be checked using the same procedure.

CAUTION: Side gear end play must be within 0.001 to 0.013 inch.

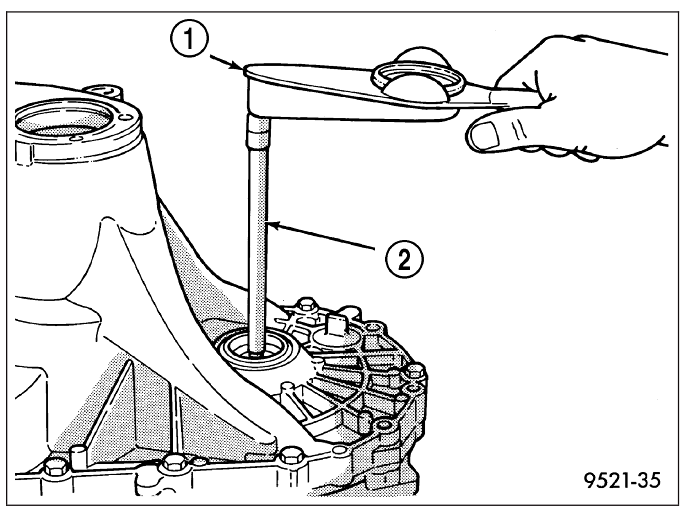


ADJUSTMENTS

DIFFERENTIAL BEARING PRELOAD ADJUSTMENT / SHIM SELECTION

Measure and adjust differential side bearing preload during any transaxle service, especially when the following components are replaced:

- Transaxle gear case
- Clutch bellhousing case
- Differential case
- Differential bearings

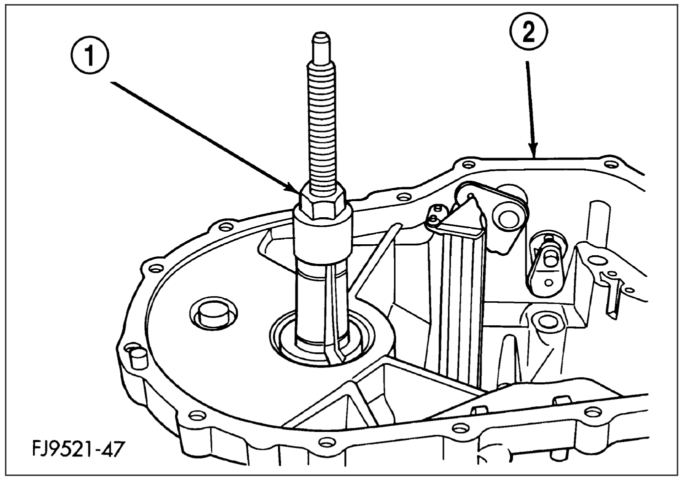


NOTE: True bearing turning torque readings can be obtained only with the geartrain removed from the case.

1. Remove bearing cup and existing shim from clutch bellhousing case.
2. Press in new bearing cup into bellhousing case (or use a cup that has been ground down on the outer edge for ease of measurement).
3. Press in new bearing cup into gear case side.
4. Oil differential bearings with transmission fluid. Install differential assembly in transaxle gear case. Install clutch bellhousing over gear case. Install and torque case bolts to 29 N·m (19 ft. lbs.).
5. Position transaxle with bellhousing facing down on workbench with C-clamps. Position dial indicator (2).

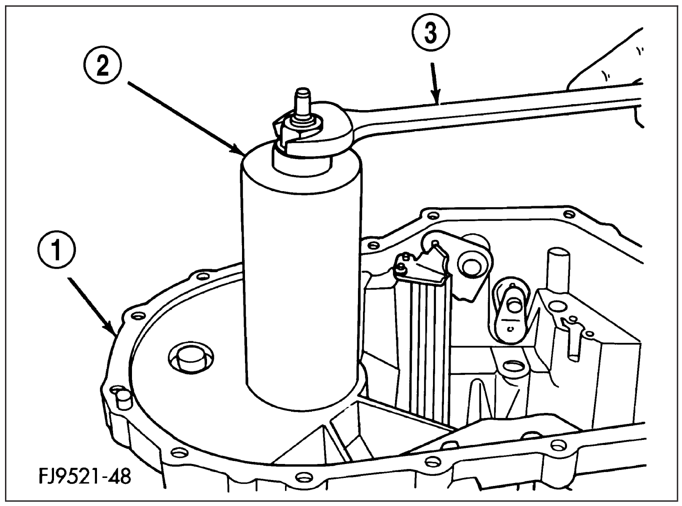
NOTE: Indicator is set up as shown for illustrative purposes only. Indicator must be parallel to T-Handle to obtain the most accurate reading.

6. Apply a medium load to differential with Torque Tool C-4995 (3) and a T-handle (1), in the downward direction. Roll differential assembly back and forth a number of times. This will settle the bearings. Zero the dial indicator (2). To obtain end play readings, apply a medium load in an upward direction while rolling differential assembly back and forth. Record end play.
7. The shim required for proper bearing preload is the **total of end play, plus (constant) preload of 0.18 mm (0.007 in.).** Never combine shims to obtain the required preload.
8. Remove case bolts. Remove clutch bellhousing differential bearing cup. Install shim(s) selected in Step 7. Then press the bearing cup into clutch bellhousing.
9. Install clutch bellhousing. Install and torque case bolts to 29 N·m (19 ft. lbs.).
10. Using Torque Tool C-4995 (2) and an inch-pound torque wrenched (1) check turning torque of the differential assembly. **The turning torque should be 6 to 12 in. lbs. If the turning torque is too high, install a 0.05 mm (0.002 inch) thinner shim. If the turning torque is too low, install a 0.05mm (0.002 inch) thicker shim.**



11. Recheck turning torque. Repeat Step 10 until the proper turning torque is obtained.

CUPS-DIFFERENTIAL BEARING



REMOVAL

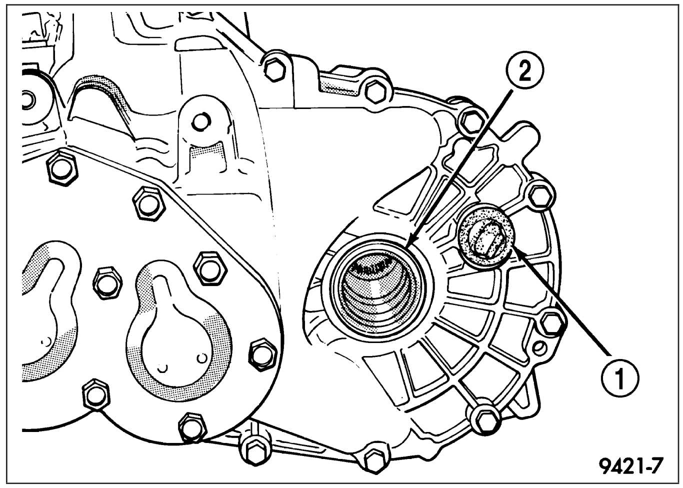
1. Remove differential assembly from gear case (2) using the procedure outlined in this group.
2. Install Remover L-4518 (1) into the differential bearing cup.

FJ9521-47

3. Install the tool cup (2) over the tool.
4. Tighten the tool until the race is removed from the case.

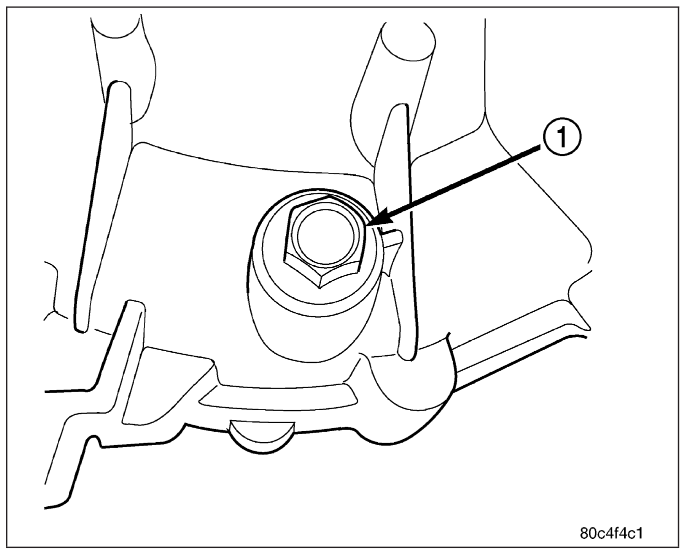
FJ9521-48

INSTALLATION



1. Position the bearing cup into the case.
2. Install the bearing cup onto Installer L-4520.
3. Using Installer L-4520 and Universal Handle C-4171, install differential bearing cup into the transaxle case.

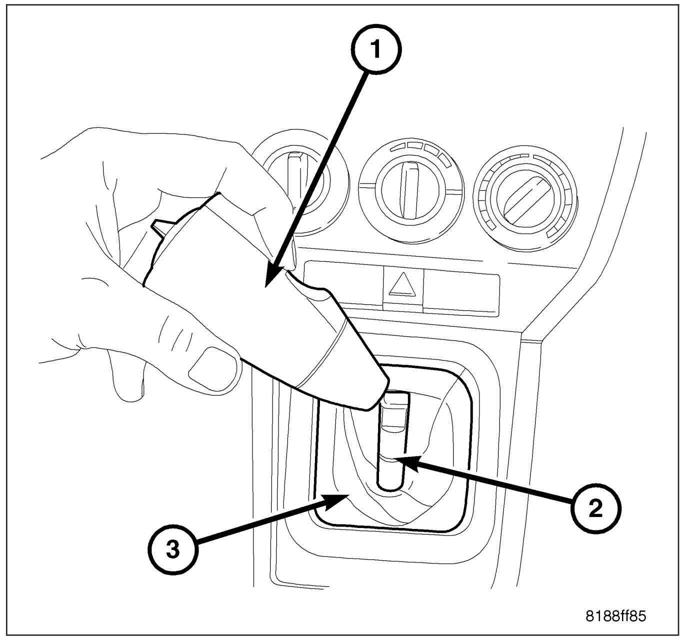
FLUID



STANDARD PROCEDURE - FLUID DRAIN AND FILL

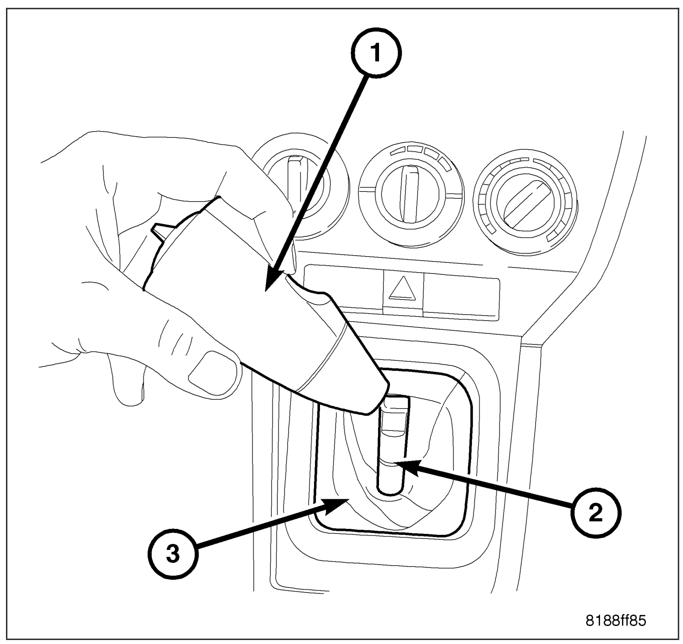
NOTE: All T355 Manual Transaxles require the use of ATF+4 (Automatic Transmission Fluid).

The transaxle fill plug (1) is located on the left side of the transaxle differential area. The fluid level should be within 3/16 inch from the bottom of the transaxle fill hole (vehicle must be level when checking).



The transaxle drain plug (1) is located on the lower right side of the transaxle differential housing. Tighten drain plug to 14 N·m (120 in. lbs.).

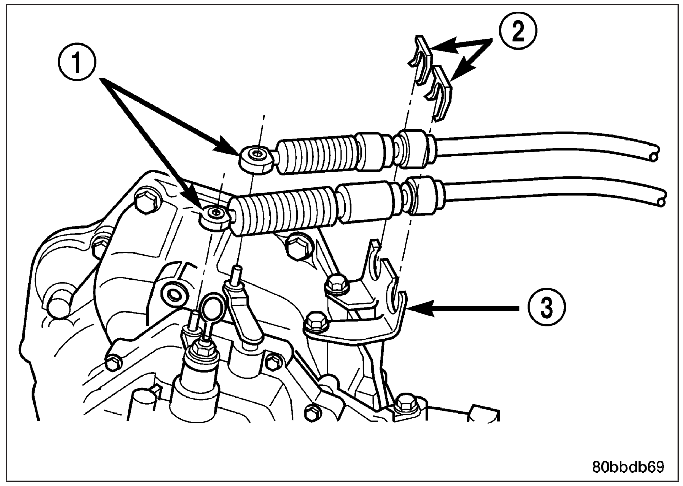
BOOT-GEAR SHIFT



REMOVAL

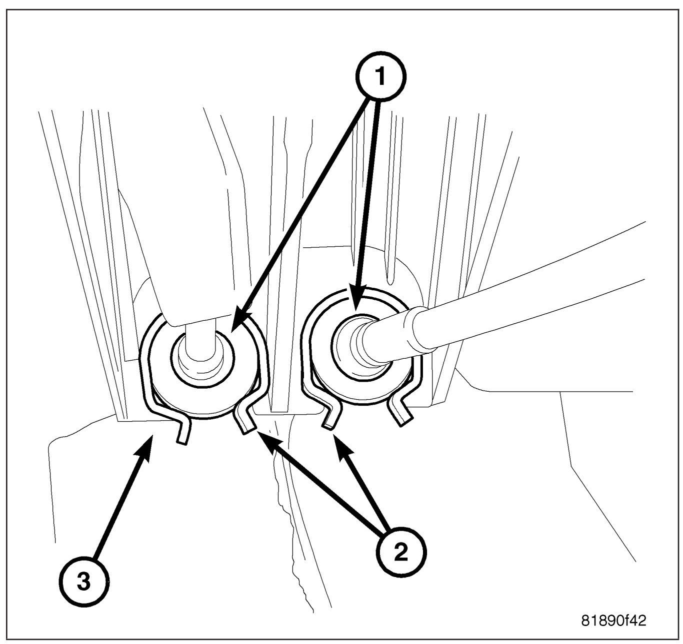
1. Pull up on gearshift knob (1) with moderate force to remove from gearshift mechanism.
2. Remove shifter boot/bezel (3) assembly from console by lifting up at mounting ring area.

INSTALLATION



1. Position gearshift boot (3) over the operating lever (2) and apply hand pressure to engage and snap console into place.
2. Position gearshift knob (1) hole over the gearshift mechanism and align the shift pattern.
3. Verify that shift pattern is aligned properly.
4. Strike knob (1) with rubber mallet to engage knob to mechanism.

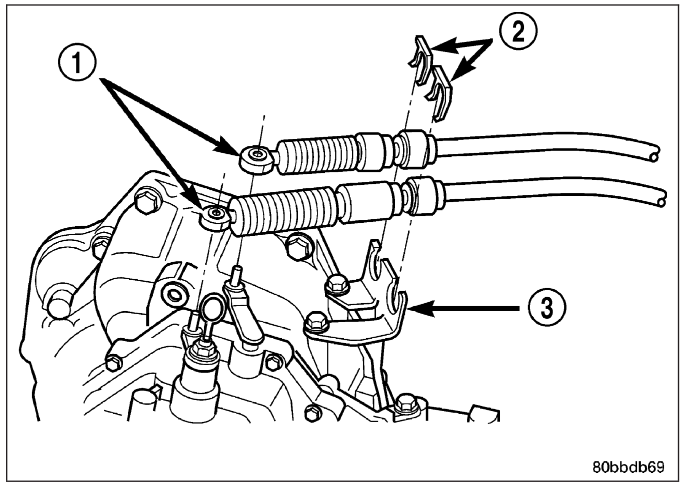
CABLE-GEAR SHIFT



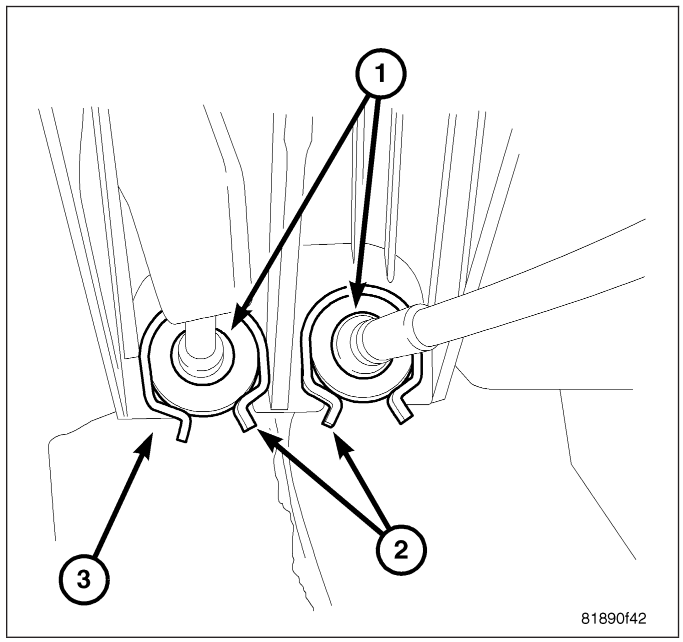
REMOVAL

1. Remove the shifter (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/SHIFT MECHANISM - REMOVAL).
2. Raise hood.
3. Remove the resonator.
4. Remove engine cover.
5. Remove air cleaner assembly.
6. Disconnect both battery cables. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL)
7. Remove battery hold down clamp and bolt, and remove battery.
8. Remove battery tray. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/TRAY - REMOVAL)
9. Disconnect cables (1) from the shift levers at the transaxle.

CAUTION: Pry up with equal force on both sides of shifter cable isolator bushings to avoid damaging cable isolator bushings.



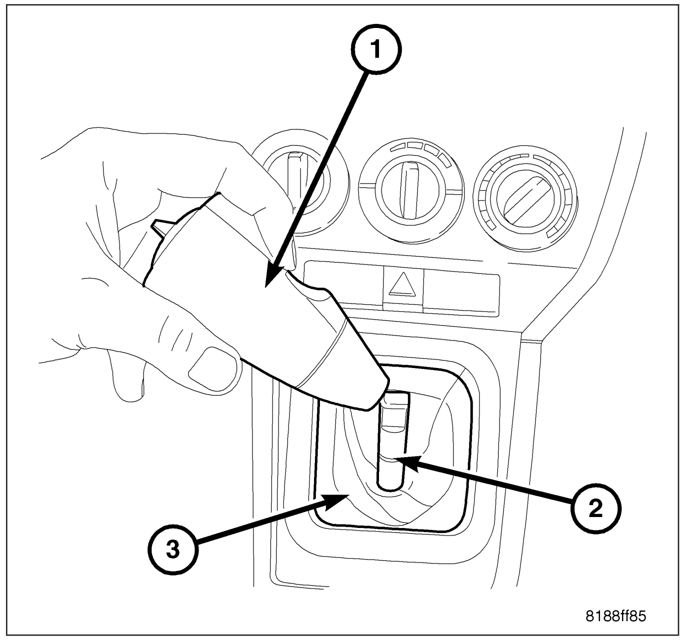
10. Remove cable retaining clips (2) and remove cables (1) from bracket (3).
11. Remove the Occupant Restraint Controller (ORC) (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/SHIFT MECHANISM - REMOVAL).
12. Remove cable clips at floor pan.
13. Remove cable assembly (1) from vehicle.



INSTALLATION

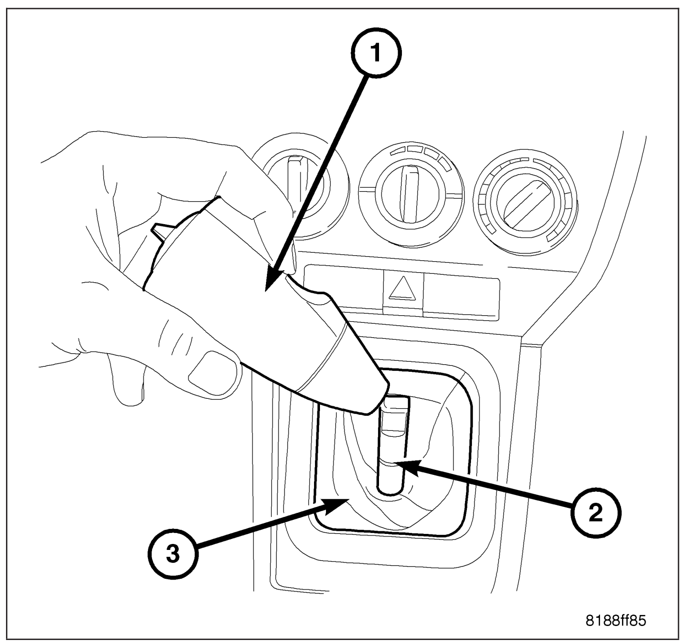
CAUTION: Gearshift cable bushings must not be lubricated or the bushings will swell and split.

1. Install cable assembly through floor pan opening and secure to floor pan with grommet plate. Make sure the
2. Route transaxle end of cable assembly into engine compartment and over transaxle assembly.
3. Connect cables (1) to the shift levers (3) at the transaxle.
4. Install cables (1) and NEW retaining clips to bracket.



5. Install gearshift cables to mounting bracket and fasten with NEW clips (2). Make sure clips are installed flush to bracket.
6. Install ORC (Refer to 8 - ELECTRICAL/RESTRAINTS/OCCUPANT RESTRAINT CONTROLLER - INSTALLATION).
7. Install shifter (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/SHIFT MECHANISM - INSTALLATION).
8. Install battery tray.
9. Install battery and hold-down clamp.
10. Install the air cleaner assembly.
11. Connect battery cables.

KNOB-GEAR SHIFT

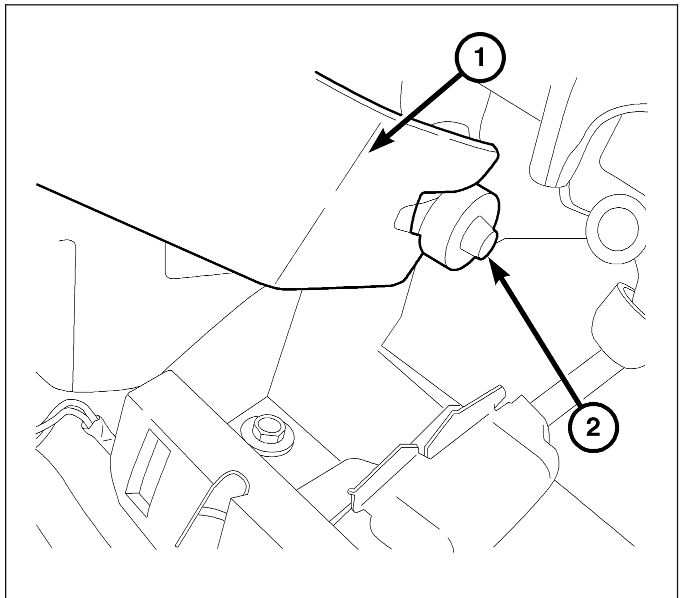


REMOVAL

1. Pull up on gearshift knob (1) with moderate force to remove from gearshift mechanism.

INSTALLATION

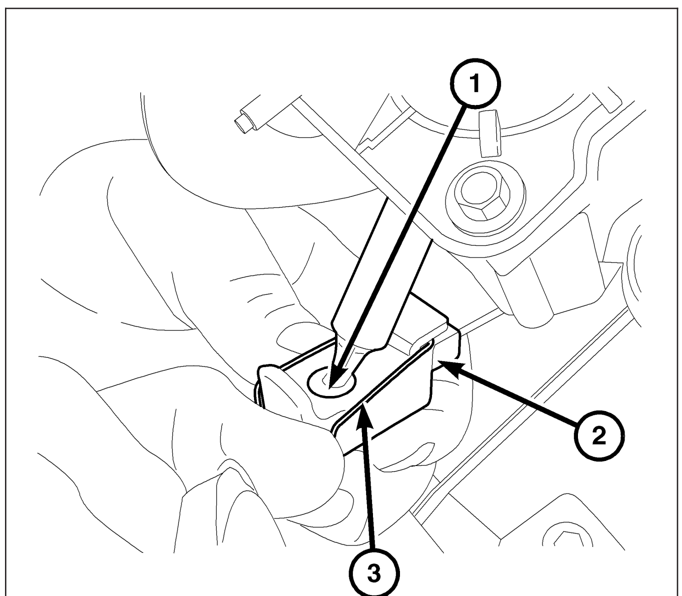
1. Position knob hole (1) over the gearshift mechanism and align the shift pattern.
2. Verify that shift pattern is aligned properly.
3. Strike knob (1) with rubber mallet to engage knob to mechanism.



MECHANISM-GEAR SHIFT

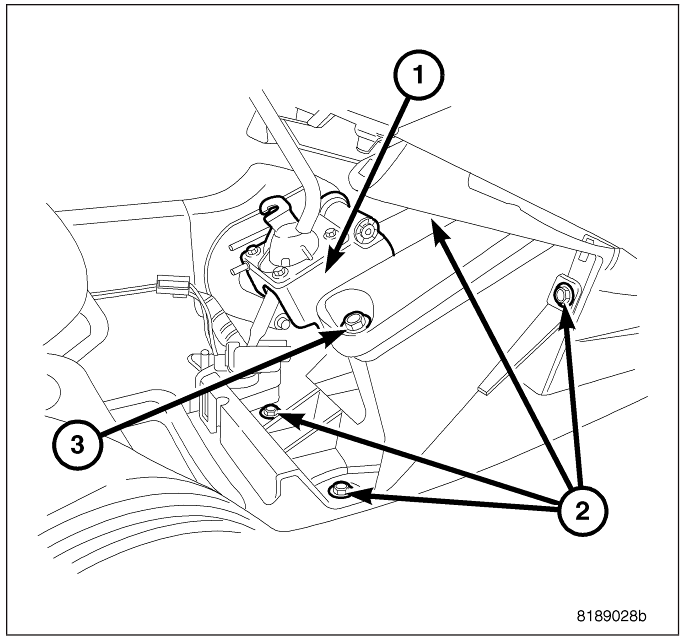
REMOVAL

1. Remove gear shift knob (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT KNOB - REMOVAL).
2. Remove gear shift boot (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT BOOT - REMOVAL).
3. Remove the center console assembly (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL). Remove rear power window switch (if equipped) and disconnect harness from console.



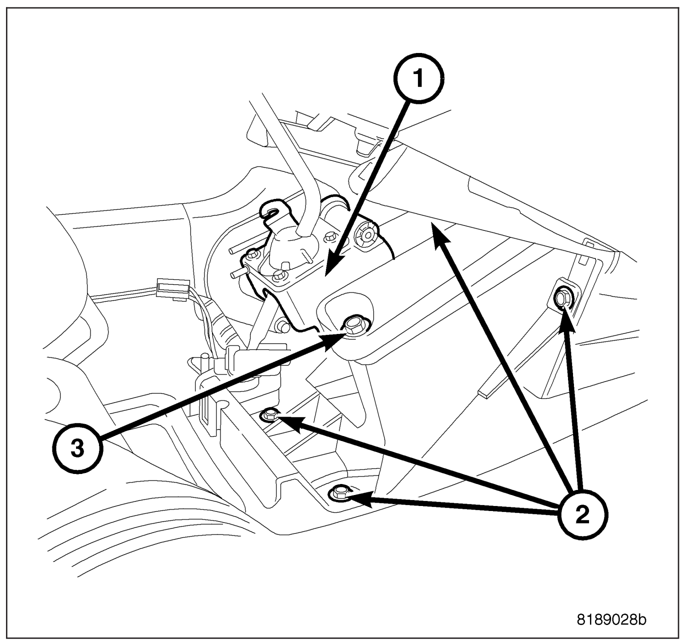
NOTE: Cable is pushed into a rubber grommet

4. Remove crossover cable (2) from shift lever (1).



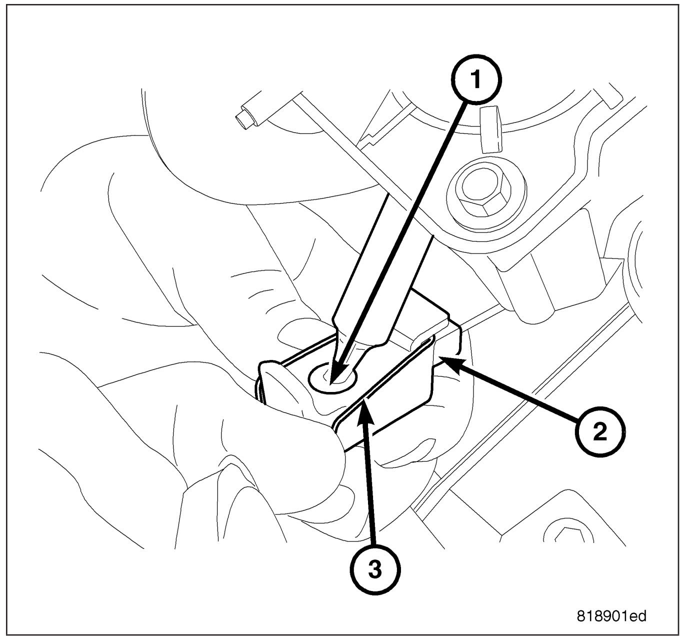
818900f8

5. Remove selector cable retaining clip (3) and disconnect cable (2) from the shift lever (1).

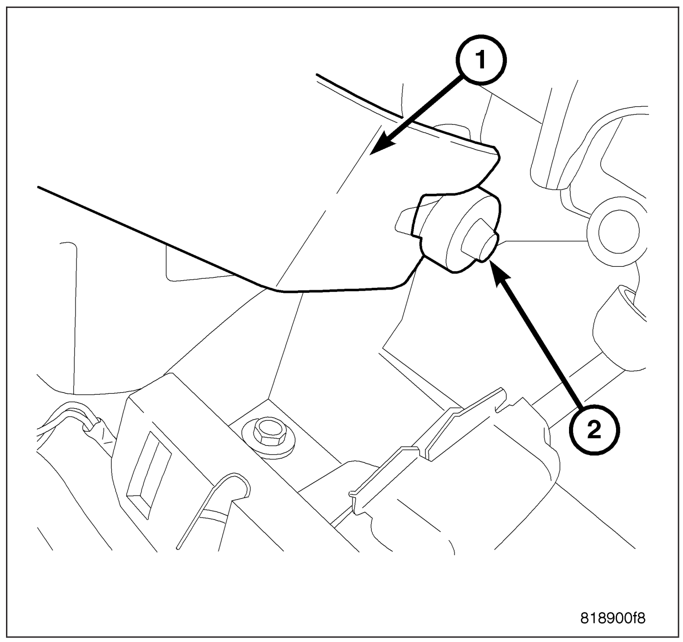


818901ed

6. Remove The shifter assy. to floor pan bolts and remove shifter from vehicle.

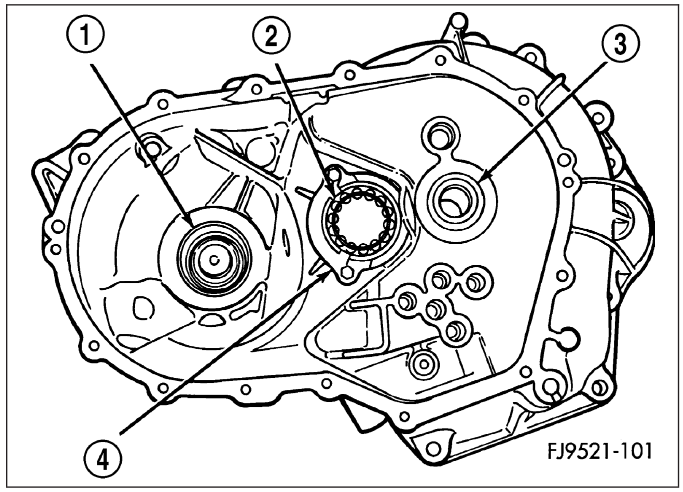


INSTALLATION

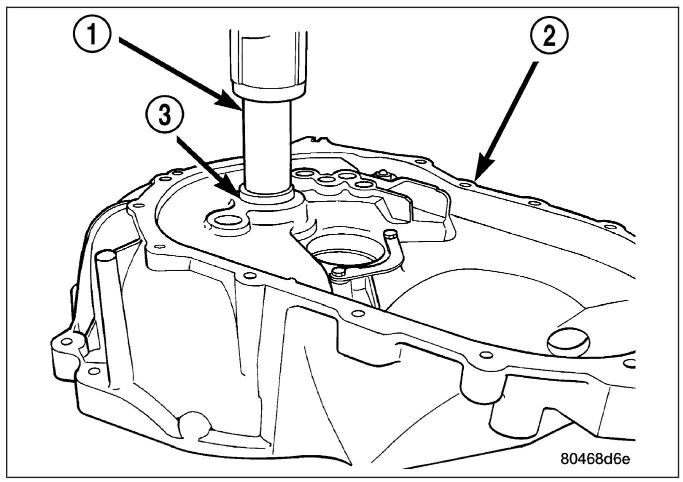


1. Install shifter assy. (1) to floor pan. Install and torque bolts to 7N·m (61 in. lbs.).

2. Install selector cable (2) to shifter lever (1) and secure cable to shifter bracket with clip (3).



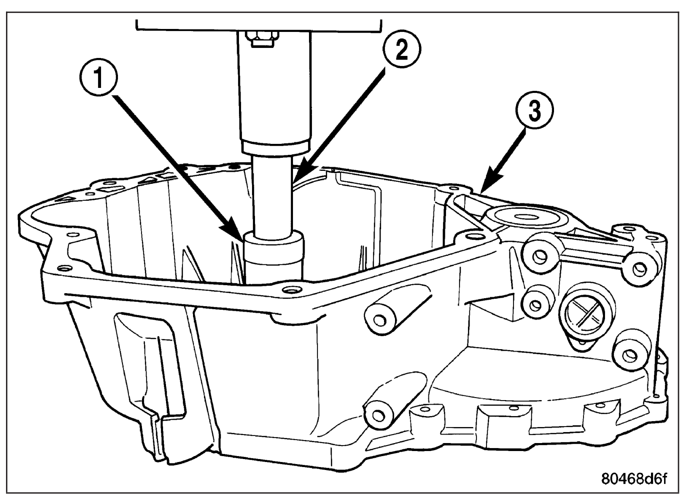
3. Install crossover cable to shifter lever and secure cable to shifter bracket.
4. Install center console assembly. Install rear power window switch (if equipped) and fasten harness to console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).
5. Install gearshift boot (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT BOOT - INSTALLATION).
6. Install gearshift knob (Refer to 21 - TRANSMISSION/TRANSAXLE/MANUAL/GEAR SHIFT KNOB - INSTALLATION).
7. Verify that shift pattern is aligned properly.



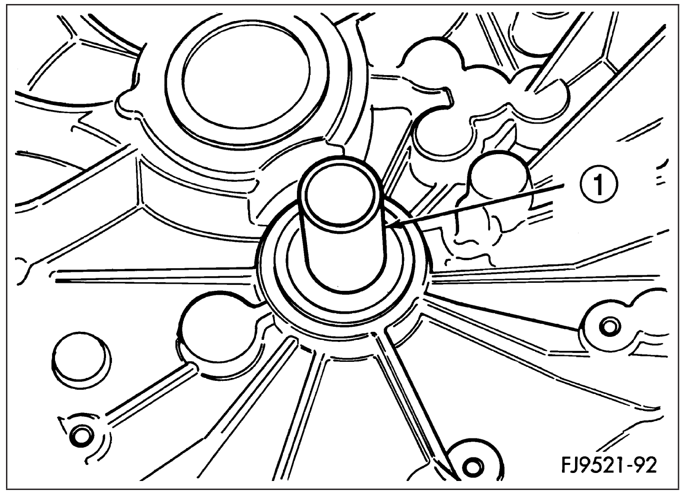
BEARING AND SLEEVE-INPUT

REMOVAL

The input bearing (3) is a one-piece bearing and sleeve unit. The sleeve is the slide point for the clutch-release bearing and lever.



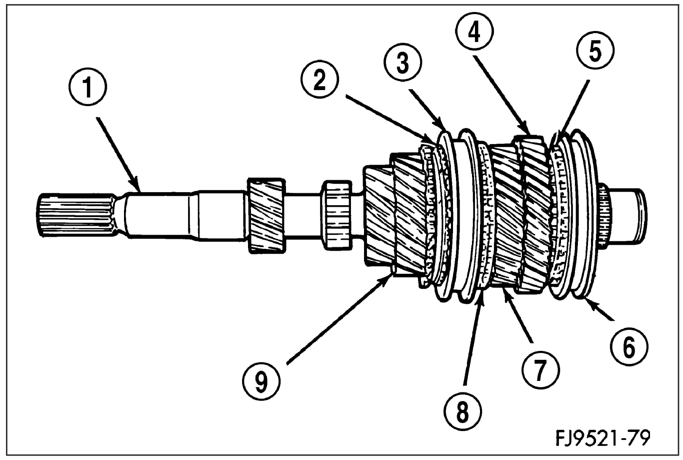
1. Install Driver 6342 (1) over input bearing on the gear case side of the transaxle clutch housing (2).
2. Press the input bearing (3) out of the housing.



INSTALLATION

1. Apply coating of Loctite® sealant on bearing outer diameter. Position sleeve and bearing assembly at input bearing bore.
2. Install Seal Remover C-4680-1 (1), over input bearing.

3. Using a suitable spacer tool and shop press, install input bearing (1) into bore until it is fully seated.

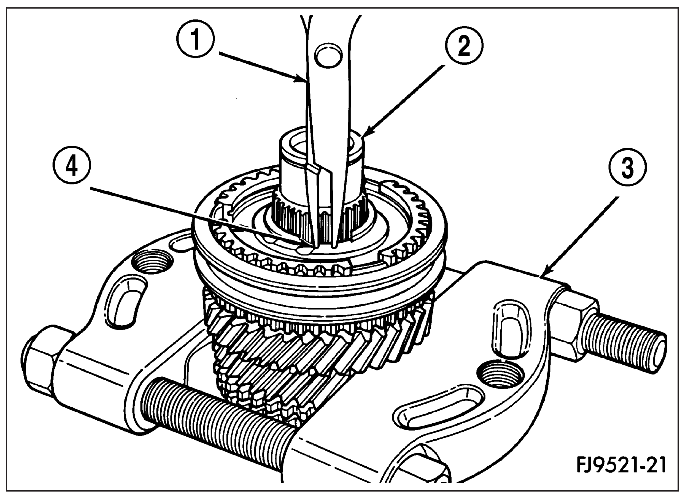


SHAFT-INPUT

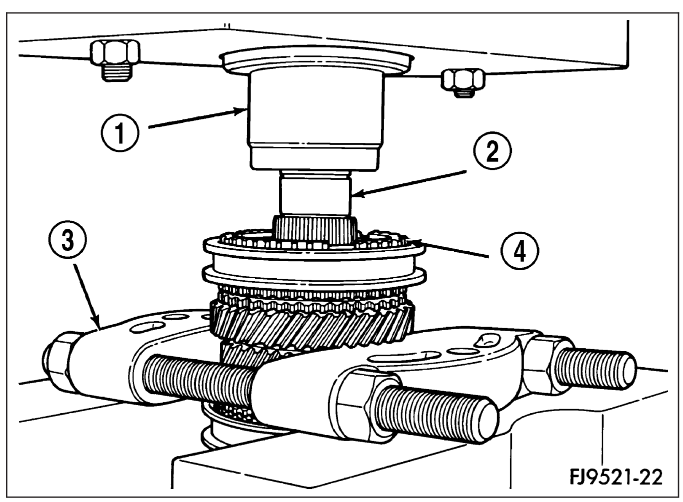
DISASSEMBLY

Before disassembly of the input shaft (1), it is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings (2,5, and 8) and the speed gears. The correct gaps are listed below:

- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)
- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in).
- 5th - 0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake - 0.505-1.74 mm (0.020-0.068 in.)

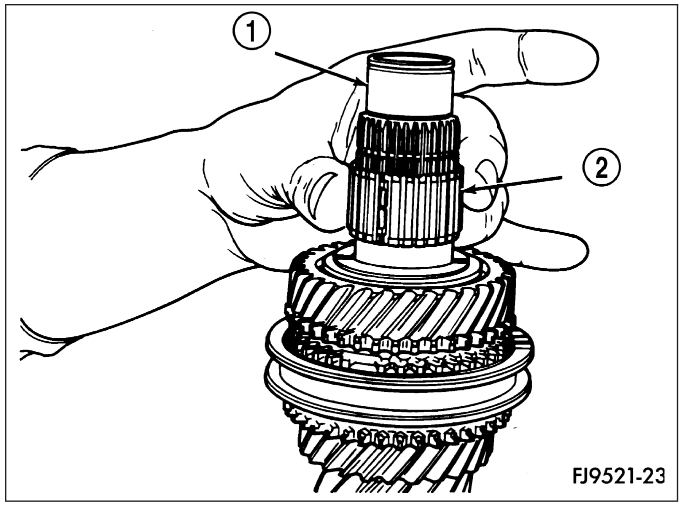


The reverse brake measurement is taken between the stop ring and case.

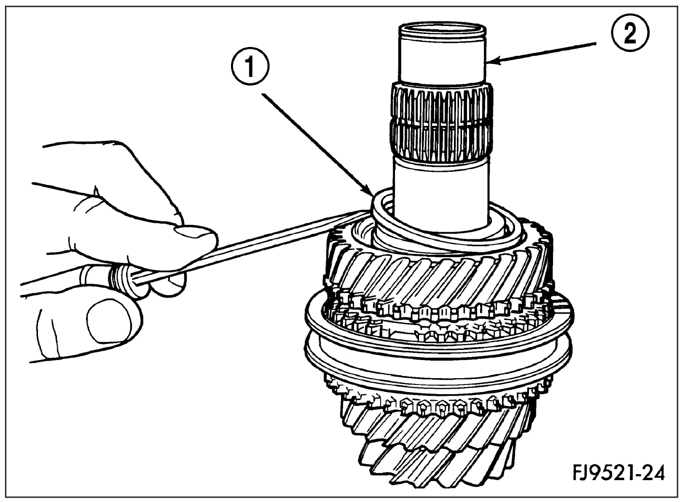


If a stop ring gap does not fall within the specifications, it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.

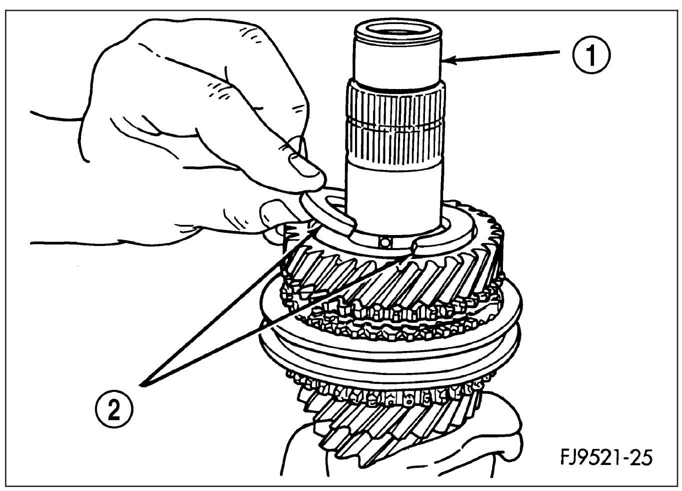
The input shaft incorporates the 3rd, 4th, and 5th speed gears and synchronizers on the assembly.



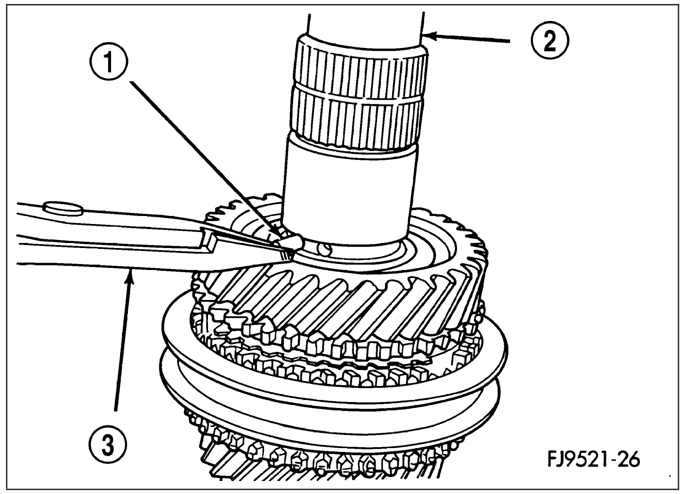
1. Install bearing splitter (3) behind 5th speed gear. Remove snap ring (4) at 5th synchronizer hub on input shaft (2).



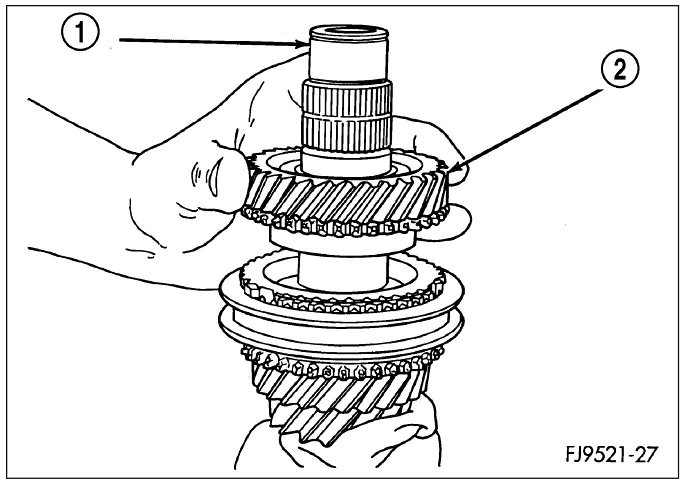
2. Remove synchronizer (4) and gear using shop press (1).



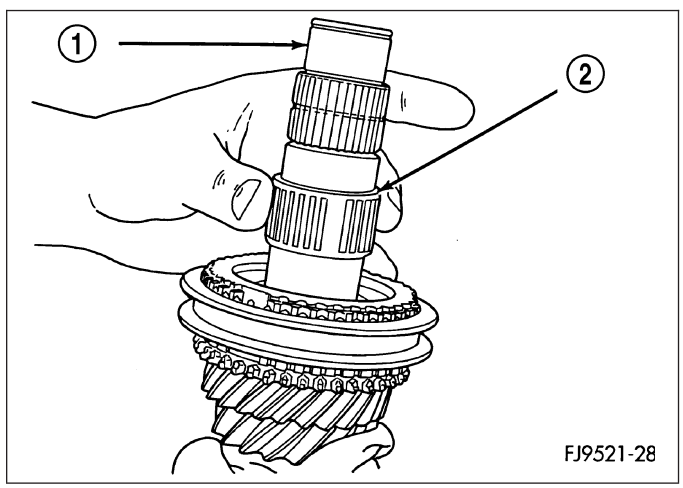
3. Remove caged needle bearing (2).



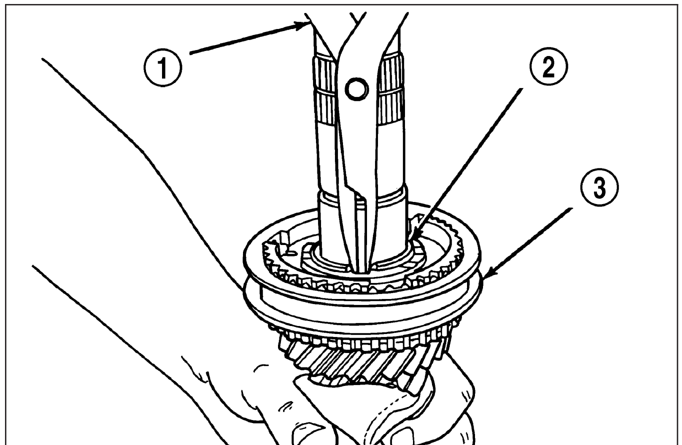
4. Remove 4-5 gears split thrust washer ring (1).



5. Remove split thrust washer (2).

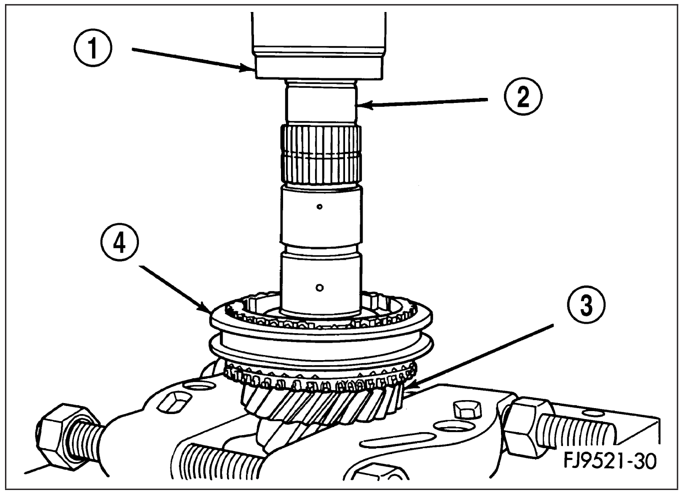


6. Remove split thrust washer separation pin (1).

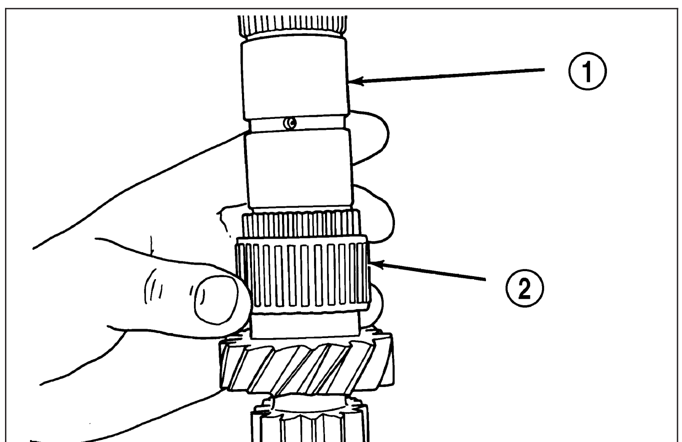


7. Remove 4th gear (2).

8. Remove 4th gear caged needle bearing (2). Check the caged needle bearing (2) for a broken retention spring.



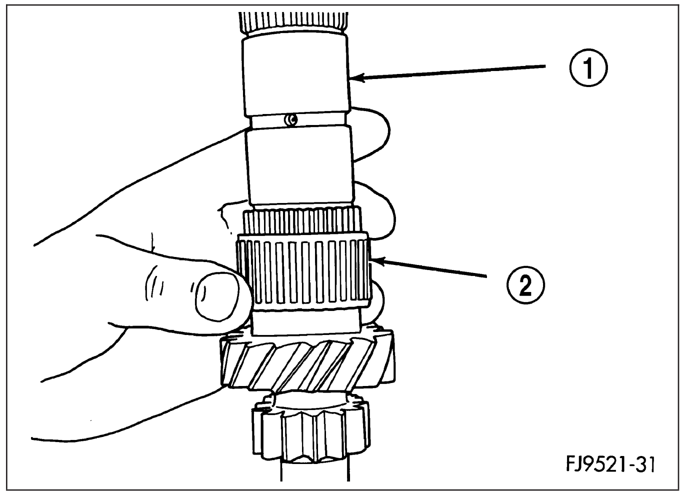
9. Remove blocking ring. Remove 3-4 synchronizer hub retaining snap ring (3).



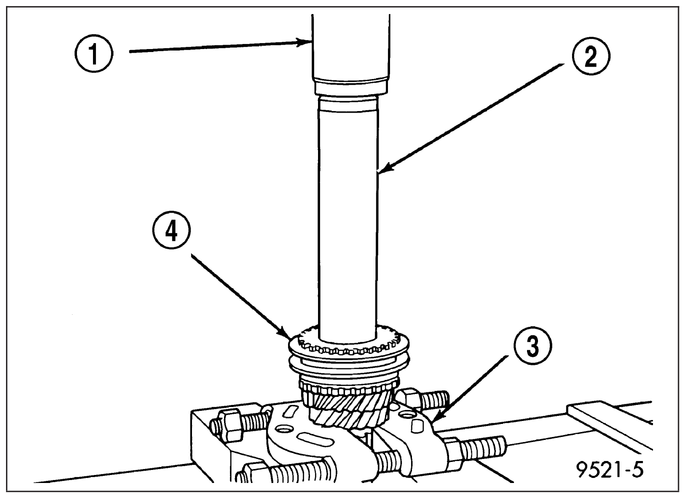
FJ9521-29

10. Install input shaft in shop press (1). Using bearing splitter, remove 3-4 synchronizer and 3rd gear (3).

FJ9521-30

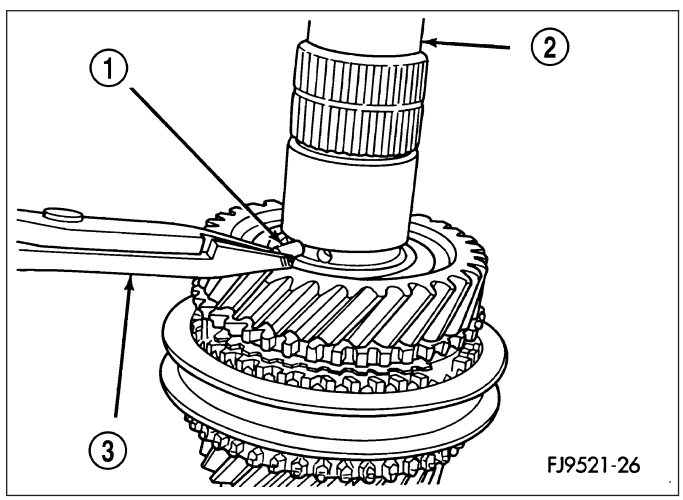


11. Remove 3rd gear caged needle bearing (2). Inspect needle bearing for a broken retention spring.
12. Inspect the input shaft for worn or damaged bearing races or chipped gear teeth. Replace as necessary.

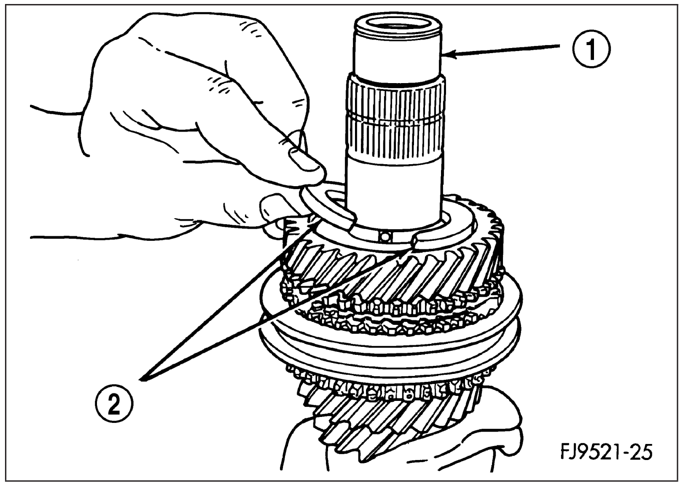


FJ9521-31

ASSEMBLY

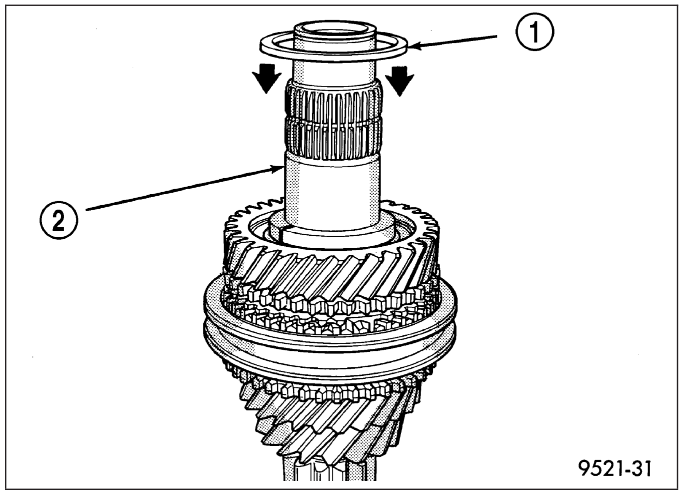


1. Place input shaft into shop press.
2. Install 3rd gear caged needle bearing (2).

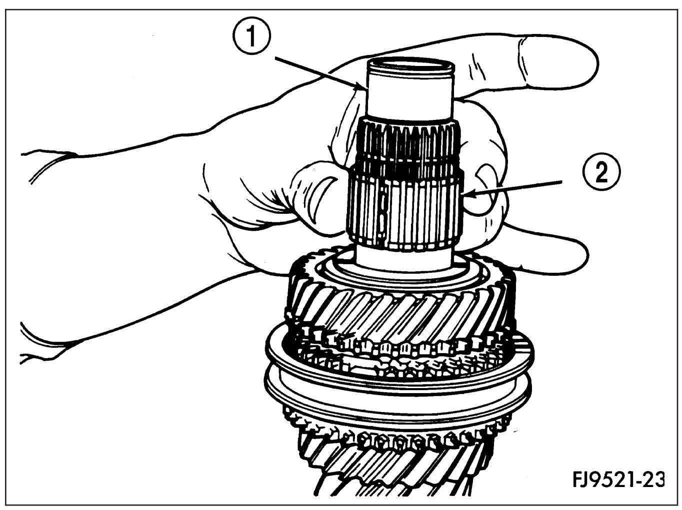


3. Install 3rd gear and 3-4 synchronizer (4) onto input shaft. Install Sleeve C-3717 (2) over input shaft and press on synchronizer hub and 3rd gear. The synchronizer hub has the letter **U** stamped on the top face of the hub. This designates that the hub must be installed with the **U** facing upward.

4. Install 3-4 synchronizer snap ring into slot on input shaft.
5. Install blocking ring into 3-4 synchronizer. Install 4th gear caged needle bearing.
6. Install 4th gear onto input shaft.
7. Install 4-5 split thrust washer separation pin (1).

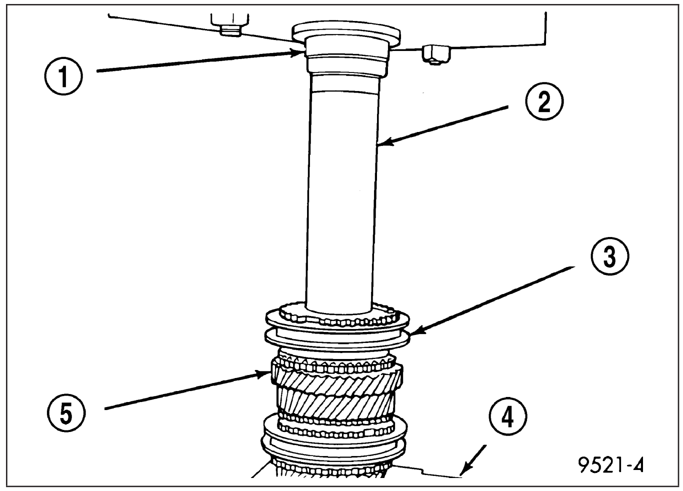


8. Install split thrust washer (2) onto input shaft (1).



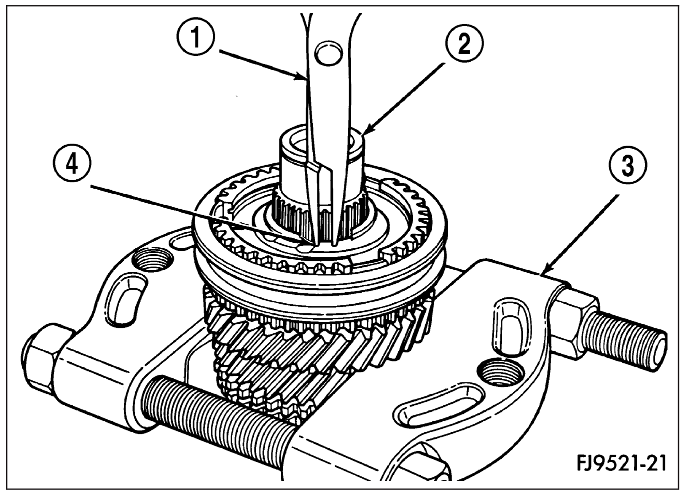
FJ9521-25

9. Install split thrust washer retaining ring (1).



9521-31

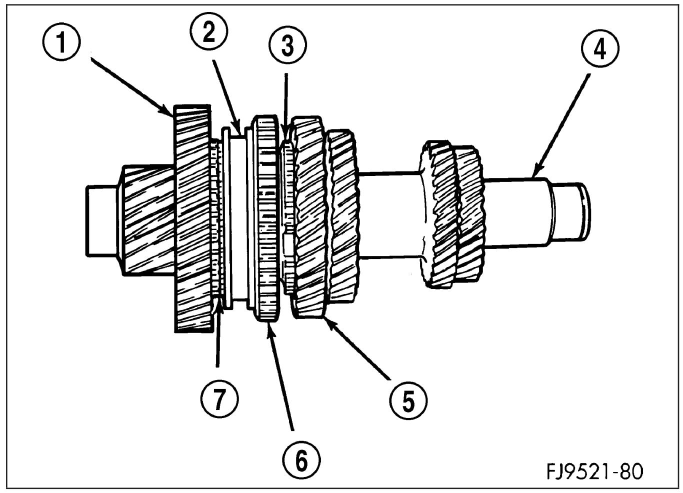
10. Install 5th gear caged needle bearing (2).



FJ9521-23

11. Using special Sleeve C-3717 (2), install 5th speed gear (5) and synchronizer (3). The 5th gear synchronizer hub has the letter **S** stamped on the top face of the hub. This designates that the hub must be installed with the **S** facing upward.

12. Install 5th gear synchronizer snap ring (4).



SHAFT-OUTPUT

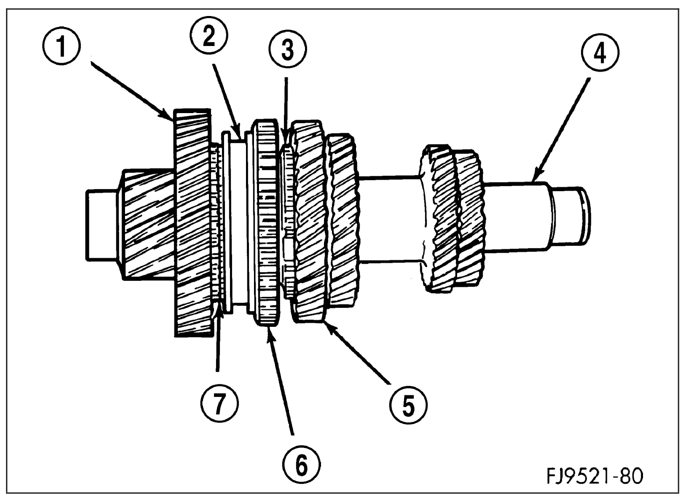
DISASSEMBLY

CAUTION: The output shaft is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the output shaft assembly.

It is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears. The correct gaps are listed below:

- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)
- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in)
- 5th - 0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake - 0.51-1.74 mm (0.020-0.068 in.)

If a stop ring gap does not fall within the specifications it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.



The output shaft incorporates the 1st and 2nd gears and synchronizers on the assembly.

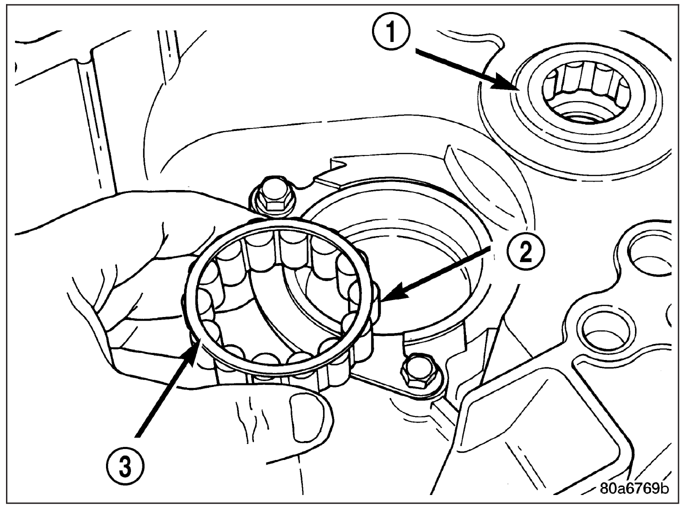
INSPECTION

CAUTION: The output shaft is serviced as an assembly. Do not try to repair any component on the output shaft. If the 1-2 synchronizer or gear fails, it is necessary to replace the output shaft assembly.

It is necessary to check the synchronizer stop ring gap. Use a feeler gauge to measure the gaps between the stop rings and the speed gears (3,7). The correct gaps are listed below:

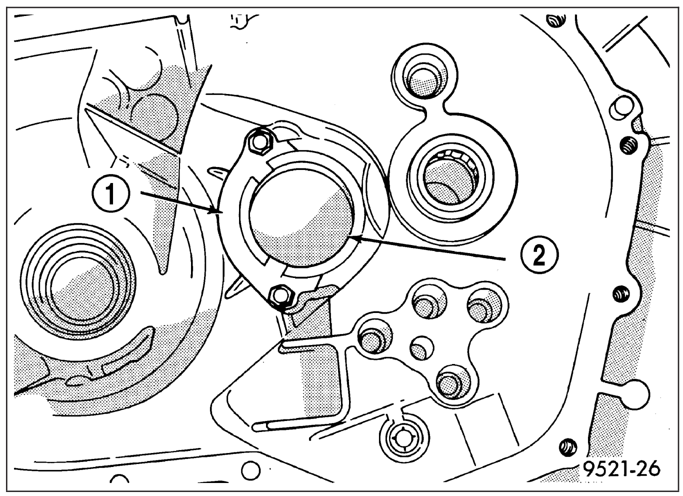
- 1st - 0.522-2.208 mm (0.021-0.087 in)
- 2nd - 0.522-2.208 mm (0.021-0.087 in)
- 3rd - 0.73-1.53 mm (0.029-0.060 in)
- 4th - 0.77-1.57 mm (0.030-0.062 in)
- 5th - 0.73-1.53 mm (0.029-0.060 in)
- Reverse Brake - 0.51-1.74 mm (0.020-0.068 in.)

If a stop ring gap does not fall within the specifications it must be inspected for wear and replaced. If the 1st or 2nd synchronizer stop ring is worn beyond specifications, the complete output shaft assembly must be replaced.



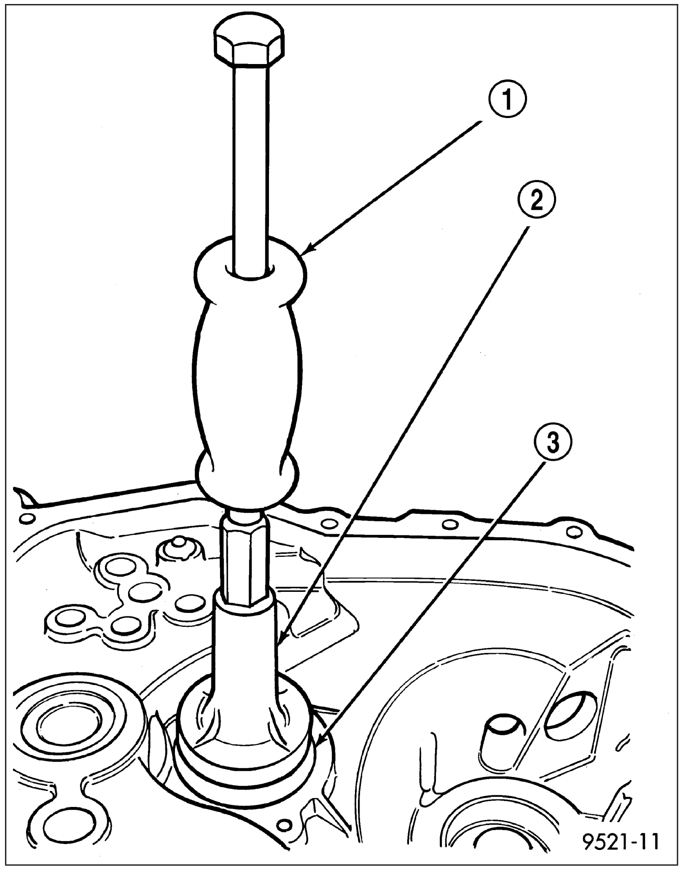
The output shaft incorporates the 1st and 2nd gears and synchronizers on the assembly.

BEARING AND RACE-OUTPUT



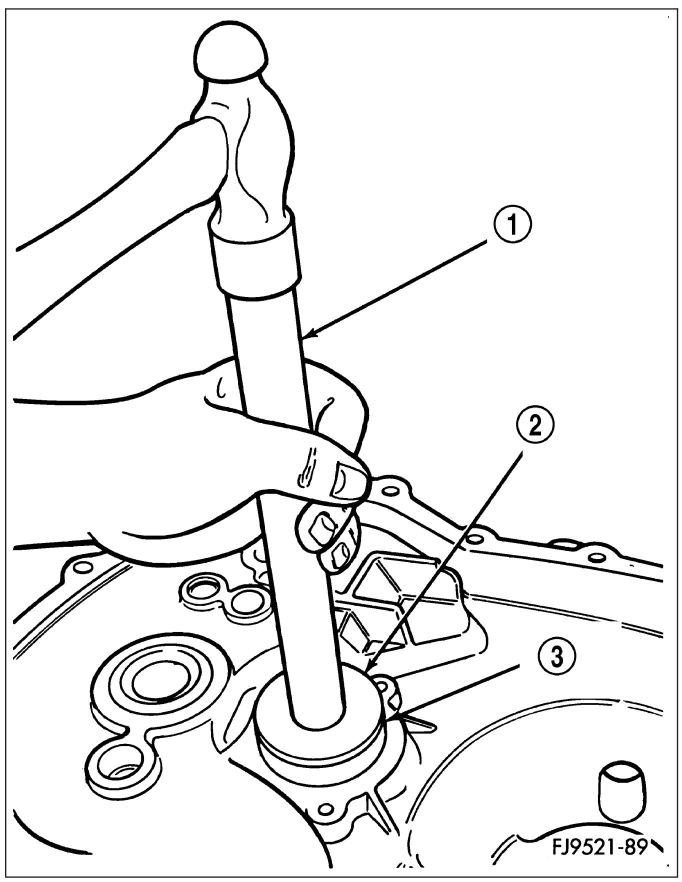
REMOVAL

CAUTION: The position of the output shaft bearing is critical. The bearing is not identical end-to-end. Install bearing with larger diameter cage ring facing out.



1. Remove caged roller bearing (3) from output bearing race.

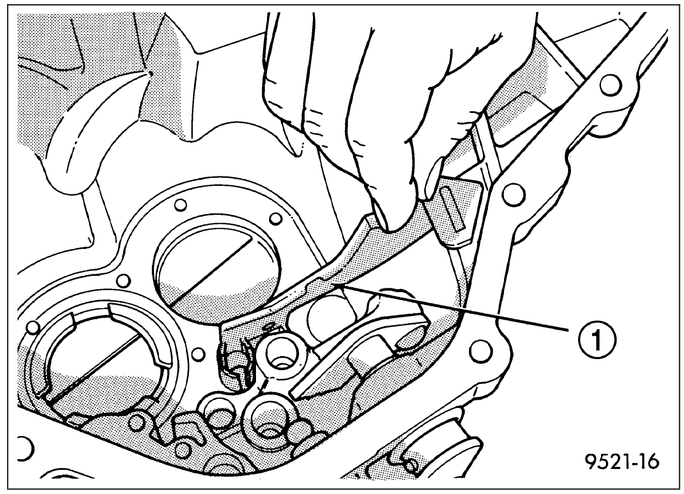
2. Remove screws at output bearing retainer strap (1).



3. Install slide Remover 6787 and Slide Hammer C-3752 (2). Tighten tool to output bearing race.
4. Using slide hammer, remove output bearing race (3).

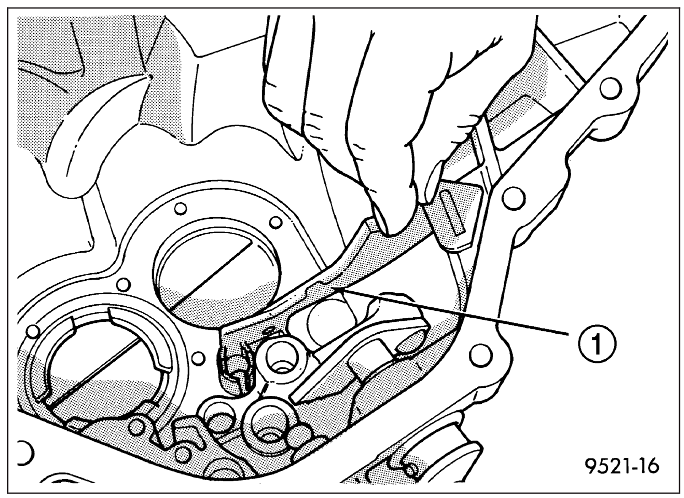
INSTALLATION

1. Line up output bearing race (3) to race bore.
2. Insert tool Installer 4628 (2) with Handle C-4171 (1) into output bearing race. Tap race into bore. Install output bearing into race. Verify that the larger diameter cage is facing outward. Position bearing retaining strap. Tighten bolts to 11 N·m (96 in. lbs.).



TROUGH-REAR BEARING OIL FEED

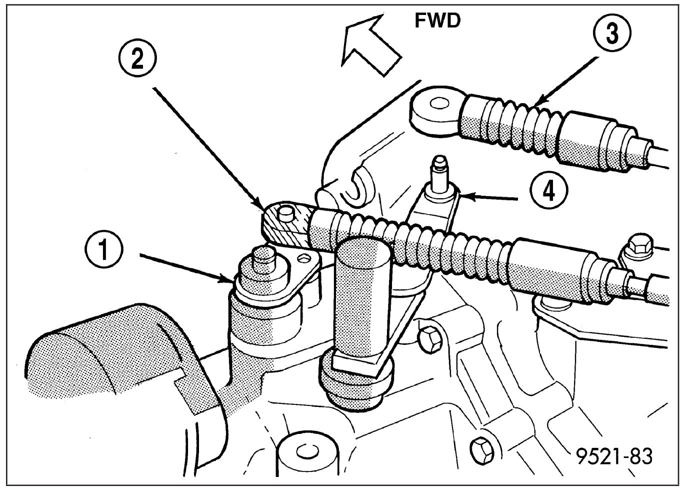
REMOVAL



The bearing oil feed trough (1) is retained in the case by a pin that is molded into the case and clips that are part of the trough.

1. Using light plier pressure, squeeze the clips together at the rear of the trough.
2. Slide the trough over the retaining pin that locates the trough in the case.

INSTALLATION

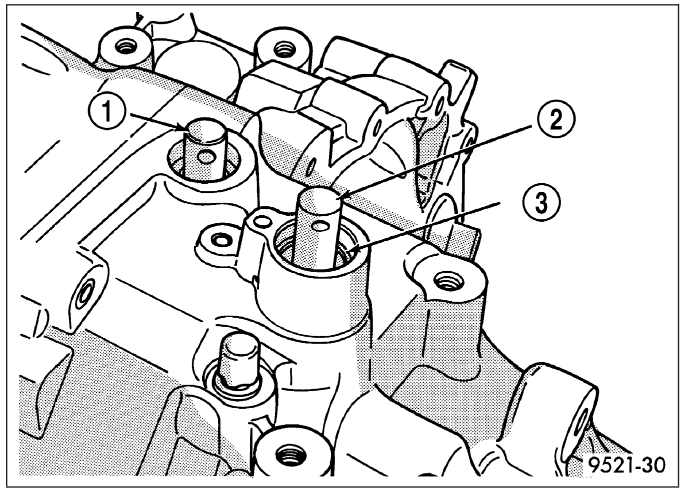


1. Slide the trough (1) over the retaining pin that locates the trough in the case.

LEVER-SHIFT CROSSOVER

REMOVAL

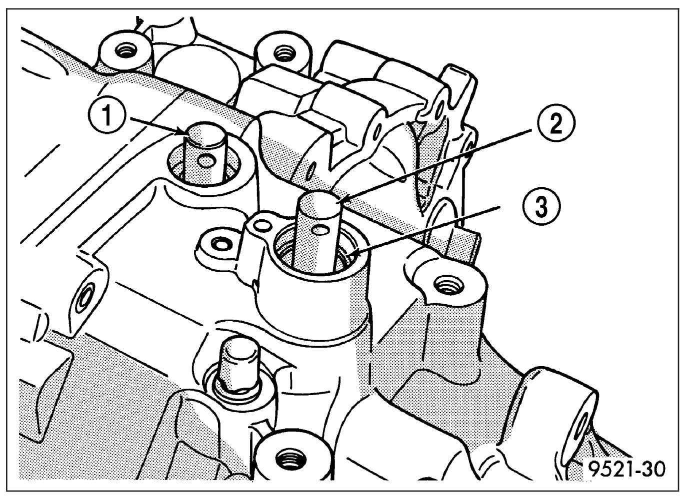
1. Disconnect crossover cable (2) from crossover lever (1) and cable bracket.
2. Using a pin punch, remove the crossover roll pin from lever (4).
3. Pull up and remove the crossover lever (4) from the transaxle crossover shaft.



INSTALLATION

1. Install crossover lever to shaft and fasten with NEW roll pin.
2. Install crossover cable to bracket. Fasten with clip.
3. Install crossover cable to crossover lever.

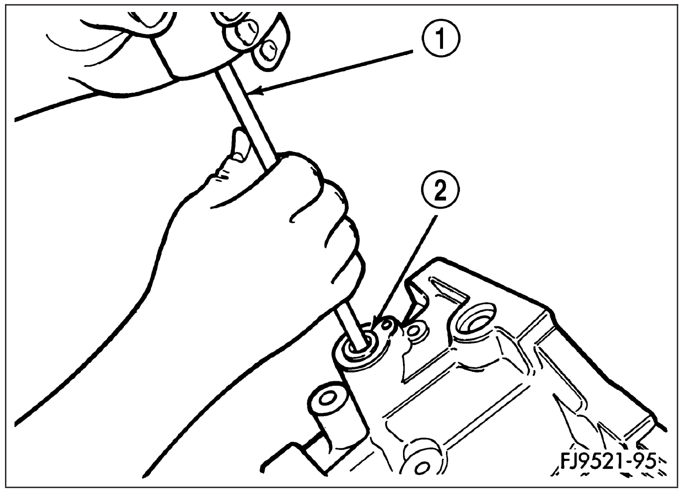
SHAFT-SHIFT CROSSOVER



REMOVAL

1. Disassemble transaxle.
2. With the transaxle disassembled, remove the crossover shaft seal.
3. Using snap-ring pliers, remove the snap ring (3) at the crossover shaft bore.
4. Push the crossover shaft (2) in the case and remove the crossover assembly.

INSTALLATION



1. Install crossover shaft to case and install snap ring (3).
2. Install the crossover shaft seal.
3. Assemble transaxle.

BUSHING-SHIFT CROSSOVER SHAFT

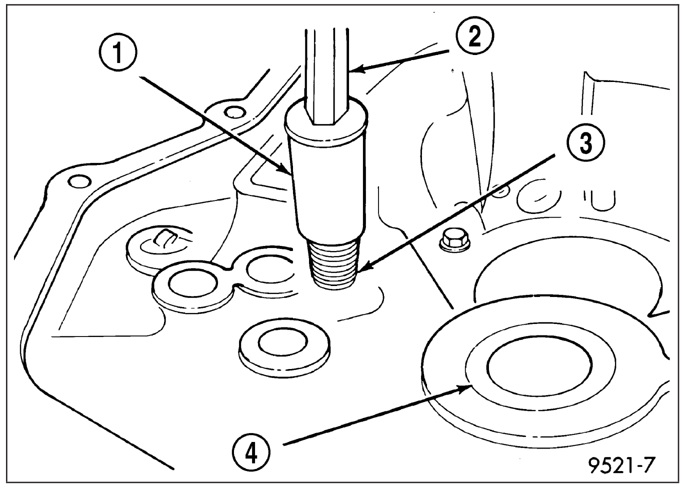
REMOVAL

1. Install Slide Hammer C-3752 (1) through the crossover bushing.
2. Thread nut and washer onto slide hammer.
3. Using the slide hammer, remove the crossover shaft bushing (2).

INSTALLATION

1. Position the replacement crossover shaft bushing over the crossover shaft bushing bore.
2. Using an appropriate size deep-well socket, install the crossover shaft bushing into the bushing bore.

RAIL AND FORK-SHIFT



DISASSEMBLY

1. Remove shift rails from the geartrain.
2. To service the 5-R shift rail, remove the C-clip retaining the reverse shift lever arm. Remove the 5th shift fork roll pin and remove the 5th shift fork. Remove the shift lug roll pin and remove the shift lug. Replace parts as necessary.
3. To service the 3-4 shift rail, remove the roll pin retaining the 3-4 shift fork. Remove the shift fork. Remove the shift lug roll pin and remove the shift lug. Replace parts as necessary.
4. To service the 1-2 shift rail, remove the roll pin retaining the 1-2 shift fork. Remove the shift fork and replace parts as necessary.

BUSHINGS-SHIFT RAIL

REMOVAL

1. Thread Remover 6786 (1) into shift rail bushing.
2. Install slide hammer C-3752 (2) onto tool.
3. Remove bushing (3) using slide hammer and tool assembly.

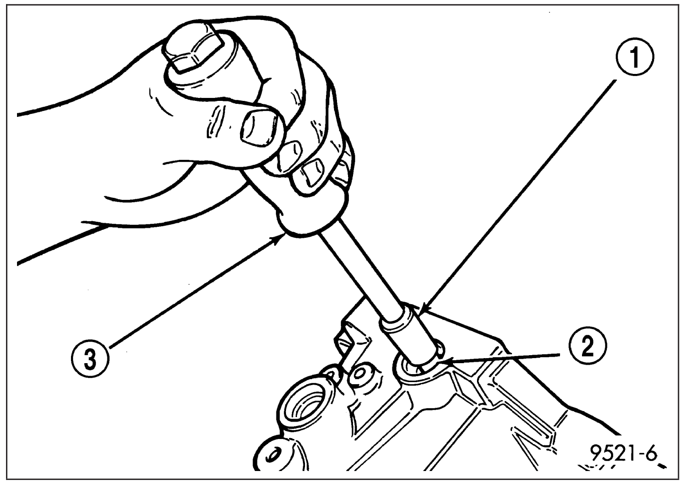
INSTALLATION

1. Line up replacement bushing in bore.
2. Using Installer MD998343, tap bushing into bore until flush with the chamfer in the case.

SHAFT-SHIFT SELECTOR

REMOVAL

1. Disassemble transaxle.
2. With the transaxle disassembled, remove the selector shaft by pushing on the shaft from the outside. Pull shaft out from the inside.

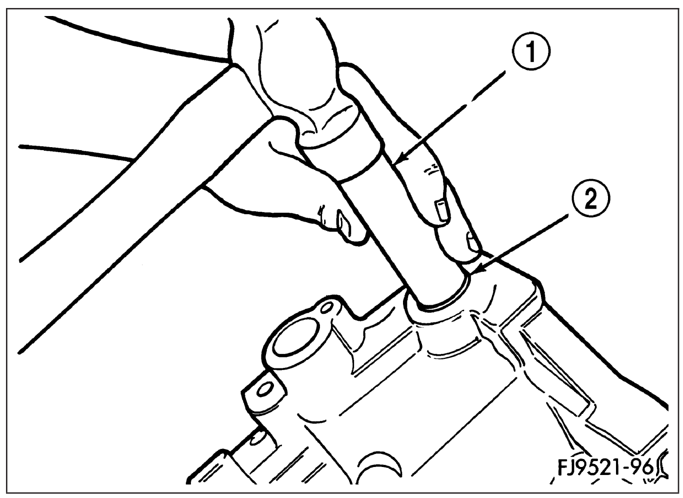


INSTALLATION

1. Pull selector shaft into position from the outside.
2. Assemble transaxle.

BUSHING-SHIFT SELECTOR SHAFT

REMOVAL



1. Remove selector shaft using procedure in this group.
2. Thread Remover 6786 (1) into bushing.
3. Install slide hammer C-3752 (3) onto tool and remove bushing (2) using slide hammer

.

INSTALLATION

1. Position replacement bushing over selector shaft bore.
2. Using an appropriate size deep-well socket (1), install bushing (2) in selector shaft bore.

SEALS-SHIFT SHAFT

REMOVAL

It is not necessary to remove the shift shafts from the transaxle to service the shift shaft seals.

1. Using a pick tool, pry up on the shift shaft seal, and remove seal from bore.

INSTALLATION

1. Position new shift shaft seal into bore.
2. Install shift shaft seal into bore using an appropriate size deep-well socket.

SYNCHRONIZER

DISASSEMBLY

Place synchronizer in a clean shop towel and wrap. Press on inner hub. Carefully open up shop towel and remove springs, balls, keys, hub, and sleeve.

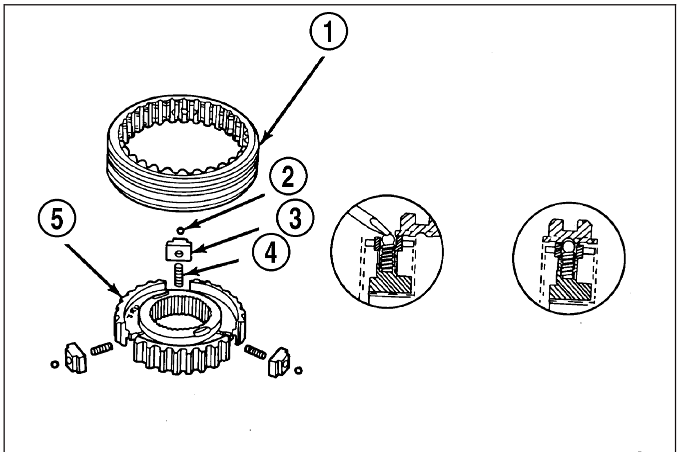
CLEANING

CLEAN

Do not attempt to clean the blocking rings in solvent. The friction material will become contaminated. Place synchronizer components in a suitable holder and clean with solvent. Air dry.

INSPECTION

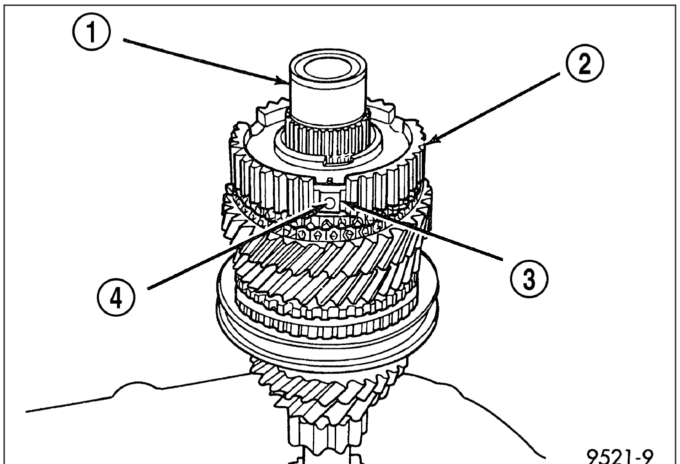
INSPECT



Proper inspection of components involve:

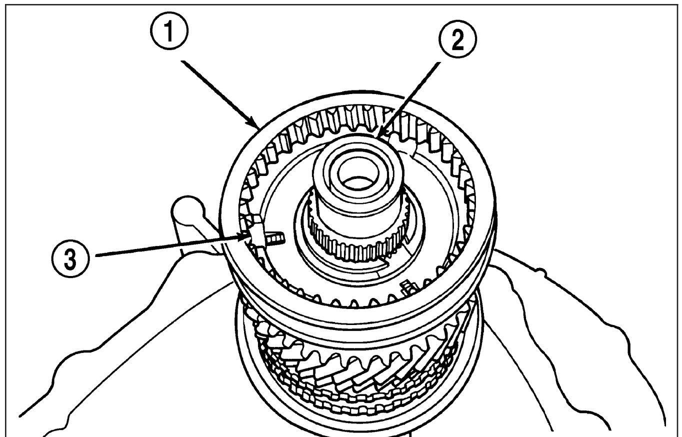
- Teeth, for wear, scuffed, nicked, burred, or broken teeth
- Keys, for wear or distortion
- Balls and springs, for distortion, cracks, or wear

If any of these conditions exist in these components, replace as necessary.



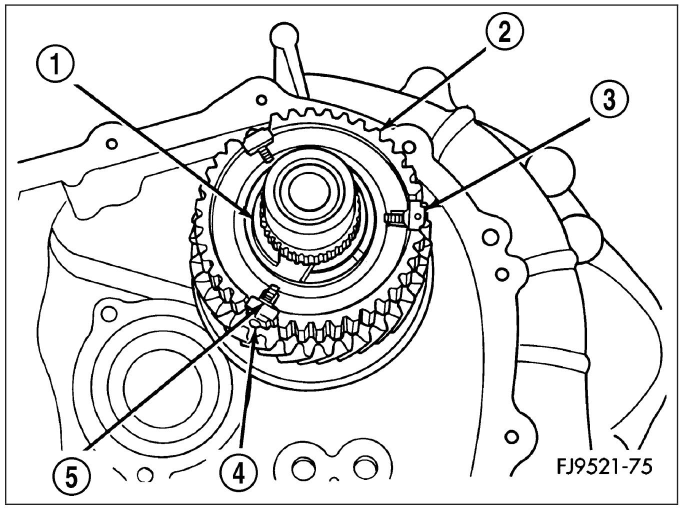
ASSEMBLY

1. Position synchronizer hub (5) onto a suitable holding fixture (input shaft). The synchronizer hubs (5) are directional. The hubs must be installed with the **U** facing upward.
2. Install springs (4) into hub slot.



9521-69

3. Insert key (3) into hub (2) and spring.
4. Apply petroleum jelly to the hole in the key. Insert balls (4) into each key.



9521-9

5. Slide sleeve (1) over the hub and depress balls as you carefully slip the sleeve into position.

FJ9521-76

6. Line up stop ring tang over the keys in the hub, install stop rings, center the keys (3) and balls (4) by pushing on both stop rings.

FJ9521-75

SENSOR-VEHICLE SPEED

DESCRIPTION

VEHICLE SPEED SENSOR

The Vehicle Speed Sensor (VSS) is a hall effect sensor mounted above the transaxle differential. The sensor is triggered by the ring gear teeth passing below it. The VSS pulse signal to the speedometer/odometer is monitored by the PCM speed control circuitry to determine vehicle speed and to maintain speed control set speed.

REMOVAL

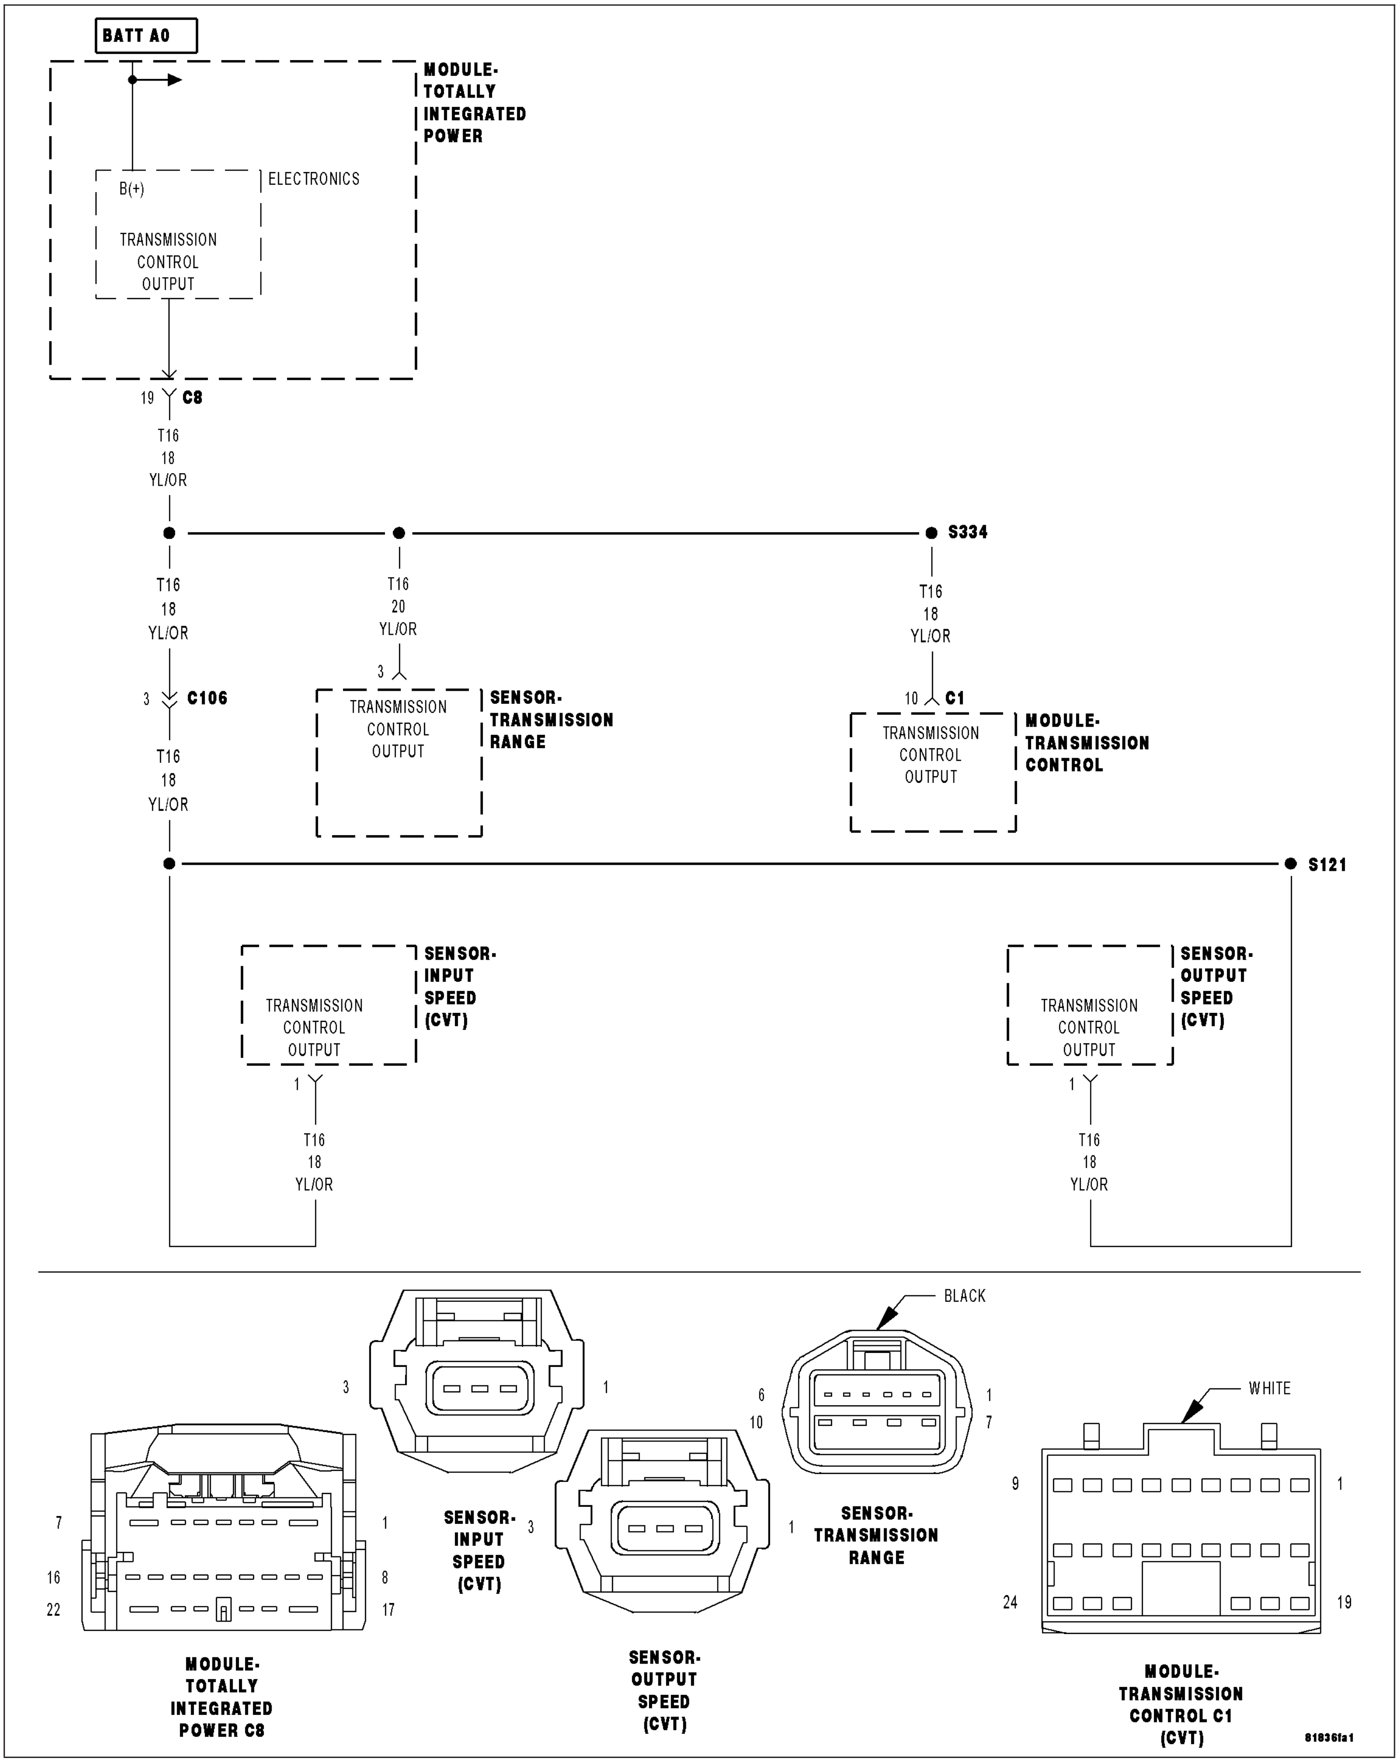
1. Open hood.
2. Remove the air cleaner housing. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)
3. Disconnect the speed sensor connector (1).

CAUTION: Clean area around speed sensor before removing to prevent dirt from entering the transaxle during speed sensor removal.

4. Remove speed sensor retaining bolt.
5. Remove speed sensor from transaxle.

INSTALLATION

1. Using a NEW o-ring (3), install the speed sensor (2) to the transaxle.
2. Install the bolt and torque to 7 N·m (60 in. lbs.).
3. Connect speed sensor connector (1).
4. Install the air cleaner housing. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION)



AUTOMATIC - CVT-ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

AUTOMATIC - CVT-ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

P128B-TCM POWER CONTROL CIRCUIT 2 LOW - TIPM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  A shorted condition is detected in the Transmission Control Output circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, check Transmission DTCs.

Are there any Speed Sensor or Transmission Range Sensor DTCs present?

Yes >> Refer to the transmission category and perform the appropriate symptom(s).

No >> Go to 2

2. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, check TIPM DTCs.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Go to 6

3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO GROUND

Turn the ignition off
Disconnect the TIPM C8 harness connector.
Disconnect the TCM C1 harness connector.
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.
Measure the resistance between ground and the (T16) Transmission Control Output circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T16) Transmission Control Output circuit for a short to ground.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go to 4

4. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Connect the TIPM C8 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at all the (T16) Transmission Control Output circuits?

Yes >> Go To 5

No >> Repair the (T16) Transmission Control Output circuit for an open.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

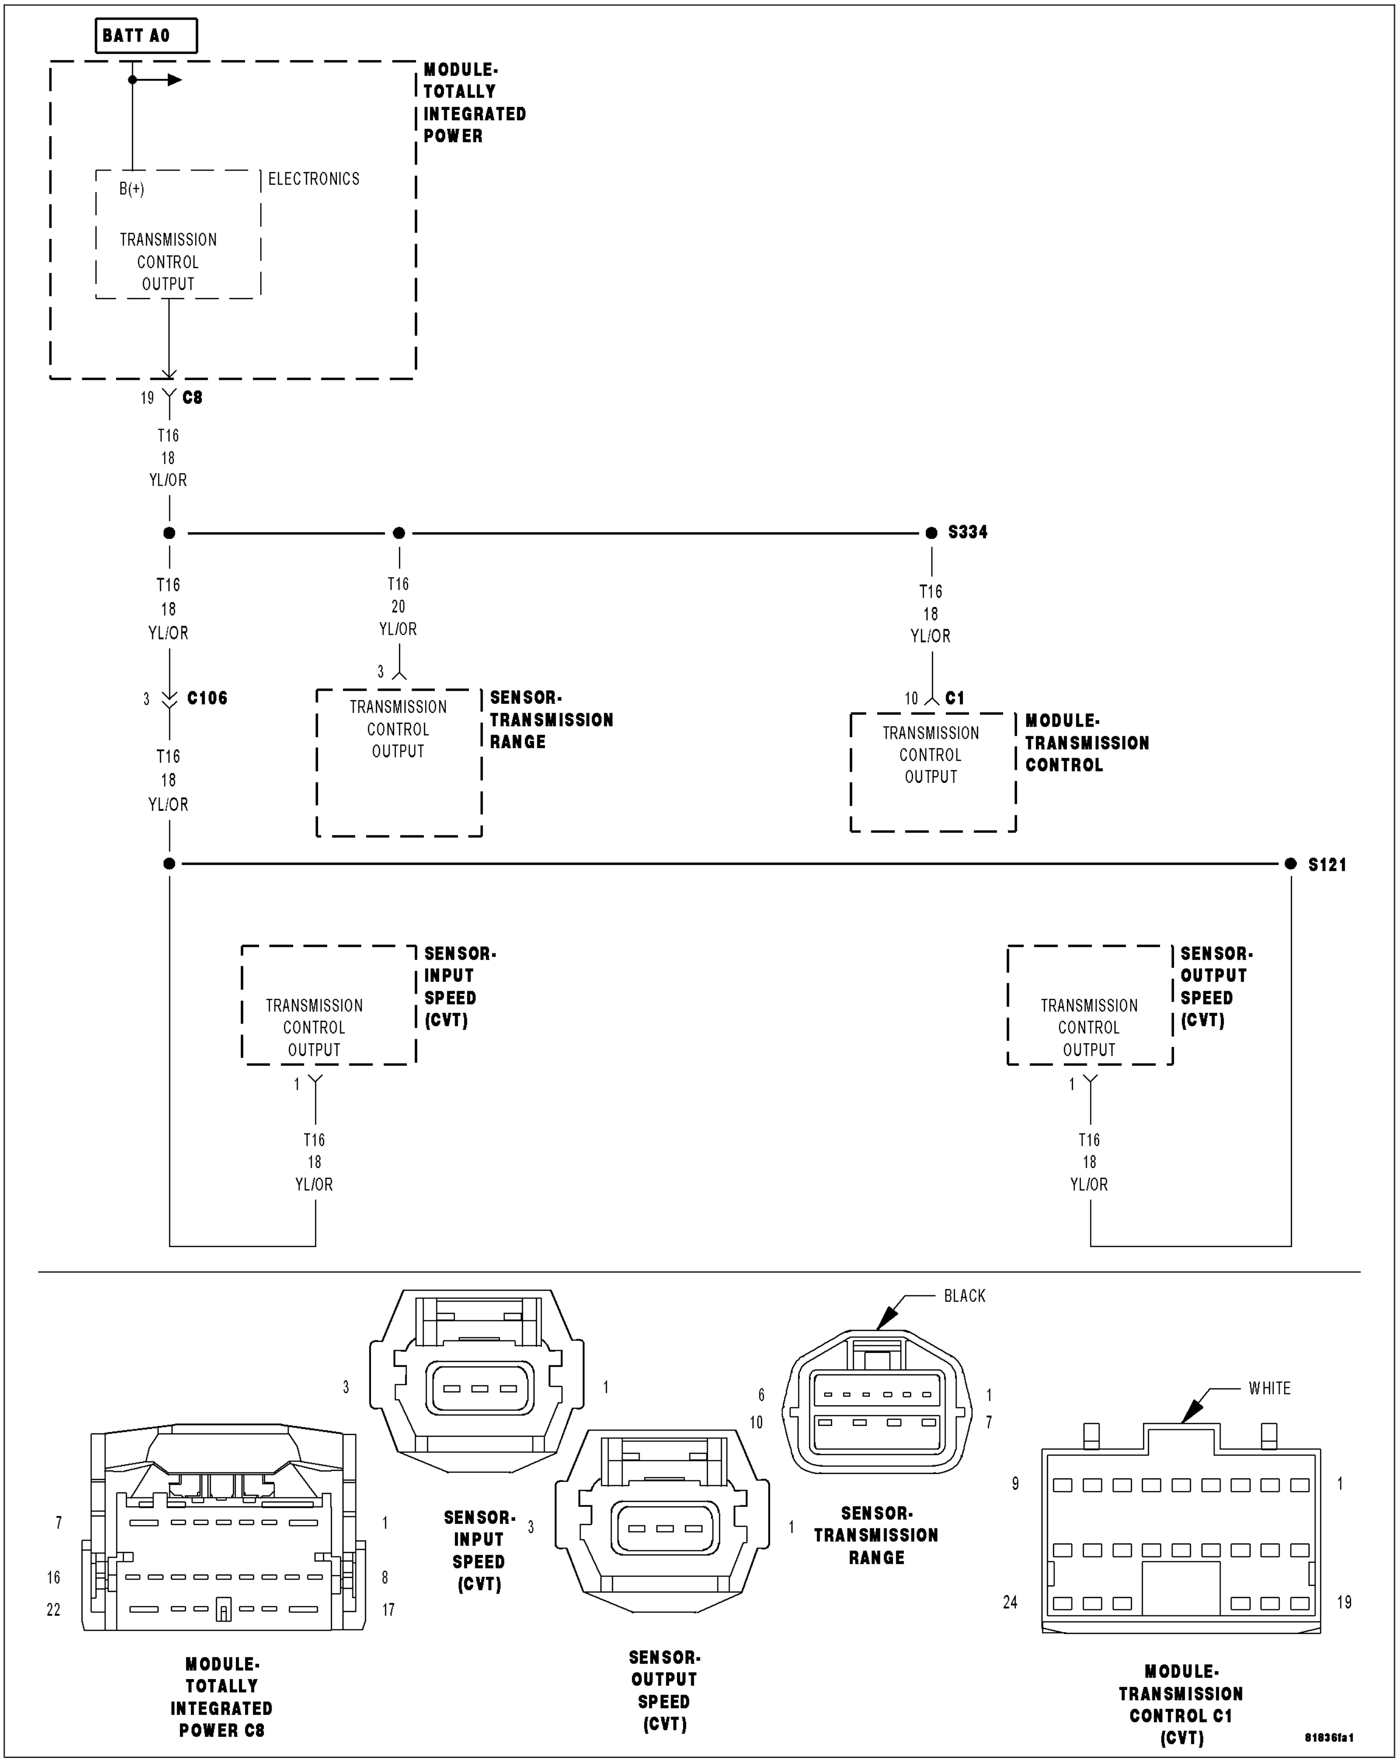
No >> Replace and program the TIPM per Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.



Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test complete.

P128C-TCM POWER CONTROL CIRCUIT 2 HIGH - TIPM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  A shorted condition is detected in the TIPM Transmission Control Output circuit.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, read TIPM DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 4

2. (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TIPM C10 harness connector.

Disconnect the TCM C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T16) Transmission Control Output circuit.

Is the voltage above 10.0 volts?

Yes >> Repair the (T16) Transmission Control Output circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go to 3

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out

Pay particular attention to all power and ground circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

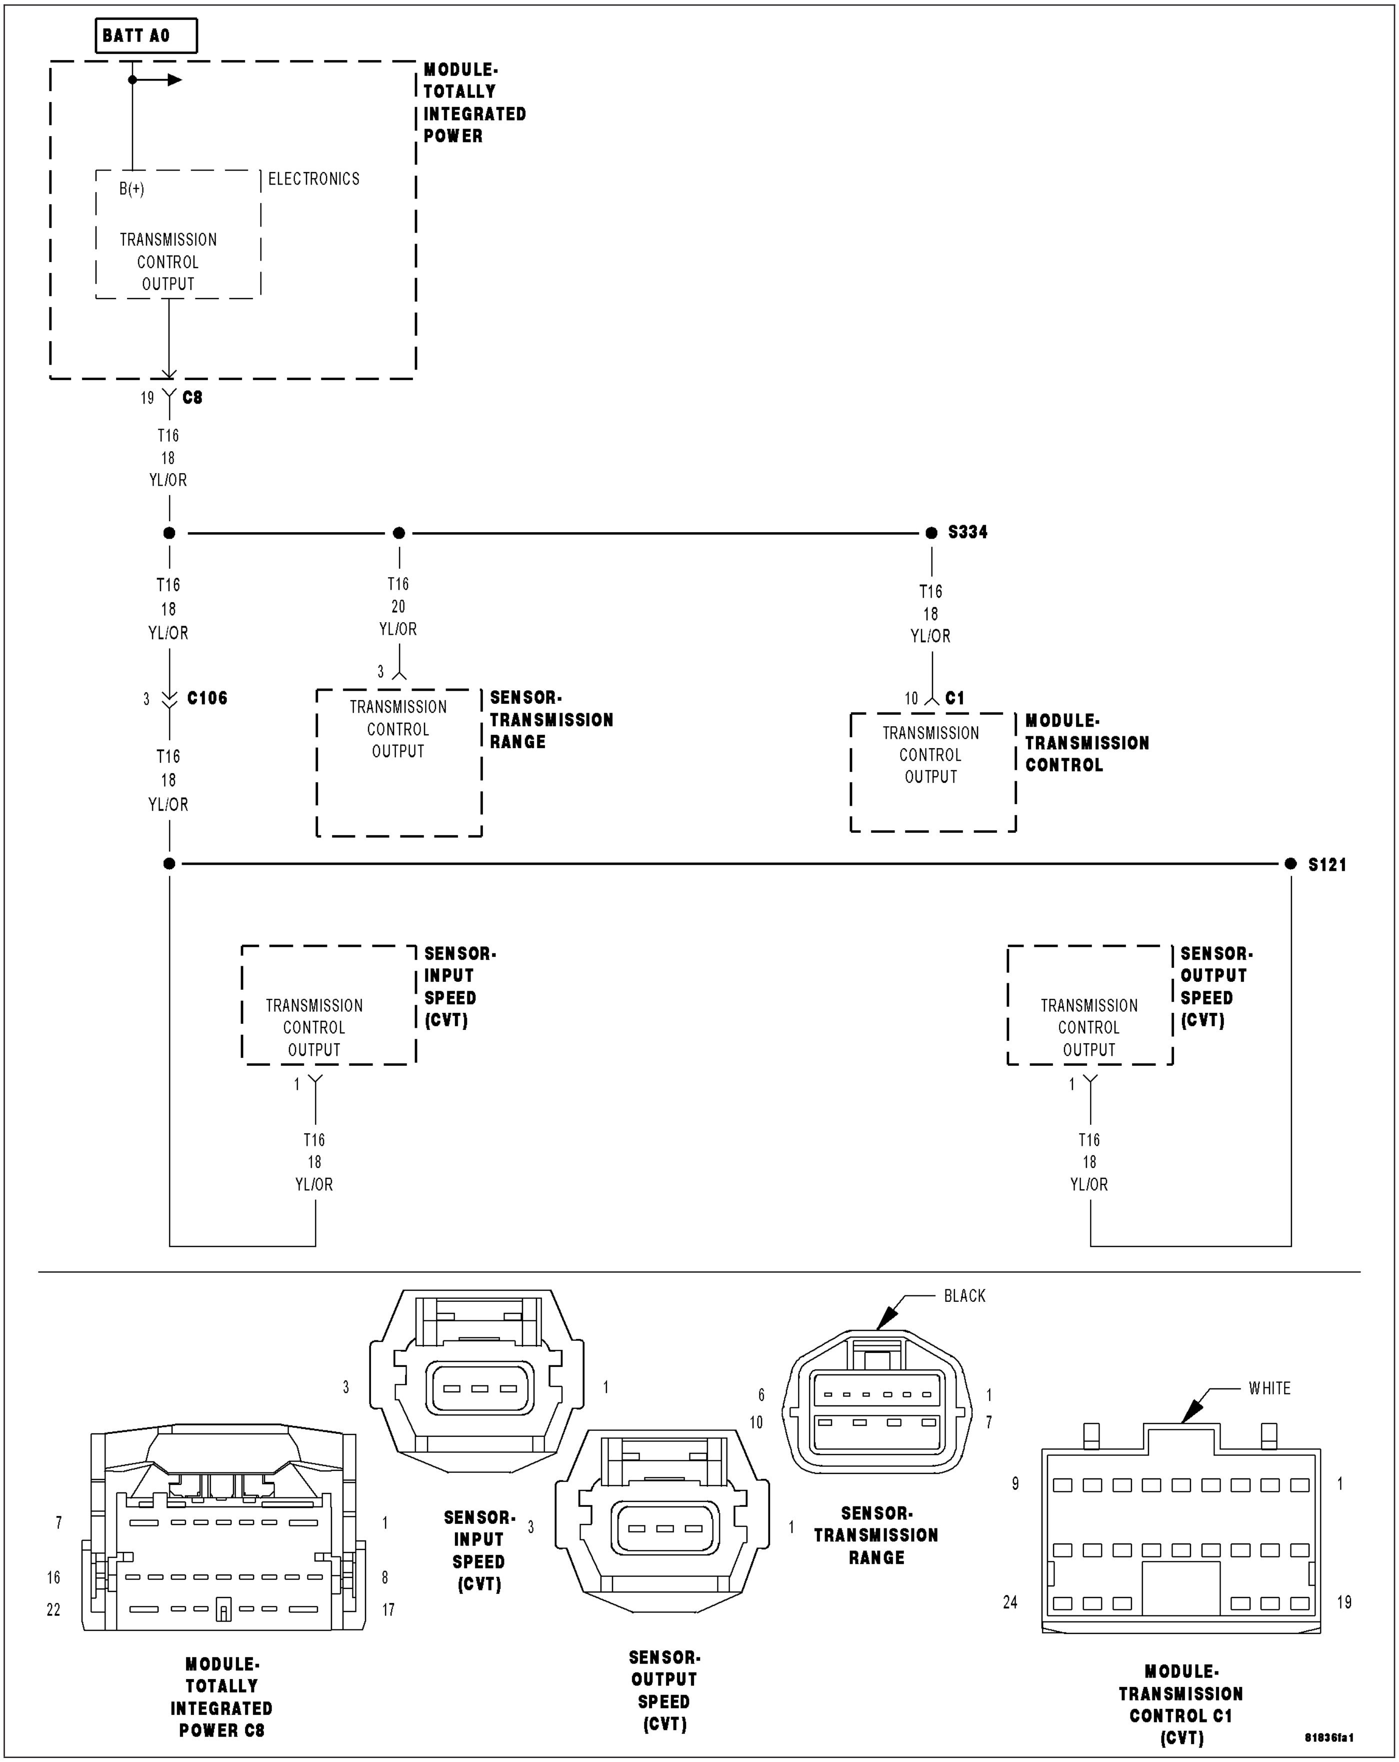
4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Were any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test complete.

P128D-TCM POWER CONTROL CIRCUIT 2 OPEN - TIPM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  An open condition of the Transmission Control Output circuit is detected by the Totally Integrated Power Module (TIPM).

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 4

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuits.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (T16) Transmission Control Output circuit for an open.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

3. TOTALLY INTEGRATED POWER MODULE

Using the schematics as a guide, inspect the wire harness and connectors.

Check the TIPM harness connector terminals for corrosion, damage, or terminal push out.

Pay particular attention to all power and ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace and program the TIPM per Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

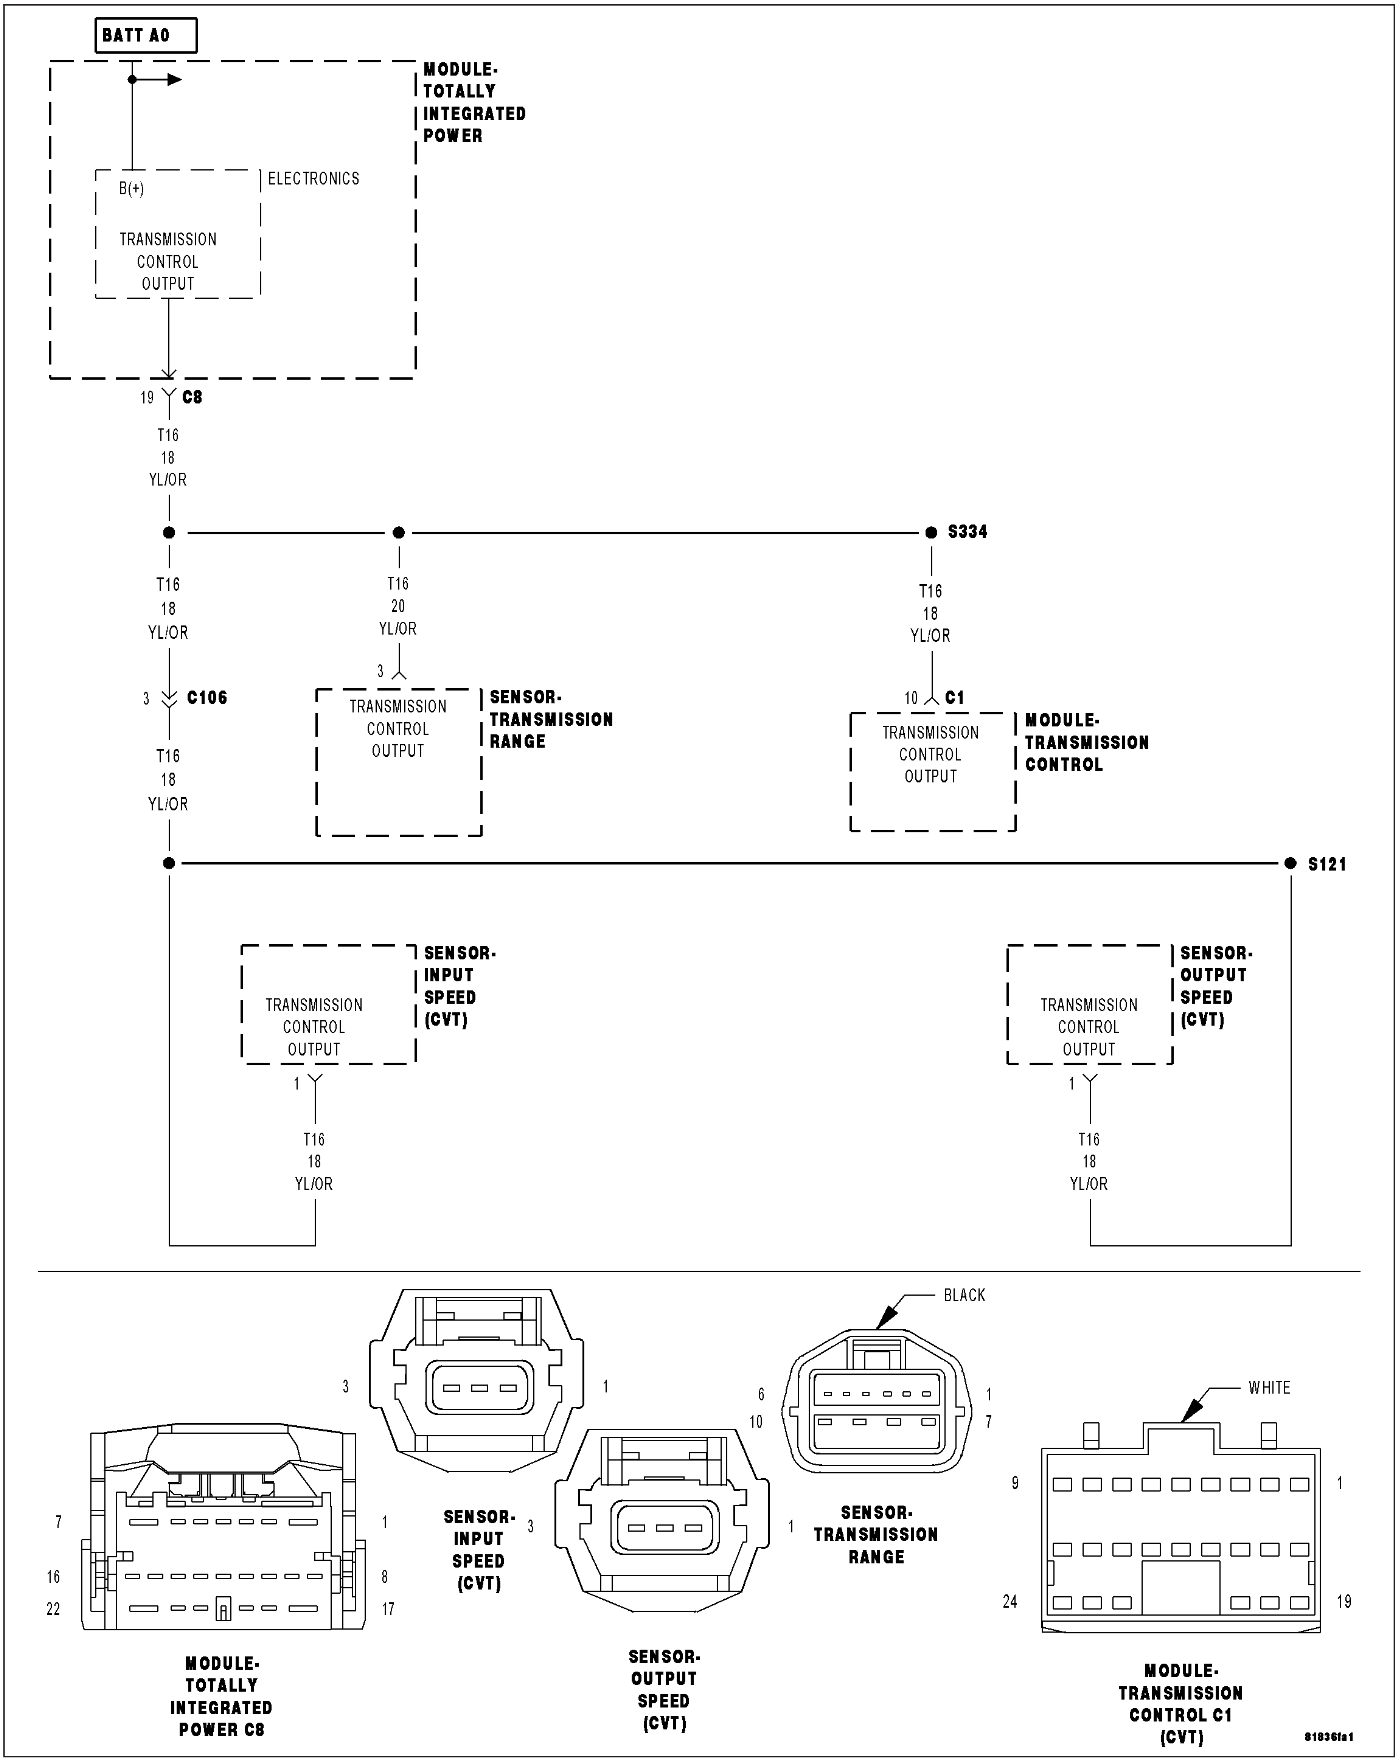
The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Were any problems found?



Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test complete.

P128E-TCM POWER CONTROL CIRCUIT 2 OVERCURRENT - TIPM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  An overcurrent condition is detected in the TCM Power Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
INPUT OR OUTPUT SPEED SENSOR
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.

With a scan tool, read TIPM DTCs.

Is the DTC active at this time?

Yes >> Go To 2

No >> Go To 4

2. CHECK IF THE DTC IS ACTIVE

Ignition on, engine not running.

With a scan tool, read Transmission DTCs.

Are there any Input or Output Speed Sensor or Transmission Range Sensor (TRS) DTCs present?

Yes >> Refer to the Transmission category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE TCM

Disconnect the amp meter from the TIPM C10 harness connector and battery positive.

Disconnect the TCM C1 harness connector.

Connect the positive probe of an ammeter to battery positive and connect the negative probe to the (T16) Transmission Control Output circuit in the TIPM C10 harness connector.

Read the amperage on the ammeter.

Does the amperage read below 2.0 amps?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Control Module per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0219-ENGINE OVERSPEED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) receives a engine rpm over the CAN bus. If the engine rpm exceeds a predetermined value a DTC will set.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  No active CAN Bus DTCs present.
  System voltage between 9.0 and 16 volts.
- **Set Condition:**
  Monitored engine speed over the CAN Bus is greater than 6800 rpm for the period of 100 msecs.

Possible Causes
ENGINE MECHANICAL PROBLEM
TRANSMISSION MECHANICAL PROBLEM
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR OTHER TRANSMISSION DTCS

With the scan tool, check for other transmission DTCs.

Are there any TCC, gear ratio and/or speed sensor DTCs present in addition to P0219?

Yes >> Refer back to the CVT Transaxle Diagnosis and Testing category and perform the appropriate symptom. If speed sensor DTCs are present, perform their respective tests first.

No >> Go To 2

2. CHECK FOR ENGINE DTCS

With the scan tool, check for engine DTCs.

Are there any engine DTCs present?

Yes >> Refer back to the Engine Diagnosis and Testing category and perform the appropriate symptom.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF DTC RESETS

With the scan tool erase transmission DTCs.

Test drive the vehicle and try to duplicate the setting conditions.

Pick the answer that best describes your findings:

DTC resets with a speed sensor DTC
Refer to the Transmission Diagnostic and Testing category and perform the appropriate symptom.

DTC resets without a speed sensor DTC
Replace or repair the CV Transmission as necessary per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0571-BRAKE SWITCH 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the brake switch 1 signal over the CAN Bus. If the Transmission is shifted into any valid gear position without confirming that the brake was depressed before the shift, a DTC will set.

- **When Monitored:**
  After initial start and any time the shift lever is changed from park to reverse, drive or neutral.
  System voltage between 9.0 and 16 volts.
  No active CAN Bus DTCs present.
- **Set Condition:**
  The brake switch status does not change during a drive cycle with a vehicle speed greater than 30 Km/h (18.5 mph) for the period of 10 seconds.
  It take to consecutive problem identification trips to set the MIL.

Possible Causes
ENGINE BRAKE SWITCH DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4

2. CHECK FOR ENGINE BRAKE SWITCH DTCS

With the scan tool, check for engine brake switch DTCs.

With the scan tool, check if the brake switch changes when the brake pedal is pressed.

Are there any engine brake switch DTCs present or is the brake switch not registering any change on the scan tool?

Yes >> Refer to the engine Diagnosis and Testing category and perform the appropriate symptom. If no DTCs are present and the brake switch does not seem to function, diagnose the brake switch as though a valid DTC is present.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK OTHER CONTROLLERS FOR BRAKE SWITCH DTCS

With the scan tool check other controllers for Brake Switch DTCs.

Do any other controllers report a Brake Switch DTC?

Yes >> Refer to the Engine Diagnosis and Testing category and perform diagnostics for P0571 as though the DTC is active.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0602-CONTROL MODULE PROGRAMING ERROR/NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

After initial vehicle start, the Transmission Control Module (TCM) looks for a message over the CAN BUS verifying vehicle information which is crucial for transmission configuration. After the information is received it is stored in the EEPROM of the TCM. If the TCM does not receive a valid configuration within a predetermined time, the DTC will set and the MIL will be illuminated.

- **When Monitored:**
  After an initial vehicle start with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  Transmission Control Module (TCM) does not receive valid vehicle information from the Front Control Module (FCM) for the period of 5 seconds.

Possible Causes
CAN BUS DTCS PRESENT
TOTALLY INTEGRATED CONTROL MODULE (TIPM) NOT PROGRAMED
TRANSMISSION CONTROL MODULE (TCM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR CAN BUS DTCS

With the scan tool, check for CAN BUS DTCs.

Are there any CAN BUS DTCs present?

Yes >> Refer to the Communication category and perform the appropriate symptom. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 2

2. CHECK IF CONTROLLER WAS REPLACED

Has the Transmission Control Module been recently replaced?

Yes >> Go To 3

No >> Go To 5

3. CHECK IF CONTROLLER WAS PROGRAMED

Was the Transmission Control Module flashed?

Yes >> Go To 4

No >> Flash the control module with the proper part number for the vehicle.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK FOR OTHER DTCS

With the scan tool, check Transmission DTCs.

Are the DTCs P0602 and U140F Active and P161B and P1729 Stored?

Yes >> Check the Controller part number coincides with the vehicle setup such as engine size or with or without All wheel Drive (AWD). This is an indication of an improper vehicle configuration. Verify all configurations to the Vehicle Identification Number (VIN) and reprogram as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE FCM FOR PROPER PROGRAMING OF TIRE SIZE

With the scan tool, check the TIPM/FCM for proper tire size programing.

Is the tire size properly programed in the TIPM/FCM?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Program the TIPM/FCM with the proper tire size.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

P0610-ECU VEHICLE OPTIONS MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) stores in its EEPROM vehicle information data transmitted over the CAN Bus from the FCM/TIPM. If the stored information in the TCM does not match the information obtained over the CAN Bus, the DTC will set.

- **When Monitored:**
  One time at initial ignition on with system voltage between 9.0 and 16.0 volts.
  FCM/TIPM variant data received more than once over the CAN Bus.
  FCM/TIPM variant data is in a valid range.
  Vehicle Configuration Learn Routine not finished.
- **Set Condition:**
  The vehicle option data received over the CAN Bus does not match the data stored in the EEPROM of the TCM. It takes one trip of problem identification to set the MIL.

Possible Causes
USED CONTROLLER INSTALLED WITH WRONG CONFIGURATION
FCM/TIPM NOT PROPERLY PROGRAMED OR WAS REPLACED AND NOT PROGRAMED
NEW TCM INSTALLED
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 4

2. CHECK THE TIPM

Has the TIPM been reprogrammed (tire size) or replaced without being programed?

Yes >> Program the TIPM if not programed. If the tire size was changed, with the scan tool clear the TCM memory and relearn.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE TCM

Has the TCM been recently replaced with a new or used controller?

Yes >> With the scan tool perform a TCM relearn.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

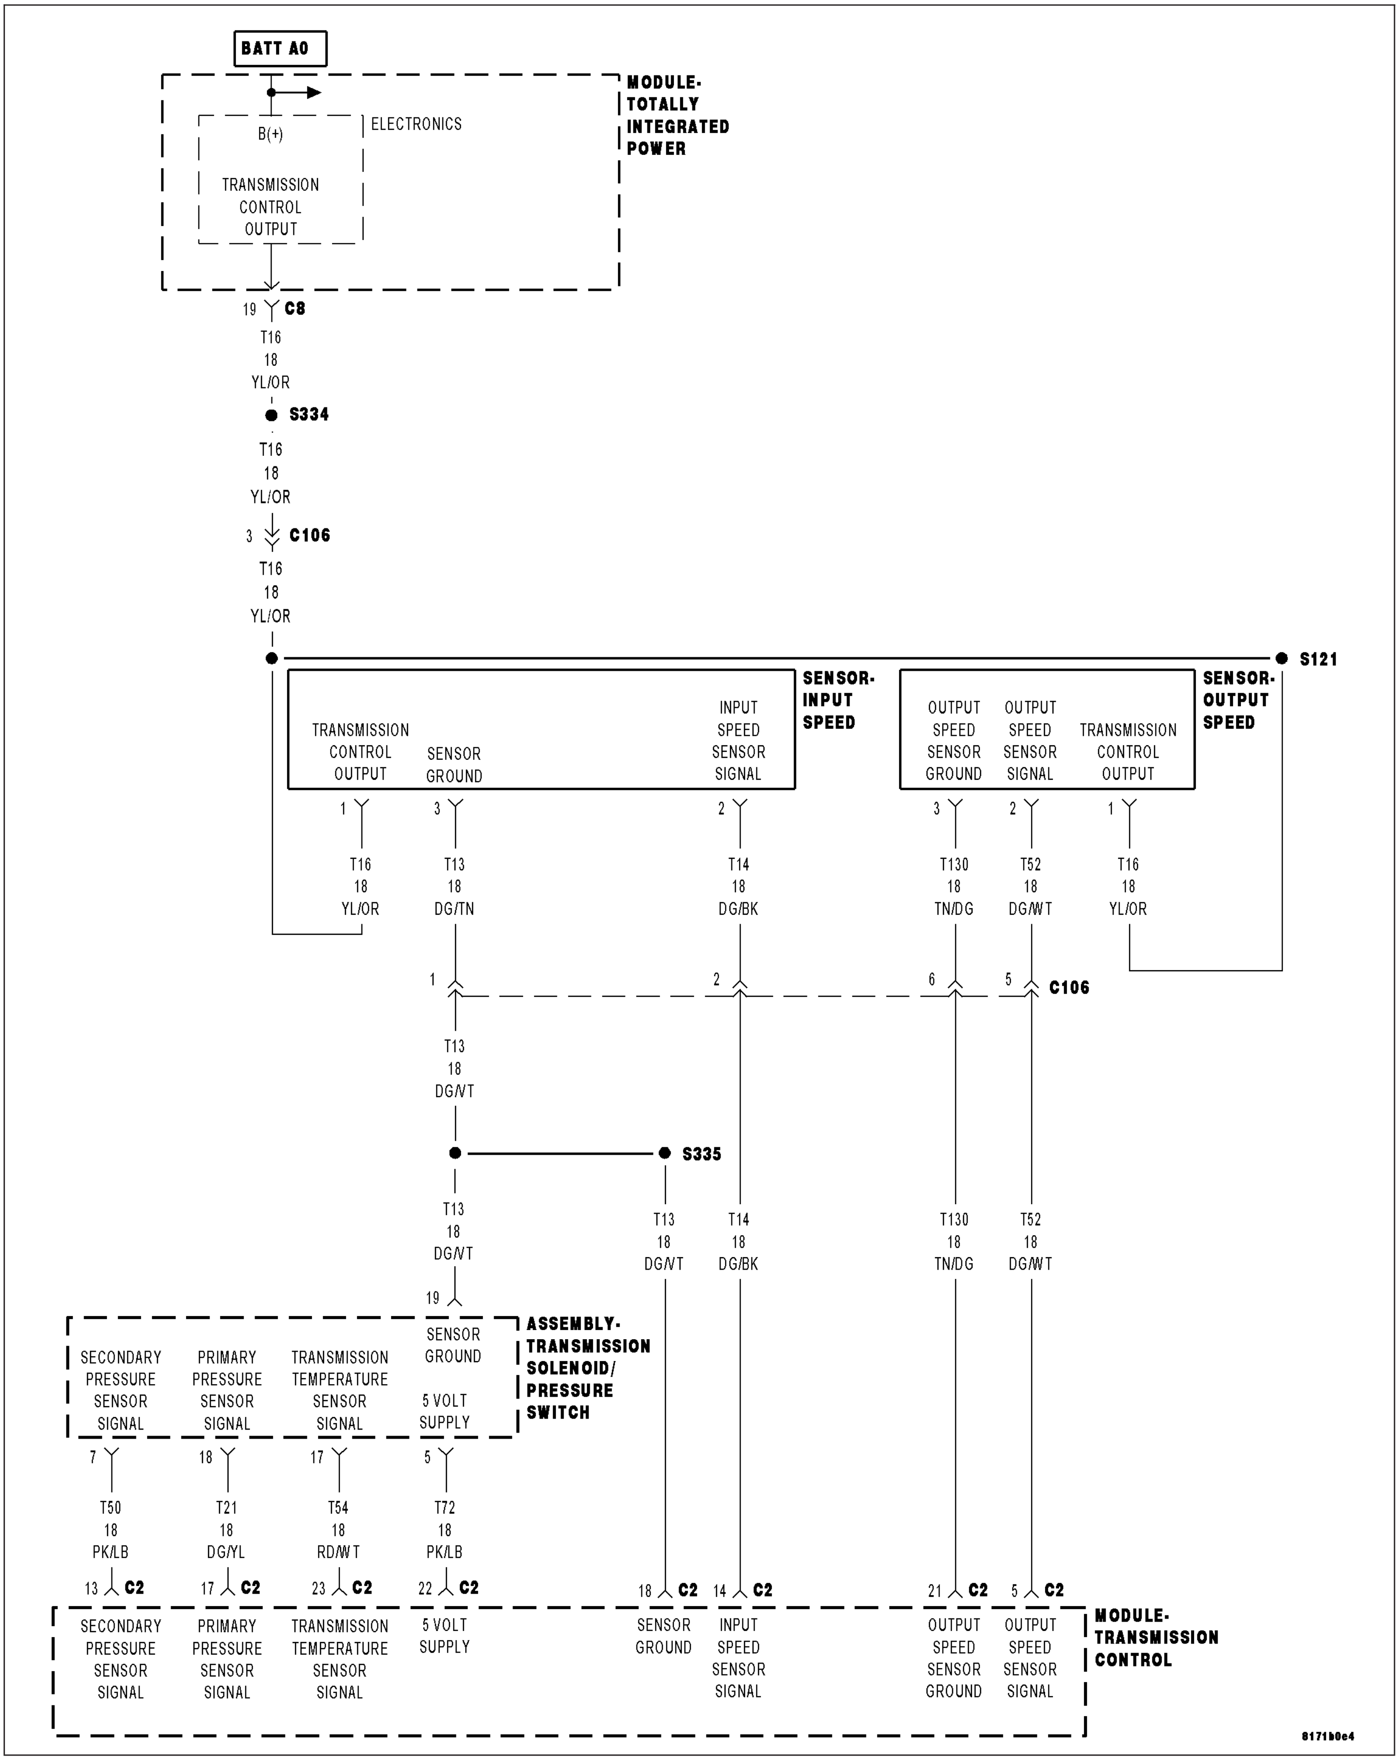
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0641-SENSOR REFERENCE VOLTAGE 1 CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

A common 5-volt power supply is used by both the primary and secondary pressure sensors as well as an internal ROM Assembly. If the power supply does not maintain a predetermined voltage range to the pressure sensors after the period of 5.0 seconds, the Transmission Control Module (TCM) sets the DTC and illuminates the MIL.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  When the monitored input voltage from primary pressure sensor and secondary pressure sensor is less than 0.05 volts for a continuous period of 5.0 seconds.

Possible Causes
(T72) 5-VOLT SUPPLY CIRCUIT OPEN
(T72) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

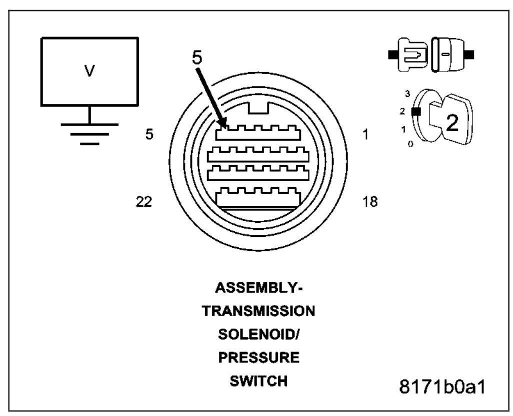
1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 5



2. CHECK THE (T72) 5-VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off to the lock position.

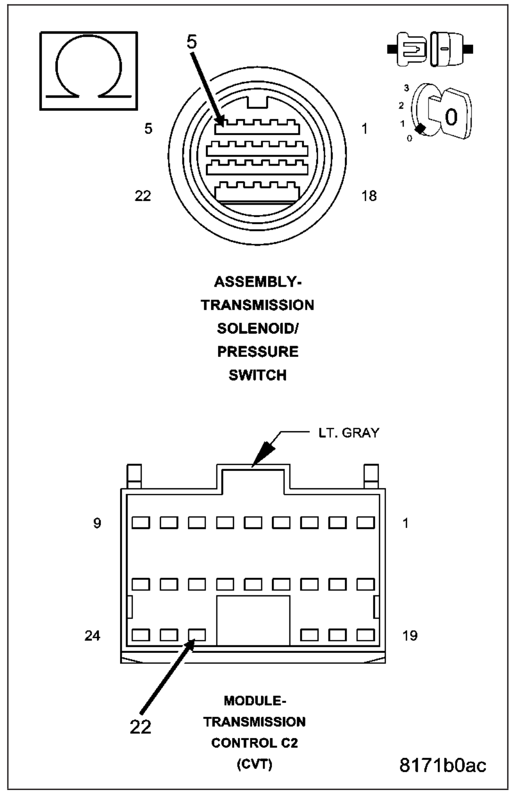
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5-volt Supply circuit.

Is the voltage 5.0 volts (± 0.5 volts)?

Yes >> Replace the Valve Body per the Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



No >> Go To 3

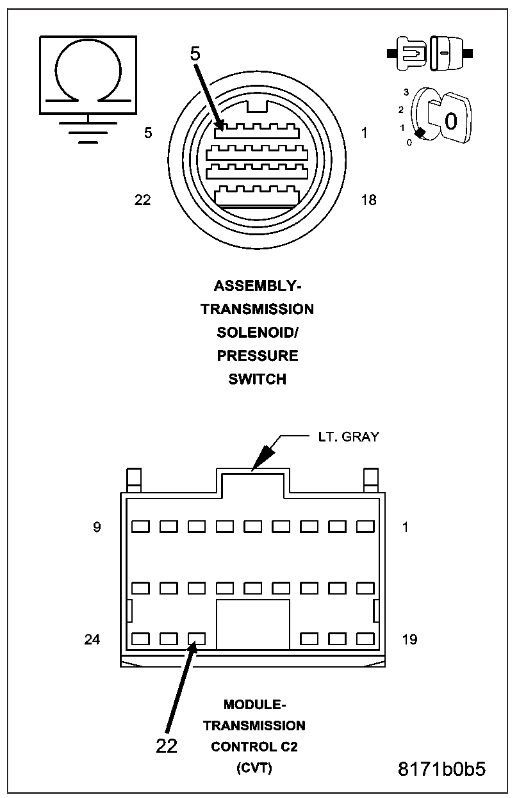
3. CHECK THE (T72) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (T72) 5-volt Supply circuit between the TCM C2 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?



Yes >> Repair the (T72) 5-volt Supply circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T72) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T72) 5-volt Supply circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T72) 5-volt Supply circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

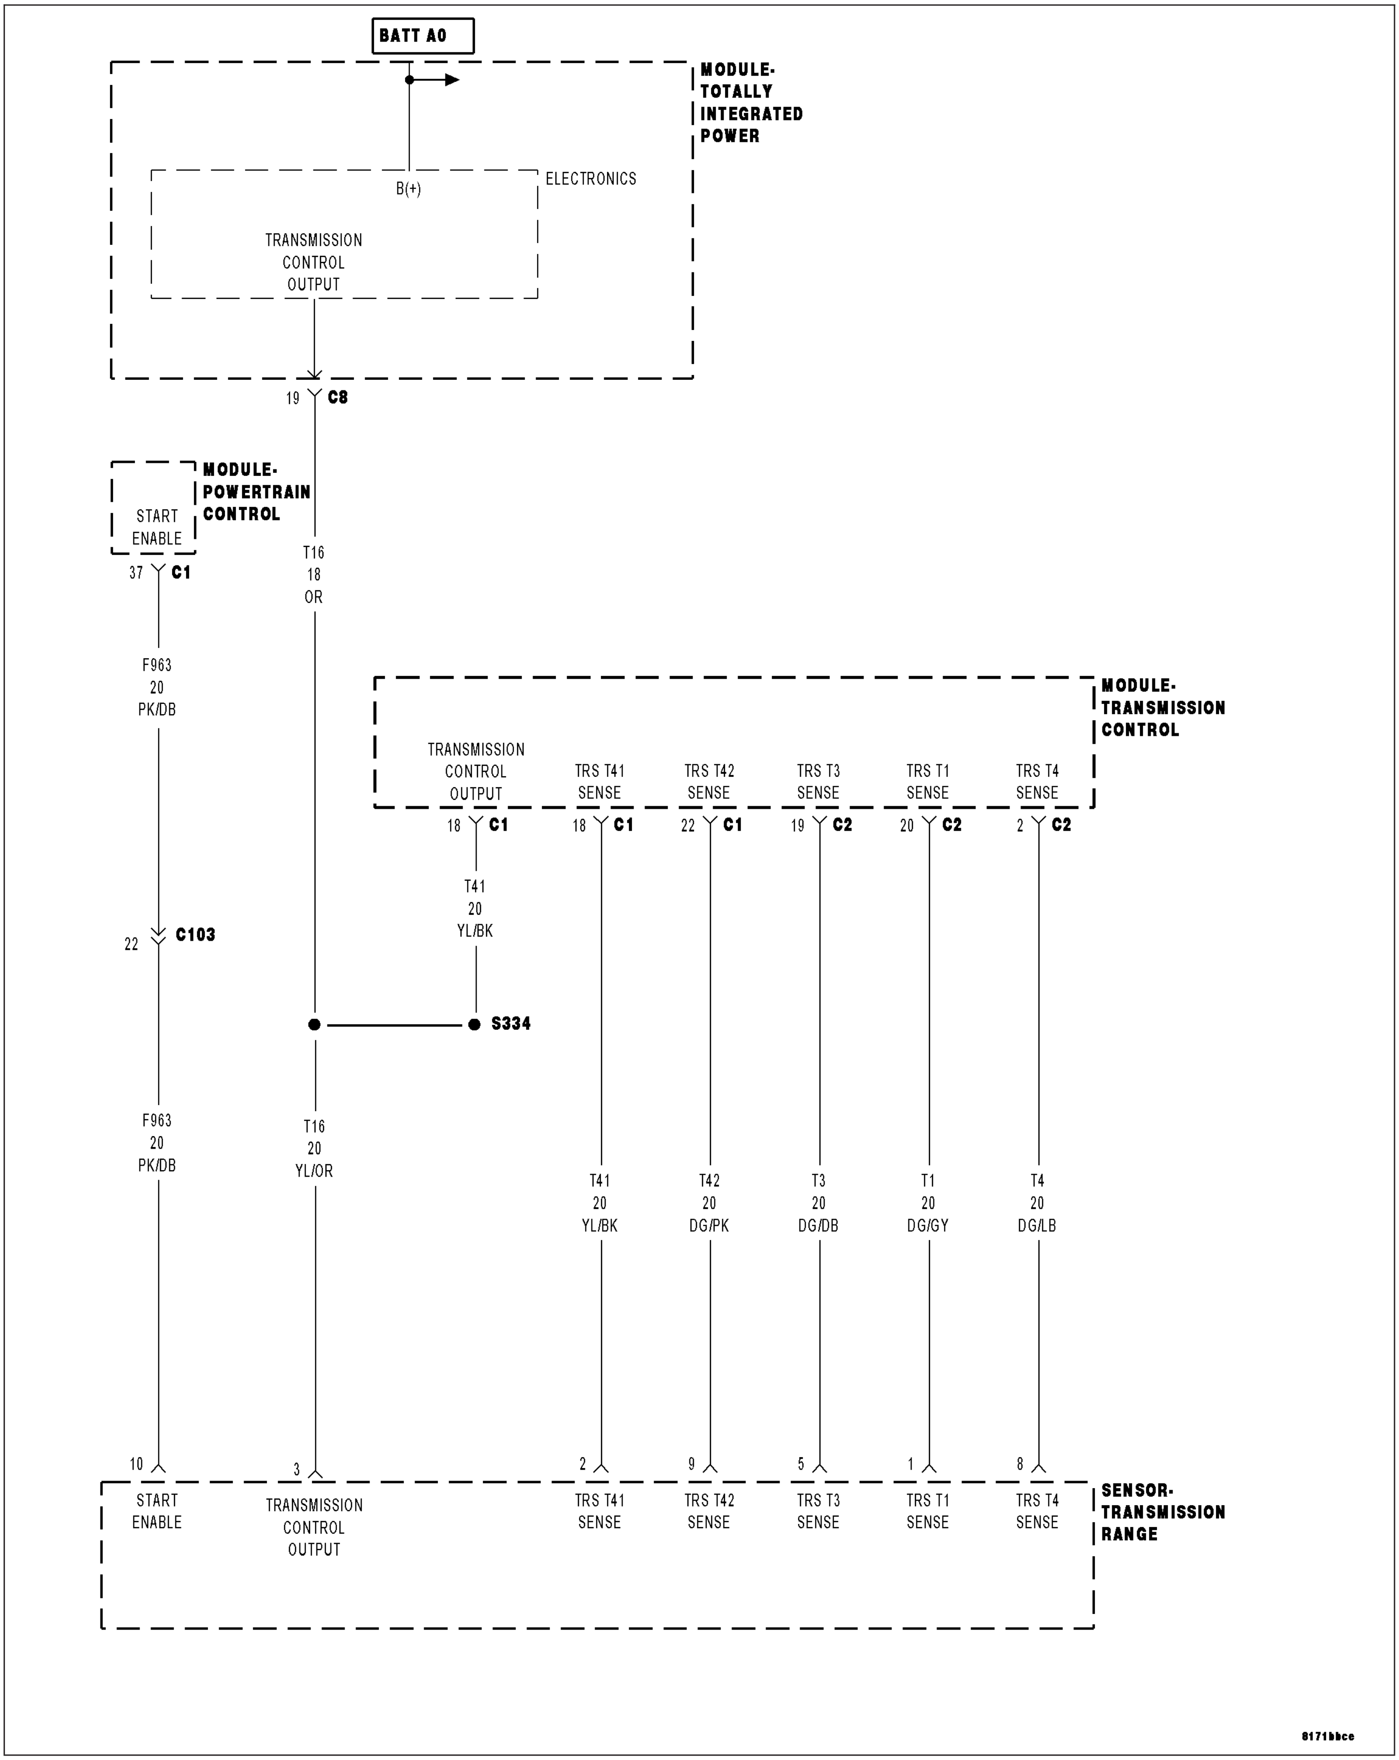
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0707-TRANSMISSION RANGE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Range Sensor (TRS) has a contact point for each shift lever position. The Transmission Control Module (TCM) monitors the signal from the TRS which specifies the shift lever position. The TCM also broadcast the shift lever position over the CAN BUS to other modules.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16.0 volts.
  Vehicle speed above 10 Km/h (6 mph).
  No other Transmission Range Sensor (TRS) DTCs present.
- **Set Condition:**
  If a continuous input signal loss is read by the TCM from the TRS for the period of 5 seconds. It takes two consecutive one trips of problem identification to light the MIL.

Possible Causes
TRANSMISSION RANGE SENSOR CONNECTOR UNPLUGGED OR DAMAGED
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
TRS SENSE CIRCUIT OPEN
TRS SENSE CIRCUIT SHORT TO GROUND
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?

Yes >> Go To 2

No >> Go To 8

2. CHECK THE TRS HARNESS CONNECTOR

Turn the ignition off to the lock position.

Check if the TRS harness connector for terminal push out, corrosion or if it is properly plugged in.

NOTE: If the Transmission Range Sensor is unplugged the vehicle will not start.

Were there any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE TRS READINGS ON THE SCAN TOOL

SHIFT LEVER POSITION TO TRS SWITCH STATE				
PARK	**REVERSE**	**NEUTRAL**	**DRIVE**	**LOW**
T41 CLOSED	T42 CLOSED	T4 CLOSED	T3 CLOSED	T1 CLOSED

Ignition on, engine not running.

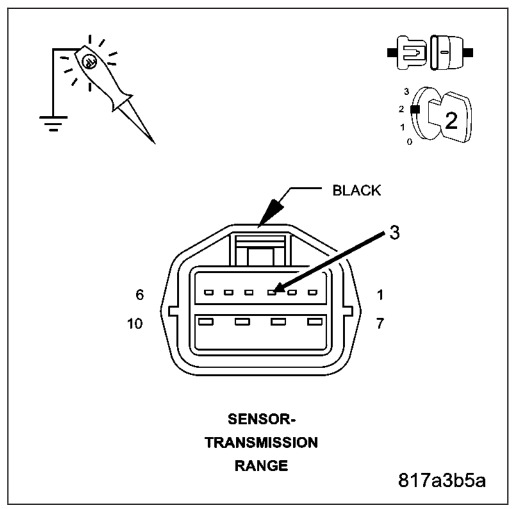
With the scan tool, read the TRS states while moving the shift lever to all positions note any circuits that do not change.

Pick which answer best describes your findings:

One TRS Sense circuit failed to change on the scan tool

Go To 5

None of the TRS Sense circuits changed at all



Go To 4

All TRS Sense circuits changed properly on the scan tool

Check the Sift Lever Cable for proper adjustment and binding per the Service Information. If no problems are found, using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If again no problems are found, replace the TCM per the Service Information

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TRS harness connector.

Ignition on, engine not running.

Using the scan tool under TIPM, actuate the transmission.

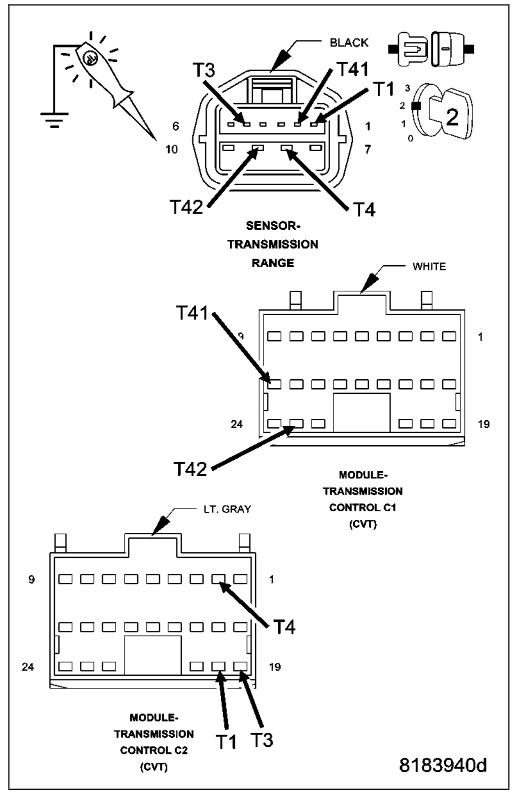
Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit in the TRS harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 7

No >> Repair the (T16) Transmission Control Output circuit for an open.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE TRS SENSE CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

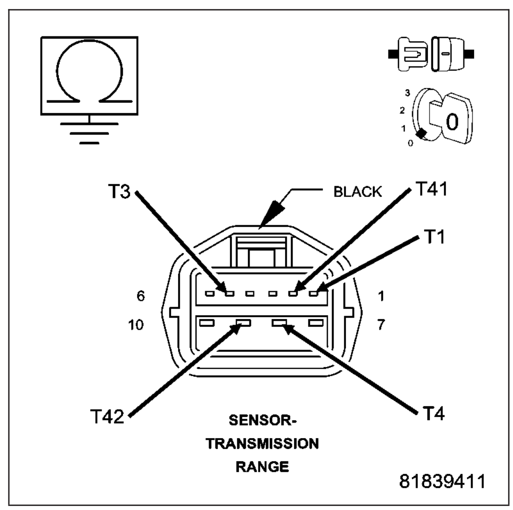
Disconnect the TRS harness connector.

Check the resistance of the previously identified TRS Sense circuit between the TRS harness connector and the TCM harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the identified TRS Sense circuit for an open

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



No >> Go To 6

6. CHECK THE TRS SENSE CIRCUIT FOR A SHORT TO GROUND

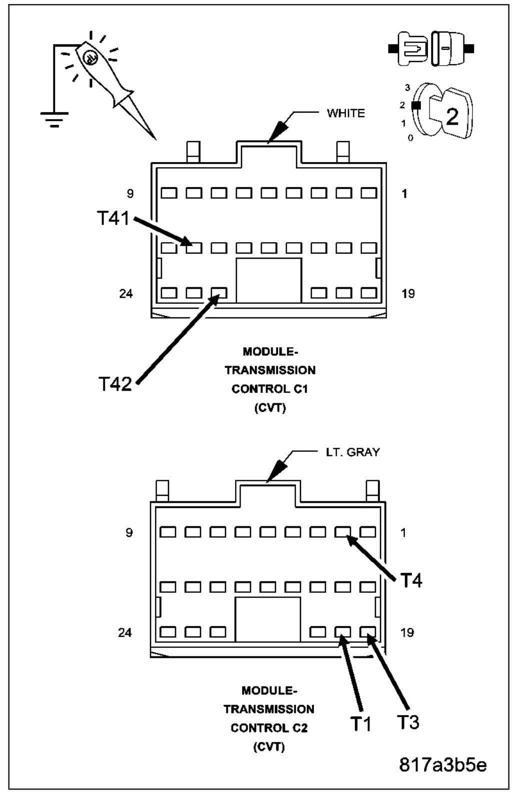
Turn the ignition off to the lock position.

Disconnect the TRS harness connector.

Check the resistance between ground and the identified TRS Sense circuit in the previous test procedure.

Is the resistance below 5.0 ohms?

Yes >> Repair the identified TRS Sense circuit for a short to ground



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Transmission Range Sensor (TRS) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. CHECK THE TRANSMISSION RANGE SENSOR

SHIFT LEVER POSITION TO TRS SWITCH STATE				
PARK	**REVERSE**	**NEUTRAL**	**DRIVE**	**LOW**
T41 CLOSED	T42 CLOSED	T4 CLOSED	T3 CLOSED	T1 CLOSED

Stop the scan tool transmission actuation and turn the ignition off to the lock position.

Reconnect the TRS harness connector.

Disconnect the TCM C1 and C2 harness connectors.

Ignition on, engine not running.

Using the scan tool under TIPM, actuate the transmission.

Using a 12-volt test light connected to ground, check each TRS Sense circuit (T41, T42, T4, T3, and T1) in the TCM C1 and C2 harness connectors while moving the shift lever to each desired position.

NOTE: Use the above chart to identify which sense circuit should be closed in each shift lever position.

Does the test light illuminate brightly on all the TRS Sense circuits?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Transmission Range Sensor per the Service Information.

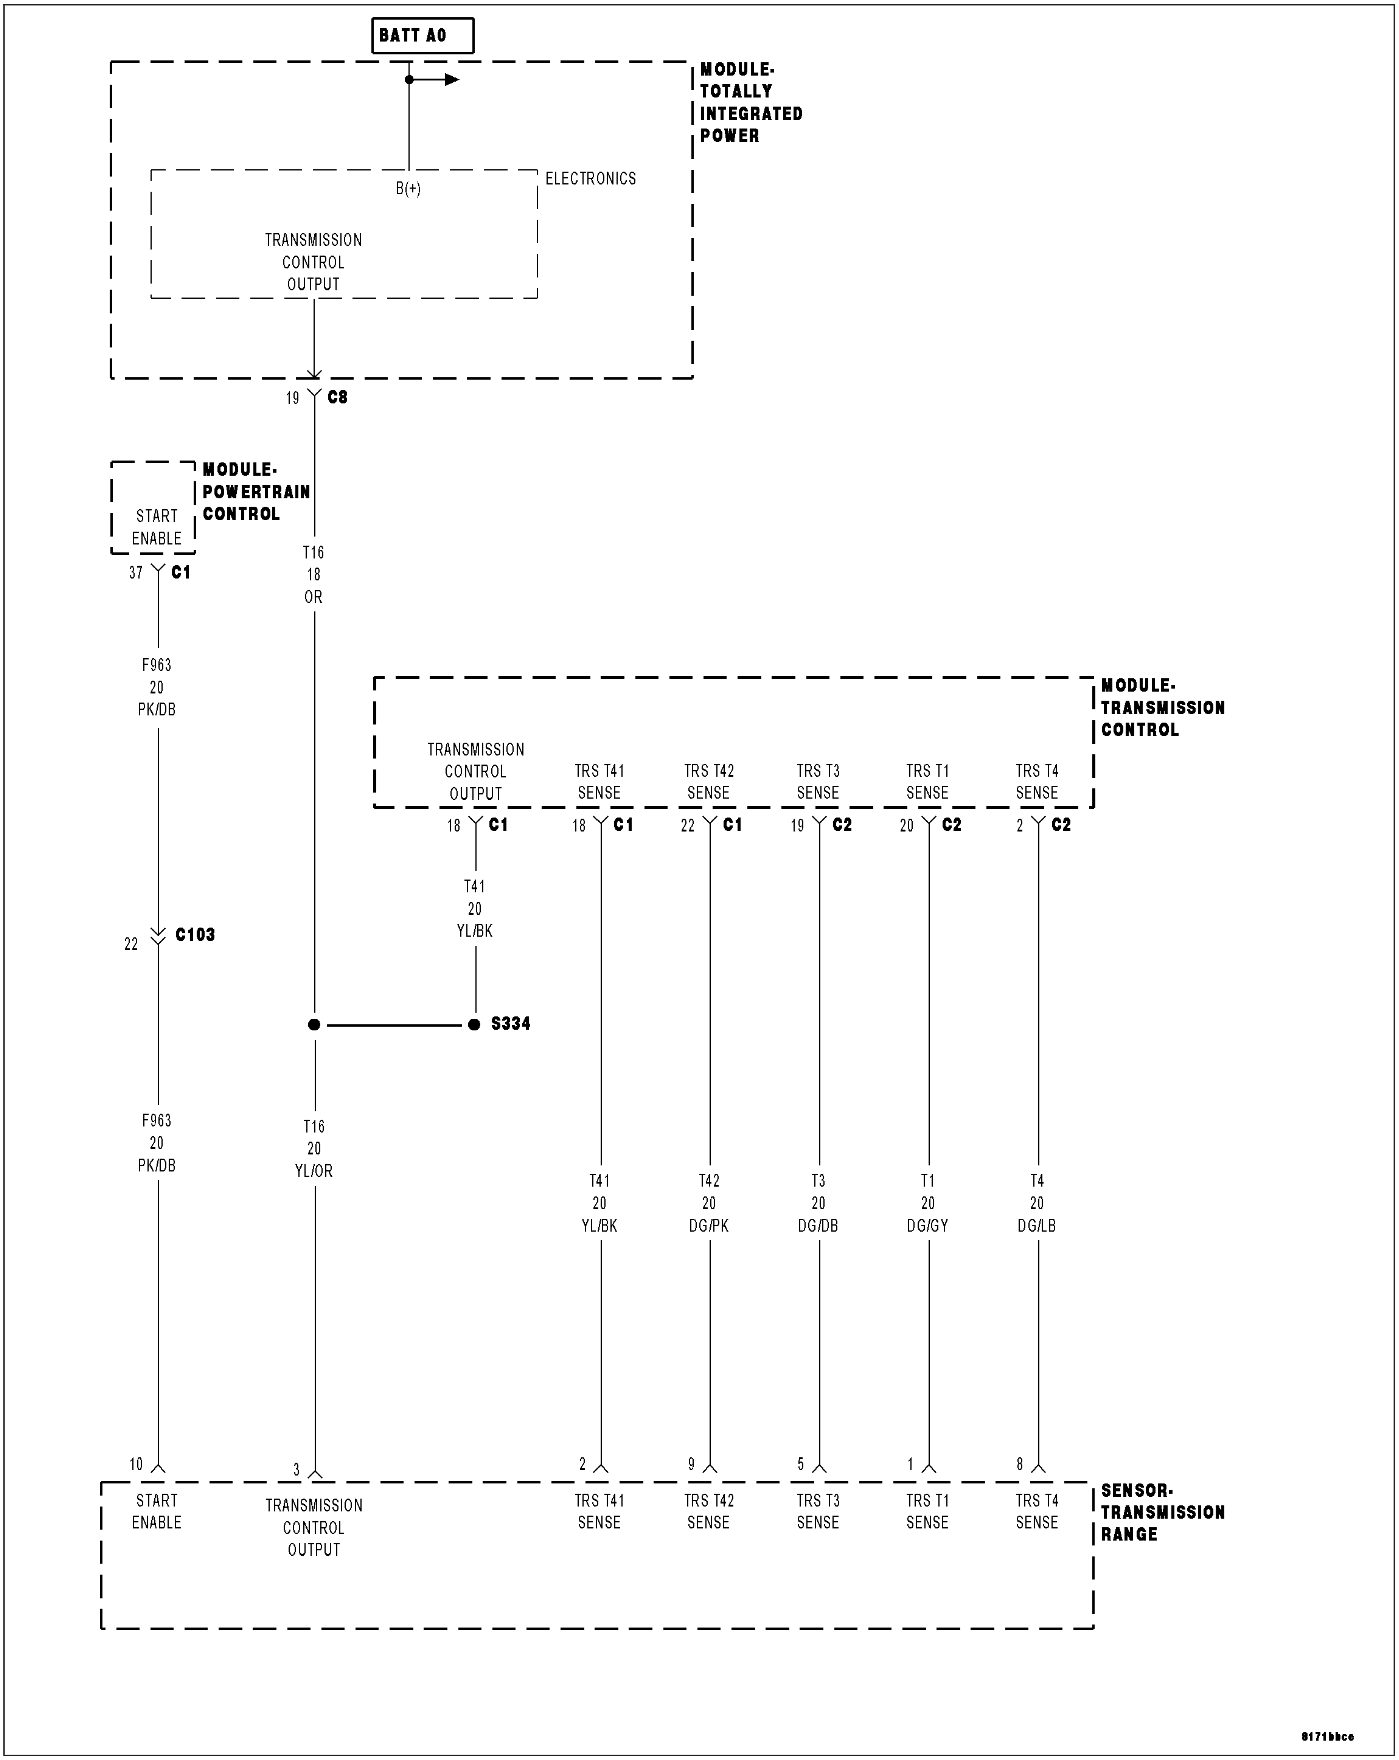
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0708-TRANSMISSION RANGE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Range Sensor (TRS) has a contact point for each shift lever position. The Transmission Control Module (TCM) monitors the signal from the TRS which specifies the shift lever position. The TCM also broadcast the shift lever position over the CAN BUS to other modules.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16.0 volts.
  No other Transmission Range Sensor (TRS) DTCs present.
- **Set Condition:**
  When the Transmission Control Module (TCM) receives more than one Transmission Range Sensor (TRS) signal from the TRS continuously for the period of 2.0 seconds.

Possible Causes
TRS SENSE CIRCUIT SHORT TO VOLTAGE
TWO TRS SENSE CIRCUITS SHORTED TOGETHER
TRANSMISSION RANGE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 5

2. CHECK THE TRS READINGS ON THE SCAN TOOL

SHIFT LEVER POSITION TO TRS SWITCH STATE				
PARK	**REVERSE**	**NEUTRAL**	**DRIVE**	**LOW**
T41 CLOSED	T42 CLOSED	T4 CLOSED	T3 CLOSED	T1 CLOSED

Ignition on, engine not running.

With the scan tool, read the TRS states while moving the shift lever to all positions note any circuits may close at the same time.

Did one or more TRS Sense circuits show being closed at the same time?

Yes >> Go To 3

No >> Check the Shift Lever Cable for proper adjustment and binding per the Service Information. If no problems are found, using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If again no problems are found, replace the TCM per the Service Information

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

3. CHECK THE TRS SENSE CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TRS harness connector.

NOTE: The possibility of erroneous DTCs may set due to disconnection of the TRS harness connector. Disregard any additional DTCs that may set.

Ignition on, engine not running.

Using the scan tool, read the TRS Sense circuit states.

Do any of the TRS Sense circuits read closed?

Yes >> Repair the identified TRS Sense circuit for a short to voltage.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE TRS SENSE CIRCUIT FOR A SHORT TO ANOTHER TRS SENSE CIRCUIT

Turn the ignition off to the lock position.

Disconnect the TCM C1 and C2 harness connectors.

Measure the resistance between the two identified TRS Sense circuits in the second step.

Is the resistance below 5.0 ohms?

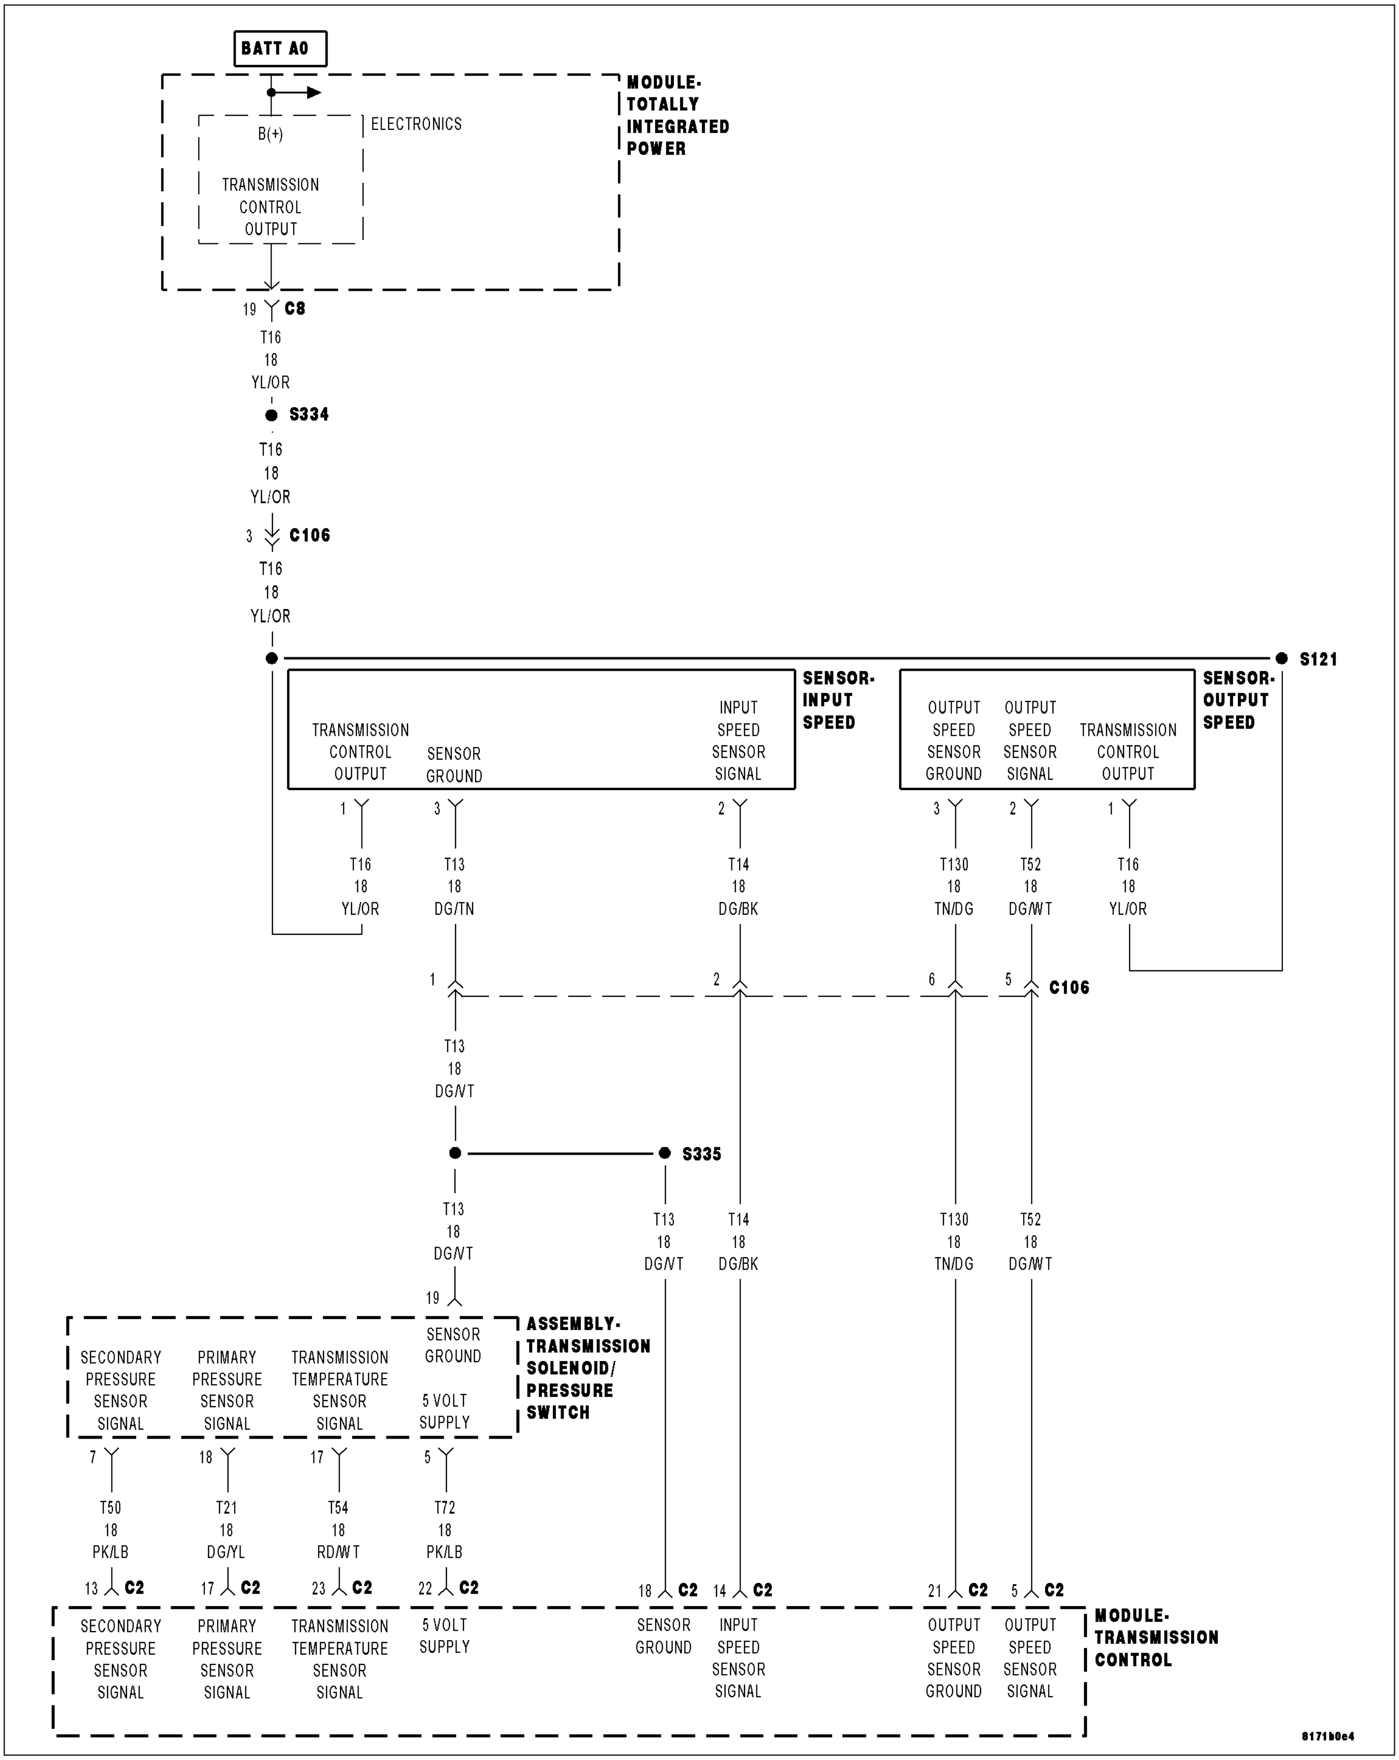
Yes >> Repair the identified TRS Sense circuits for a short to each other.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the TRS Assembly per the Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.



Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0711-TRANSMISSION TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the Transmission Temperature Sensor Signal circuit for voltage changes within desired limits. The TCM calculates the transmission fluid temperature from the temperature sensor signal voltage. This value is used in conjunction with various other inputs to calibrate different operating modes such as Torque Converter lock-up and Torque reduction.

The Transmission Temperature Sensor is a thermistor that changes resistive value when subject to different temperatures. When the monitored voltage rises, the calculated temperature decreases.

- **When Monitored:**
  Condition one : Transmission in a valid forward gear.
  System voltage between 9.0 and 16.0 volts.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm.
  Condition two: Ignition off for greater than 8 hours.
  Difference between the engine coolant temperature and the intake temperature is less than 3° C (37° F).
  No other temperature sensor or sensor ground DTCs present.
- **Set Condition:**
  Condition one: No change in the Transmission oil temperature the period of 10 minutes.
  Condition two: Transmission oil temperature is 40° C (104° F) different than the average temperature which consists of the combined average of the Engine Coolant temperature, Intake Temperature, Oil Temperature, and Ambient Temperature for the period of 5 seconds.

Possible Causes
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR ENGINE DTCS

With the scan tool, read Engine DTCs.

Are there any Engine Temperature Sensor DTCs present?

Yes >> Refer to the Engine Diagnostic and Testing category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 2

2. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 3

No >> Go To 7

3. IDENTIFY THE SETTING CONDITION

NOTE: The vehicle must be completely cooled for a minimum period of 8 hours for the following test procedure.

With the scan tool monitor the Transmission Temperature while test driving the vehicle.

NOTE: It may take up to 10 to 12 minutes of continuous driving to accurately test the Transmission Temperature Sensor.

Did the Transmission Temperature stay the same or increase a very limited amount?

Yes >> Go To 6

No >> Go To 4

4. CHECK THE TRANSMISSION TEMPERATURE SENSOR

Did the TCM set a one trip DTC during the previous test drive?

Yes >> Go To 5

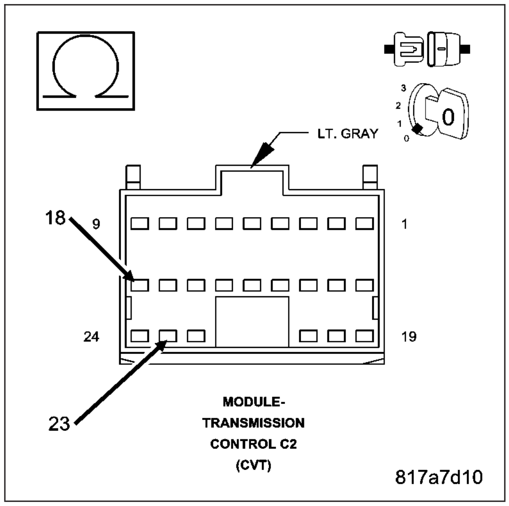
No >> Go To 7

5. COMPARE TRANSMISSION TEMPERATURE TO OTHER TEMPERATURES

With the scan tool compare the Transmission Temperature to other Temperature sensors such as Engine Coolant, Intake, Oil Temperature.

Is the Transmission Temperature within 40° C (104° F) of the other temperatures?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the CVT or repair the Transmission Temperature Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR

Temperature Sensor Resistive Values Chart	
Transmission Temperature	Resistive Value Compared to Temperature (± 10%)
20° C (68° F)	2.5k ohms to 6.5k ohms
80° C (176° F)	0.3k ohms to 0.9k ohms

Start the engine and allow to obtain normal operating temperature (approximately 10 min. of engine run time).

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and the (T13) Sensor Ground circuit in the TCM C2 harness connector.

Is the resistance within the desired range listed on the above chart?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the CVT or repair the Transmission Temperature Sensor (Valve Body) per the Service Information.

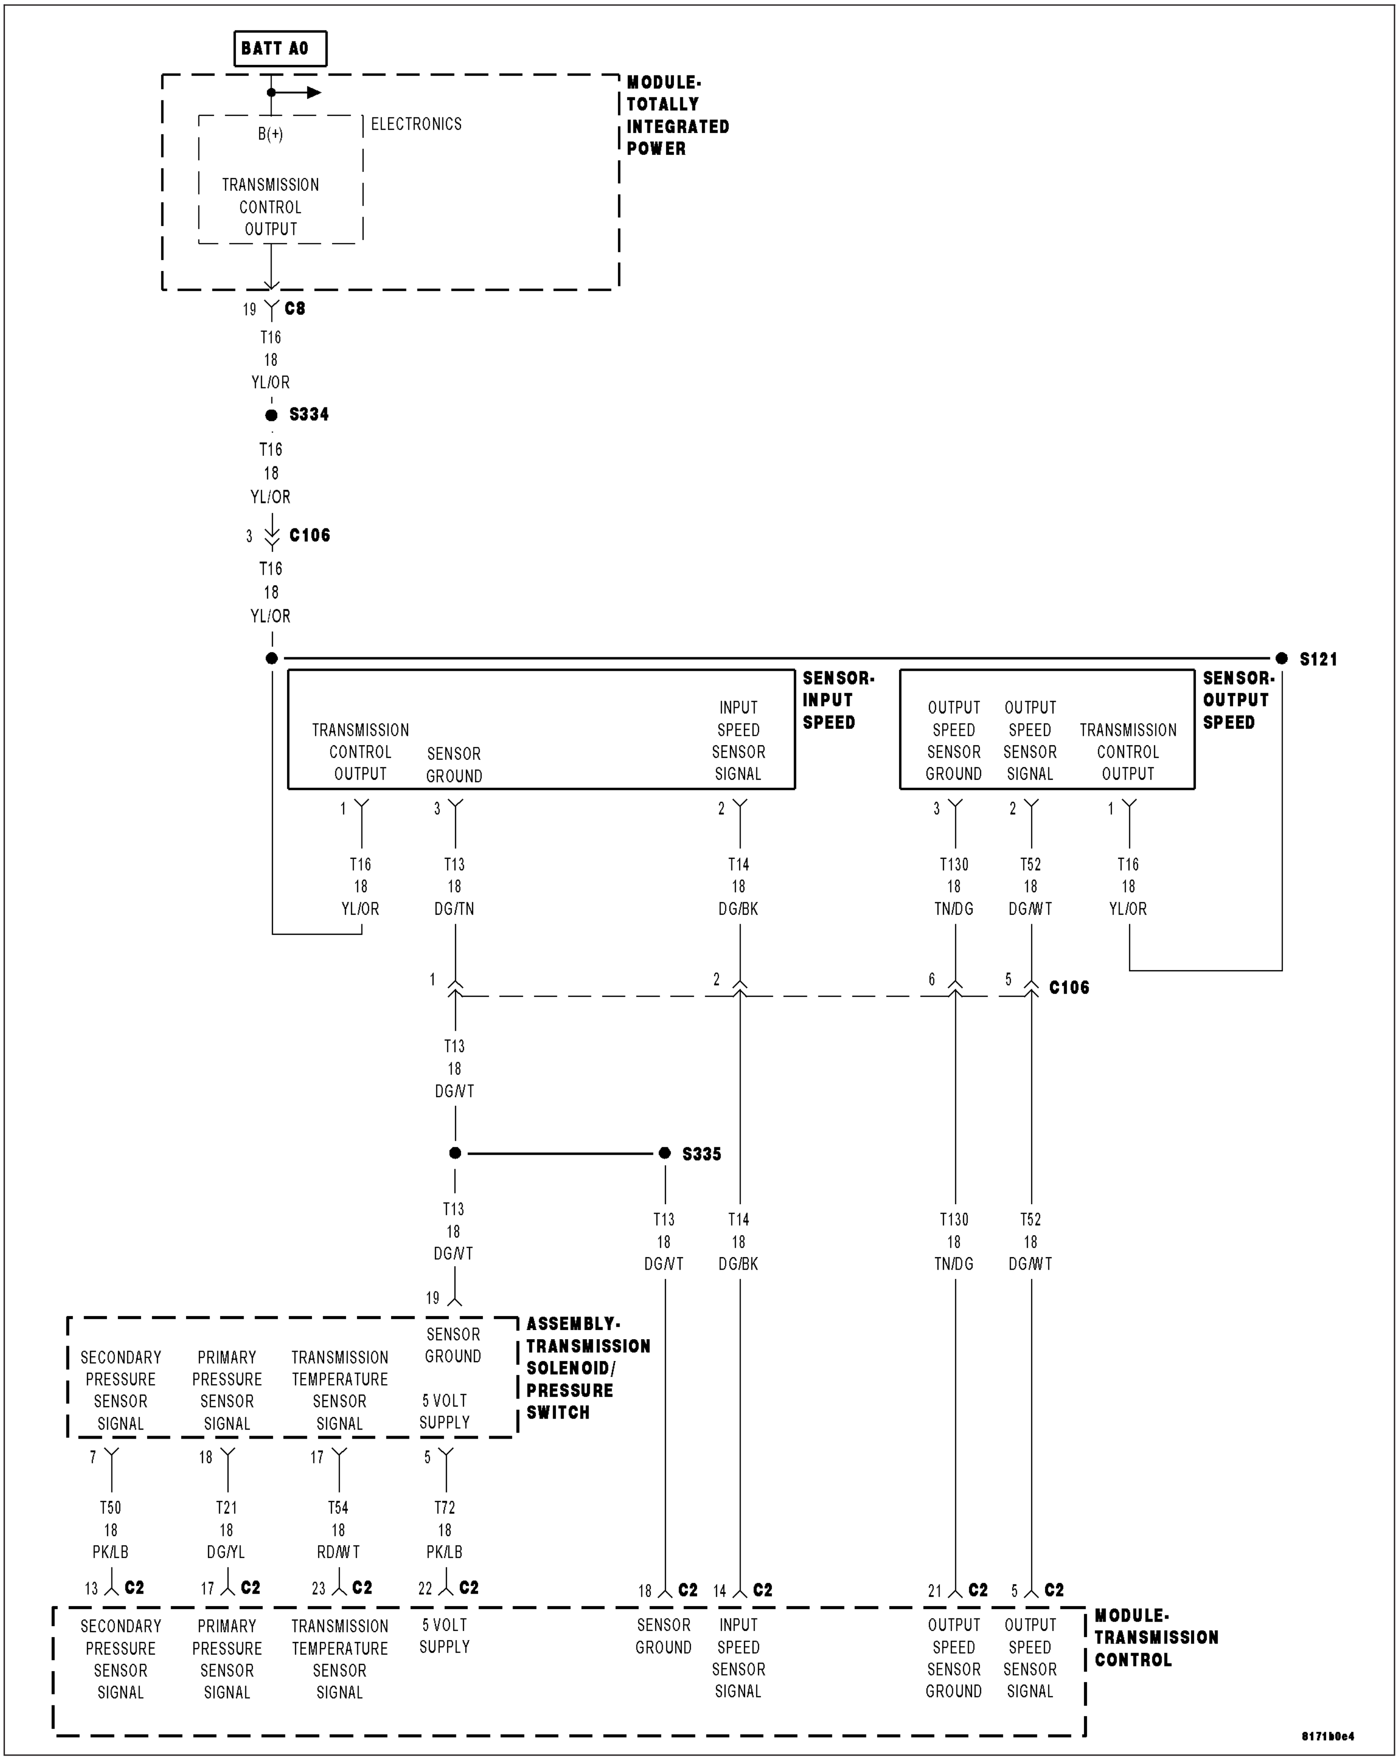
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0712-TRANSMISSION TEMPERATURE SENSOR LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the Transmission Temperature Sensor Signal circuit for voltage changes within desired limits. The TCM calculates the transmission fluid temperature from the temperature sensor signal voltage. This value is used in conjunction with various other inputs to calibrate different operating modes such as Torque Converter lock-up and Torque reduction.

The Transmission Temperature Sensor is a thermistor that changes resistive value when subject to different temperatures. When the monitored voltage rises, the calculated temperature decreases.

- **When Monitored:**
  Ignition on with battery voltage between 9.0 and 16.0 volts.
  Vehicle speed greater than 10 Km/h (6 mph).
  No secondary speed sensor or sensor ground DTCs detected.
- **Set Condition:**
  Indicated temperature is greater than 180° C (356° F) for the continuous period of 5 seconds.

Possible Causes
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

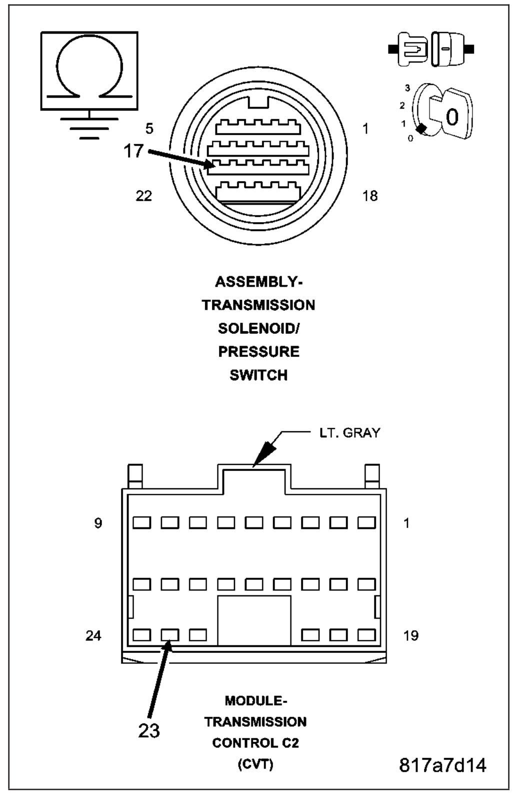
1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?

Yes >> Go To 2

No >> Go To 4



2. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T54) Transmission Temperature Sensor Signal circuit.

Is the resistance below 5.0 ohms?

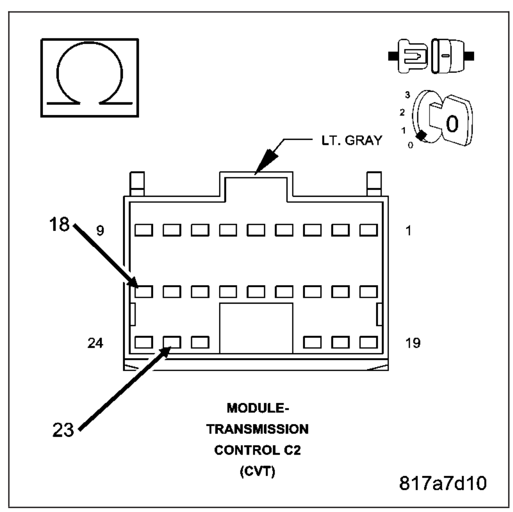
Yes >> Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR

Temperature Sensor Resistive Values Chart	
Transmission Temperature	Resistive Value Compared to Temperature (± 10%)
20° C (68° F)	2.5k ohms to 6.5k ohms
80° C (176° F)	0.3k ohms to 0.9k ohms



Reconnect all previously disconnected connectors.

Start the engine and allow to obtain normal operating temperature (approximately 10 min. of engine run time).

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and the (T13) Sensor Ground circuit in the TCM C2 harness connector.

Is the resistance within the desired range listed on the above chart?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible

causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Transmission Temperature Sensor (Valve Body) per the Service Information.

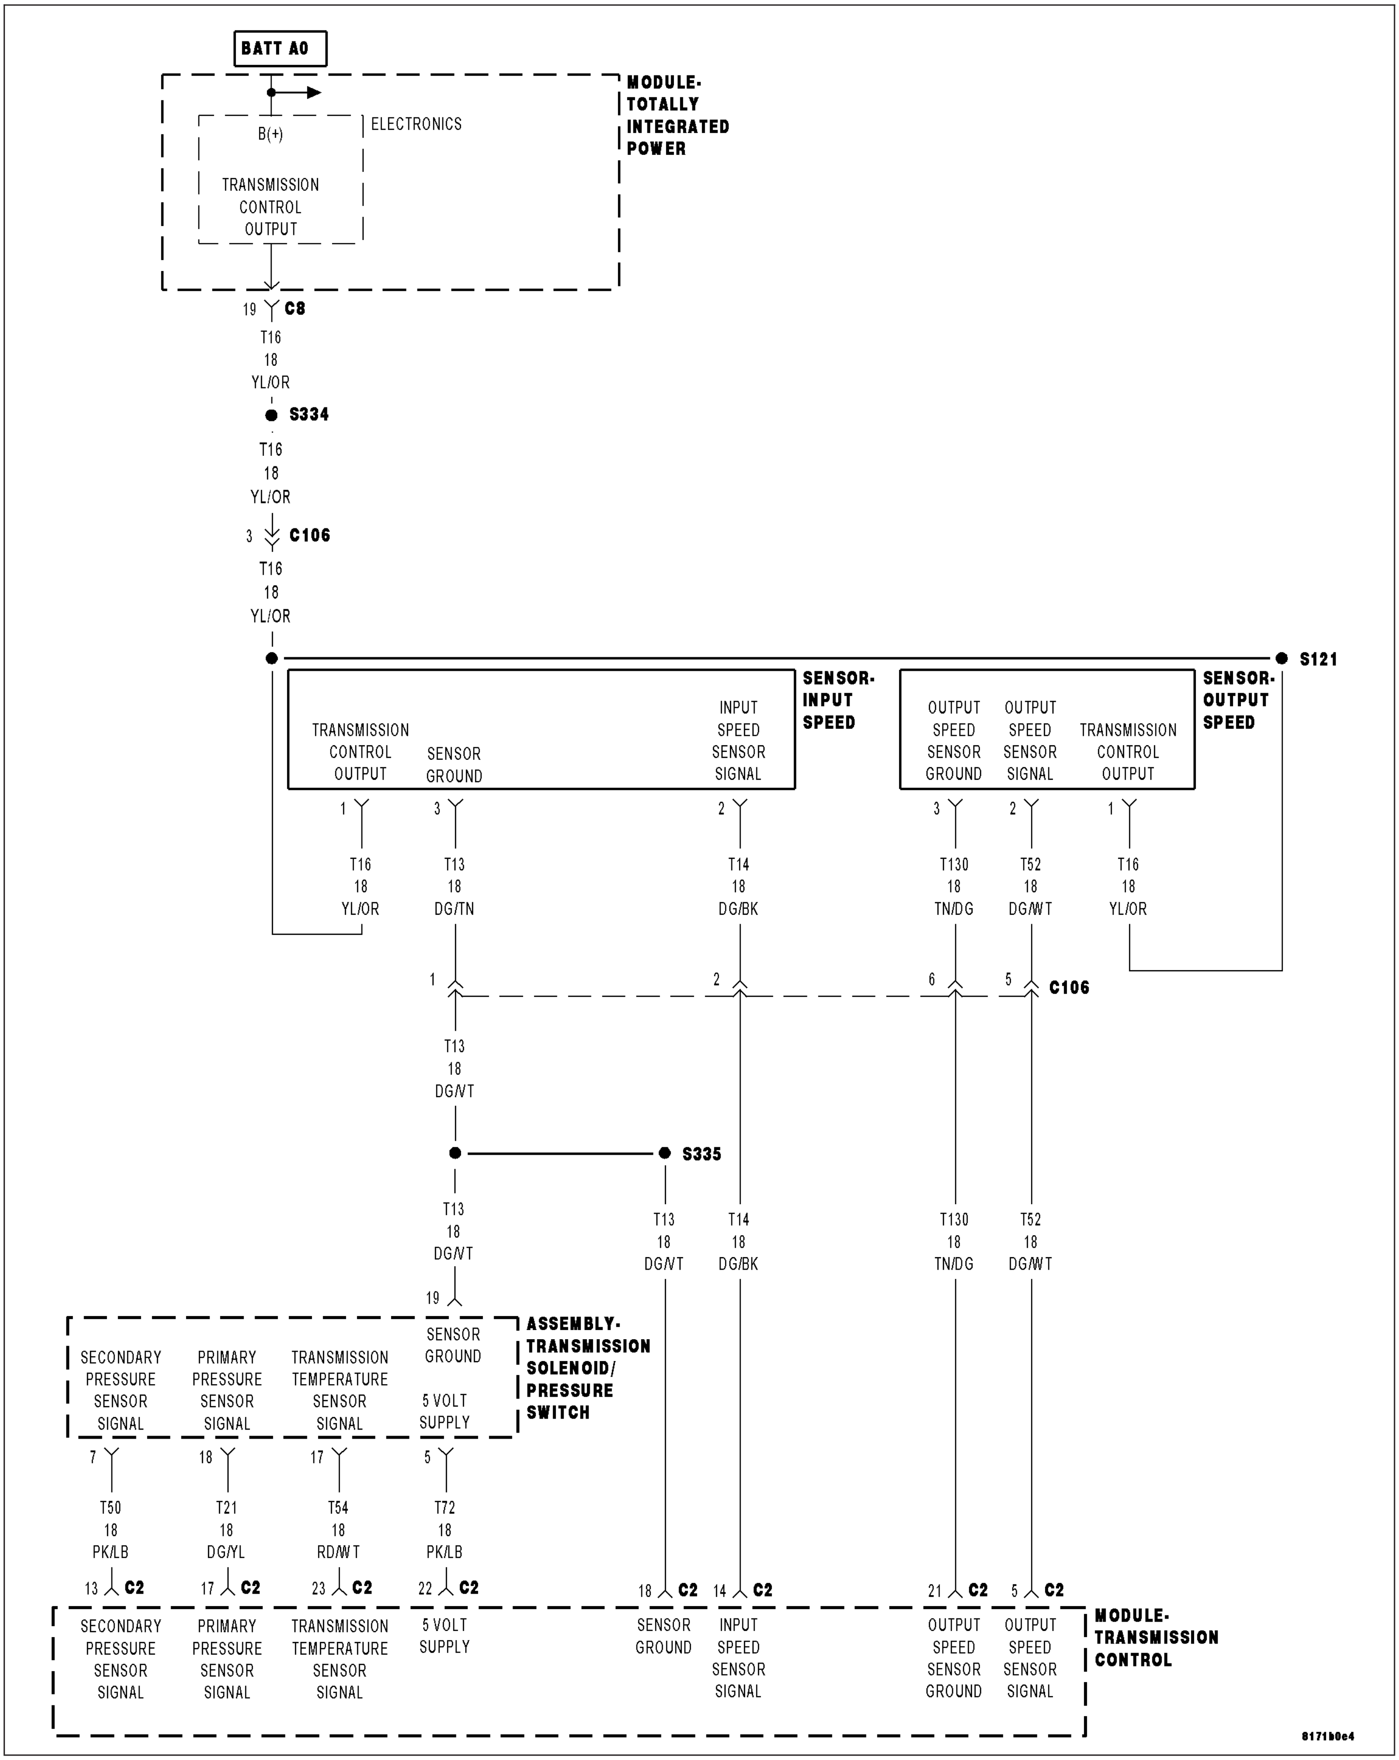
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the Transmission Temperature Sensor Signal circuit for voltage changes within desired limits. The TCM calculates the transmission fluid temperature from the temperature sensor signal voltage. This value is used in conjunction with various other inputs to calibrate different operating modes such as Torque Converter lock-up and Torque reduction.

The Transmission Temperature Sensor is a thermistor that changes resistive value when subject to different temperatures. When the monitored voltage rises, the calculated temperature decreases.

- **When Monitored:**
  Ignition on engine running with battery voltage between 9.0 and 16.0 volts.
  Vehicle speed greater than 10 Km/h (6 mph).
  No secondary speed sensor or sensor ground DTCs present.
- **Set Condition:**
  Indicated temperature drops below -40° C (-40° F) for the continuous period of 5.0 seconds.

Possible Causes
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
TRANSMISSION TEMPERATURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active or is the STARTS SINCE SET counter 2 or less for this DTC?

Yes >> Go To 2

No >> Go To 6

2. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

In the following step using the scan tool, monitor the Transmission Temperature voltage.

Jump the (T54) Transmission Temperature Sensor Signal circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector to ground.

Did the Transmission Temperature voltage drop from approximately 2.5 volts to 0.0 volts?

Yes >> Replace the Transmission Temperature Sensor (Valve Body) per the Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

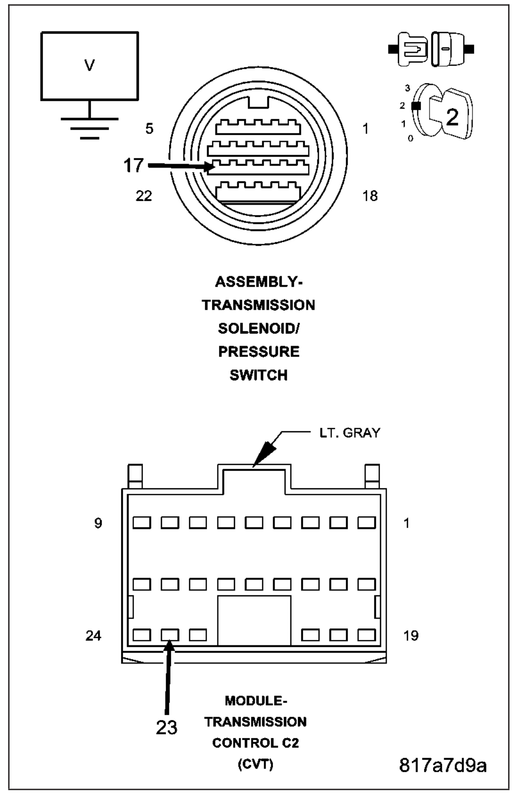
No >> Go To 3

3. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.



Measure the voltage of the (T54) Transmission Temperature Sensor Signal circuit.

Is the voltage above .05 volts?

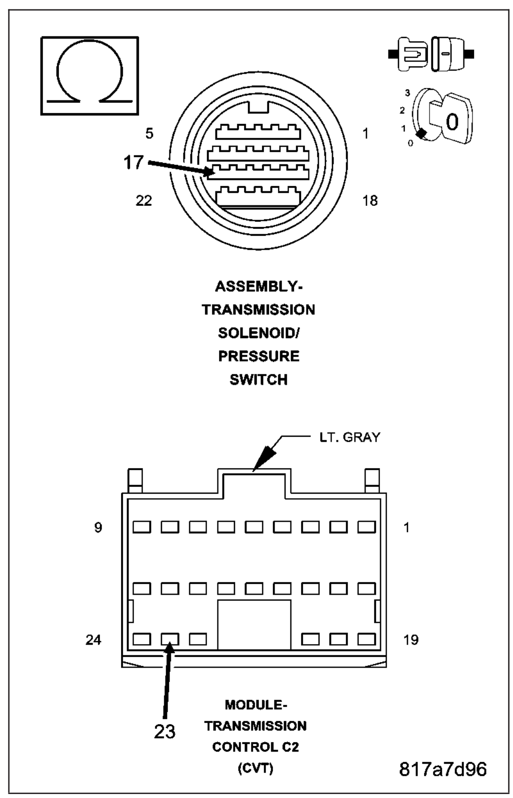
Yes >> Repair the (T54) Transmission Temperature Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.



Measure the resistance of the (T54) Transmission Temperature Sensor Signal circuit between the TCM C2 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

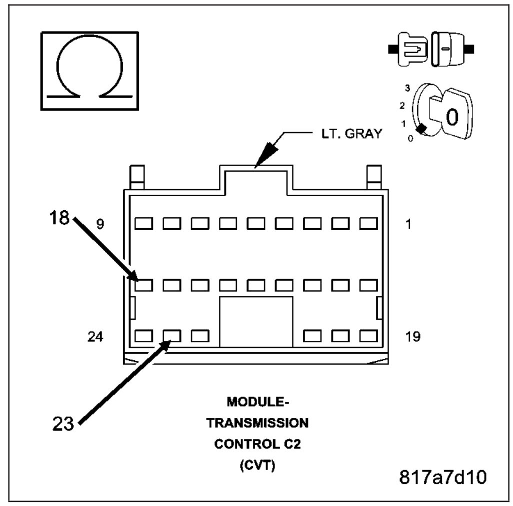
Yes >> Repair the (T54) Transmission Temperature Sensor Signal circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (T54) TRANSMISSION TEMPERATURE SENSOR

Temperature Sensor Resistive Values Chart	
Transmission Temperature	Resistive Value Compared to Temperature (± 10%)
20° C (68° F)	2.5k ohms to 6.5k ohms
80° C (176° F)	0.3k ohms to 0.9k ohms



Reconnect all previously disconnected connectors.

Start the engine and allow to obtain normal operating temperature (approximately 10 min. of engine run time).

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance between the (T54) Transmission Temperature Sensor Signal circuit and the (T13) Sensor Ground circuit in the TCM C2 harness connector.

Is the resistance within the desired range listed on the above chart?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Transmission Temperature Sensor (Valve Body) per the Service Information.

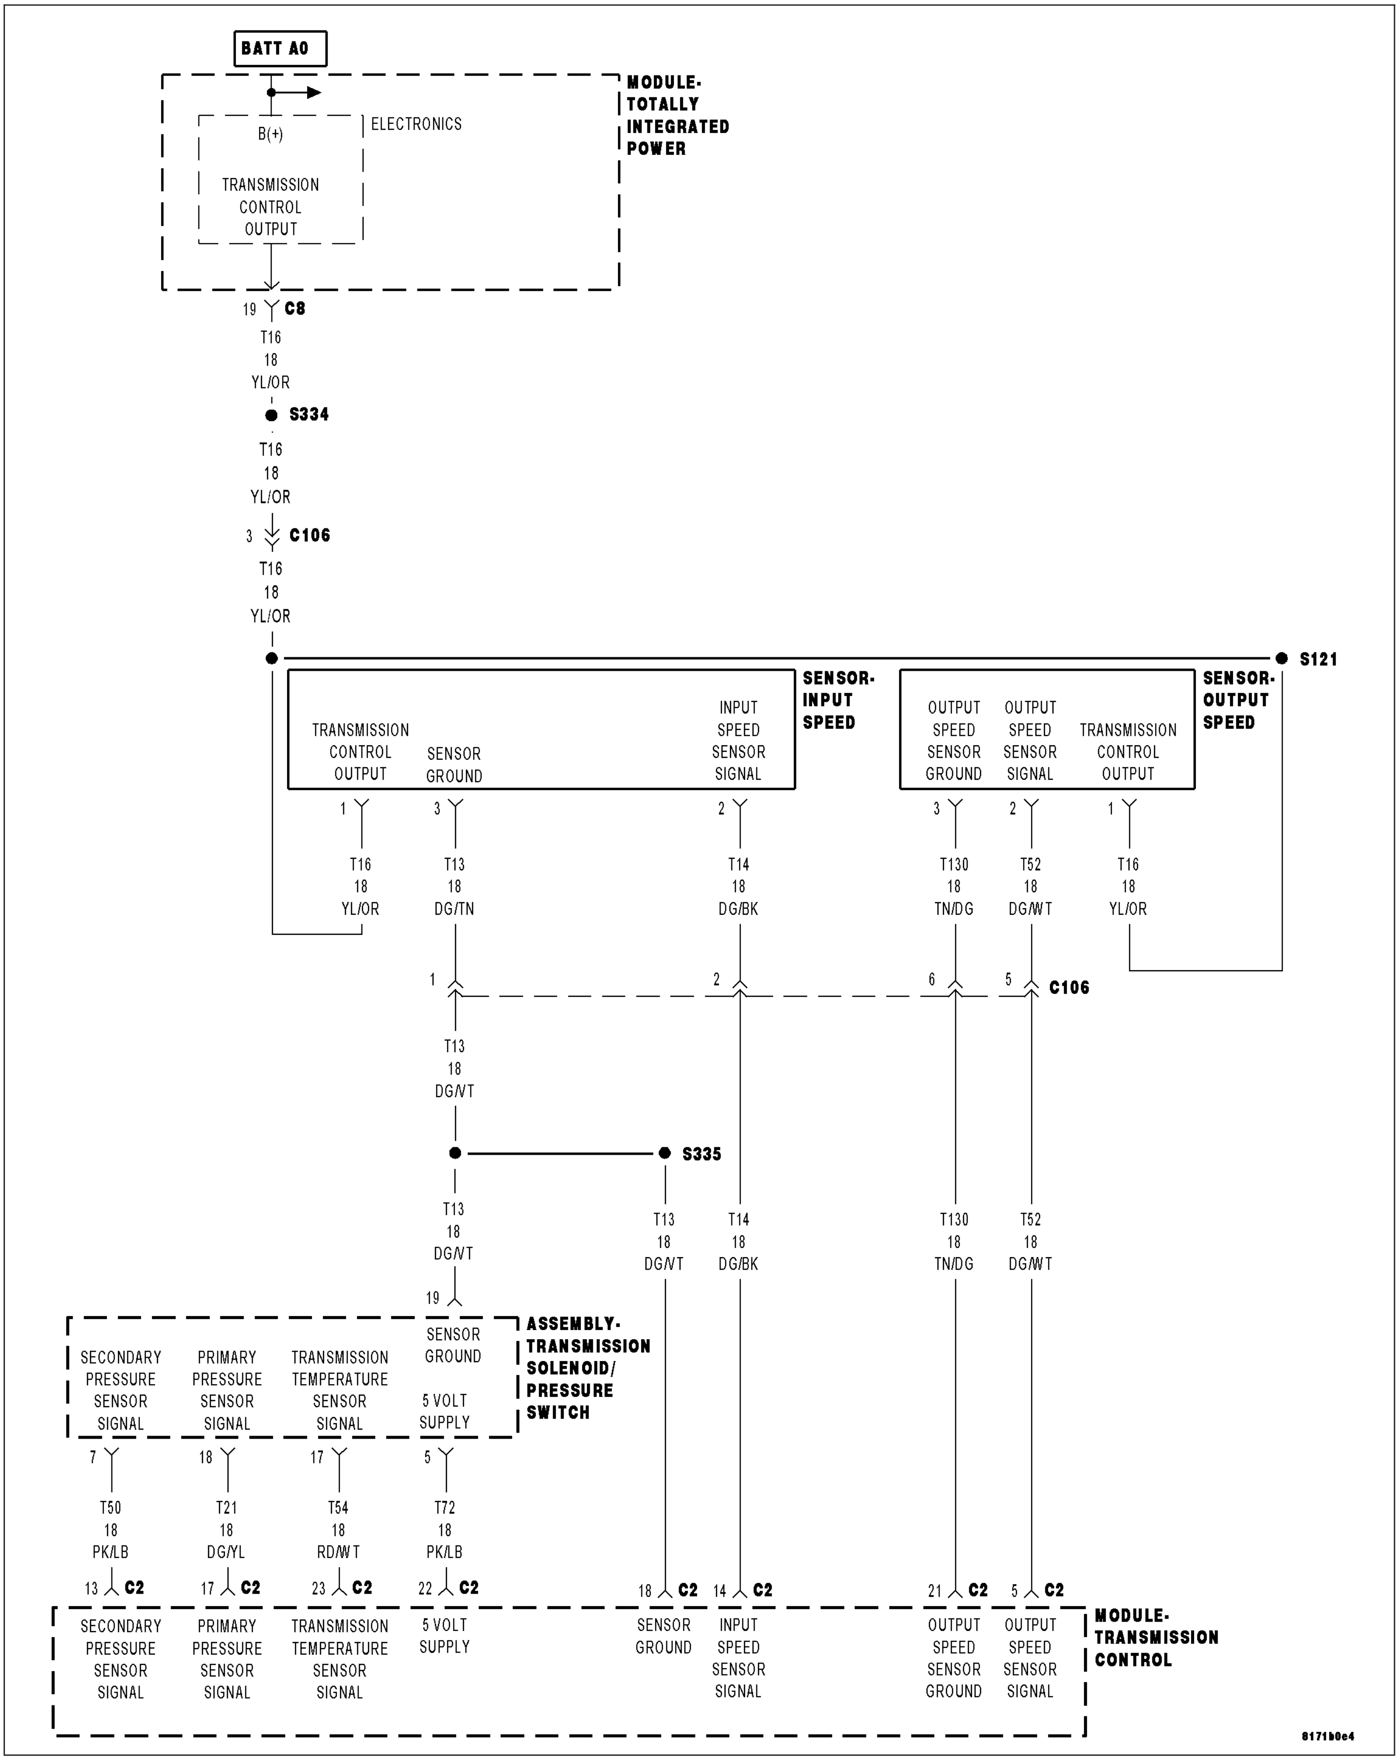
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The transmission system uses two speed sensors. One is used to measure input rpm (primary pulley) and one to measure output rpm (secondary pulley).

The Input Speed sensor detects the primary pulley rpm by the use of a three-wire magnetic pickup devices that generates a square wave signal as rotation occurs and is monitored by the Transmission Control Module (TCM). These inputs are essential for proper transmission operation.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  System voltage between 9.0 and 16.0 volts
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with TCC lock-up enabled.
  No DTCs from the following:
- TCC Solenoid
- Lock-up solenoid
- Step motor
- Input or Output Speed Sensor No Signal
- Transmission Range Sensor (TRS)
- Sensor Ground
- CAN
- **Set Condition:**
  All the below conditions must be present for the period of 5 seconds for the DTC to set:
- Engine speed minus the primary speed is greater than 1000 rpm.
- Secondary speed multiplied by the estimated ratio, minus the Primary speed is greater than 1000 rpm.
- Engine speed minus the Secondary speed, multiplied by the estimated ratio is less than 1000 rpm.

Possible Causes
ENGINE CAM OR CRANK DTCS PRESENT
DIRTY OR DAMAGED INPUT SPEED SENSOR
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(T14) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T14) INPUT SPEED SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
INPUT SPEED SENSOR
TORQUE CONVERTER CLUTCH
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

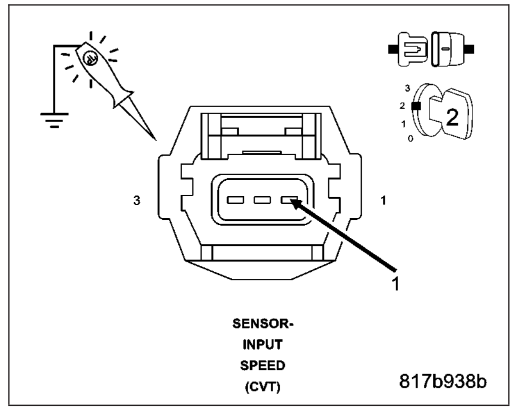
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 10

2. CHECK FOR ENGINE CAM OR CRANK SENSOR DTCS



With the scan tool, check engine DTCs.

Are there any Engine Cam or Crank sensor DTCs present?

Yes >> Refer to the engine category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

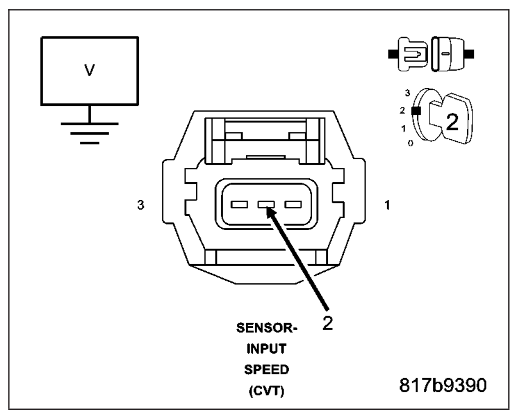
3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Disconnect the Input Speed Sensor harness connector.

Ignition on, engine not running

With the scan tool under TIPM, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit at the Input Speed Sensor harness connector.



NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 4

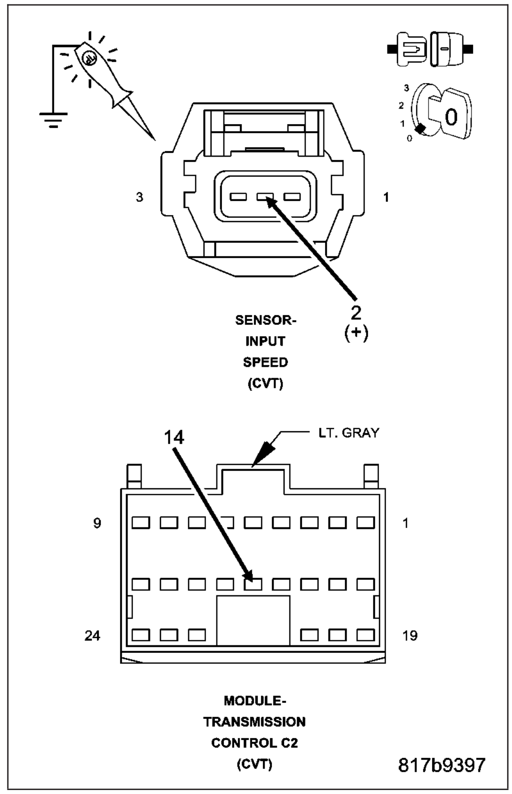
No >> Repair the (T16) Transmission Control Output circuit for an open or high resistance.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT

With the scan tool under TIPM, stop the Transmission actuator.

Turn the ignition off, wait 5 seconds, then turn the ignition on.

Measure the voltage of the (T14) Input Speed Sensor Signal circuit.



Pick the answer that best matches your findings:

Voltage above 5.5 volts
Go To 6

Voltage below 4.5 volts
Go To 5

Voltage between 4.5 and 5.5 volts
Go To 7

5. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Turn the ignition off to the lock position.

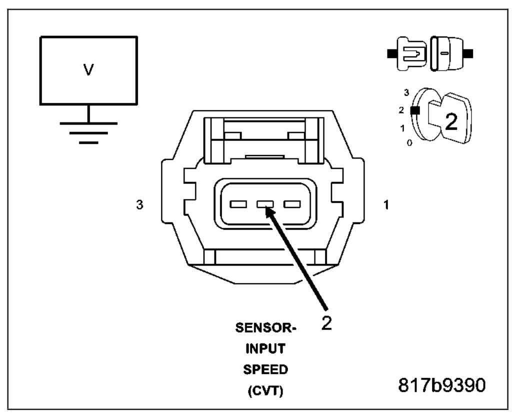
Disconnect the TCM C2 harness connector.

Connect a jumper wire between the (T14) Input Speed Sensor Signal circuit in the Input Speed Sensor harness connector and B(+).

Using a 12-volt test light connected to ground, check the (T14) Input Speed Sensor Signal circuit in the TCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?



Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Repair the (T14) Input Speed Sensor Signal circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running

Measure the voltage of the (T14) Input Speed Sensor Signal circuit.

Is the voltage above 0.2 volts?

Yes >> Repair the (T14) Input Speed Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. CHECK THE TORQUE CONVERTER

Turn the ignition off to the lock position.

Reinstall all components and reconnect all previously disconnected harness connectors.

Ignition on, engine not running

With the scan tool, erase all Transmission DTCs.

Test drive the vehicle to speeds allowing the Torque Converter to obtain lock-up. Note the Engine rpm compared to the Transmission Input rpm.

Did the difference between the Engine rpm and the Transmission Input rpm differ over 1000 rpm?

Yes >> Go To 8

No >> Go To 9

8. CHECK THE INPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Input Speed Sensor per the Service Information.

Check the Input Speed Sensor for any debris buildup or damage.

Did the Input Speed Sensor show any signs of debris buildup or damage?

Yes >> If there is a debris build up, clean the Output Speed Sensor as necessary and reinstall. If damaged or questionable in condition, replace the Input Speed Sensor.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the Torque Converter per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

9. CHECK IF THE DTC RESETS

Did the DTC P0716-INPUT SPEED SENSOR 1 CIRCUIT PERFORMANCE reset during the test drive?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 10

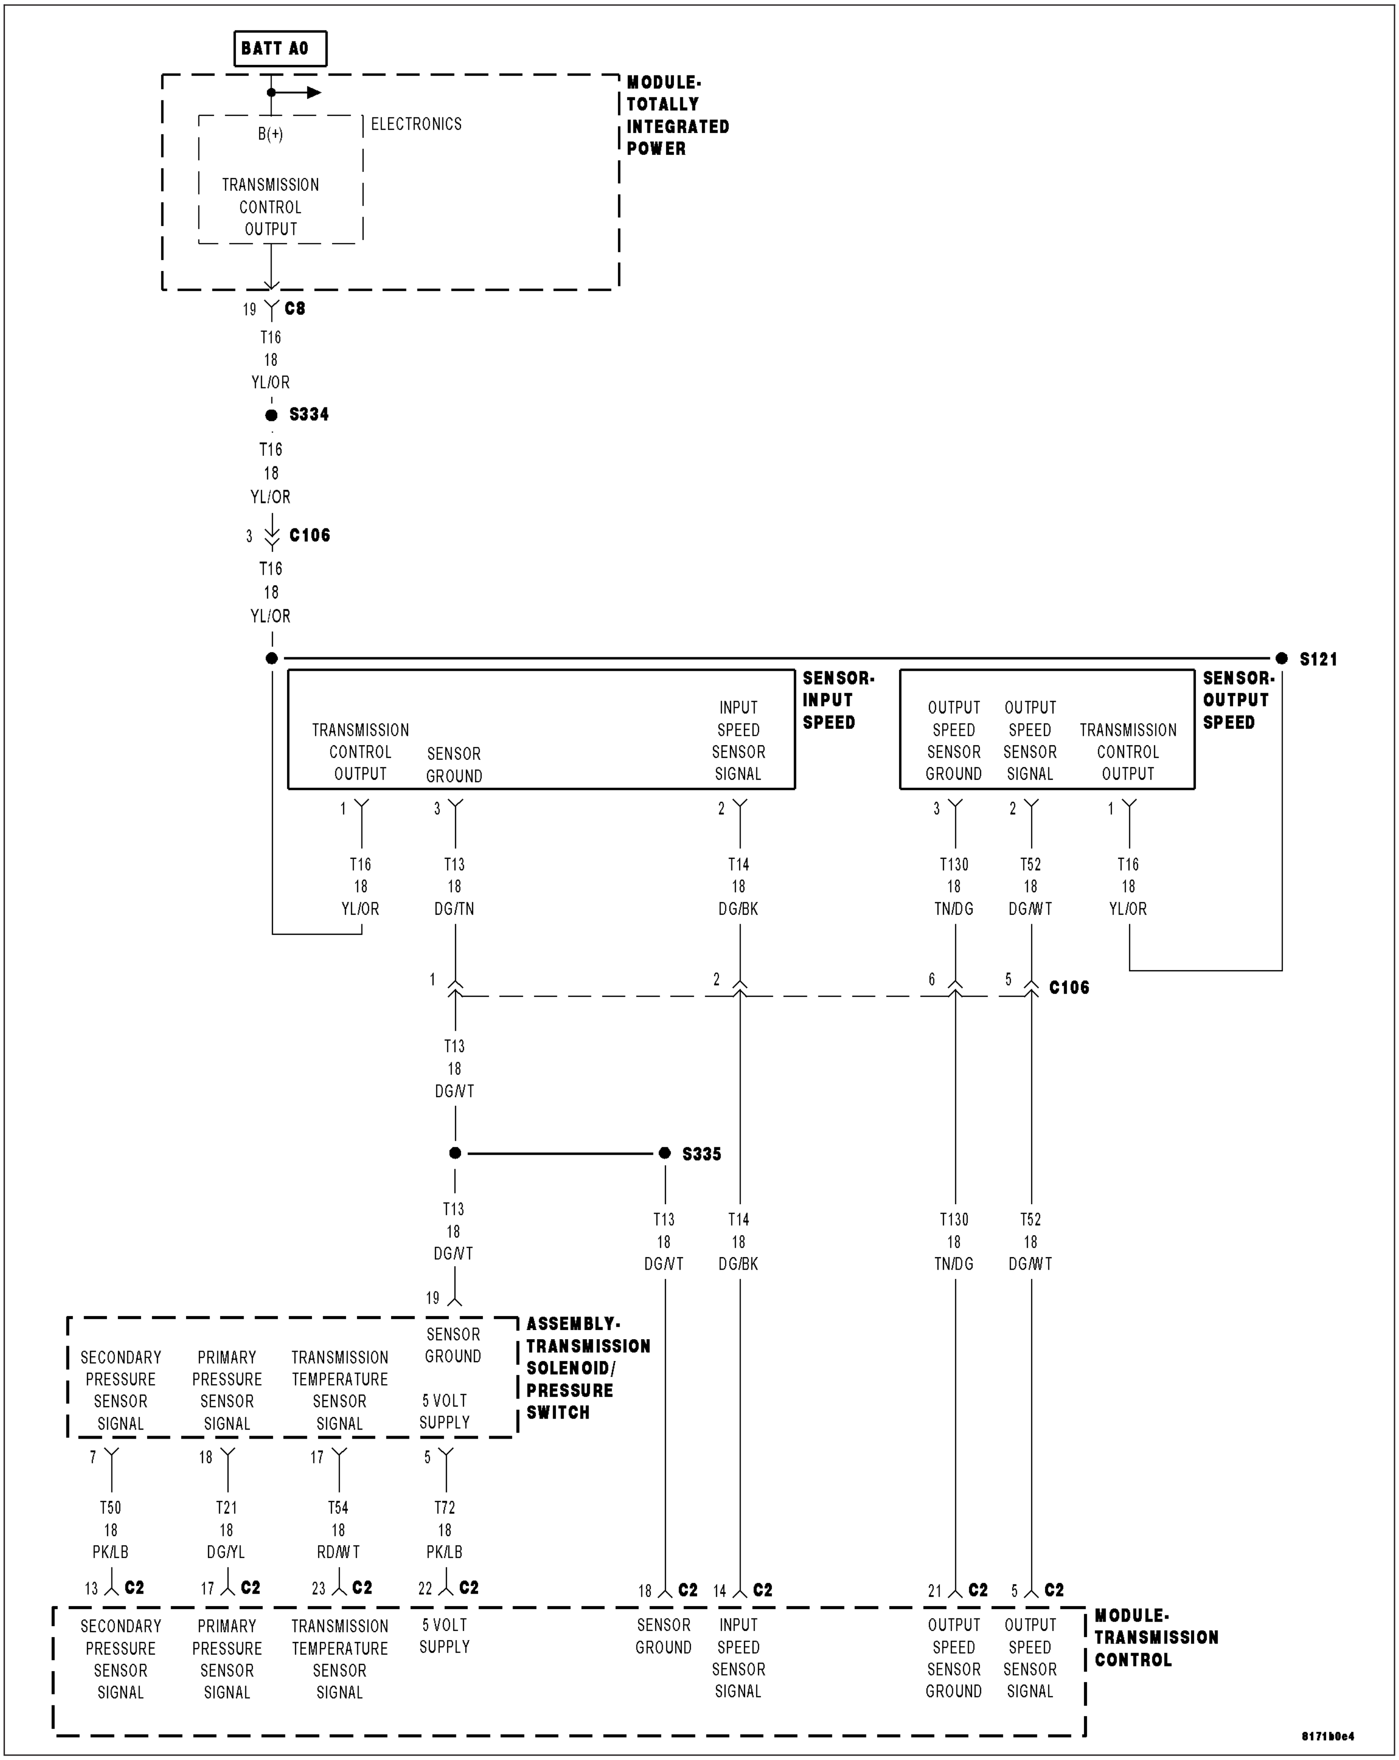
10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Check for any Service Bulletins for possible causes that may apply.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0717-INPUT SPEED SENSOR 1 CIRCUIT NO SIGNAL

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The transmission system uses two speed sensors. One is used to measure input rpm (primary pulley) and one to measure output rpm (secondary pulley).

The Input Speed sensor detects the primary pulley rpm by the use of a three-wire magnetic pickup device that generates a square wave signal as rotation occurs and is monitored by the Transmission Control Module (TCM). These inputs are essential for proper transmission operation.

- **When Monitored:**
  Ignition on, engine running with system voltage between 9.0 and 16.0 volts.
  No detected Primary Speed Sensor and/or Sensor ground DTCs.
- **Set Condition:**
  Condition one: Input speed rpm is less than 150 rpm with a Output speed rpm greater than 1000 rpm for the period of 5 seconds.
  Condition two: Input speed rpm last value is greater than 1000 rpm where as the Input speed rpm current value is zero rpm for the period of 500 msec.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T14) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T14) INPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T14) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T13) SENSOR GROUND CIRCUIT OPEN
INPUT SPEED SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

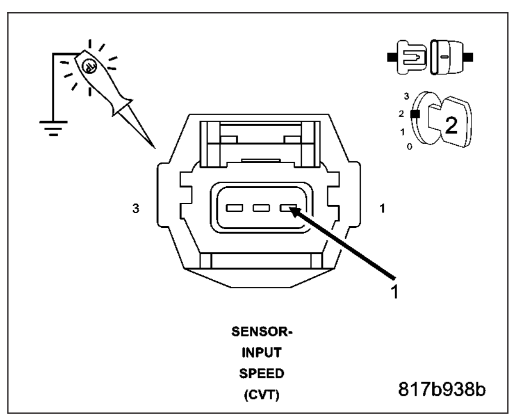
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 8

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

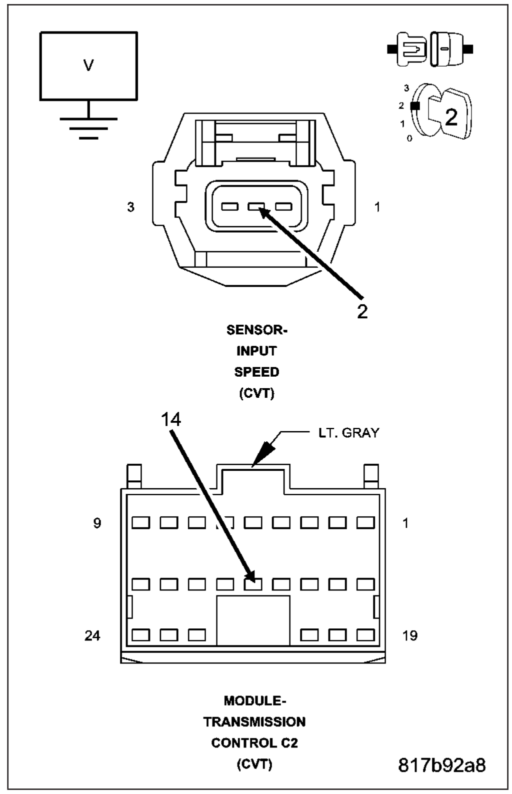
Disconnect the Input Speed Sensor harness connector.

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit at the Input Speed Sensor harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (T16) Transmission Control Output circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

3. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T14) Input Speed Sensor Signal circuit.

Is the voltage above 0.5 volts?

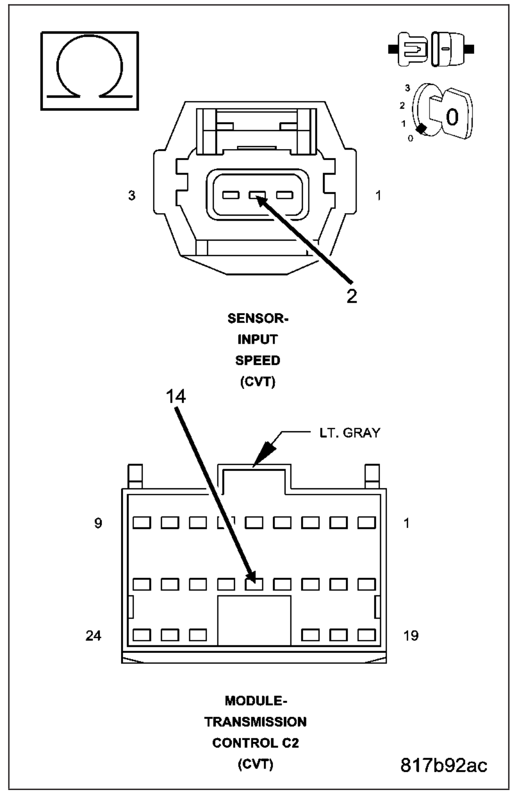
Yes >> Repair the (T14) Input Speed Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.



Measure the resistance of the (T14) Input Speed Sensor Signal circuit between the TCM C2 harness connector and the Input Speed Sensor harness connector.

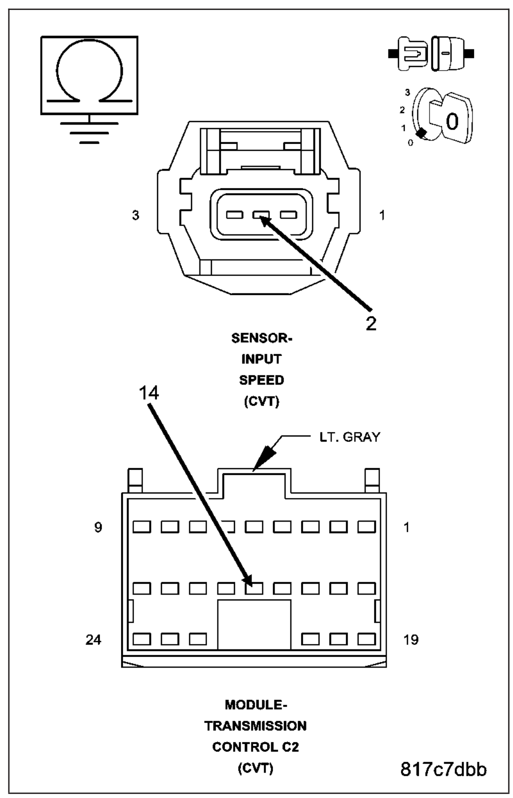
Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (T14) Input Speed Sensor Signal circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE (T14) INPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND



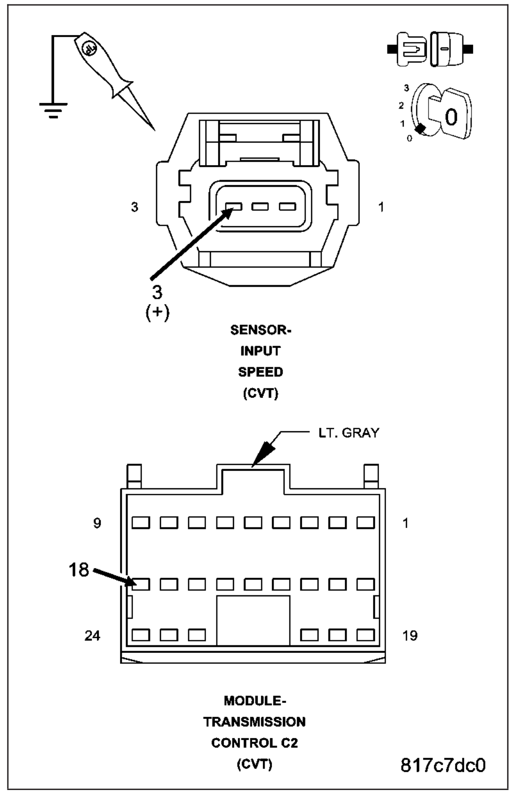
Measure the resistance between ground and the (T14) Input Speed Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T14) Input Speed Sensor Signal circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 6



6. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Connect a jumper wire between the (T13) Sensor Ground circuit in the Input Speed Sensor harness connector and B(+).

Using a 12-volt test light connected to ground, check the (T13) Sensor Ground circuit in the TCM C2 harness connector.

Does the test light illuminate brightly?

Yes >> Go To 7

No >> Repair the (T13) Sensor Ground circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. CHECK THE INPUT SPEED SENSOR

Turn the ignition off to the lock position

Replace the Input Speed Sensor per the Service Information.

Reconnect all previously disconnected connectors.

Ignition on, engine not running.

With the scan tool, erase all Transmission DTCs.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

NOTE: Make sure to perform a test drive of the vehicle.

With the scan tool, read Transmission DTCs.

Did the DTC P0717 reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

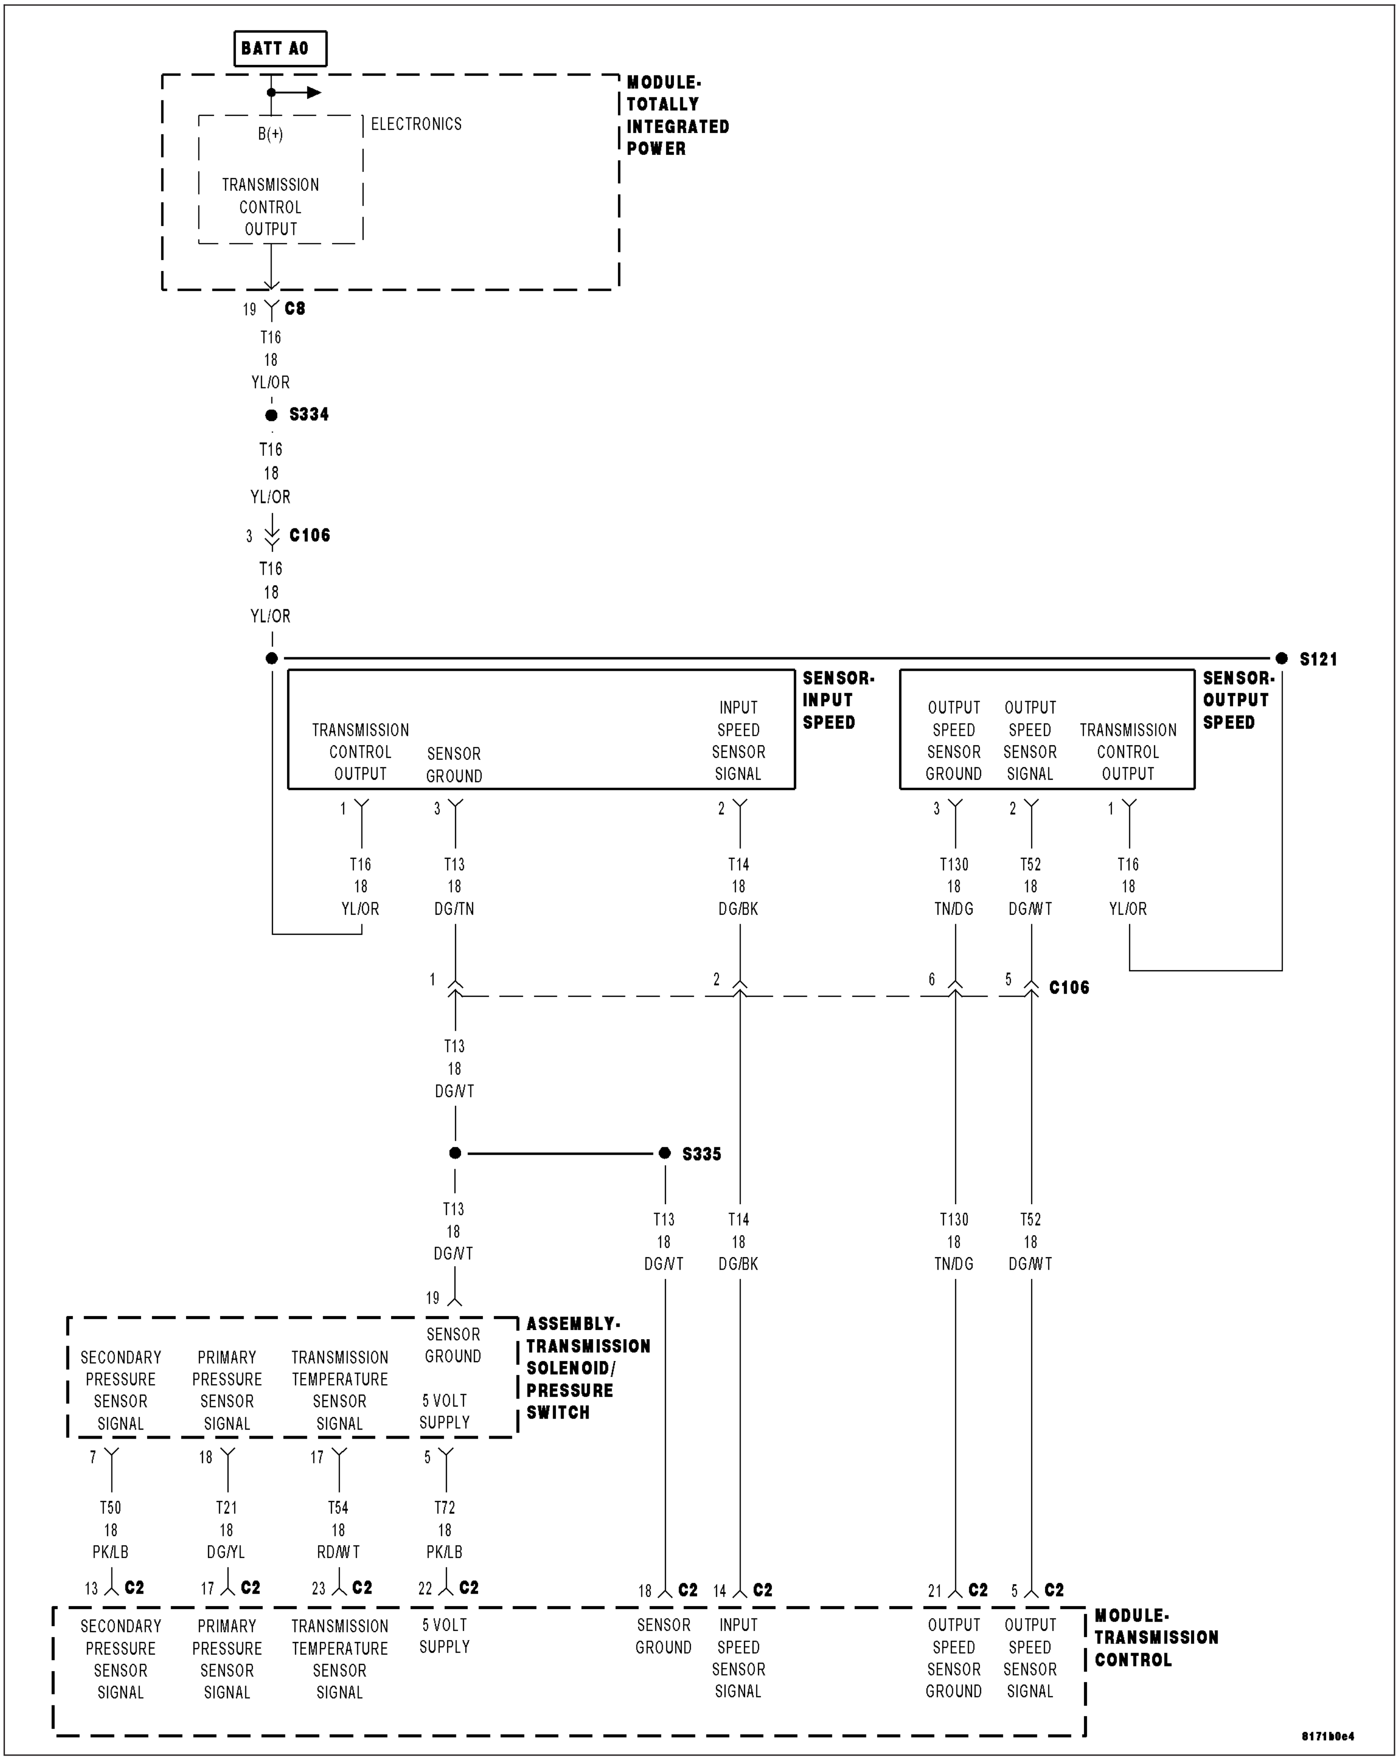
No >> Repair is complete.

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0721-OUTPUT SPEED SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The transmission system uses two speed sensors. One is used to measure input rpm (primary pulley) and one to measure output rpm (secondary pulley).

The Input Speed sensor detects the primary pulley rpm by the use of a three-wire magnetic pickup device that generates a square wave signal as rotation occurs and is monitored by the Transmission Control Module (TCM). These inputs are essential for proper transmission operation.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  System voltage between 9.0 and 16+.0 volts.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with TCC lock-up enabled.
  No active DTCs from the following:
- Torque Convertor Clutch (TCC)
- Lock-up Solenoid
- CAN Bus
- Step Motor
- Input or Output Speed Sensor No Signal
- Transmission Range Sensor (TRS)
- Sensor Ground
- **Set Condition:**
  All the below conditions must be present for the period of 5 seconds for the DTC to set:
- Engine speed minus the primary speed is less than 1000 rpm.
- Secondary speed multiplied by the estimated ratio, minus the Primary speed is greater than 1000 rpm.
- Vehicle speed minus the Vehicle speed calculated using the Secondary speed, is greater than or equal to 20 Km/h (12.5 mph)

Possible Causes
ENGINE CAM OR CRANK DTCS PRESENT
DIRTY OR DAMAGED OUTPUT SPEED SENSOR
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
(T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
(T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T130) OUTPUT SPEED SENSOR GROUND CIRCUIT HIGH RESISTANCE
OUTPUT SPEED SENSOR
TORQUE CONVERTER CLUTCH
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 11

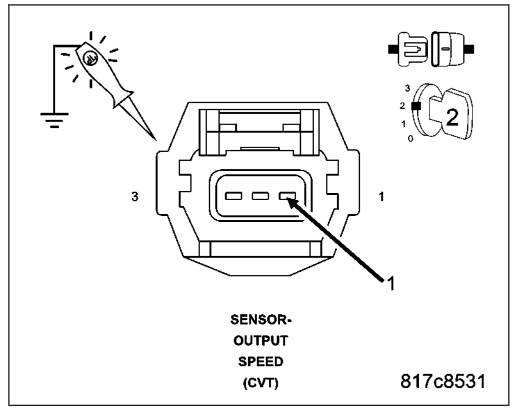
2. CHECK FOR ENGINE CAM OR CRANK SENSOR DTCS

With the scan tool, check engine DTCs.

Are there any Engine Cam or Crank sensor DTCs present?

Yes >> Refer to the engine category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3



3. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Disconnect the Output Speed Sensor harness connector.

Ignition on, engine not running

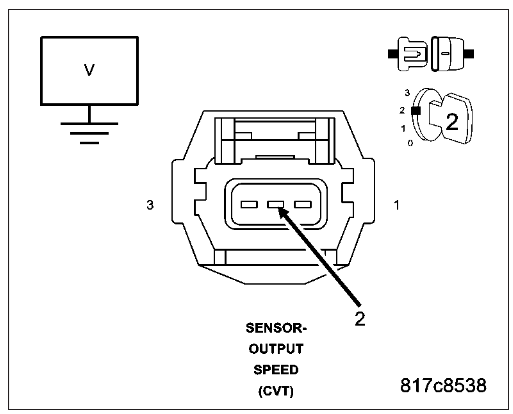
With the scan tool under TIPM, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit at the Output Speed Sensor harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 4



No >> Repair the (T16) Transmission Control Output circuit for an open or high resistance.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT

With the scan tool under TIPM, stop the Transmission actuator.

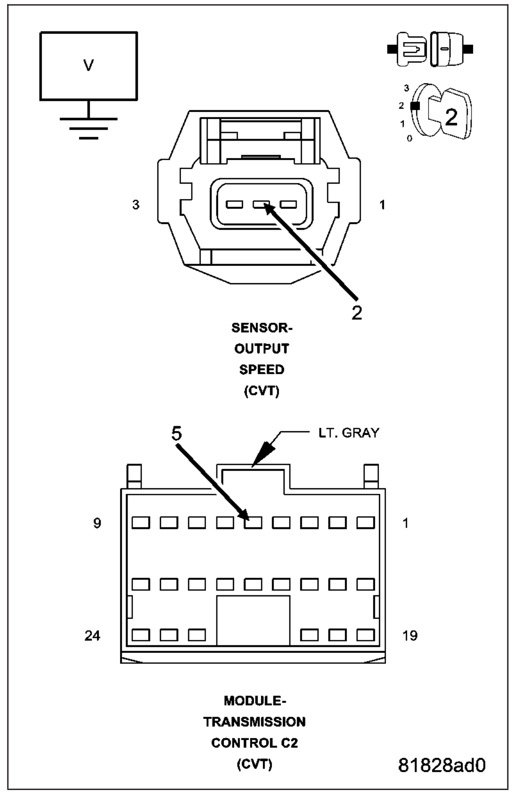
Turn the ignition off, wait 5 seconds, then turn the ignition on.

Measure the voltage of the (T52) Output Speed Sensor Signal circuit.

Pick the answer that best matches your findings:

Voltage above 9.0 volts
Go To 5

Voltage below 9.0 volts
Go To 6



5. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running

Measure the voltage of the (T52) Output Speed Sensor Signal circuit.

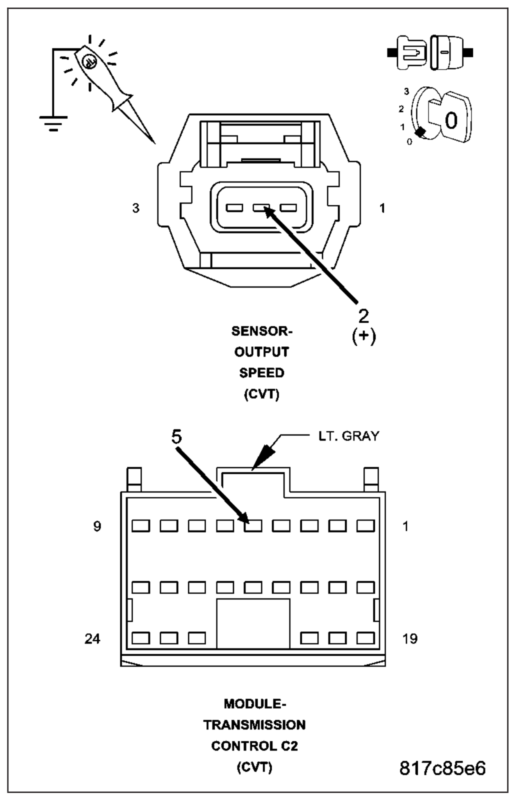
Is the voltage above 0.2 volts?

Yes >> Repair the (T52) Output Speed Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



6. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Connect a jumper wire between the (T52) Output Speed Sensor Signal circuit and B(+) in the Output Speed Sensor harness connector.

Using a 12-volt test light connected to ground, check the (T52) Output Speed Sensor Signal circuit in the TCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 7

No >> Repair the (T52) Output Speed Sensor Signal circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. CHECK THE (T130) OUTPUT SPEED SENSOR GROUND CIRCUIT SHORT TO VOLTAGE

Disconnect the jumper wire.

Disconnect the TCM C2 harness connector.

Measure the voltage of the (T130) Output Speed Sensor Ground circuit.

Is the volage above 0.2 volts?

Yes >> Repair the (T130) Output Speed Sensor Ground circuit for a short to voltage

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 8

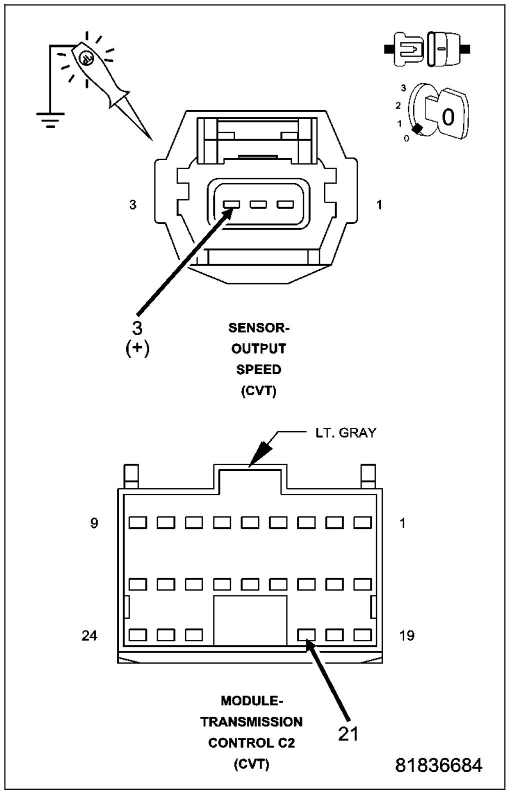
8. CHECK THE (T130) OUTPUT SPEED SENSOR GROUND CIRCUIT FOR AN OPEN (HIGH RESISTANCE)

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Connect a jumper wire between the (T130) Output Speed Sensor Ground circuit in the Output Speed Sensor harness connector and B(+).

Using a 12-volt test light connected to ground, check the (T130) Output Speed Sensor Ground circuit in the TCM C2 harness connector.



NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 9

No >> Repair the (T130) Output Speed Sensor Ground circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

9. CHECK THE OUTPUT SPEED SENSOR

Turn the ignition off to the lock position.

Remove the Output Speed Sensor per the Service Information.

Check the Output Speed Sensor for any debris buildup or damage.

Did the Output Speed Sensor show any signs of debris buildup or damage?

Yes >> If there is a debris build up, clean the Output Speed Sensor as necessary and reinstall. If damaged or questionable in condition, replace the Output Speed Sensor.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 10

10. REPLACE SPEED SENSOR AND TEST DRIVE VEHICLE

Turn the ignition off to the lock position.

Replace the Output Speed Sensor per the Service Information

Reconnect all previously disconnected harness connectors.

Ignition on, engine not running

With the scan tool, erase all Transmission DTCs.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

NOTE: Test drive the vehicle to speeds that will allow Torque Converter lock-up.

With the scan tool, read Transmission DTCs.

Does the DTC P0721 reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

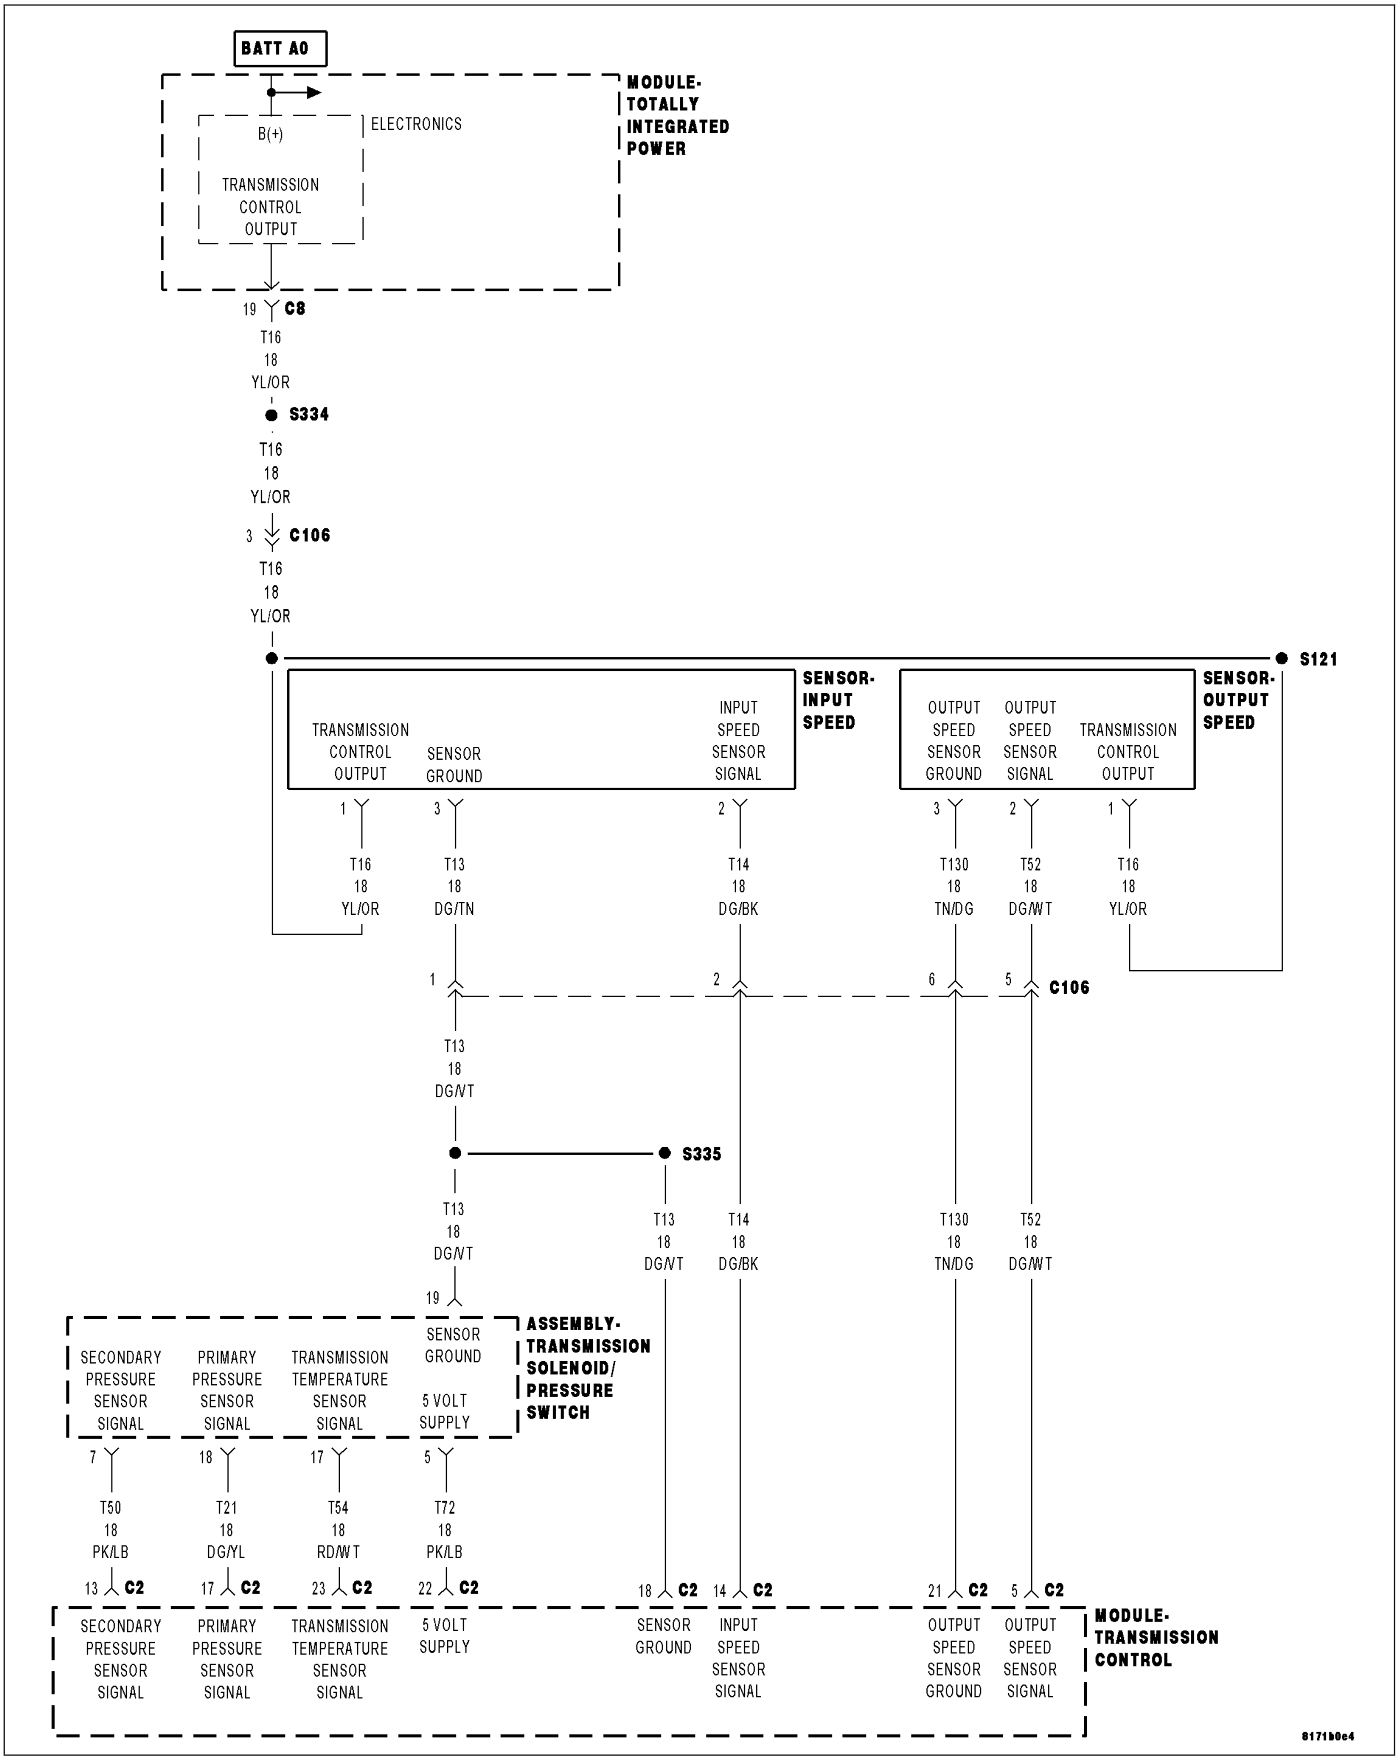
No >> Test Complete.

11. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0722-OUTPUT SPEED SENSOR CIRCUIT NO SIGNAL

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The transmission system uses two speed sensors. One is used to measure input rpm (primary pulley) and one to measure output rpm (secondary pulley).

The Output Speed sensor detects the secondary pulley rpm by the use of a three-wire magnetic pickup device that generates a square wave signal as rotation occurs and is monitored by the Transmission Control Module (TCM). These inputs are essential for proper transmission operation.

- **When Monitored:**
  Ignition on, engine running with system voltage between 9.0 and 16.0 volts.
  No detected Primary Speed Sensor and/or Sensor ground DTCs.
- **Set Condition:**
  Condition one: Output speed rpm is less than 150 rpm with a Input speed rpm greater than 1000 rpm for the period of 5 seconds.
  Condition two: Vehicle speed is greater than 20 Km/h (12.5 mph) calculated by the last secondary speed with the current Output Speed value equals to 0 rpm for the period of 500 msec.

Possible Causes
(T16) TRANSMISSION CONTROL OUTPUT CIRCUIT OPEN
(T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
(T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT OPEN
(T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(T130) OUTPUT SPEED SENSOR GROUND CIRCUIT OPEN
OUTPUT SPEED SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

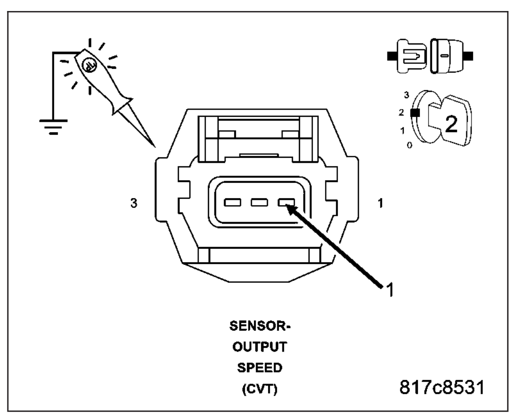
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 8

2. CHECK THE (T16) TRANSMISSION CONTROL OUTPUT CIRCUIT FOR AN OPEN



Turn the ignition off to the lock position.

Disconnect the Output Speed Sensor harness connector.

Ignition on, engine not running.

With the scan tool under TIPM, actuate the Transmission.

Using a 12-volt test light connected to ground, check the (T16) Transmission Control Output circuit at the Output Speed Sensor harness connector.

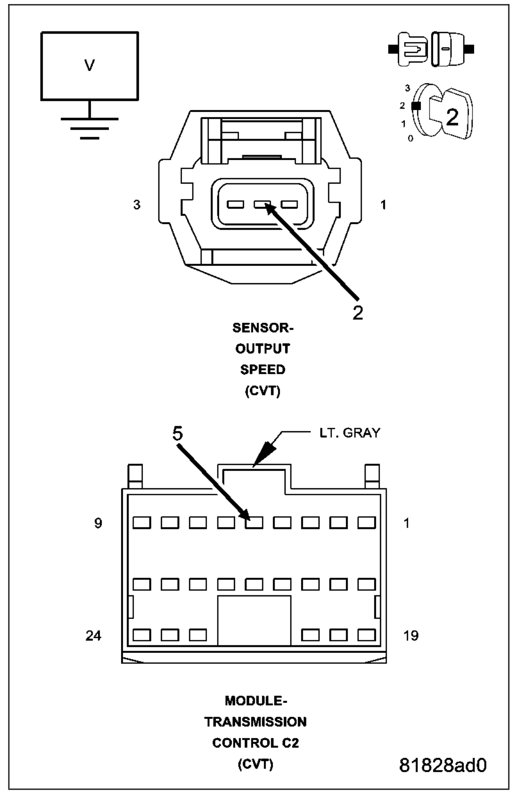
NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Repair the (T16) Transmission Control Output circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



3. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T52) Output Speed Sensor Signal circuit.

Is the voltage above 0.5 volts?

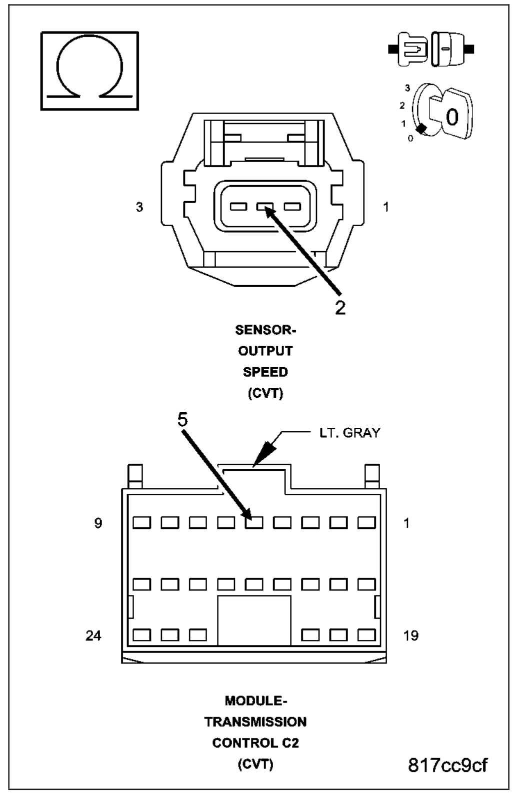
Yes >> Repair the (T52) Output Speed Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.



Measure the resistance of the (T52) Output Speed Sensor Signal circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

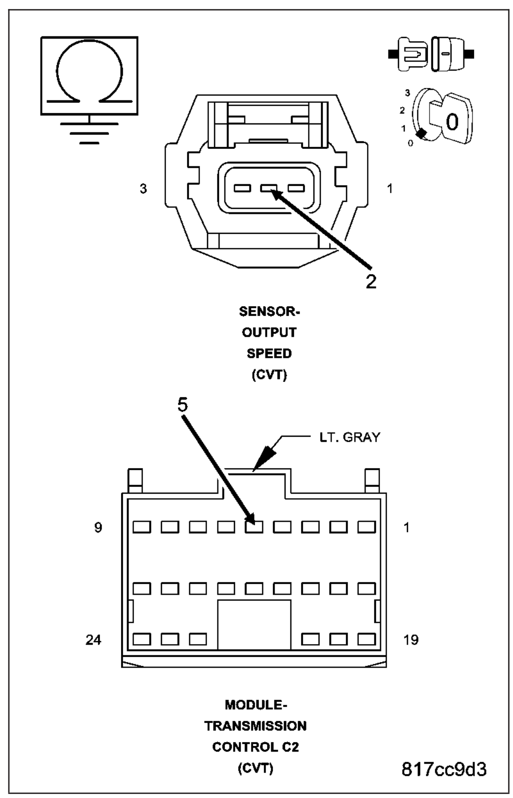
Is the resistance below 5.0 ohms?

Yes >> Go To 5

No >> Repair the (T52) Output Speed Sensor Signal circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

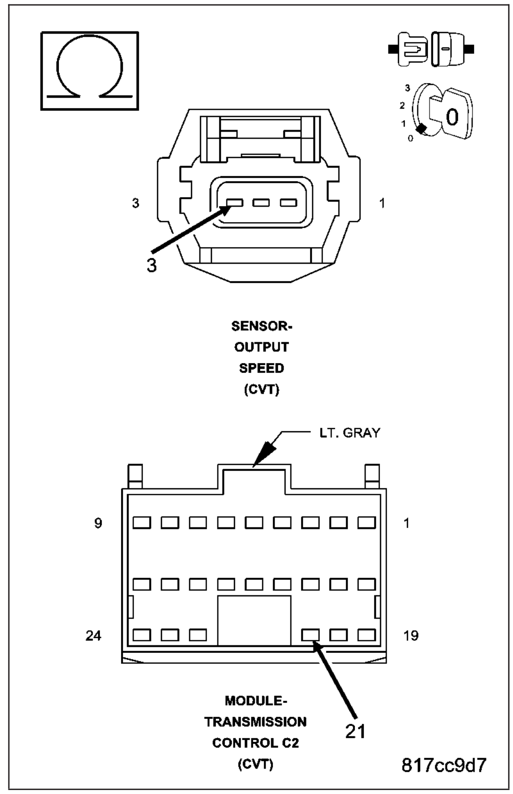
5. CHECK THE (T52) OUTPUT SPEED SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND



Measure the resistance between ground and the (T52) Output Speed Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T52) Output Speed Sensor Signal circuit for a short to ground.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 6

6. CHECK THE (T130) OUTPUT SPEED SENSOR GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (T130) Output Speed Sensor Ground circuit between the TCM C2 harness connector and the Output Speed Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the (T130) Output Speed Sensor Ground circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. CHECK THE OUTPUT SPEED SENSOR

Turn the ignition off to the lock position

Replace the Output Speed Sensor per the Service Information.

Reconnect all previously disconnected connectors.

Ignition on, engine not running.

With the scan tool, erase all Transmission DTCs.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

NOTE: Make sure to perform a test drive of the vehicle.

With the scan tool, read Transmission DTCs.

Did the DTC P0722 reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Repair is complete.

8. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0730-INCORRECT GEAR RATIO

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module controls the gear ratio by the use of a Step motor that transfers electrical power to mechanical movement. The rationality is a continuous test that monitors the Step motor movement. If the Step motor is stuck at a certain position, the estimated ratio is increased or decreased continuously by the feedback value of the primary pulley speed difference. When the difference between the estimated and actual primary pulley speed has reached 1000 rpm, a DTC will set.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  System voltage between 9.0 and 16.0 volts.
  Accelerator Pedal Position (APP) greater than 12.5% with an engine rpm greater than 450 rpm.
  Vehicle speed greater than 10 Km/h (6 mph).
  Transmission fluid temperature greater than 20° C (68° F).
  No active DTCs from the following:
- Step Motor
- Transmission Temperature Sensor
- Transmission Range Sensor
- Line Pressure Solenoid
- Input or Output Speed Sensor
- Primary or Secondary Pressure Sensor
- Over Temperature
- **Set Condition:**
  If the difference between the transmission estimated pulley speed and the measured primary pulley speed is greater than 1000 rpm (belt slipping) for the continuous period of 5.0 seconds.

Possible Causes
STEP MOTOR PERFORMANCE
SHIFT VALVE STICKING
CVT BELT SLIPPING
HYDRAULIC CIRCUIT
INTERNAL TRANSMISSION

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. REPAIR INTERNAL TRANSMISSION

This DTC indicates an internal transmission problem.

Check for the following possible causes but not limited to these:

- Step motor
- Shift Valve sticking
- CVT Belt slipping
- Hydraulic control circuit including the Valve Body

Repair

Replace or repair the CV Transmission per the Service Information. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

P0741-TORQUE CONVERTER CLUTCH CIRCUIT PERFORMANCE

Theory of Operation

The Transmission Control Module (TCM) monitors the Torque Convertor Clutch for slippage using a calculation derived from turbine revolution (input speed) and engine rpm broadcast over the CAN C BUS. If the slip value exceeds a predetermined value the DTC will set.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  System voltage between 9.0 and 16.0 volts.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with TCC lock-up enabled.
  TCC Lock up command is ON (True).
  No active DTCs from the following:
- Step motor,
- Line Pressure Solenoid
- Secondary Solenoid
- Input or Output Speed Sensor
- Primary or Secondary Pressure Sensor
- CAN Bus
- **Set Condition:**
  The DTC is detected If the Torque Convertor Clutch (TCC) slip monitored by the Transmission Control Module (TCM) is greater than a predetermined value for the period of 30 seconds. Note: This is not an electrical fault but a mechanical malfunction such as a control valve sticking in its bore or a TCC Solenoid hydraulic malfunction. It takes two consecutive problem identification trips for the DTC to mature and illuminate the MIL.

Possible Causes
TORQUE CONVERTOR HYDRAULIC CIRCUIT
TORQUE CONVERTOR CLUTCH SOLENOID
TORQUE CONVERTOR CLUTCH
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, erase Transmission DTCs.

Start the vehicle and check Transmission Fluid Level per the Service Information and adjust as necessary.

Test drive the vehicle to a constant speed greater than 40 Km/h (25 mph) for the period of at least 30 seconds.

NOTE: This can not be performed on a hoist, actual road conditions must be present for proper results.

Did the DTC reset (one trip) during the road test?

Yes >> Replace or repair the CV Transmission as necessary. Note the components related to the Torque Converter Clutch (TCC) such as the TCC Solenoid, control valves, valve body leakage or the TCC. Refer to the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

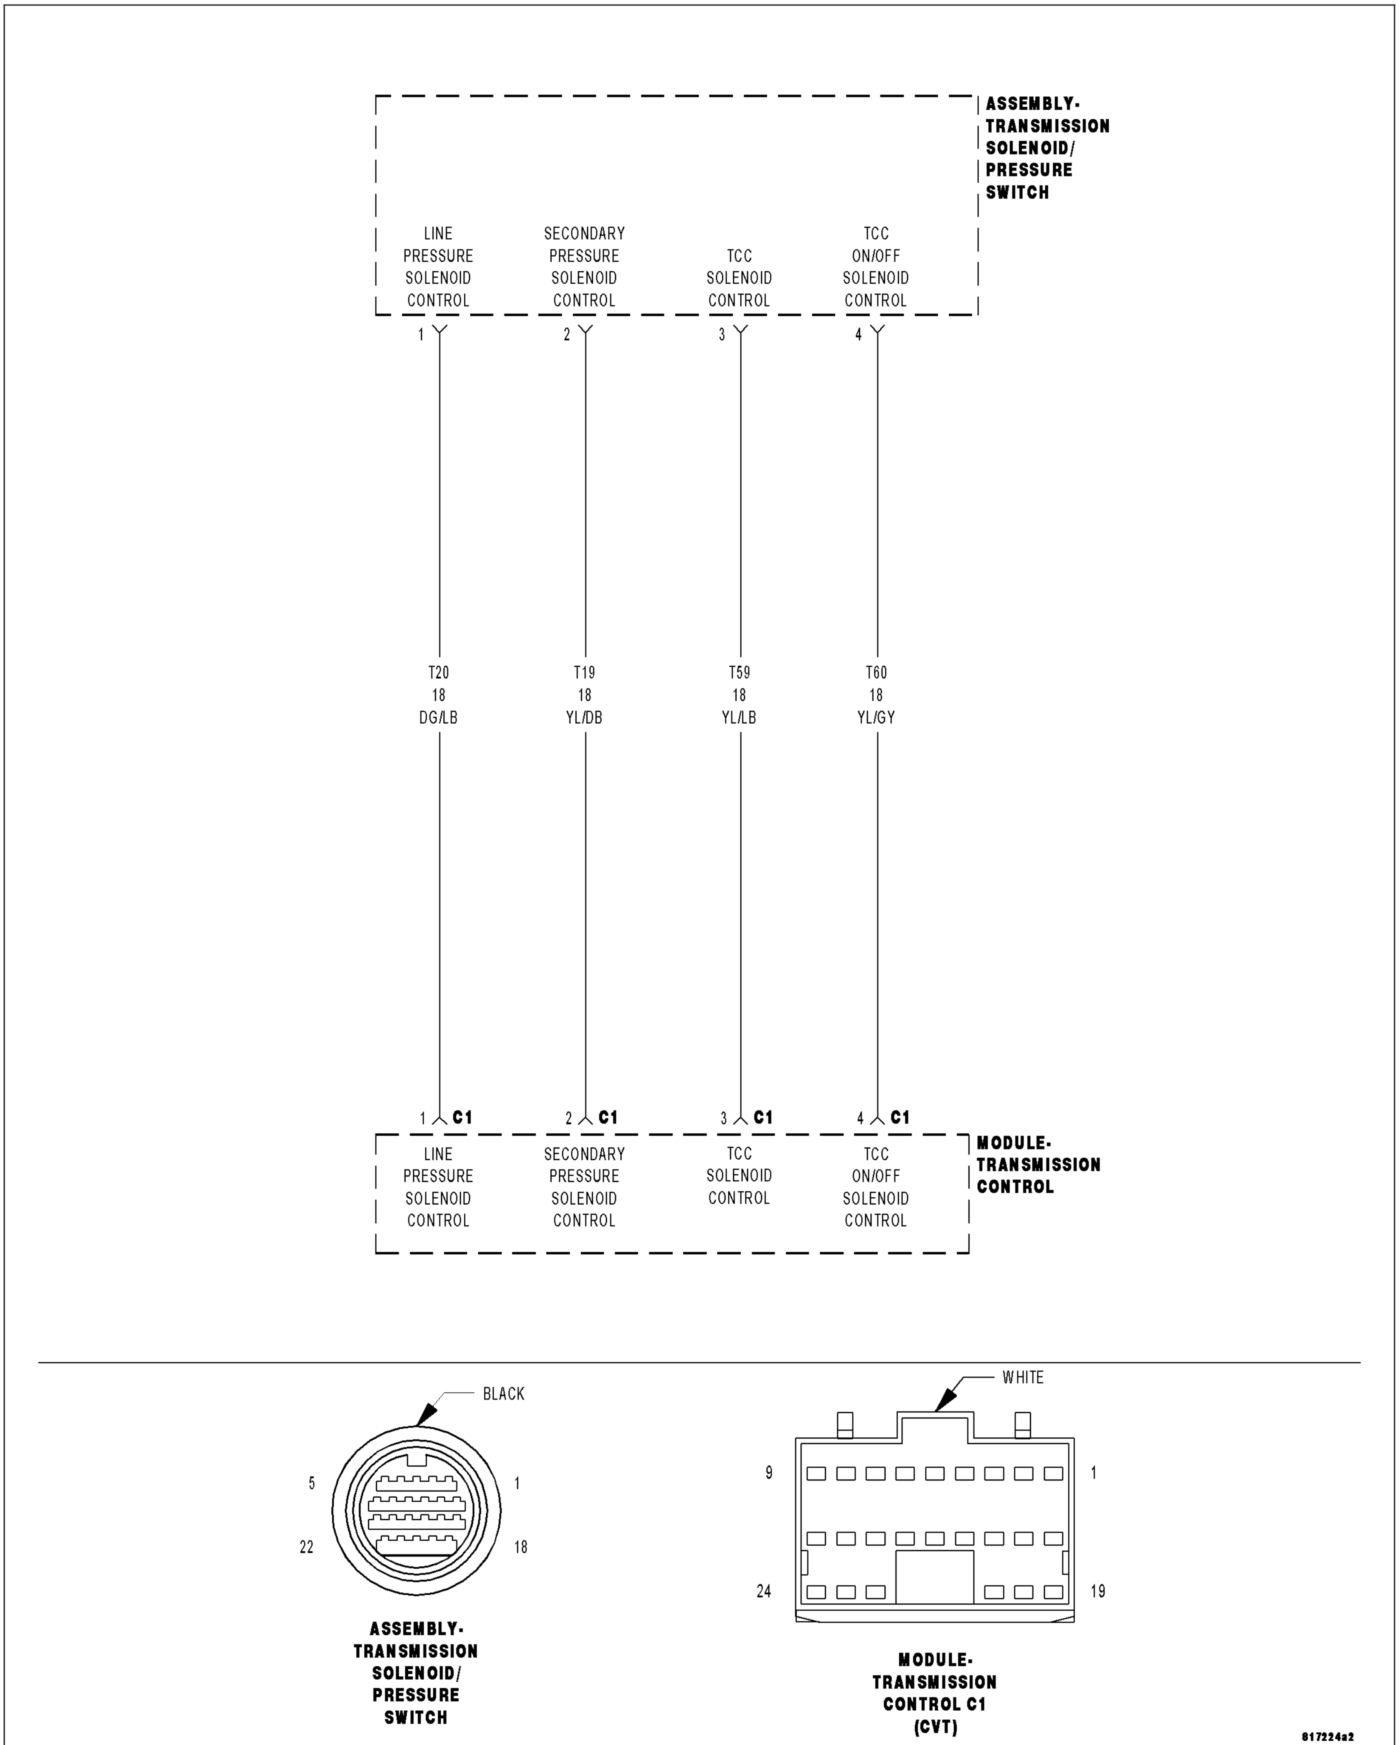
No >> Go To 2

2. INTERMITTENT CONDITION

The conditions necessary to set this DTC are not present at this time.

Refer to an Technical Service Bulletins that may apply.

It may be necessary to Test Drive the vehicle again trying different conditions that may cause the DTC to reset.



Were there any problems found or did the DTC reset?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0746-LINE PRESSURE SOLENOID PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Line Pressure Solenoid regulates the Line Pressure (Oil Pump discharge pressure) which is controlled by the Transmission Control Module (TCM). If the line pressure does not reach at the desired pressure due to driving conditions, the possibility of belt slippage can occur. The gear ratio changes to a value beyond the maximum gear ratio which is a calculation between the Primary Pulley speed and the Secondary Pulley speed. If the gear ratio exceeds a predetermined limit a DTC will set.

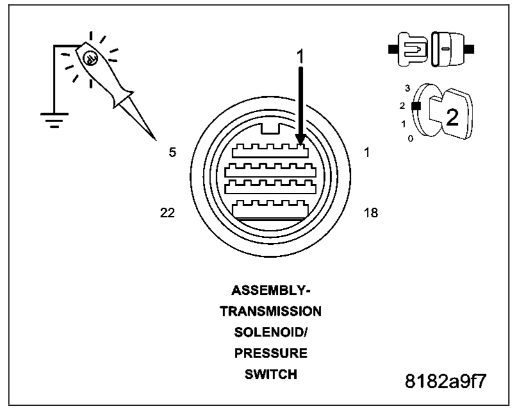
- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm.
  Primary Pulley Speed grater than 500 rpm.
  No active DTCs from the following:
- Line Pressure Solenoid
- Temperature Sensor
- Primary or Secondary Pressure Sensor
- Transmission Range Sensor
- Step Motor
- Secondary Solenoid electrical
- Input and Output Speed Sensor
- Torque Convertor Clutch
- CAN Bus
- Over Temperature Condition
- **Set Condition:**
  Condition one: Gear ratio is greater than 2.7 - 2 for the period of 0.2 seconds (first trip).
  Condition two: Gear ratio is greater than 3.5 - 1 for the period of 0.1 seconds (second trip).

Possible Causes
(T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT OPEN (HIGH RESISTANCE)
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE



With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4

2. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT

Turn the ignition off to the lock position.

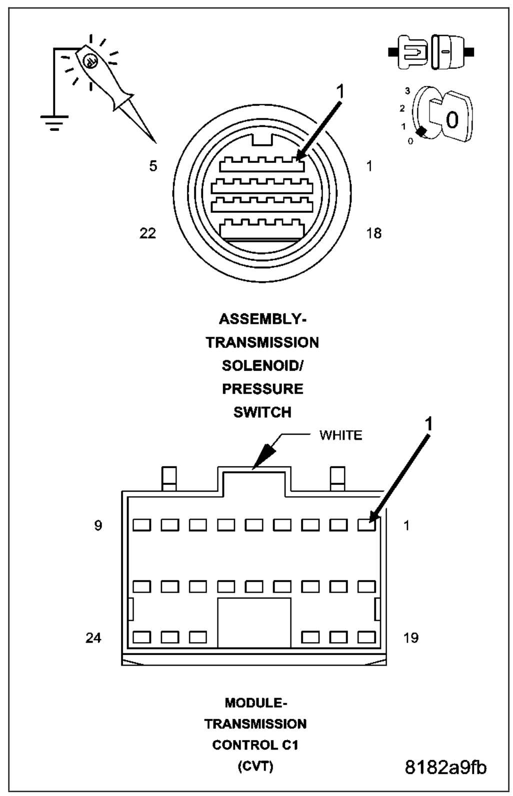
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool, actuate the Line Pressure Solenoid (PL).

Using a 12-volt test light connected to ground, check the (T20) Line Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Replace or repair the CV Transmission per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE TRANSMISSION CONTROL MODULE

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Connect a jumper wire between the (T20) Line Pressure Solenoid Control circuit in the TCM C1 harness connector and B(+).

Using a 12-volt test light connected to ground, check the (T20) Line Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Does the test light illuminate brightly?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Repair the (T20) Line Pressure Solenoid Control circuit for an open (high resistance).

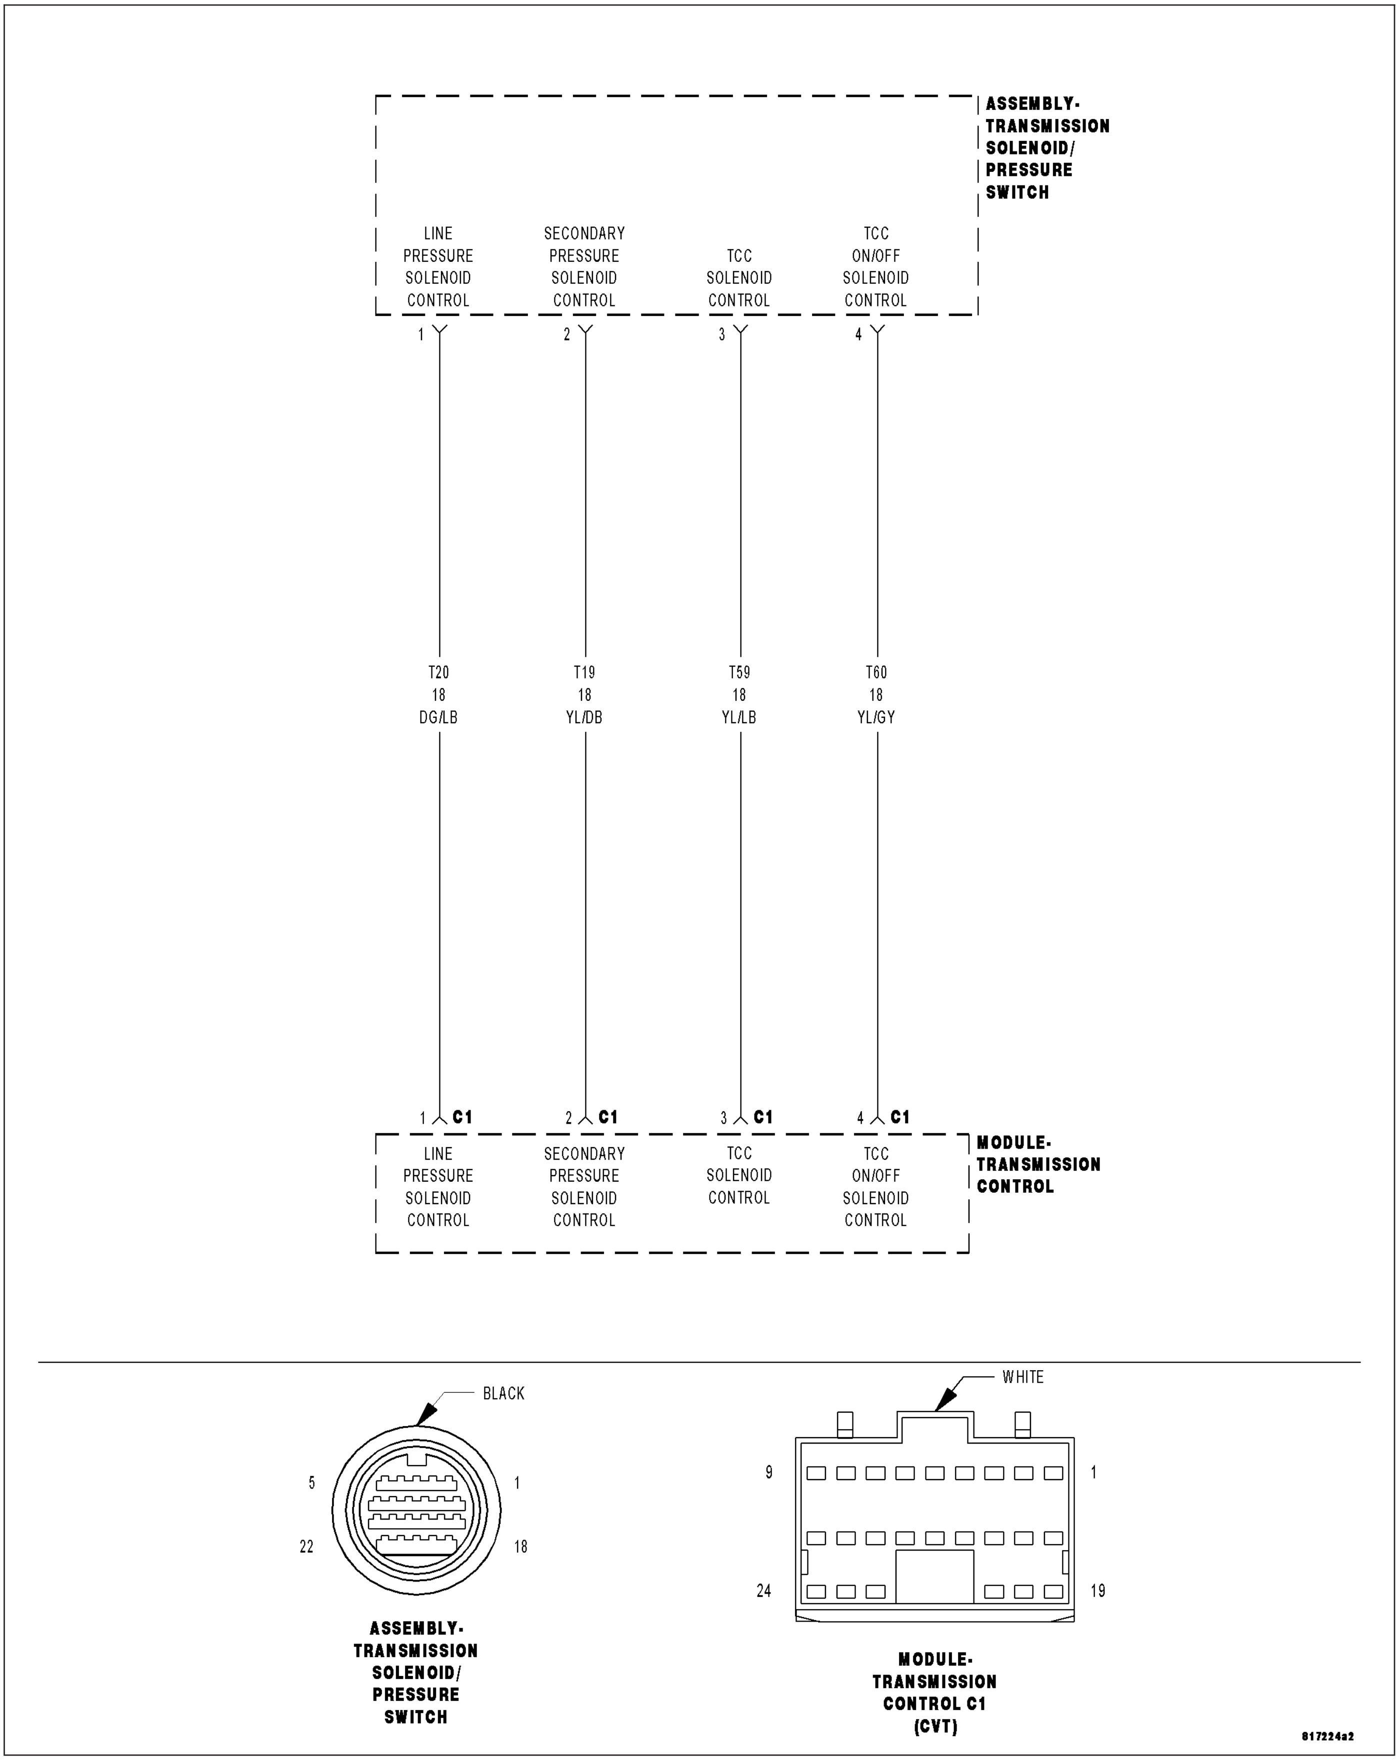
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0776-SECONDARY PRESSURE SOLENOID STUCK OFF (HIGH PRESSURE)

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the secondary line pressure (secondary pulley pressure) from the secondary pressure sensor. The TCM compares the actual secondary line pressure to the target (desired) line pressure. Failure to match the target line pressure over a given time will set the DTC.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with a transmission fluid temperature greater than 20° C (68° F)
  No active DTCs from the following:
- Line Pressure Solenoid
- Lock-up Solenoid
- Primary or Secondary Pressure Sensor
- Transmission Range Sensor
- Step Motor
- Secondary Solenoid electrical
- Input and Output Speed Sensor
- Torque Convertor Clutch
- CAN Bus
- Over Temperature Condition
- **Set Condition:**
  When the difference between actual secondary pressure compared to the target (desired) secondary pressure is greater than 1200 Kpa (174 psi) for the period of 30 seconds. It takes two consecutive problem identified trips to set the DTC.

Possible Causes
(T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT
LINE PRESSURE
SECONDARY PRESSURE SENSOR
SECONDARY PRESSURE SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 7

2. CHECK LINE PRESSURE

Approximate Engine rpm to Line pressure readings

Engine rpm	Line Pressure
Idle	750 kPa (108.8 psi) ± 2%
2.0L – 2500 to 3000 rpm 2.4L – 2600 to 3100 rpm	5300 - 5700 kPa (768.5 - 826.5 psi) ± 2%

Start the engine and warm the transmission to 50 - 80° C (122 - 174° F).

Turn the ignition off to the lock position.

Install an appropriate pressure gauge in the Line Pressure test port per the Service Information.

WARNING: The CV Transmission can generate a line pressure up to 7000 kPa (1015 psi). Failure to use recommended test equipment referred to by the Service Information can result in personal injury or death.

With the scan tool, erase Transmission DTCs.

WARNING: Apply the parking brake. Failure to follow these instructions can result in personal injury or death.

With the brakes firmly applied, start the engine allow to idle and shift the transmission into Reverse, Drive and Low while recording the scan tool Line pressure reading and the pressure gauge reading in each shift lever position.

With the brakes still firmly applied, raise the engine rpm between 2700 - 3250 rpm and shift the transmission into Reverse, Drive and Low while recording the scan tool line pressure reading and the pressure gauge reading in each shift lever position.

CAUTION: Do not hold the engine rpm between 2700 - 3250 rpm for more than 5 seconds in any given shift position. If the 5 second threshold is exceeded, transmission damage can occur. Allow to idle in neutral between shifts for at least 15 to 20 seconds to allow transmission fluid to cool.

Do the gauge readings fall into the desired pressure ranges?

Yes >> Go To 4

No >> Go To 3

3. VERIFY PROBLEM

Possible causes to conditions detected

ENGINE RPM	LINE PRESSURE CONDITION DETECTED	POSSIBLE CAUSES BUT NOT JUST LIMITED TO THESE
Idle speed	Low for all shift lever positions	Oil Pump Wear
		Pressure Regulator Valve for plug sticking or spring fatigue
		Oil filter, oil pump, pressure regulator valve passage oil leak
		Engine idle speed too low
	Only low for a specific position	Oil pressure leak in a passage or component related to the position after the pressure is distributed by the manual valve
	High	TP or APP sensor signal malfunction
		CVT fluid temperature sensor malfunction
		Line pressure solenoid sticking in the off state, filter plugged, cut line
		Pressure regulator valve or plug sticking
Engine rpm between 2700 and 3250 rpm	Line pressure does not rise above the line pressure at idle	TP or APP sensor signal malfunction
		Line pressure solenoid sticking in the on state, filter plugged
		Pressure regulator valve or plug sticking
		Transmission Control Module (TCM)
		Oil pump weak or worn
	Line Pressure rises but does not reach desired level	TP or APP sensor signal malfunction
		Line pressure solenoid sticking in the off state, filter plugged, cut line
		Pressure regulator valve or plug sticking
		Oil pump weak or worn
	Line pressure is low in only one shift lever position	Oil pressure leak in a passage or component related to the position after the pressure is distributed by the manual valve

Use the above chart to help identify the possible cause.

NOTE: There may be other possible causes besides those listed on the above chart. Review any Service Bulletins and refer to the Service Information for any additional possible causes that may apply.

View repair

Repair

Replace or repair the CV Transmission as necessary per the Service Information

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE SECONDARY PRESSURE

Turn the ignition off to the lock position.

Disconnect the pressure gauge from the Line Pressure test port and reinstall the test port plug.

Install the pressure gauge in the Secondary Pressure test port per the Service Information.

With the scan tool, erase Transmission DTCs.

WARNING: Apply the parking brake. Failure to follow these instructions can result in personal injury or death.

With the brakes firmly applied, start the engine allow to idle and shift the transmission into Reverse, Drive and Low while comparing the Secondary Pressure gauge reading to the scan tool Secondary Pressure reading in each shift lever position and record your findings.

With the brakes still firmly applied, raise the engine rpm between 2700 - 3250 rpm and shift the transmission into Reverse, Drive and Low while comparing the gauge Secondary Pressure to the scan tool Secondary Pressure in each shift lever position and record your findings.

CAUTION: Do not hold the engine rpm between 2700 - 3250 rpm for more than 5 seconds in any given shift position. If the 5 second threshold is exceeded, transmission damage can occur. Allow to idle in neutral between shifts for at least 15 to 20 seconds to allow transmission fluid to cool.

Does the Secondary Pressure gauge readings match the scan tool readings in all of the above procedures?

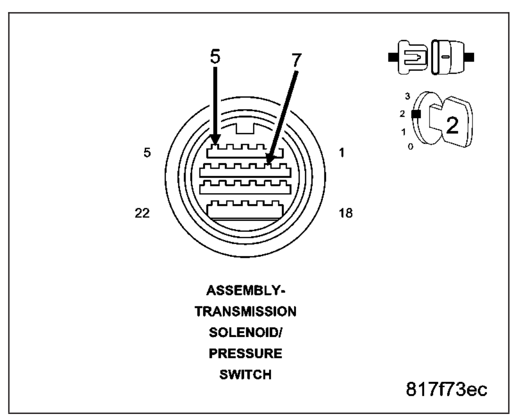
Yes >> Replace or repair the CV Transmission as necessary per the Service Information for components related to the Secondary pressure solenoid.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE SECONDARY PRESSURE SENSOR

Turn the ignition off to the lock position.



Disconnect the pressure gauge from the Secondary Pressure test port and reinstall the test port plug.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Connect a jumper wire between the (T50) Secondary Pressure Sensor Signal circuit and the and the (T72) 5-volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

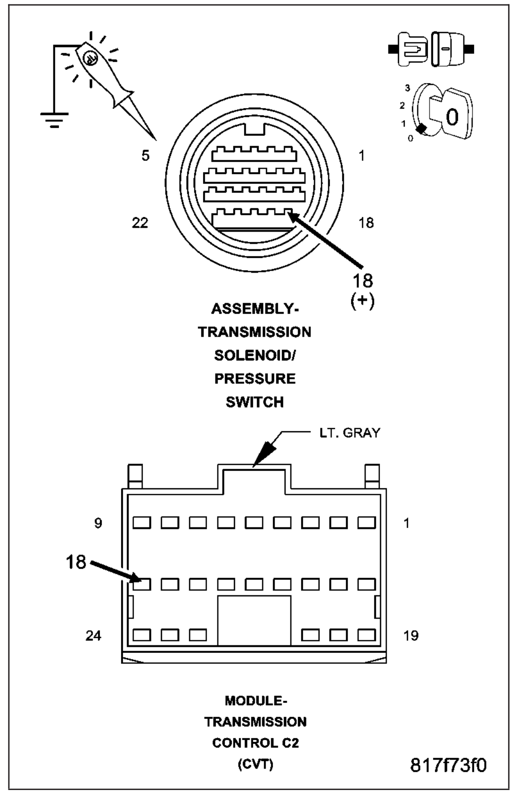
With the scan tool read the Secondary Pressure voltage.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Replace the CVT or the Secondary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 6



6. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Connect a jumper wire between the B(+) and the (T21) Primary Pressure Sensor Signal circuit in the Transmission Solenoid/Pressure Switch harness connector.

Using a 12-volt test light connected to ground, check the (T21) Primary Pressure Sensor Signal circuit in the TCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Repair the (T21) Primary Pressure Sensor Signal circuit for an open (high resistance).

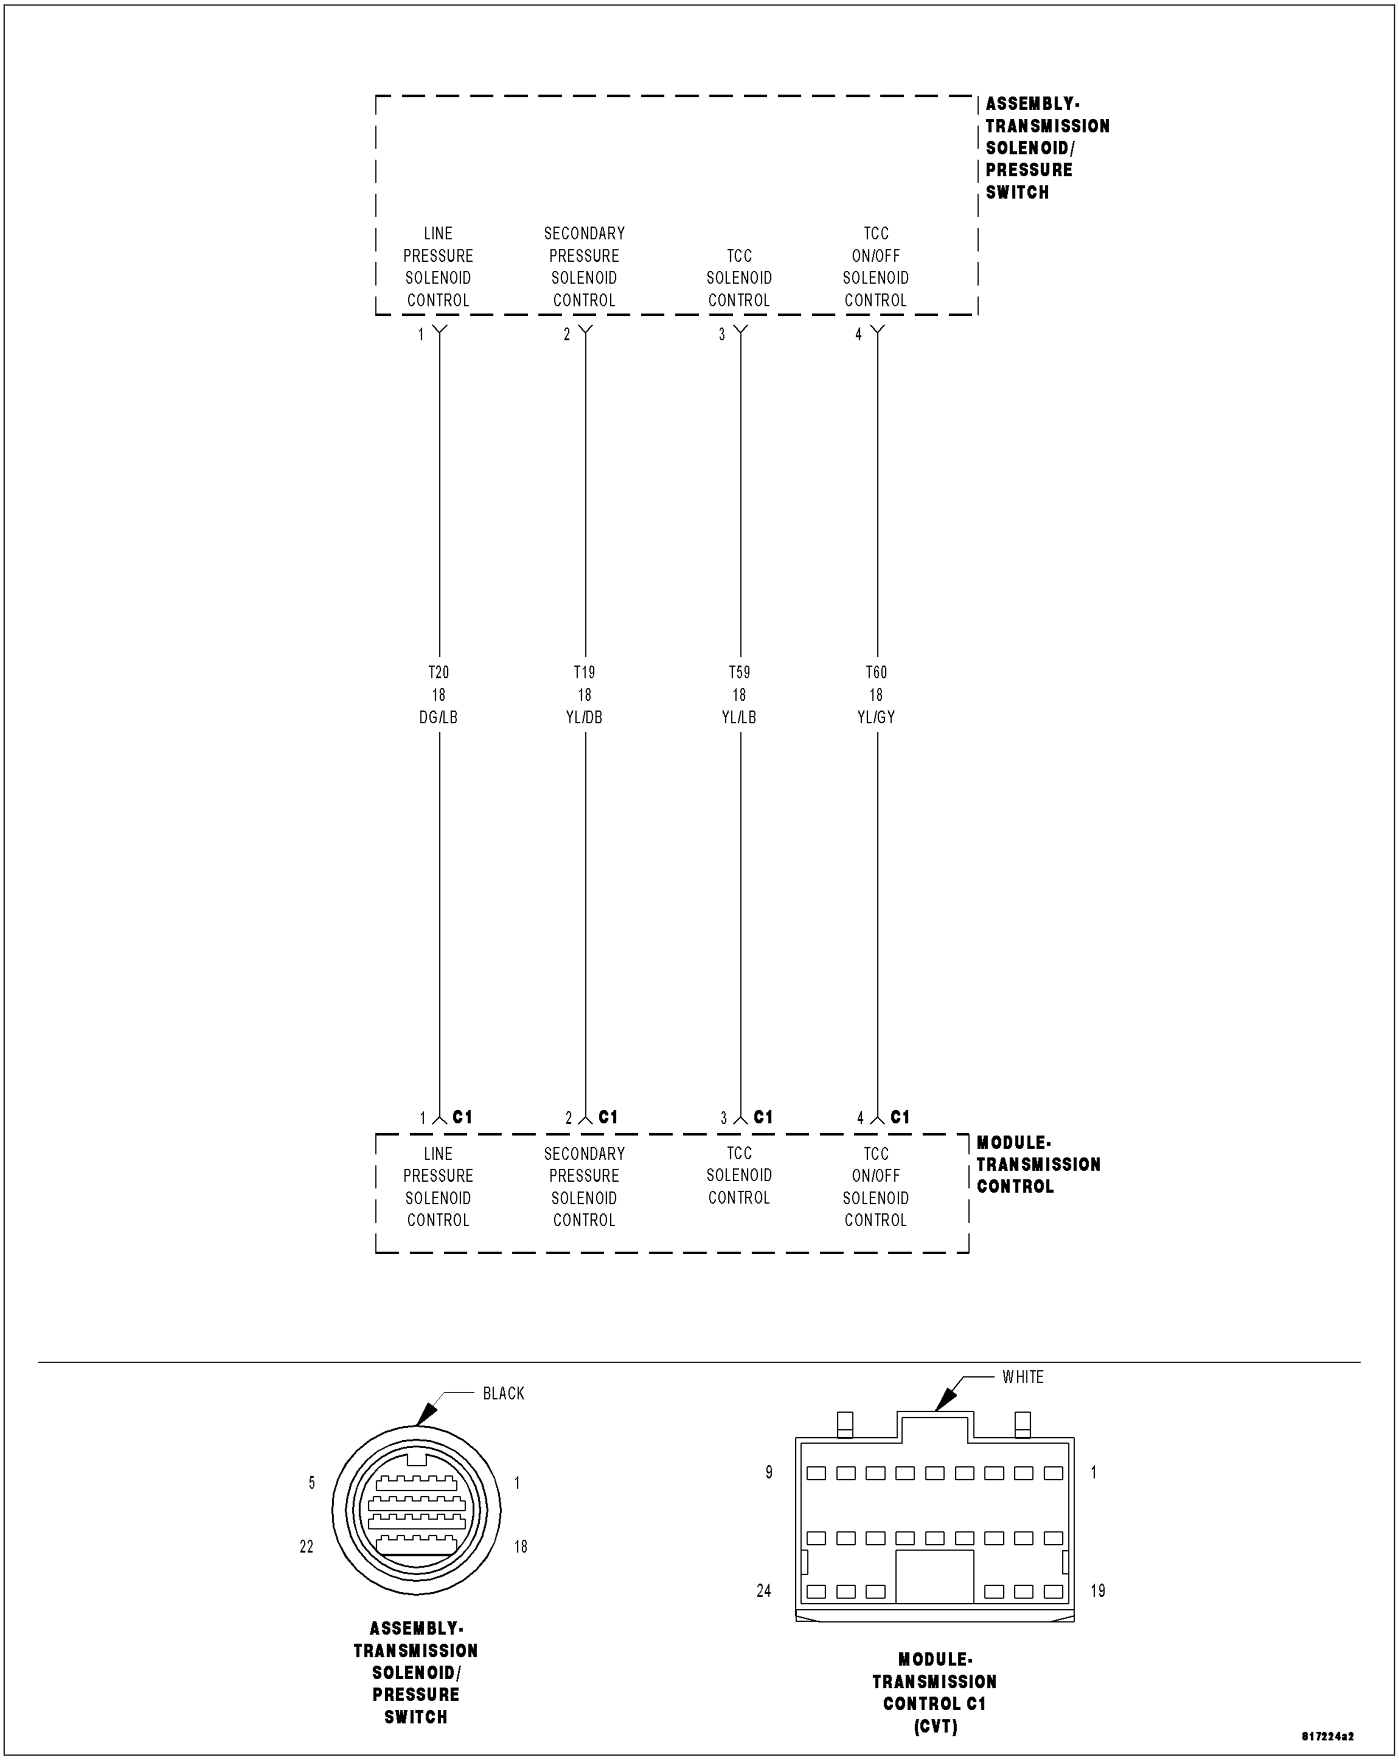
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0777-SECONDARY PRESSURE SOLENOID STUCK ON (LOW PRESSURE)

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the secondary line pressure (secondary pulley pressure) from the secondary pressure sensor. The TCM compares the actual secondary line pressure to the target (desired) line pressure. Failure to match the target line pressure over a given time will set the DTC.

- **When Monitored:**
  Ignition on, engine running with the transmission not in neutral or park.
  Transmission fluid temperature greater than -20° C (-4° F).
  Brake Switch in the OFF mode.
  Change rate of vehicle speed greater than 24 Km/h (15 mph).
  Change rate of accelerator pedal position less than ± 6.25%.
  Engine rpm greater than 450 rpm with a transmission fluid temperature greater than 20° C (68° F)
  No active DTCs from the following:
- Line Pressure Solenoid
- Primary or Secondary Pressure Sensor
- Step Motor
- Secondary Solenoid electrical
- Input and Output Speed Sensor
- CAN Bus
- **Set Condition:**
  When the secondary pressure goes down gradually below a predetermined value during a drive cycle. The DTC could be due to the failure of the secondary pressure control system, secondary pressure solenoid performance or line pressure solenoid. There are two possible setting conditions to set this DTC.
  Condition one:
- Target secondary pressure minus the measured secondary pressure is greater than 0.25 MPa (36 psi) for two consecutive instances of a problem identification for the period of 1.5 seconds within a 30 second interval.
  Condition two:
- Target secondary pressure minus the measured secondary pressure is greater than 2.0 MPa (291 psi) for the period of 800 msec.

Possible Causes
(T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT
LINE PRESSURE SOLENOID
SECONDARY PRESSURE SENSOR
SECONDARY PRESSURE SOLENOID
SECONDARY PRESSURE CONTROL SYSTEM
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 7

2. CHECK LINE PRESSURE

Approximate Engine rpm to Line pressure readings

Engine rpm	Line Pressure
Idle	750 kPa (108.8 psi) ± 2%
2.0L – 2500 to 3000 rpm 2.4L – 2600 to 3100 rpm	5300 - 5700 kPa (768.5 - 826.5 psi) ± 2%

Start the engine and warm the transmission to 50 - 80° C (122 - 174° F).

Turn the ignition off to the lock position.

Install an appropriate pressure gauge in the Line Pressure test port per the Service Information.

WARNING: The CV Transmission can generate a line pressure up to 1800 psi. Failure to use recommended test equipment referred to by the Service Information can result in personal injury or death.

With the scan tool, erase Transmission DTCs.

WARNING: Apply the parking brake. Failure to follow these instructions can result in personal injury or death.

With the brakes firmly applied, start the engine allow to idle and shift the transmission into Reverse, Drive and Low while recording the scan tool Line pressure reading and the pressure gauge reading in each shift lever position.

With the brakes still firmly applied, raise the engine rpm between 2700 - 3250 rpm and shift the transmission into Reverse, Drive and Low while recording the scan tool line pressure reading and the pressure gauge reading in each shift lever position.

CAUTION: Do not hold the engine rpm between 2700 - 3250 rpm for more than 5 seconds in any given shift position. If the 5 second threshold is exceeded, transmission damage can occur. Allow to idle in neutral between shifts for at least 15 to 20 seconds to allow transmission fluid to cool.

Do the gauge readings fall into the desired pressure ranges?

Yes >> Go To 4

No >> Go To 3

3. VERIFY PROBLEM

Possible causes to conditions detected

ENGINE RPM	LINE PRESSURE CONDITION DETECTED	POSSIBLE CAUSES BUT NOT JUST LIMITED TO THESE
Idle speed	Low for all shift lever positions	Oil Pump Wear
		Pressure Regulator Valve for plug sticking or spring fatigue
		Oil filter, oil pump, pressure regulator valve passage oil leak
		Engine idle speed too low
	Only low for a specific position	Oil pressure leak in a passage or component related to the position after the pressure is distributed by the manual valve
	High	TP or APP sensor signal malfunction
		CVT fluid temperature sensor malfunction
		Line pressure solenoid sticking in the off state, filter plugged, cut line
		Pressure regulator valve or plug sticking
Engine rpm between 2700 and 3250 rpm	Line pressure does not rise above the line pressure at idle	TP or APP sensor signal malfunction
		Line pressure solenoid sticking in the on state, filter plugged
		Pressure regulator valve or plug sticking
		Transmission Control Module (TCM)
		Oil pump weak or worn
	Line Pressure rises but does not reach desired level	TP or APP sensor signal malfunction
		Line pressure solenoid sticking in the off state, filter plugged, cut line
		Pressure regulator valve or plug sticking
		Oil pump weak or worn
	Line pressure is low in only one shift lever position	Oil pressure leak in a passage or component related to the position after the pressure is distributed by the manual valve

Use the above chart to help identify the possible cause.

NOTE: There may be other possible causes besides those listed on the above chart. Review any Service Bulletins and refer to the Service Information for any additional possible causes that may apply.

View repair

Repair

Replace or repair the CV Transmission as necessary per the Service Information

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE SECONDARY PRESSURE

Turn the ignition off to the lock position.

Disconnect the pressure gauge from the Line Pressure test port and reinstall the test port plug.

Install the pressure gauge in the Secondary Pressure test port per the Service Information.

With the scan tool, erase Transmission DTCs.

WARNING: Apply the parking brake. Failure to follow these instructions can result in personal injury or death.

With the brakes firmly applied, start the engine allow to idle and shift the transmission into Reverse, Drive and Low while comparing the Secondary Pressure gauge reading to the scan tool Secondary Pressure reading in each shift lever position and record your findings.

With the brakes still firmly applied, raise the engine rpm between 2700 - 3250 rpm and shift the transmission into Reverse, Drive and Low while comparing the gauge Secondary Pressure to the scan tool Secondary Pressure in each shift lever position and record your findings.

CAUTION: Do not hold the engine rpm between 2700 - 3250 rpm for more than 5 seconds in any given shift position. If the 5 second threshold is exceeded, transmission damage can occur. Allow to idle in neutral between shifts for at least 15 to 20 seconds to allow transmission fluid to cool.

Does the Secondary Pressure gauge readings match the scan tool readings in all of the above procedures?

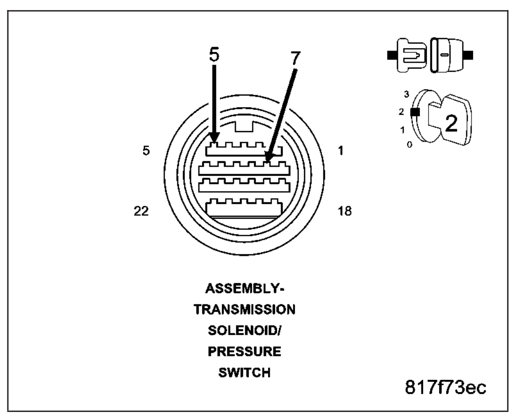
Yes >> Replace or repair the CV Transmission as necessary per the Service Information for components related to the Secondary Pressure Control System.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE SECONDARY PRESSURE SENSOR

Turn the ignition off to the lock position.



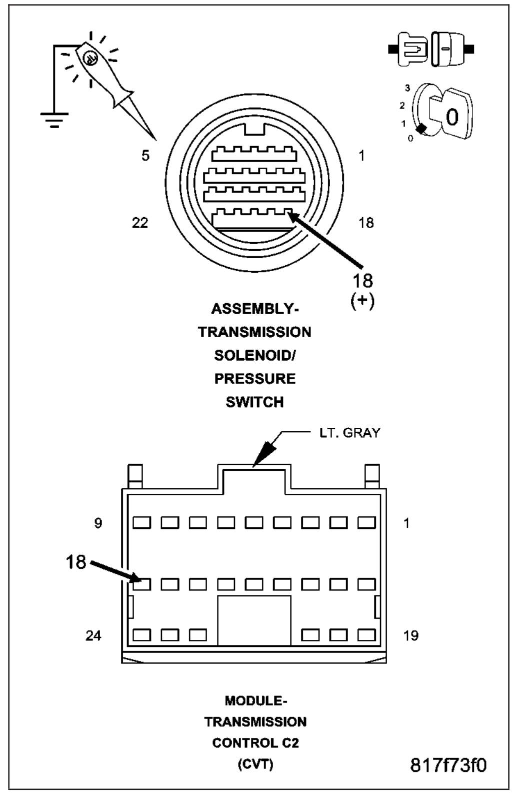
Disconnect the pressure gauge from the Secondary Pressure test port and reinstall the test port plug.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Connect a jumper wire between the (T50) Secondary Pressure Sensor Signal circuit and the (T72) 5-volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool read the Secondary Pressure voltage.



Is the voltage between 4.5 and 5.5 volts?

Yes >> Replace the CVT or the Secondary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 6

6. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Connect a jumper wire between the B(+) and the (T21) Primary Pressure Sensor Signal circuit in the Transmission Solenoid/Pressure Switch harness connector.

Using a 12-volt test light connected to ground, check the (T21) Primary Pressure Sensor Signal circuit in the TCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Repair the (T21) Primary Pressure Sensor Signal circuit for an open (high resistance).

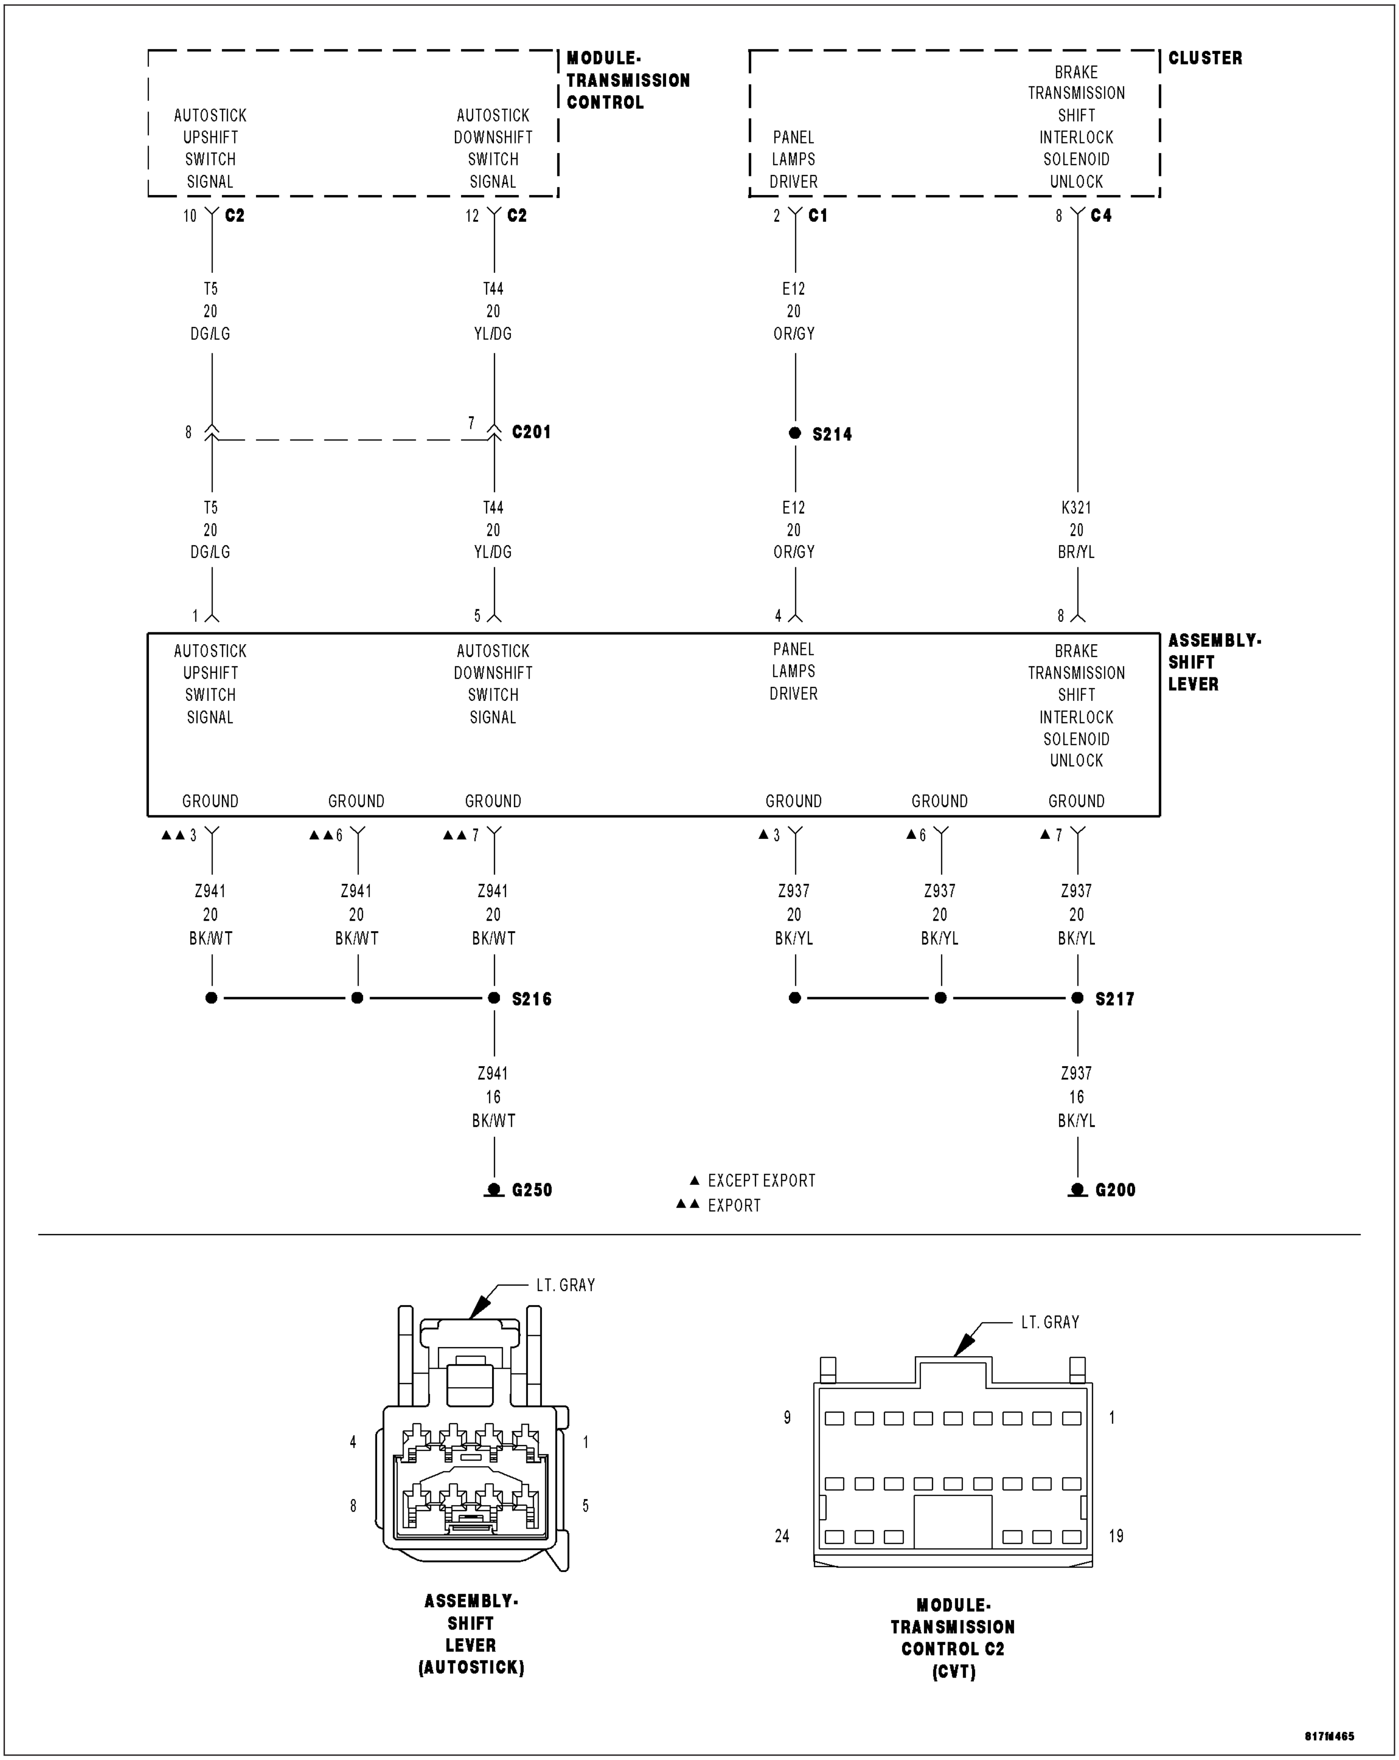
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0826-UP/DOWN SHIFT SWITCH CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The AutoStick function allows the driver to manually change the gear ratio to a locked ratio. The Transmission Control Module (TCM) monitors the AutoStick Upshift and Downshift circuits. If the TCM receives an Upshift and Downshift request simultaneously, or manual mode Upshift/Downshift request while other than in the D-Range, a DTC will set.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16 volts.
- **Set Condition:**
  Upshift and Downshift requested simultaneously while in the Drive position or the Upshift and/or Downshift request during while not in the Drive position for the period of 1.0 second.

Possible Causes
(T5) AUTOSTICK UPSHIFT SWITCH SIGNAL CIRCUIT SHORT TO GROUND
(T44) AUTOSTICK DOWNSHIFT SWITCH SIGNAL CIRCUIT SHORT TO GROUND
SHIFT LEVER ASSEMBLY
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, erase Transmission DTCs.

Start the engine, with the brakes firmly applied shift the shift lever into Drive and make several AutoStick upshifts and downshifts.

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 7

2. VERIFY PROBLEM

With the scan tool, read the AutoStick upshift and downshift status.

Does the scan tool show either the upshift or downshift as true with the shifter in the center position (pick best answer)?

Upshift shows as true
Go To 3

Downshift shows as true
Go To 5

Neither circuit shows as true
Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

3. CHECK THE SHIFT LEVER ASSEMBLY

Turn the ignition off to the lock position.

Disconnect the Shift Lever Assembly harness connector.

Ignition on, engine not running.

With the scan tool read the AutoStick Upshift status.

Does the Upshift still show as true?

Yes >> Go To 4

No >> Replace the Shift Lever Assembly per the Service Information.

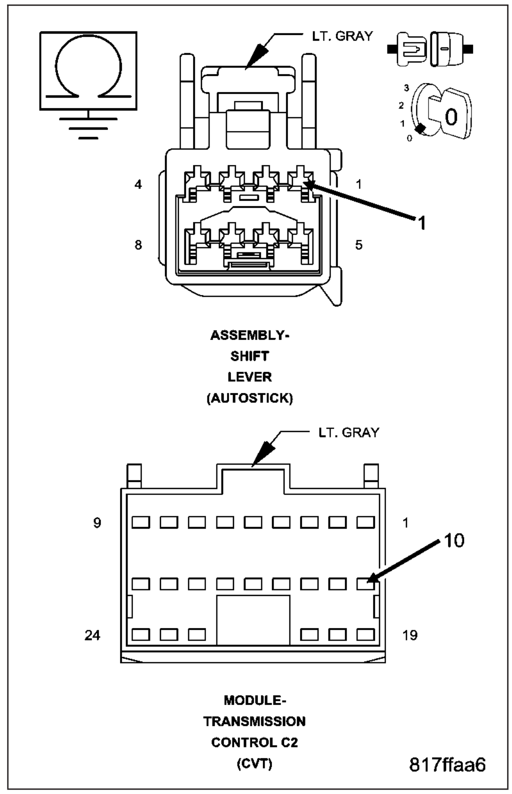
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T5) AUTOSTICK UPSHIFT SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance between ground and the (T5) AutoStick Upshift Switch Signal circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (T5) AutoStick Upshift Switch Signal circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE SHIFT LEVER ASSEMBLY

Turn the ignition off to the lock position.

Disconnect the Shift Lever Assembly harness connector.

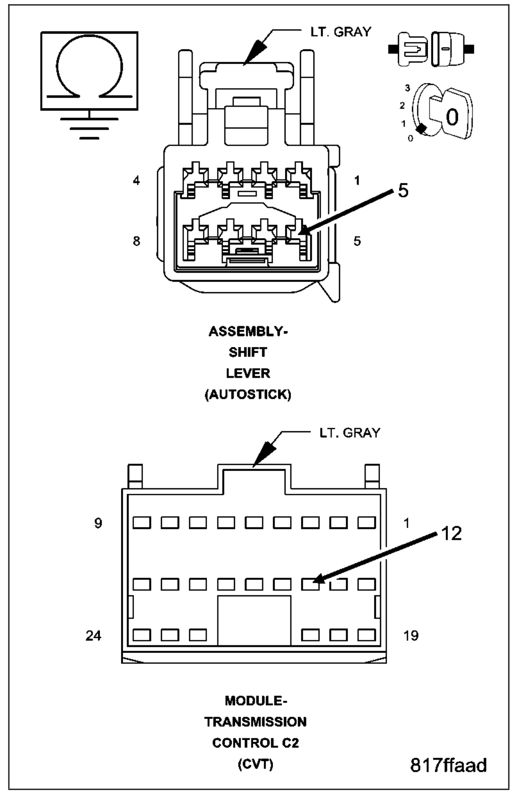
Ignition on, engine not running.

With the scan tool read the AutoStick Downshift status.

Does the Downshift still show as true?

Yes >> Go To 6

No >> Replace the Shift Lever Assembly per the Service Information.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. CHECK THE (T44) AUTOSTICK DOWNSHIFT SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance between ground and the (T44) AutoStick Downshift Switch Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T44) AutoStick Downshift Switch Signal circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

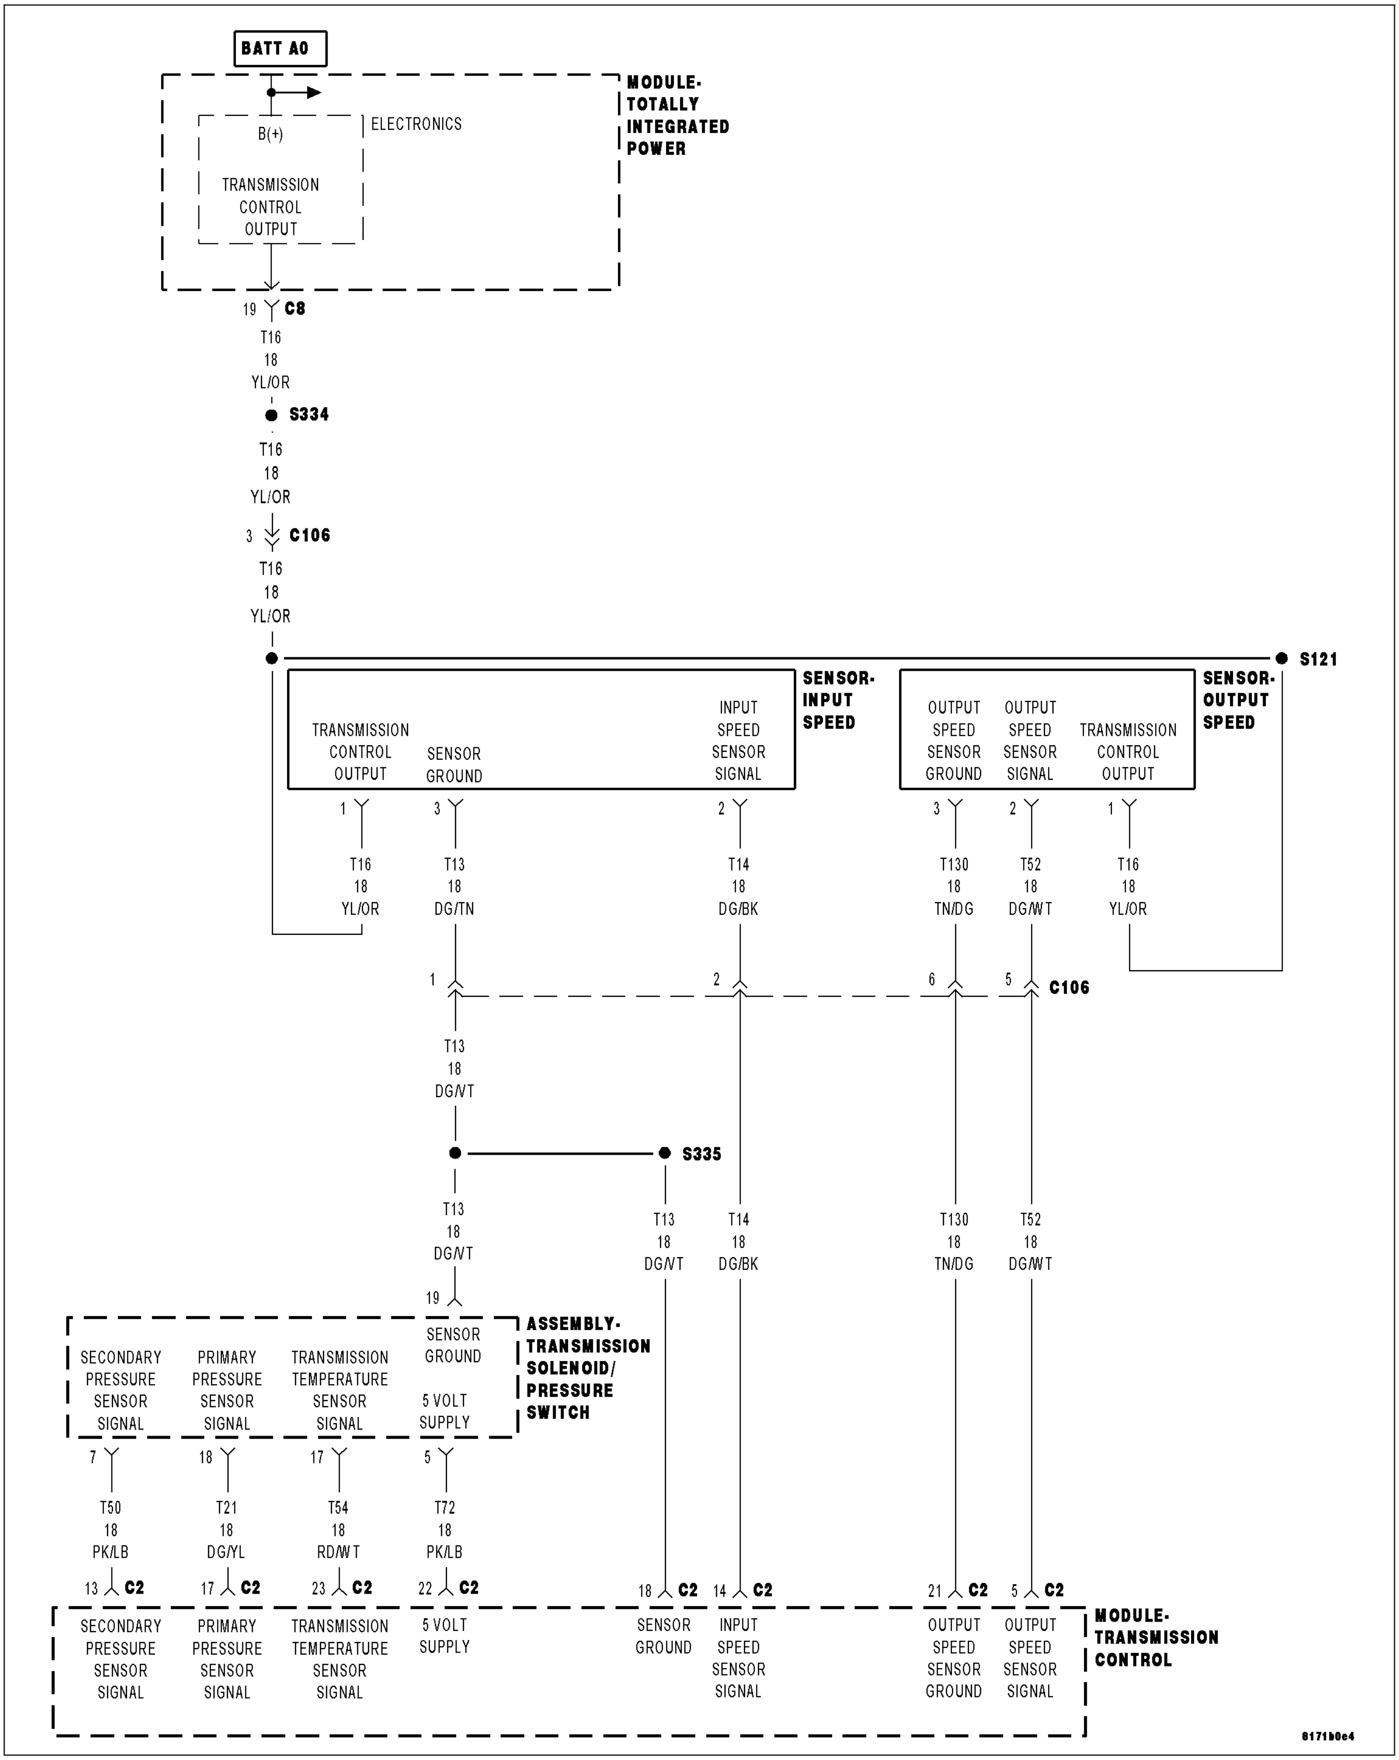
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0842-PRIMARY OIL PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the input voltage from the primary pulley pressure sensor. When the voltage is below a predetermined limit a DTC will set.

- **When Monitored:**
  Ignition on, system voltage between 9.0 and 16.0 volts.
  Transmission temperature greater than -20° C (-4° F)
  No active DTCs from the following:
- Primary Oil Pressure Sensor High
- Sensor ground
- **Set Condition:**
  When the monitored voltage drops below 0.09 volts for the period of 5 seconds.

Possible Causes
(T72) 5 VOLT SUPPLY CIRCUIT OPEN
(T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
PRIMARY PRESSURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

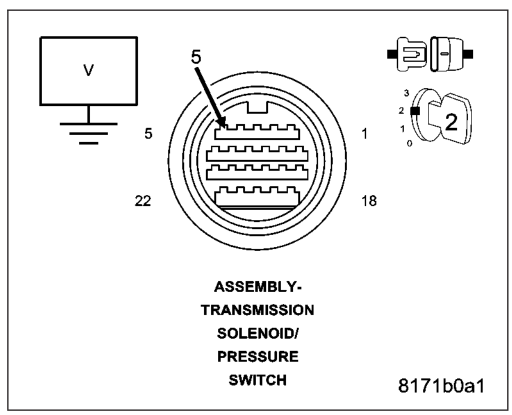
1. CHECK THE PRIMARY PRESSURE SENSOR VOLTAGE

With the scan tool, read the Primary Pulley Pressure Sensor voltage.

Is the voltage below 0.09 volts?

Yes >> Go To 2

No >> Go To 7



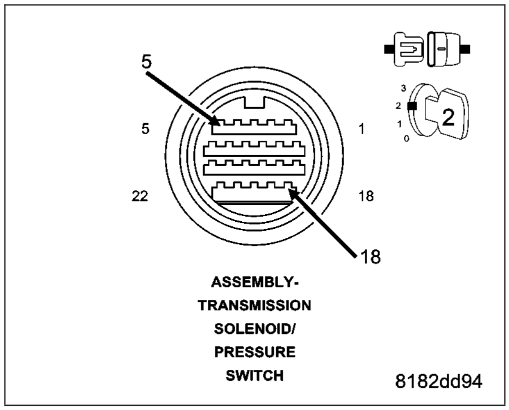
2. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.



Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Go To 3

No >> Go To 6

3. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT

8182dd94

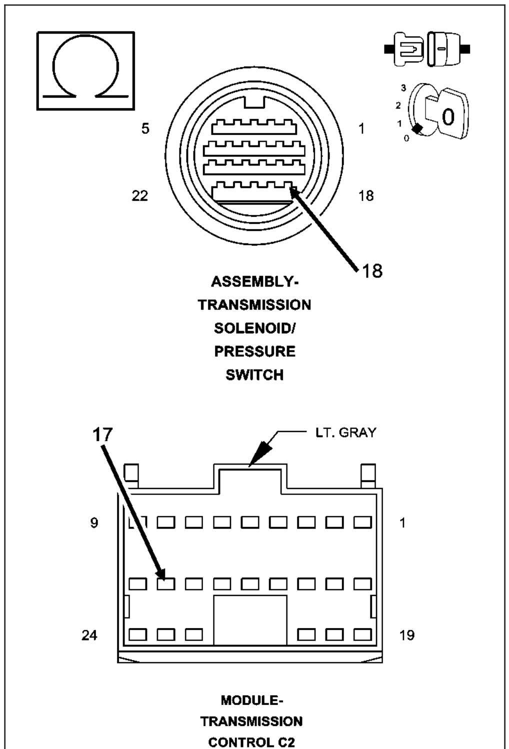
Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Connect a jumper wire between the (T21) Primary Pressure Sensor Signal circuit and the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

With the scan tool, read the Primary Pulley Pressure Sensor voltage.



Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Replace CV Transmission or replace the Primary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

8182dd98

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (T21) Primary Pressure Sensor Signal circuit between the TCM C2 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

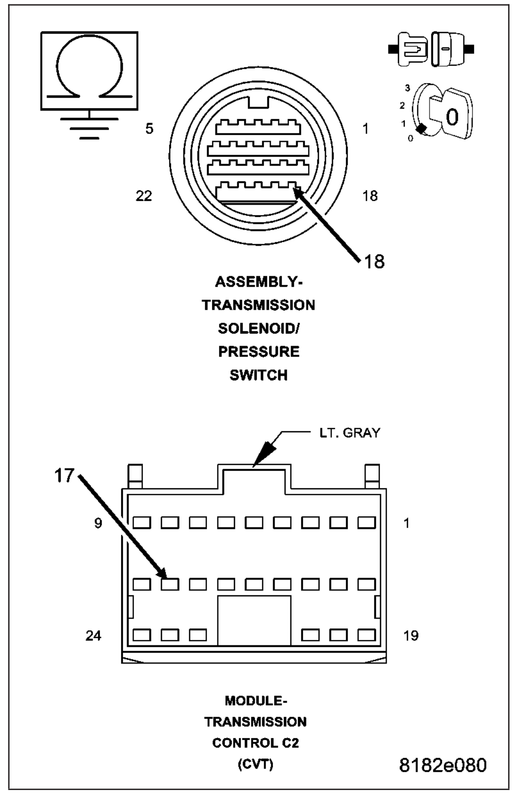
Yes >> Repair the (T21) Primary Pressure Sensor Signal circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T21) Primary Pressure Sensor Signal circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (T21) Primary Pressure Sensor Signal circuit for a short to ground.

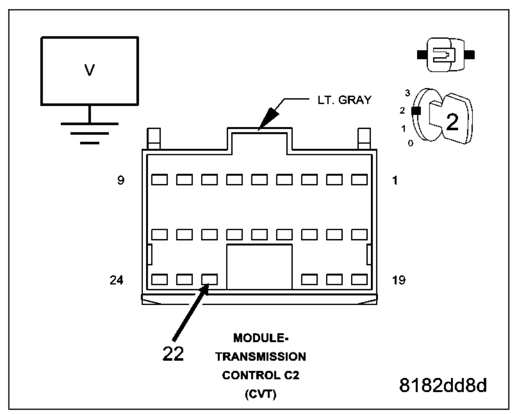
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT FOR AN OPEN

While back probing, measure the voltage of the (T72) 5 Volt Supply circuit in Transmission Solenoid/Pressure Switch Assembly harness connector.



Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Repair the (T72) 5 Volt Supply circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

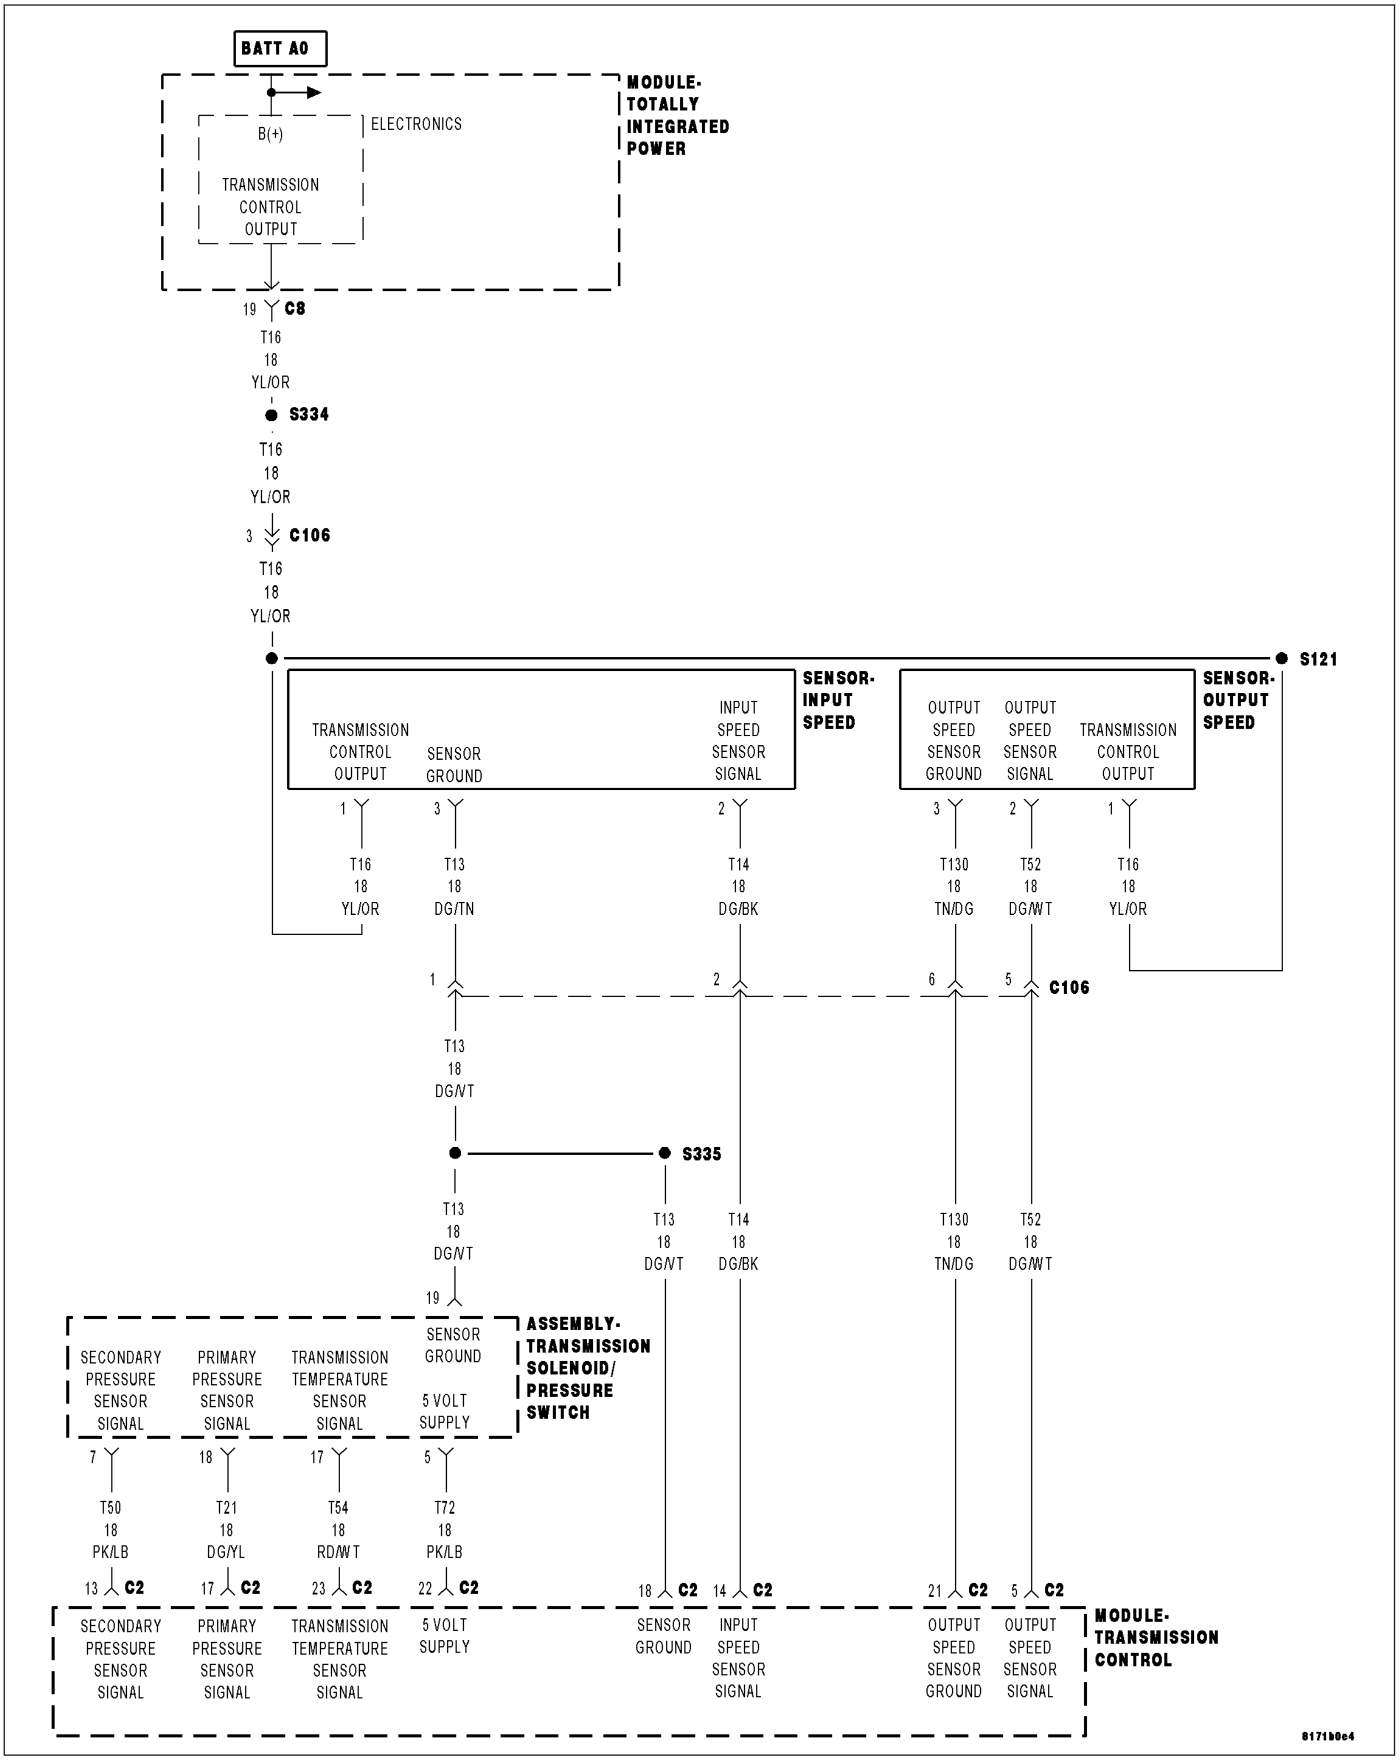
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0843-PRIMARY OIL PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the input voltage from the primary pulley pressure sensor. When the voltage is above a predetermined limit a DTC will set.

- **When Monitored:**
  Ignition on, system voltage between 9.0 and 16.0 volts.
  Transmission temperature greater than -20° C (-4° F)
  No active DTCs from the following:
- Primary Oil Pressure Sensor Low
- Sensor ground
- **Set Condition:**
  When the monitored voltage rises above 4.7 volts for the period of 5 seconds.

Possible Causes
(T72) 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
PRIMARY PRESSURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

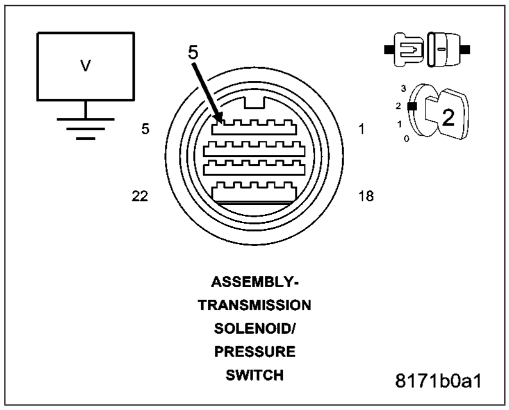
1. CHECK THE PRIMARY PRESSURE SENSOR VOLTAGE

With the scan tool, read the Primary Pulley Pressure Sensor voltage.

Is the voltage greater than 4.7 volts?

Yes >> Go To 2

No >> Go To 6



2. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go To 3

No >> Go To 5

3. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool, read the Primary Pulley Pressure Sensor voltage.

Does the scan tool read any voltage?

Yes >> Go To 4

No >> Replace CV Transmission or replace the Primary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

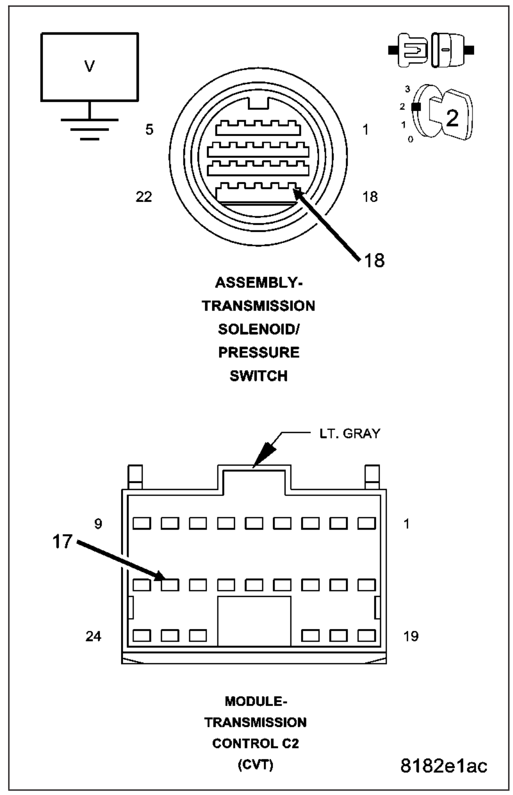
4. CHECK THE (T21) PRIMARY PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

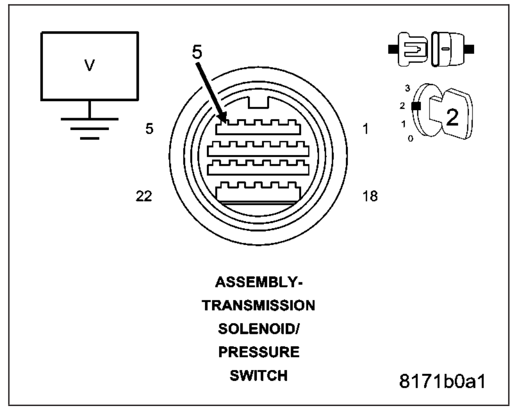
Ignition on, engine not running.

Measure the voltage of the (T21) Primary Pressure Sensor Signal circuit.



Is there any voltage present?

Yes >> Repair the (T21) Primary Pressure Sensor Signal circuit for a short to voltage.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is there any voltage present?

Yes >> Repair the (T72) 5 Volt Supply circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

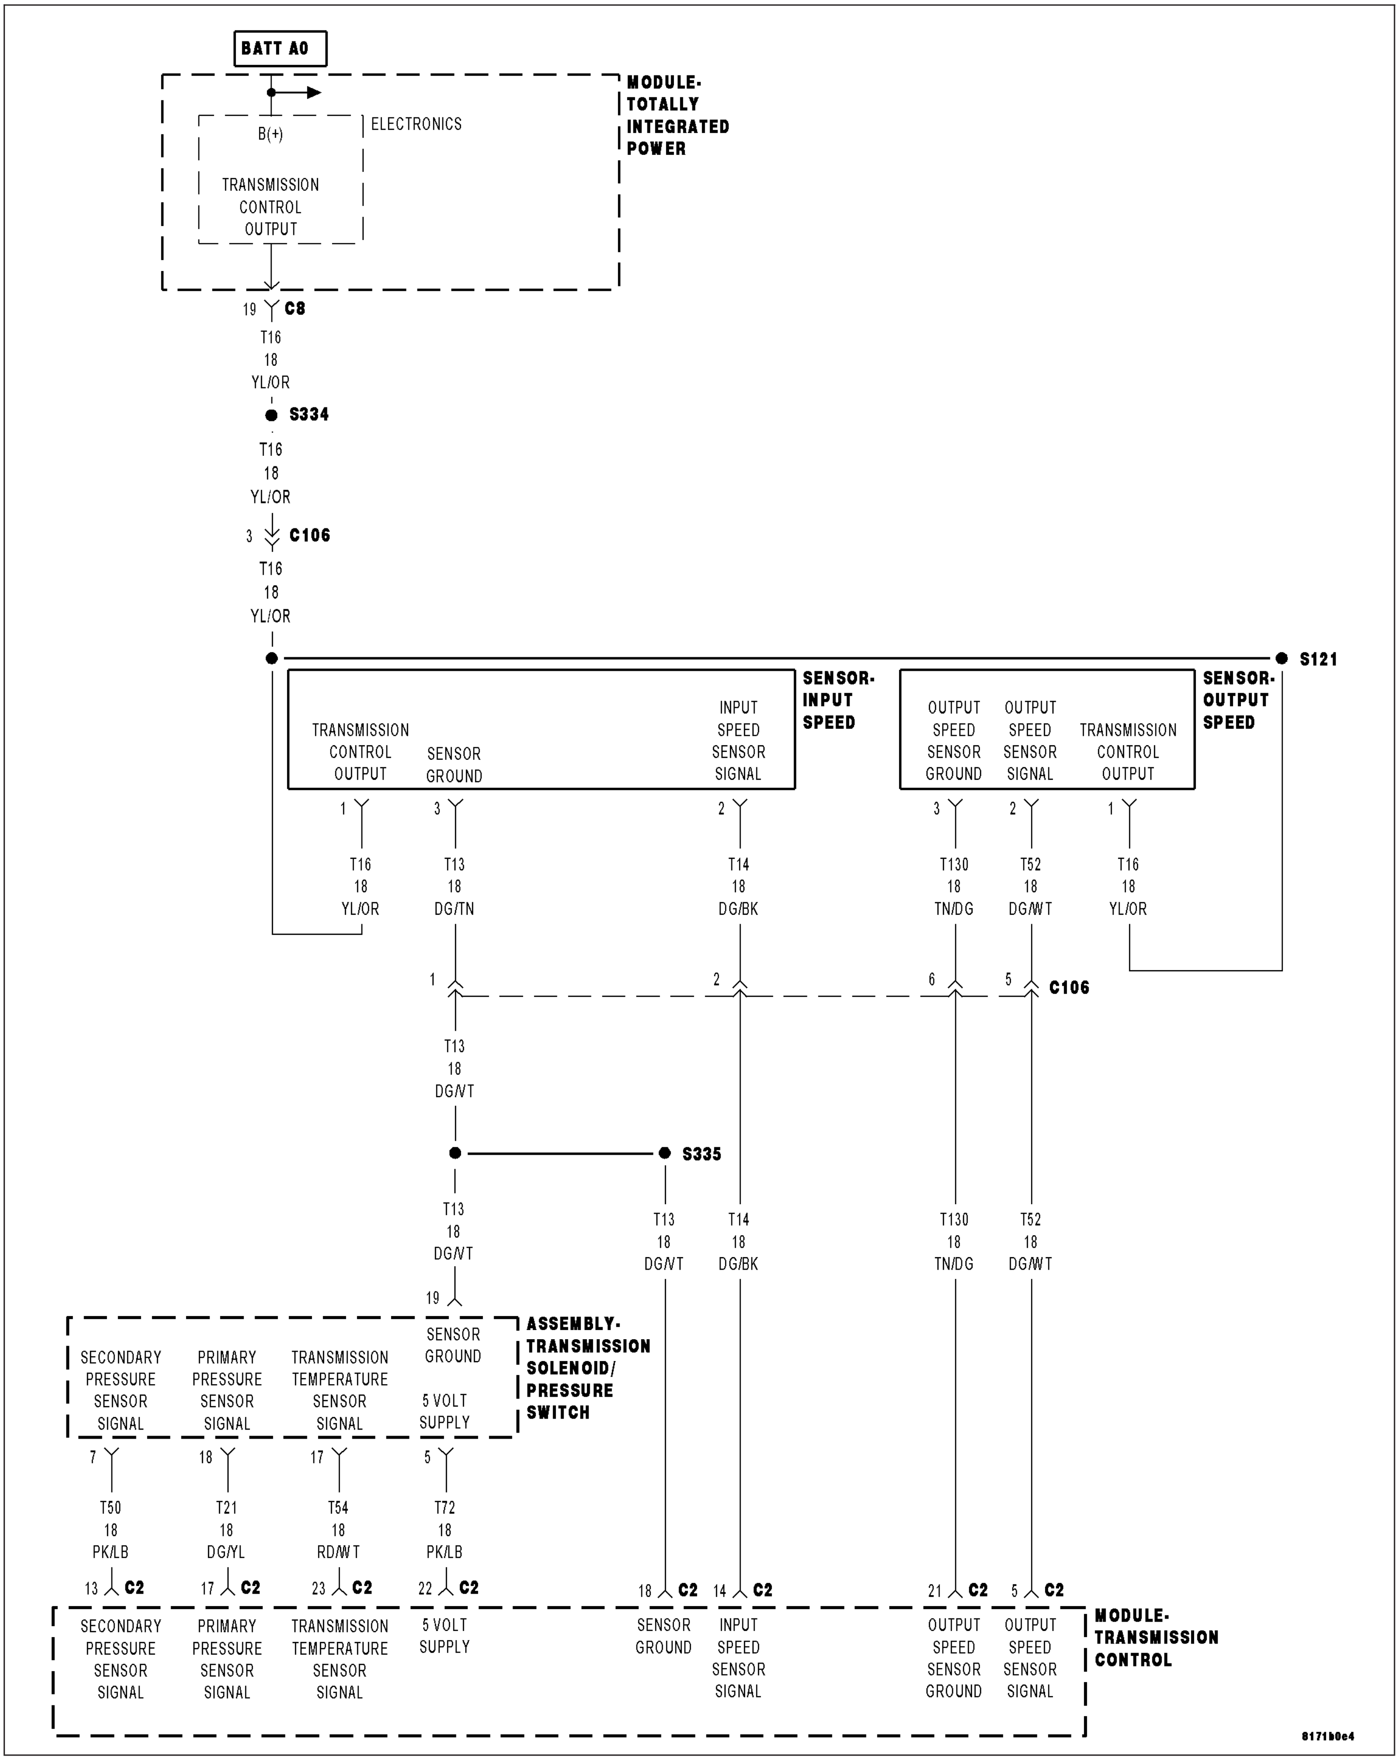
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0847-SECONDARY OIL PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the input voltage from the secondary pulley pressure sensor. When the voltage is below a predetermined limit a DTC will set.

- **When Monitored:**
  Ignition on, system voltage between 9.0 and 16.0 volts.
  Transmission temperature greater than -20° C (-4° F)
  No active DTCs from the following:
- Primary Oil Pressure Sensor High
- Sensor ground
- **Set Condition:**
  When the monitored voltage drops below 0.09 volts for the period of 5 seconds.

Possible Causes
(T72) 5 VOLT SUPPLY CIRCUIT OPEN
(T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO GROUND
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

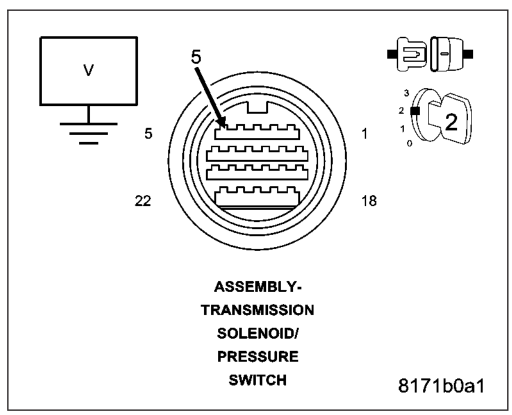
1. CHECK THE SECONDARY PRESSURE SENSOR VOLTAGE

With the scan tool, read the Secondary Pulley Pressure Sensor voltage.

Is the voltage below 0.09 volts?

Yes >> Go To 2

No >> Go To 7



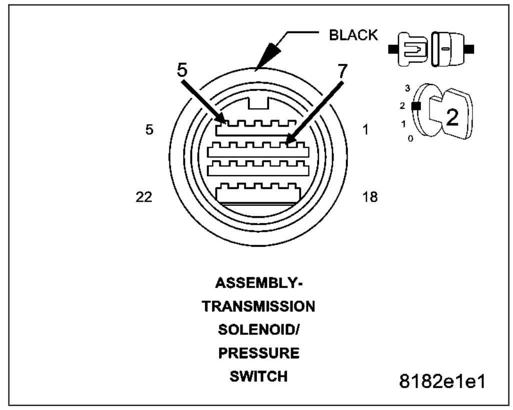
2. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.



Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Go To 3

No >> Go To 6

3. CHECK THE (T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT

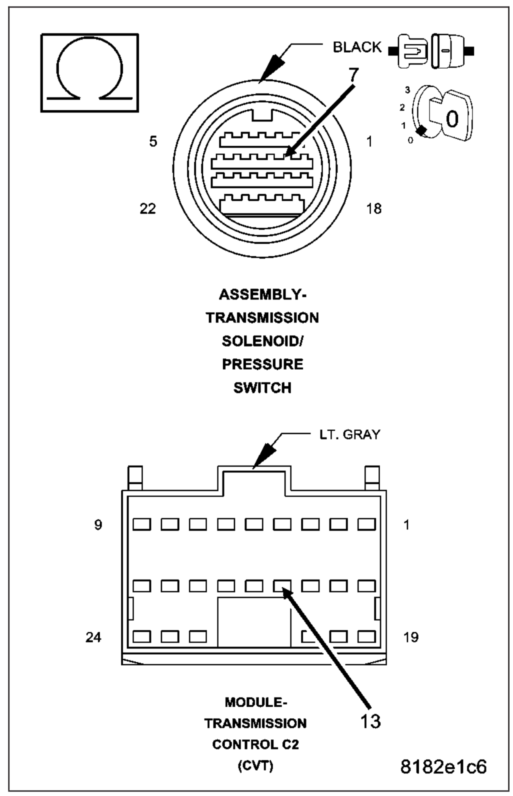
Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Connect a jumper wire between the (T50) Secondary Pressure Sensor Signal circuit and the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

With the scan tool, read the Secondary Pulley Pressure Sensor voltage.



Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Replace CV Transmission or replace the Secondary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

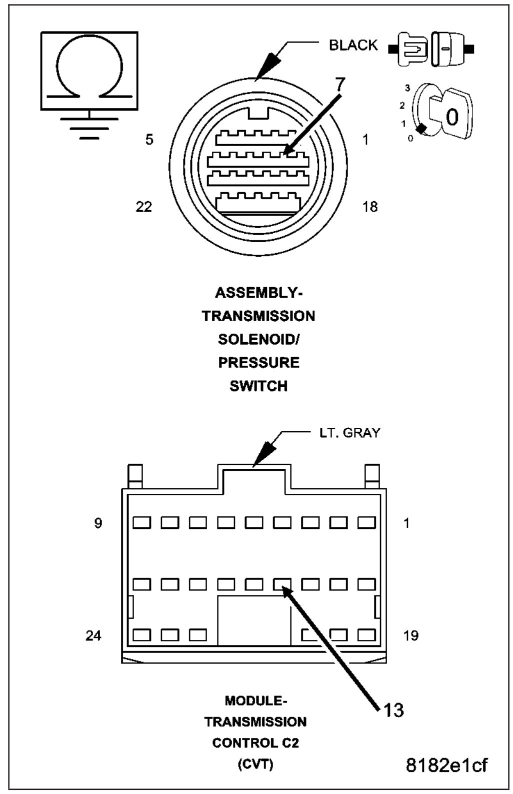
4. CHECK THE (T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (T50) Secondary Pressure Sensor Signal circuit between the TCM C2 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?



Yes >> Repair the (T50) Secondary Pressure Sensor Signal circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

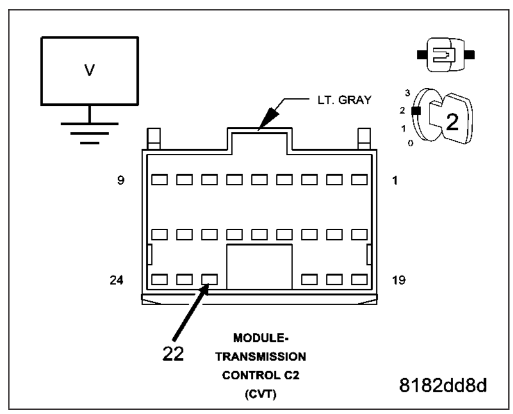
No >> Go To 5

5. CHECK THE (T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T50) Secondary Pressure Sensor Signal circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T50) Secondary Pressure Sensor Signal circuit for a short to ground.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT FOR AN OPEN

While back probing, measure the voltage of the (T72) 5 Volt Supply circuit in Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the voltage 5.0 volts (± 0.2 volts)?

Yes >> Repair the (T72) 5 Volt Supply circuit for an open or high resistance.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

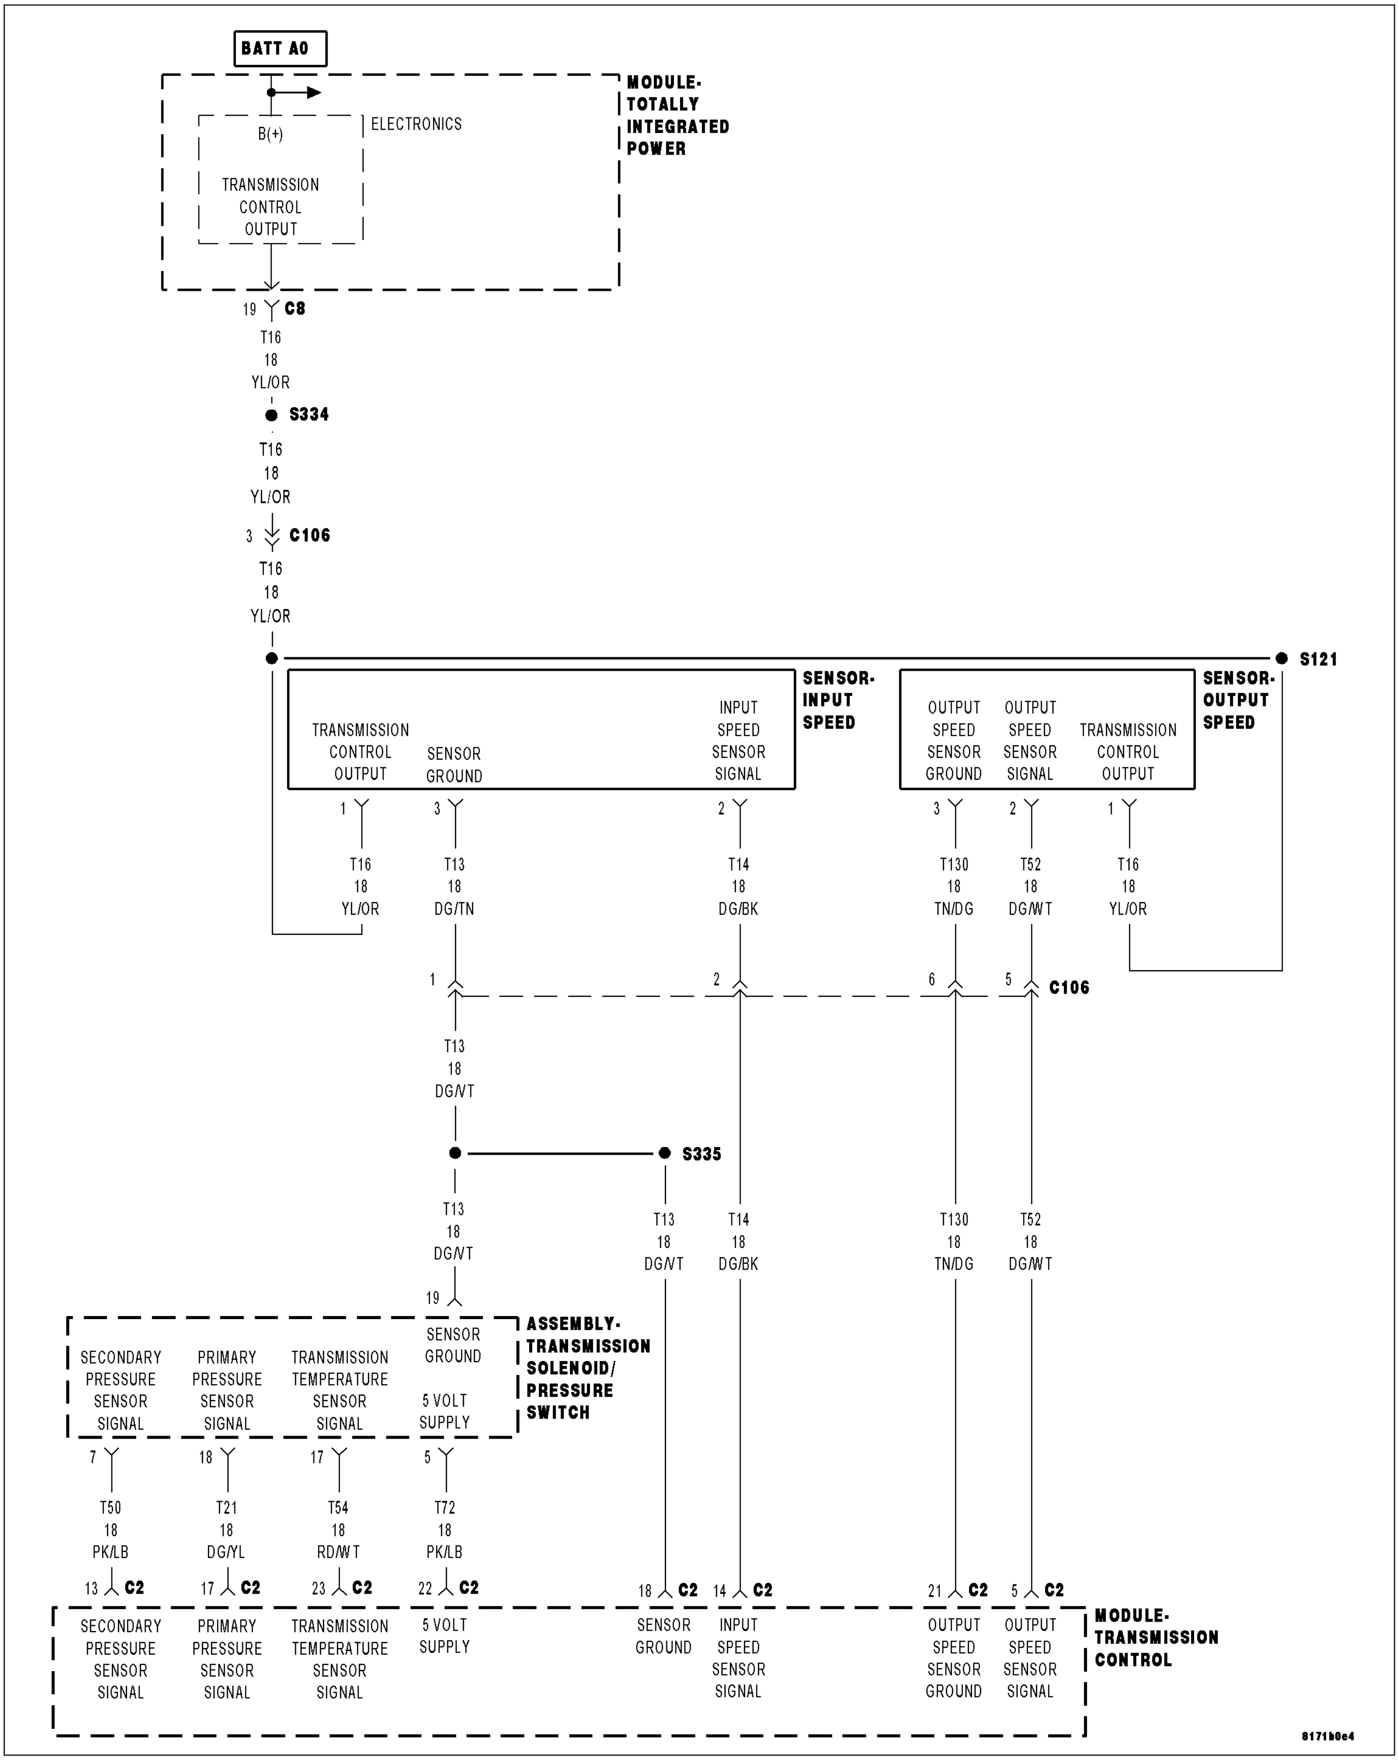
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

7. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0848-SECONDARY OIL PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the input voltage from the secondary pulley pressure sensor. When the voltage is above a predetermined limit a DTC will set.

- **When Monitored:**
  Ignition on, system voltage between 9.0 and 16.0 volts.
  Transmission temperature greater than -20° C (-4° F)
  No active DTCs from the following:
- Secondary Oil Pressure Sensor Low
- Sensor ground
- **Set Condition:**
  When the monitored voltage rises above 4.7 volts for the period of 5 seconds.

Possible Causes
(T72) 5 VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
(T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
SECONDARY PRESSURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

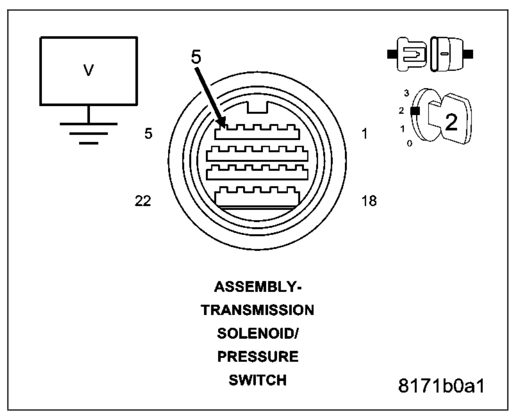
1. CHECK THE SECONDARY PRESSURE SENSOR VOLTAGE

With the scan tool, read the Secondary Pulley Pressure Sensor voltage.

Is the voltage greater than 4.7 volts?

Yes >> Go To 2

No >> Go To 6



2. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go To 3

No >> Go To 5

3. CHECK THE (T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

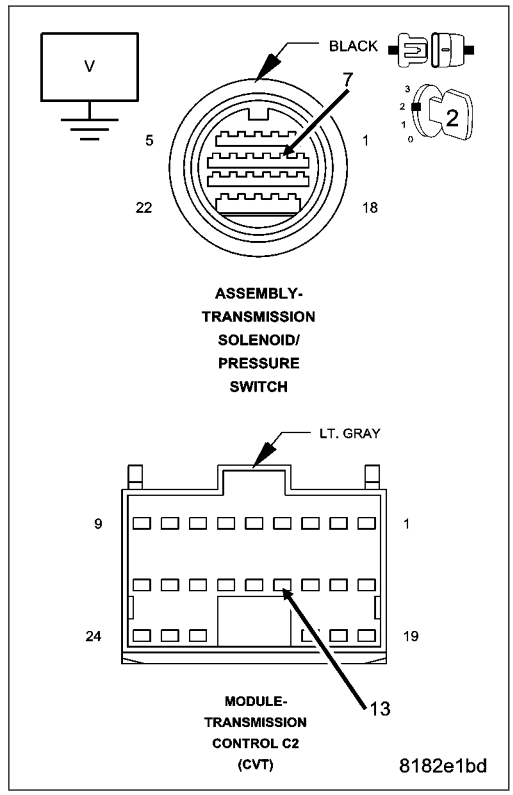
With the scan tool, read the Secondary Pulley Pressure Sensor voltage.

Does the scan tool read any voltage?

Yes >> Go To 4

No >> Replace CV Transmission or replace the Secondary Pressure Sensor (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



4. CHECK THE (T50) SECONDARY PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T50) Secondary Pressure Sensor Signal circuit.

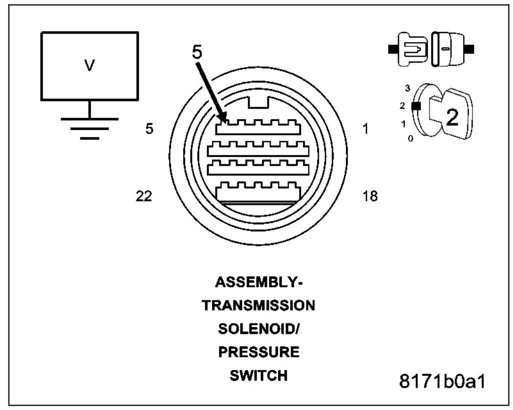
Is there any voltage present?

Yes >> Repair the (T50) Primary Pressure Sensor Signal circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



5. CHECK THE (T72) 5 VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T72) 5 Volt Supply circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is there any voltage present?

Yes >> Repair the (T72) 5 Volt Supply circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

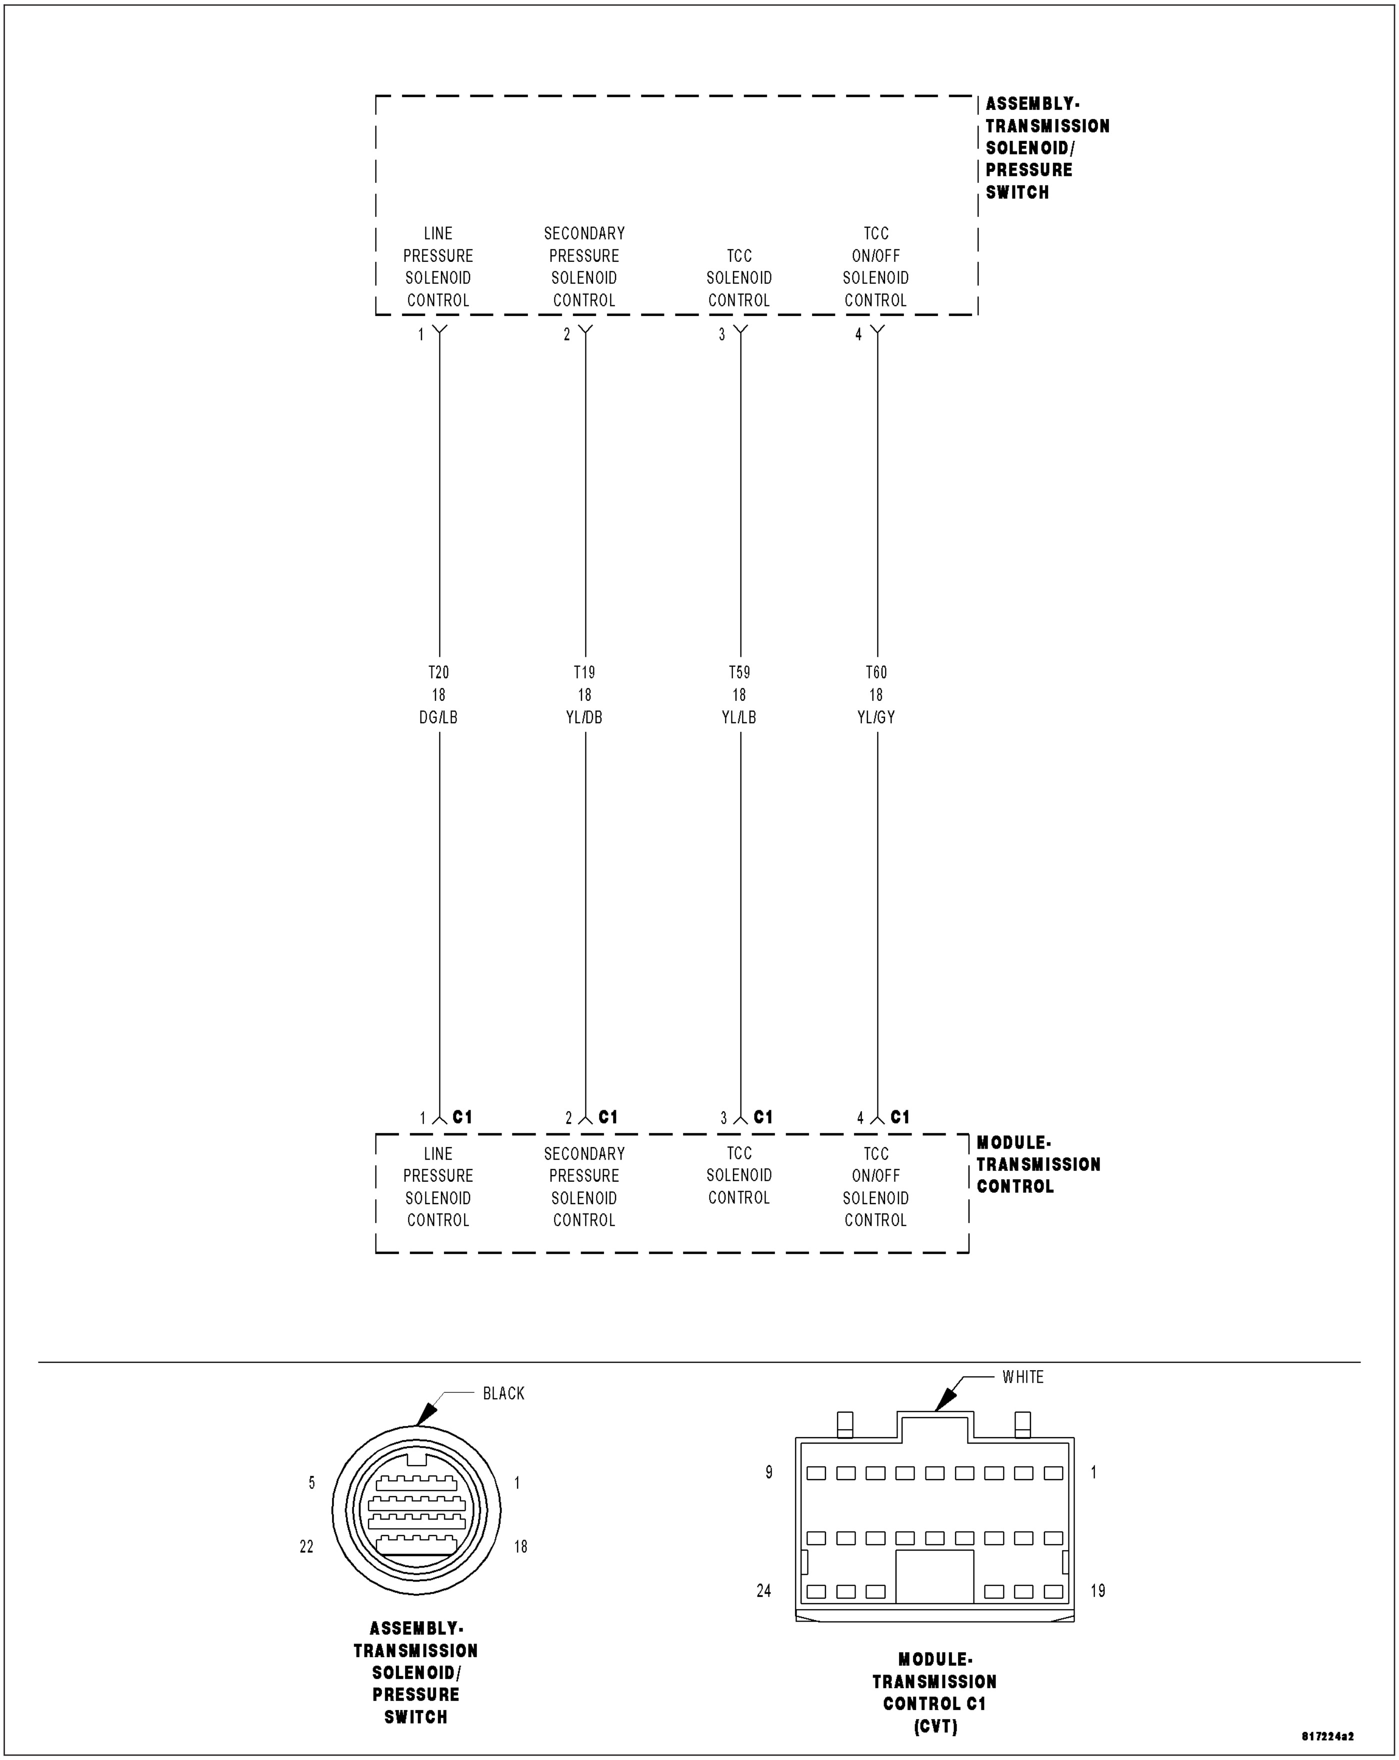
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0962-PRESSURE CONTROL SOLENOID A CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) regulates the line pressure by pulsing the line pressure solenoid. The TCM monitors the line pressure solenoid voltage and current draw during operation.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  If the monitored line pressure solenoid voltage is less than 70% of the target line pressure solenoid voltage for the period of 1.0 second.

Possible Causes
(T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT SHORT TO GROUND
LINE PRESSURE SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

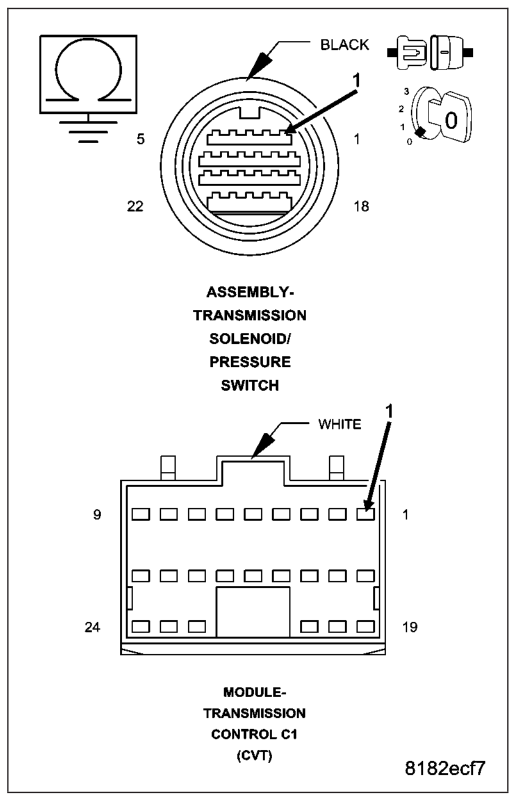
1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4



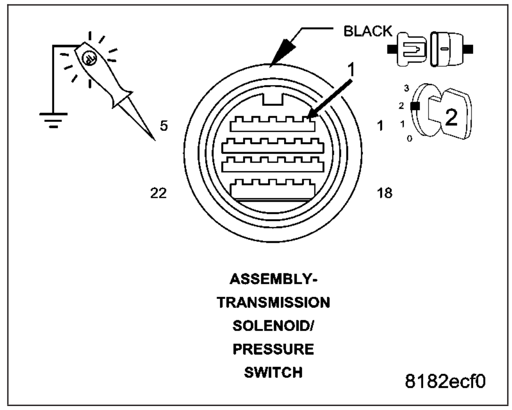
2. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T20) Line Pressure Solenoid Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (T20) Line Pressure Solenoid Control circuit for a short to ground.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT

Turn the ignition off to the lock position.

Reconnect the TCM C1 harness connector.

Ignition on, engine not running.

With the scan tool actuate the Line Pressure Solenoid.

Using a test light connected to ground, check the (T20) Line Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Replace the Line Pressure Solenoid (Valve Body) or the CVT per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

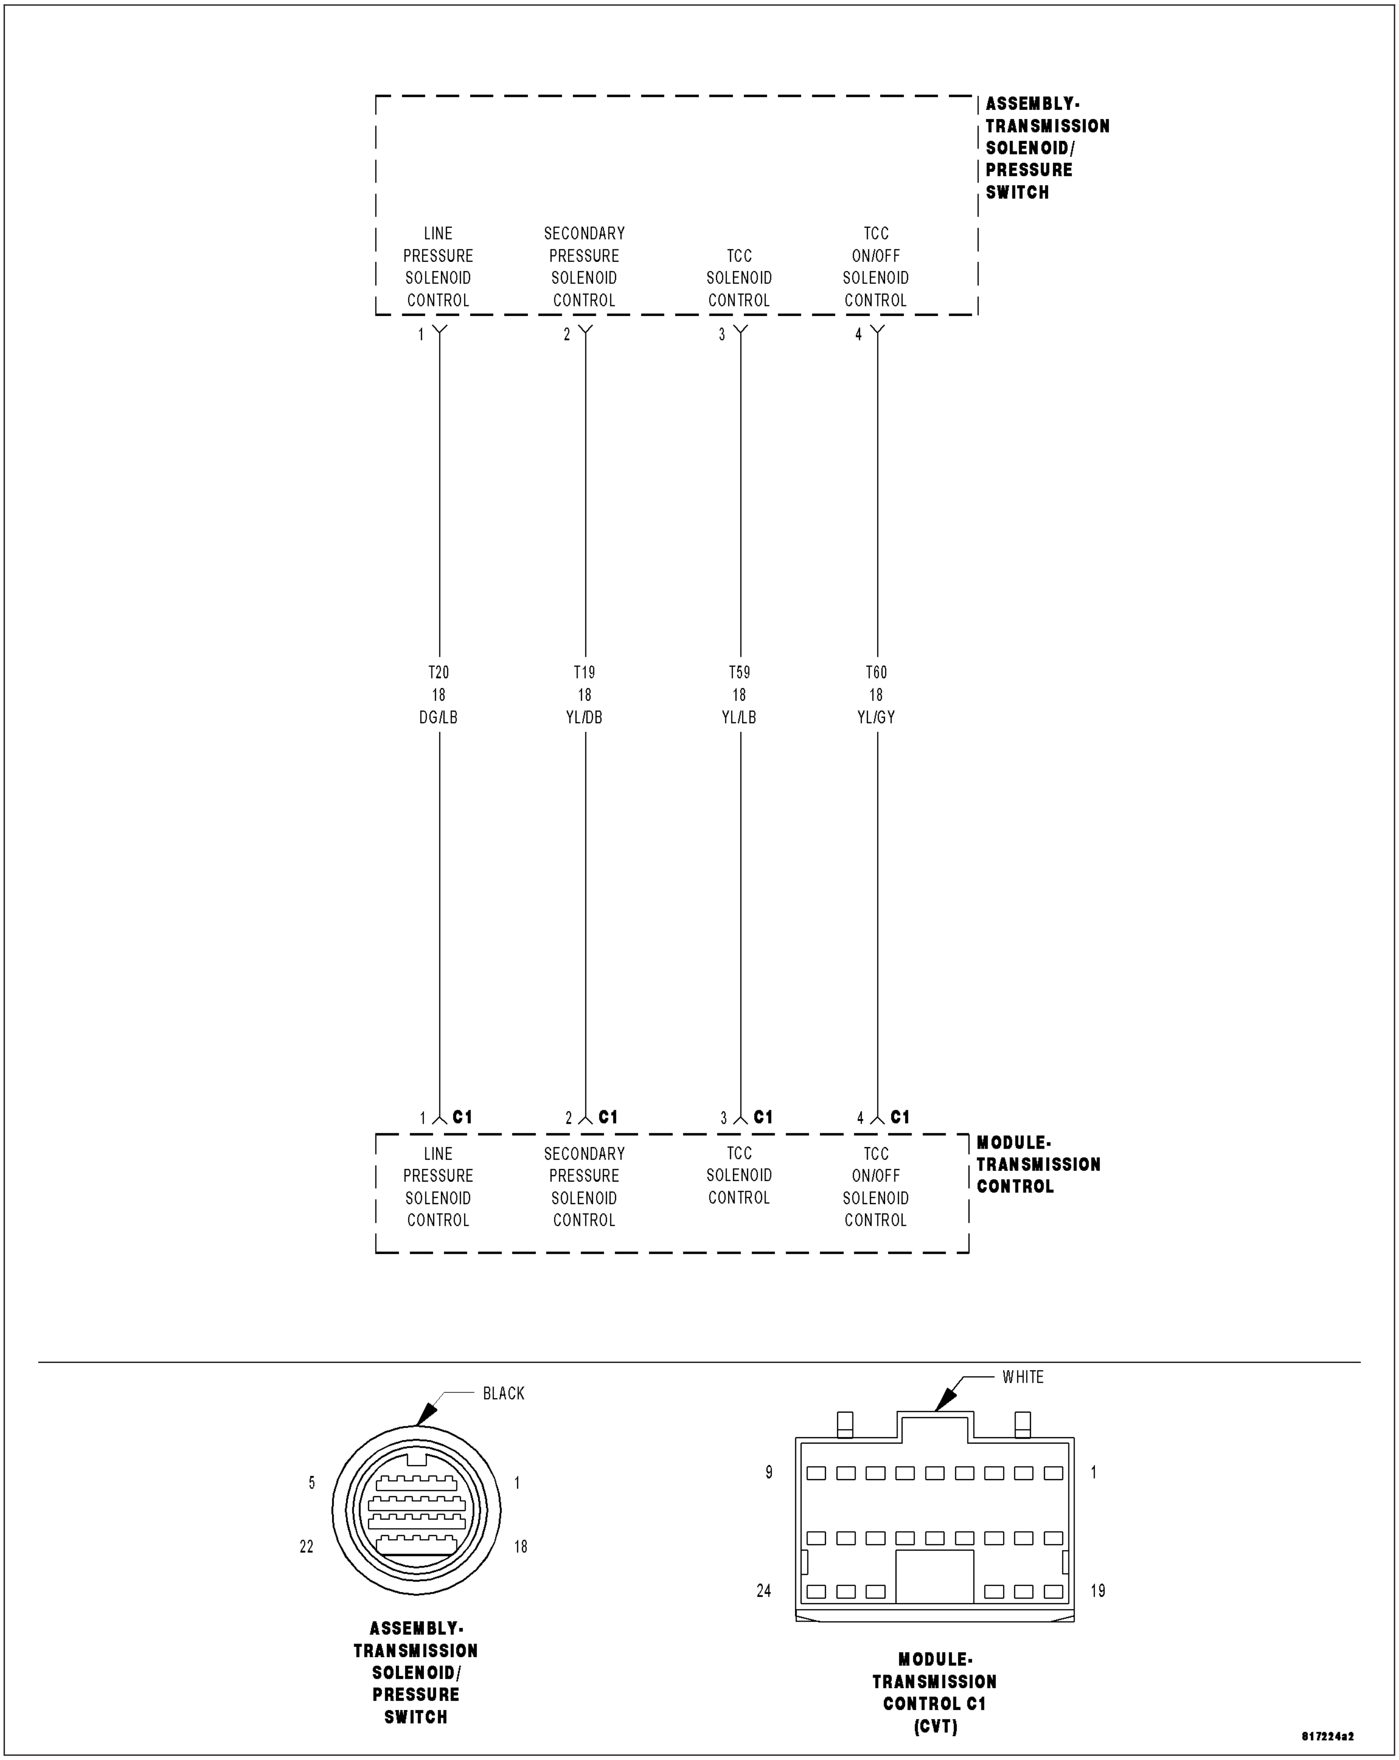
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0963-PRESSURE CONTROL SOLENOID A CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) regulates the line pressure by pulsing the line pressure solenoid. The TCM monitors the line pressure solenoid voltage and current draw during operation.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
  No Line Pressure Solenoid Circuit Low DTC present.
- **Set Condition:**
  When the target line pressure solenoid current is greater than 0.75 amps while the monitored line pressure solenoid current is less than 0.4 amps for the period of 5.0 seconds.

Possible Causes
(T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
(T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT OPEN
LINE PRESSURE SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

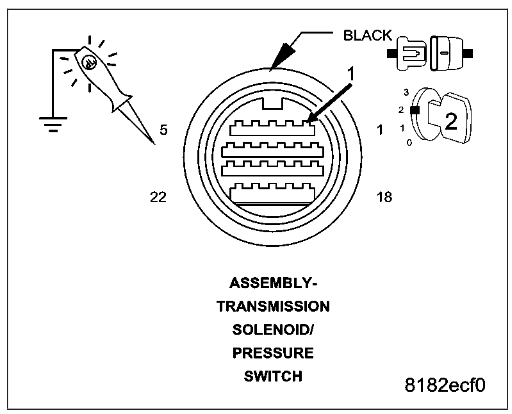
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 6

2. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT



Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool, actuate the Line Pressure Solenoid.

Using a test light connected to ground, check the (T20) Line Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

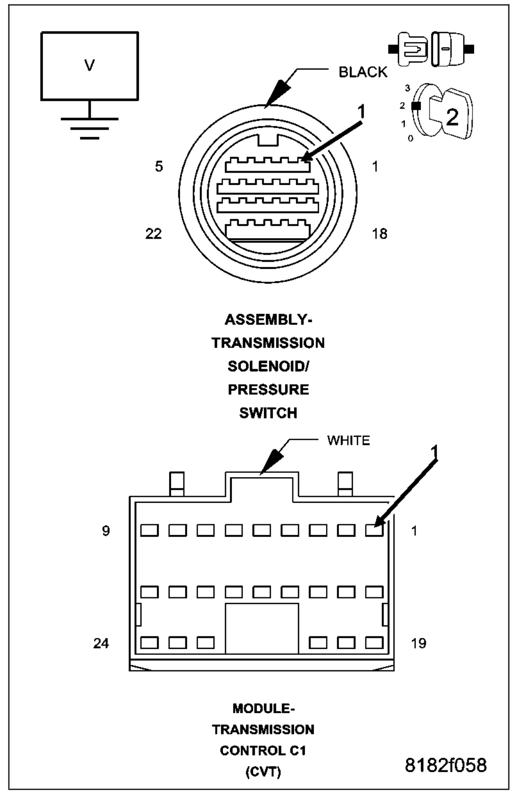
NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 5

3. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE



With the scan tool, stop the actuation of the Line Pressure Solenoid.

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T20) Line Pressure Solenoid Control circuit.

Is the voltage above .05 volts?

Yes >> Repair the (T20) Line Pressure Solenoid Control circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE LINE PRESSURE SOLENOID

Turn the ignition off to the lock position.

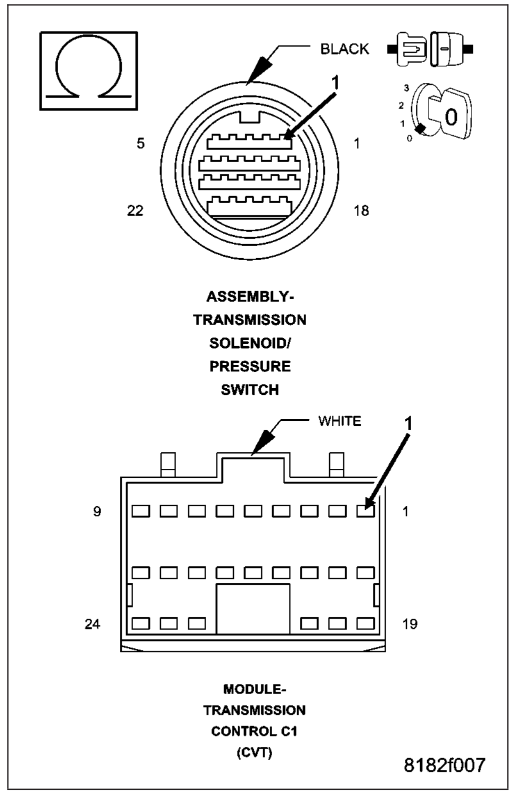
Reconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T20) Line Pressure Solenoid Control circuit in the TCM C1 harness connector.

Is the resistance between 3.0 and 9.0 ohms?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



No >> Replace the CV Transmission or replace the Line Pressure Solenoid (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE (T20) LINE PRESSURE SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Measure the resistance of the (T20) Line Pressure Solenoid Control circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the (T20) Line Pressure Solenoid Control circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

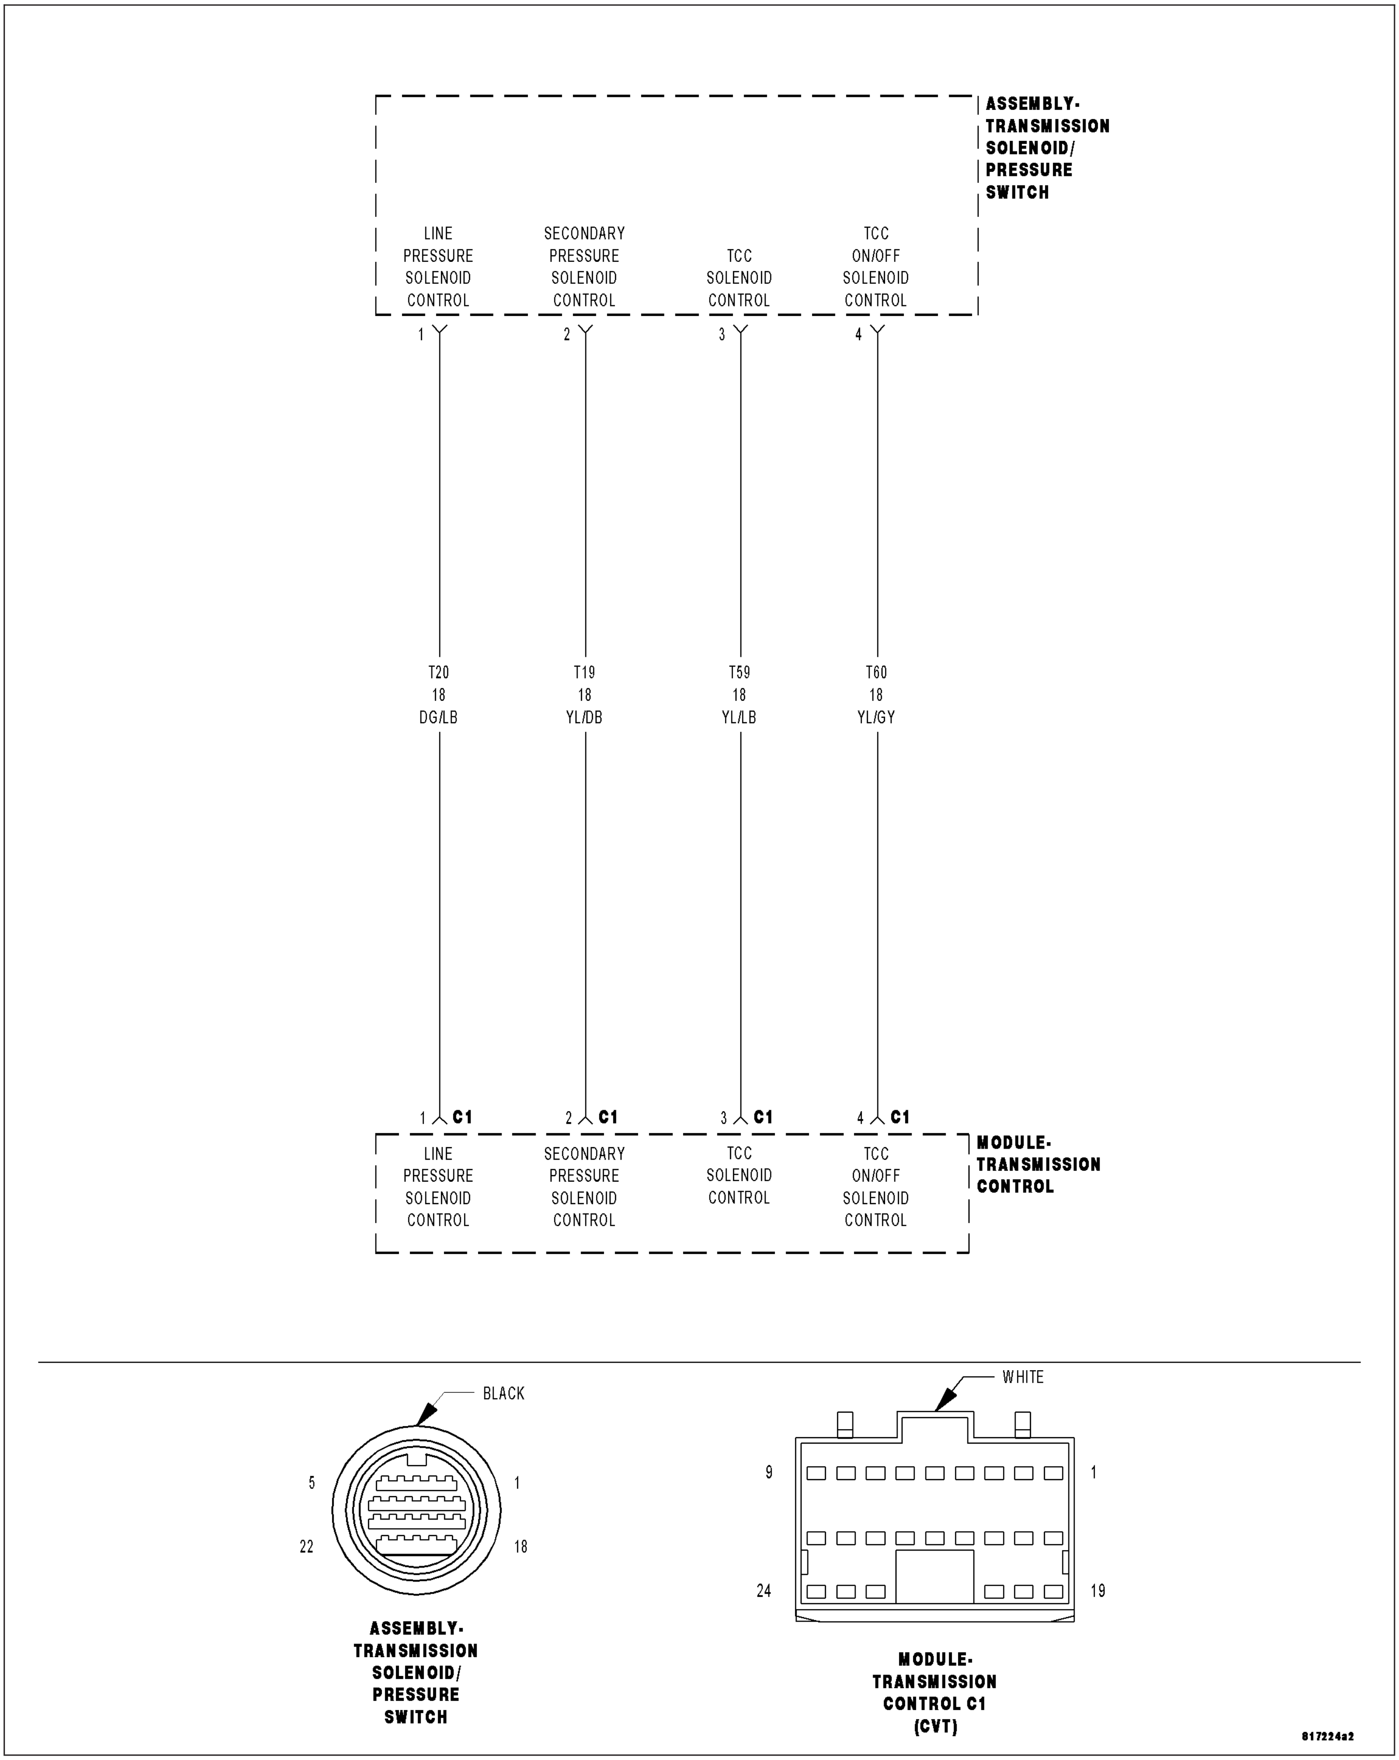
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0966-PRESSURE CONTROL SOLENOID B CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) regulates the secondary pressure by pulsing the secondary pressure solenoid. The TCM monitors the secondary pressure solenoid voltage and current draw during operation.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts..
- **Set Condition:**
  If the monitored secondary pressure solenoid voltage is less than 70% of the target secondary pressure solenoid voltage for the period of 1.0 second.

Possible Causes
(T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT SHORT TO GROUND
SECONDARY PRESSURE SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

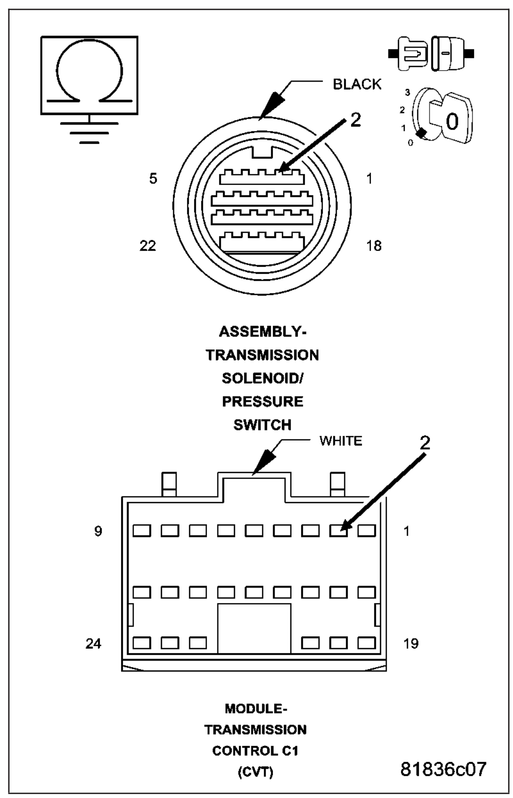
1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4



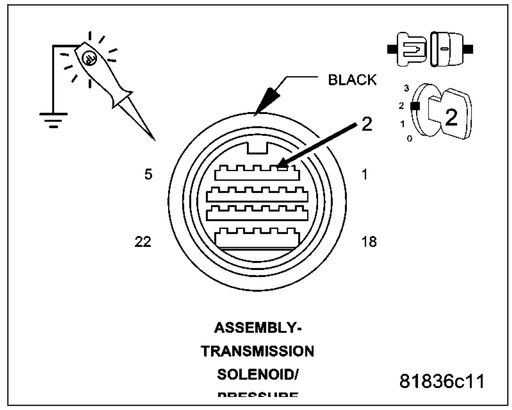
2. CHECK THE (T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T19) Secondary Pressure Solenoid Control circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (T19) Secondary Pressure Solenoid Control circuit for a short to ground.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT

Turn the ignition off to the lock position.

Reconnect the TCM C1 harness connector.

Ignition on, engine not running.

With the scan tool actuate the Secondary Pressure Solenoid.

Using a test light connected to ground, check the (T19) Secondary Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Replace the CV Transmission or repair or replace the Secondary Pressure Solenoid (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

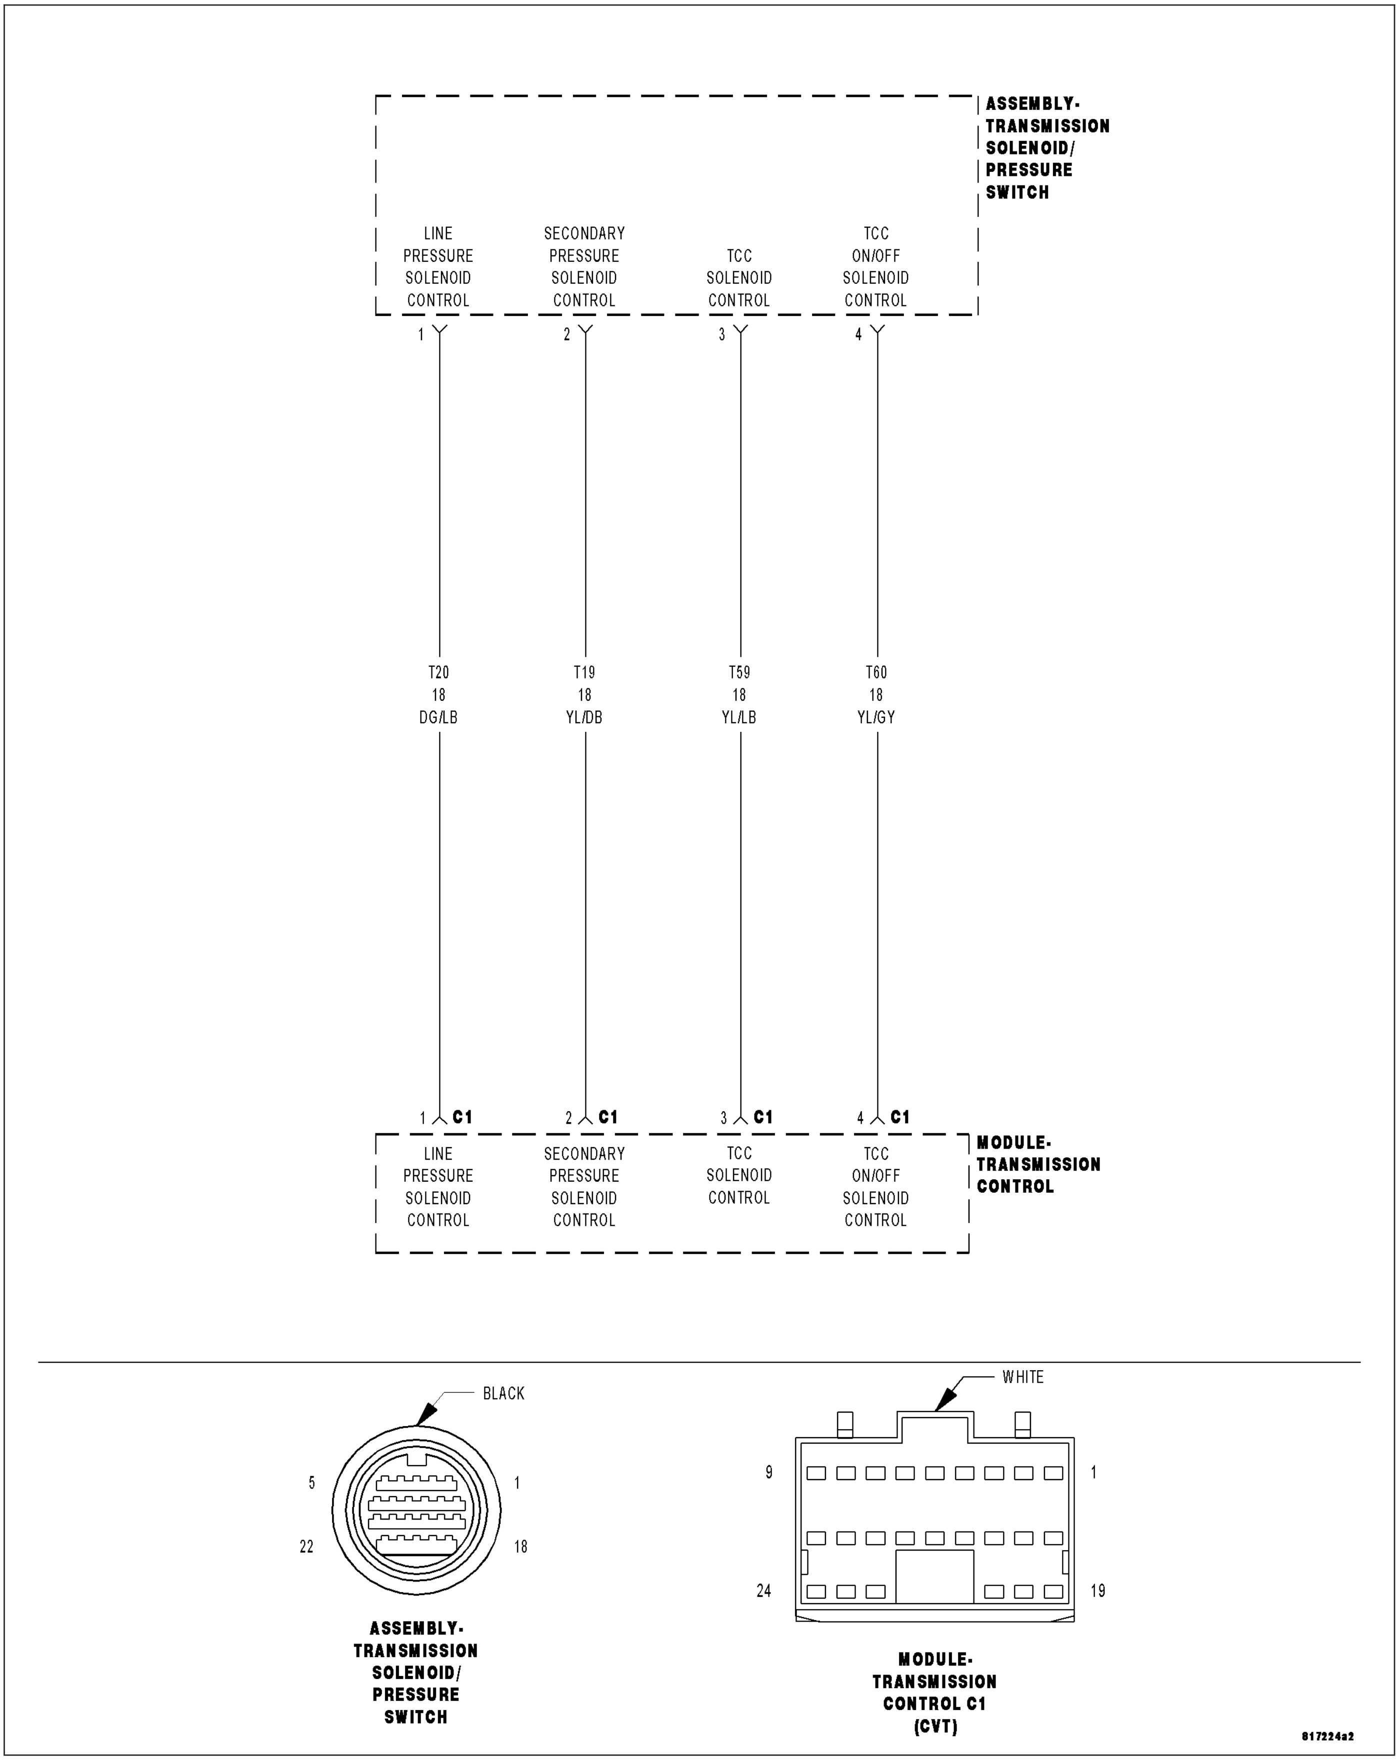
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P0967-PRESSURE CONTROL SOLENOID B CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) regulates the secondary pressure by pulsing the secondary pressure solenoid. The TCM monitors the secondary pressure solenoid voltage and current draw during operation.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
  No Secondary Pressure Solenoid Low DTC present.
- **Set Condition:**
  When the target secondary pressure solenoid current is greater than 0.75 amps while the monitored secondary pressure solenoid current is less than 0.4 amps for the period of 5 seconds.

Possible Causes
(T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
(T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT OPEN
SECONDARY PRESSURE SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 6

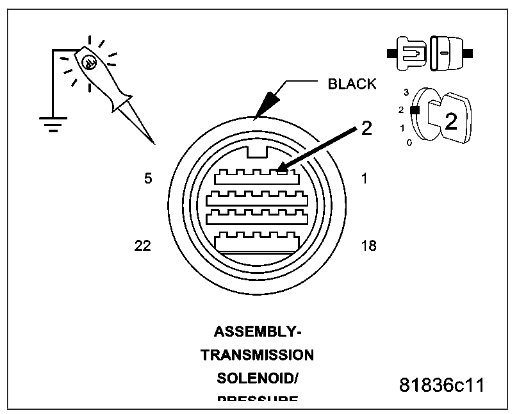
2. CHECK THE (T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool, actuate the Secondary Pressure Solenoid.



Using a test light connected to ground, check the (T19) Secondary Pressure Solenoid Control circuit in the Transmission Solenoid/Pressure Switch Assembly harness connector.

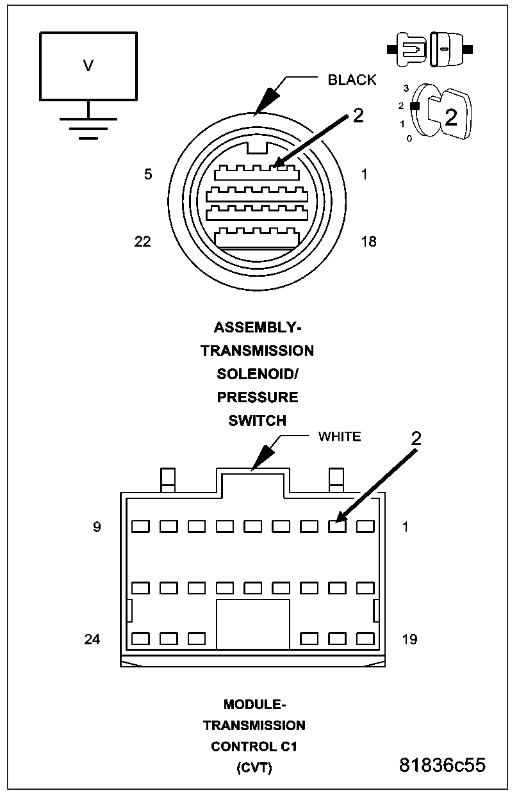
NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 5

3. CHECK THE (T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE



With the scan tool, stop the actuation of the Secondary Pressure Solenoid.

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T19) Secondary Pressure Solenoid Control circuit.

Is the voltage above .05 volts?

Yes >> Repair the (T19) Secondary Pressure Solenoid Control circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE SECONDARY PRESSURE SOLENOID

Turn the ignition off to the lock position.

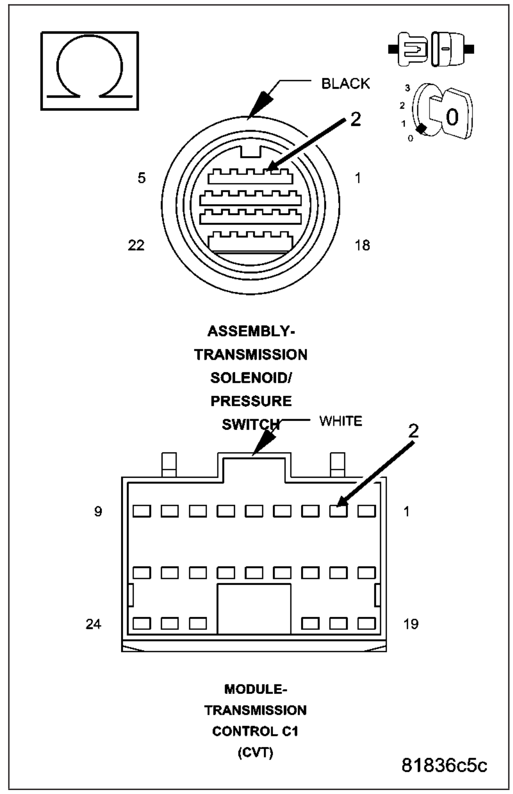
Reconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T19) Secondary Pressure Solenoid Control circuit in the TCM C1 harness connector.

Is the resistance between 3.0 and 9.0 ohms?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



No >> Replace the CV Transmission or replace the Secondary Pressure Solenoid (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE (T19) SECONDARY PRESSURE SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Measure the resistance of the (T19) Secondary Pressure Solenoid Control circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the (T19) Secondary Pressure Solenoid Control circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

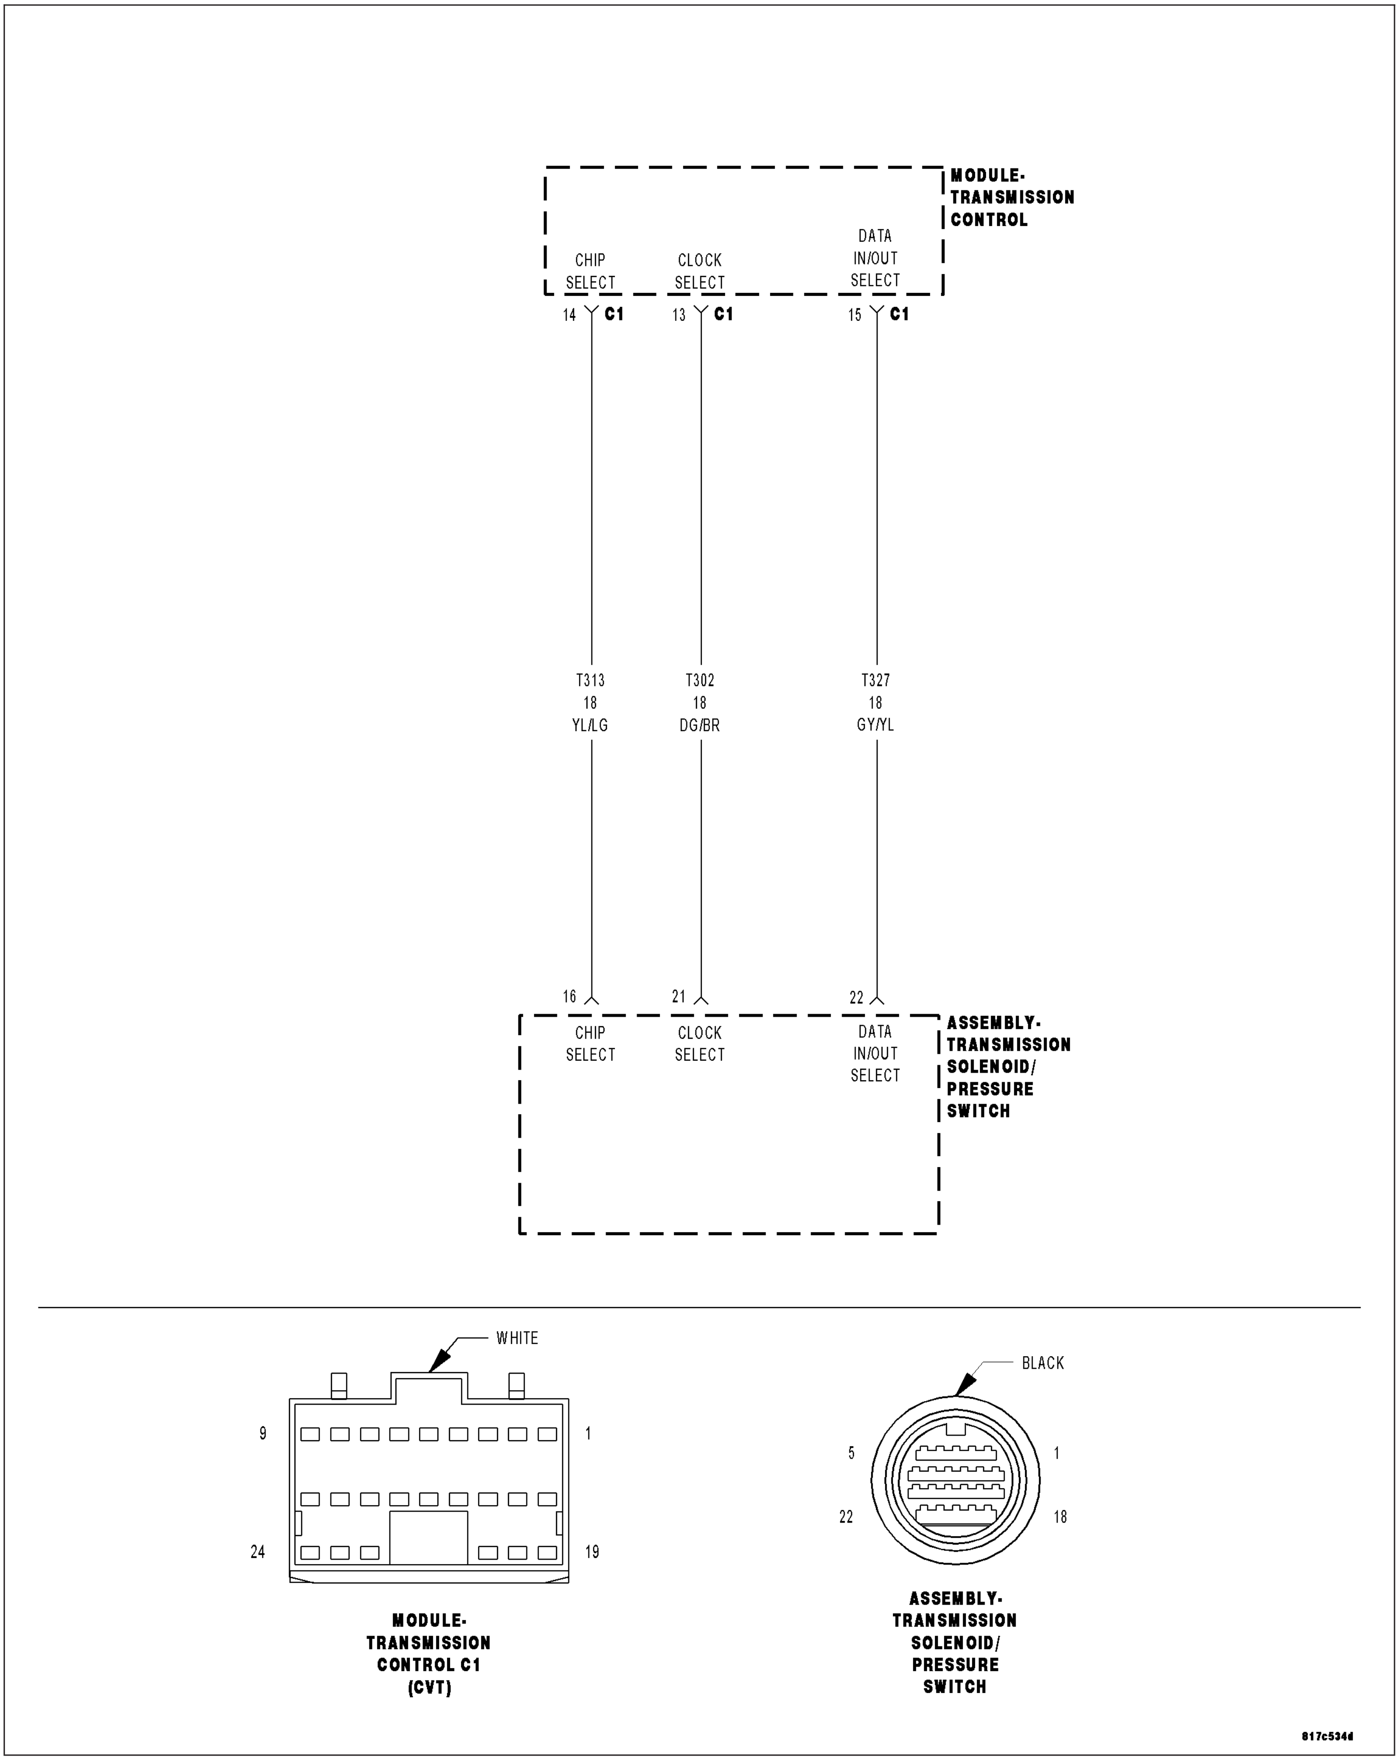
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P161B-BATTERY DISCONNECT / TCM INTERNAL

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) calculates the checksum in the EEPROM and compares it to the stored checksum value. If the calculated checksum value does not match the stored checksum value the TCM sets the DTC and illuminates the MIL.

- **When Monitored:**
  One time at every ignition on cycle.
- **Set Condition:**
  When the calculated checksum does not equal the stored checksum configuration or loss of power to the controller. It takes one trip of problem identification to set the MIL.

Possible Causes
WRONG VEHICLE CALIBRATION
FUSED B(+), TRANSMISSION CONTROL OUTPUT, AND/OR GROUND OPEN
TRANSMISSION CONTROL MODULE (TCM)

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for P161B?

Yes >> Go To 3

No >> Go To 2

2. CHECK FOR OTHER DTCS

With the scan tool, read Transmission DTCs.

Is the status Active for P0602?

Yes >> Refer to the Transmission category and perform diagnostic procedure for P0602.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE TCM

Has the TCM been flashed, a new TCM installed or the battery or TCM disconnected with the ignition in the On or Accessory position?

Yes >> This is a normal condition. Cycle the ignition off for 4 seconds and turn the ignition back on. Erase DTCs and cycle the ignition off again for 4 seconds and turn the ignition back on. Read TCM DTCs. If the DTC resets and remains active - Go To 4. If the DTC does not reset perform CVT TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

•

NOTE: A loss of the TCM Fused B(+), TCM ground, and/or the Transmission Control Output circuits can cause this fault to set.

Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace and program the TCM per the Service Information.

Perform CVT TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK IF THE RIGHT PART NUMBER IS USED

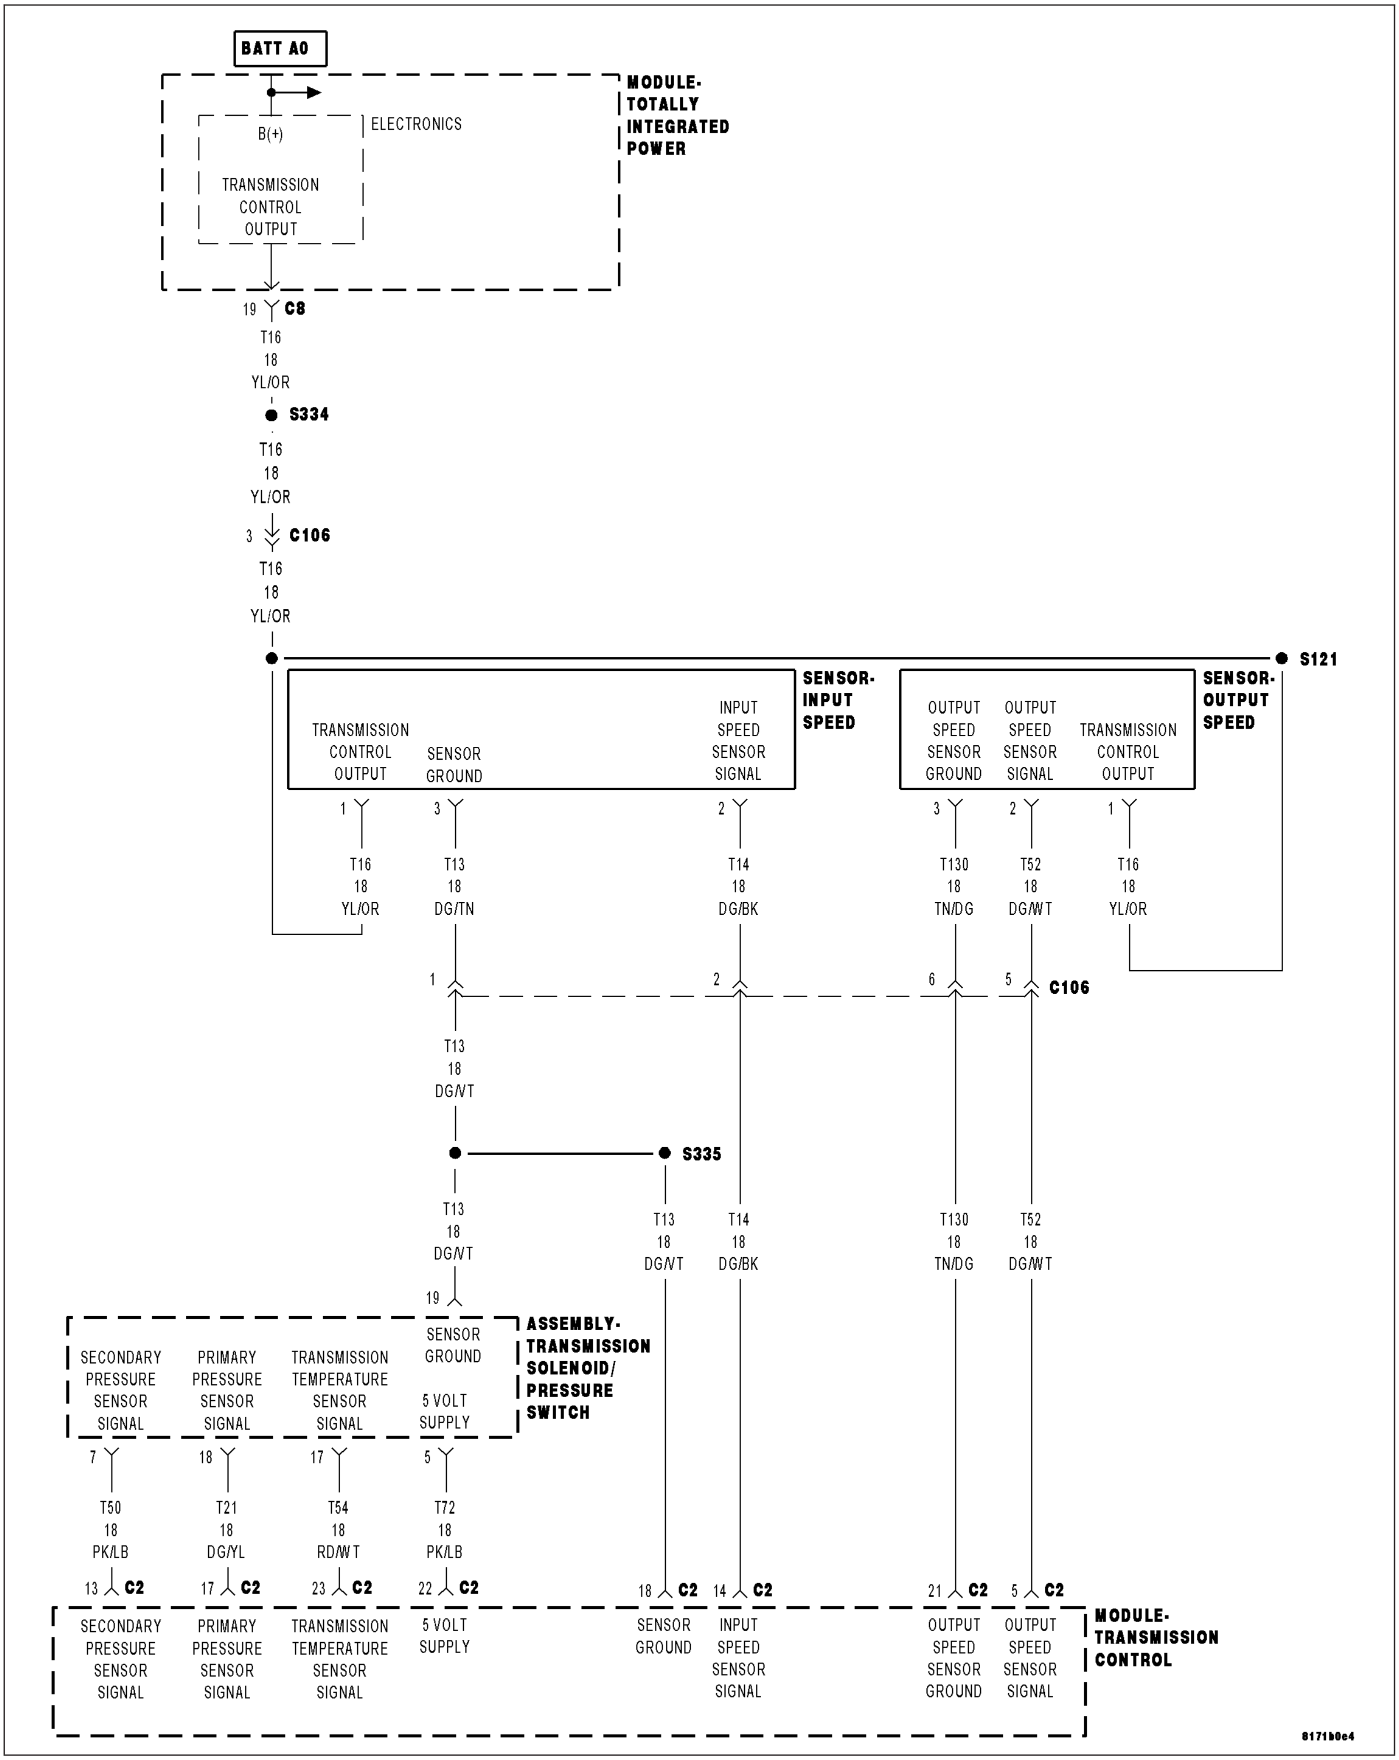
With the scan tool, check the TCM part number and compare it to the vehicle configuration.

Does the controller have the right part number?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits.

•

NOTE: A loss of the TCM Fused B(+), TCM ground, and/or the Transmission Control Output circuits can cause this fault to set.



Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace and program the TCM per the Service Information.

Perform CVT TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Do to the configuration mismatch the controller will need to be replaced with the proper part number for the configuration of the vehicle. Replace and program the TCM per the Service Information.

Perform CVT TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

P1661-SENSOR GROUND REFERENCE CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Oil Temperature Sensor , Primary and Secondary Oil Pressure Sensor and the Input Speed Sensor use a common ground circuit that returns to the Transmission Control Module (TCM). If all of these circuits show an open (high voltage) the DTC will set.

- **When Monitored:**
  With the ignition on and a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  When all are present for the period of 200 msec:
- Transmission Fluid Temperature Sensor voltage is greater than 2.5 volts.
- Primary Pressure Sensor voltage greater than 5.0 volts.
- Secondary Pressure Sensor voltage is greater than 5.0 volts

Possible Causes
(T13) SENSOR GROUND CIRCUIT OPEN
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

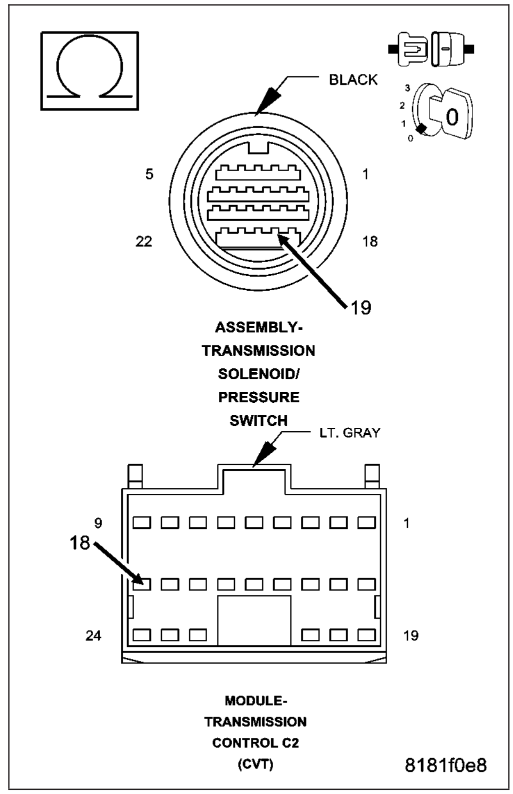
1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4



2. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Disconnect the TCM C2 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance of the (T13) Sensor Ground circuit between the TCM C2 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the (T13) Sensor Ground circuit for an open.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (T13) SENSOR GROUND CIRCUIT FOR AN OPEN INTERNALLY

Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace and program the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset during the Verification procedure?

Yes >> Replace the CV Transmission or repair the valve body (internal wiring) per the Service Information.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P1679-CALIBRATION NOT LEARNED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The first time the vehicle is started, the Transmission Control Module (TCM) receives hydraulic calibration data from an external EEPROM (located in the transmission) and stores this information in the EEPROM of the TCM. If there is no stored hydraulic calibration stored in the TCM this DTC will set. It takes one failure to turn on the MIL.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  The TCM is unable to read the hydraulic calibration data stored in the TCM EEPROM for the period of 5.0 seconds.

Possible Causes
OTHER TRANSMISSION DTCS PRESENT
TRANSMISSION RELEARN PERFORMED
TRANSMISSION CONTROL MODULE
CV TRANSMISSION REPLACED

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 4

2. CHECK FOR OTHER DTCS

With the scan tool, read Transmission DTCs.

Is the DTC U1146-LOST COMMUNICATION WITH EXTERNAL MEMORY also present?

Yes >> Refer to the Transmission Diagnosis and Testing category and perform diagnostics for U1146-LOST COMMUNICATION WITH EXTERNAL MEMORY.

No >> Go To 3

3. CHECK THE TCM

Has the Transmission Control Module (TCM), the CV Transmission been replaced, or a Transmission relearn procedure been performed?

Yes >> Cycle the ignition off for 5 seconds and then back on. Erase the DTC and cycle the ignition again. If the DTC still remains active, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any

Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

If the DTC is not active, erase the DTC and perform the CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Did the DTC P1679-CALIBRATION NOT LEARNED reset?

Yes >> Go To 2

No >> Test Complete.

P167A-CALIBRATION MISMATCH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

During the initial ignition on, the Transmission Control Module (TCM) receives the calibrated data from the EEPROM assembly inside the transmission and stores this information in the EEPROM of the TCM. At every ignition on, the TCM compares the stored data in the EEPROM to the transmitted data from the EEPROM in the transmission. If the calibration data does not match the DTC will set and the MIL will illuminate after one failure.

- **When Monitored:**
  One time at initial ignition on with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  If the TCM stored calibration does not match the EEPROM assembly in the transmission. This DTC requires only one problem identification to set the MIL.

Possible Causes
TRANSMISSION CONTROL MODULE RELEARN PROCEDURE NOT PERFORMED

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. PERFORM TCM RELEARN PROCEDURE

View repair

Repair

This is an informational DTC indicating that the TCM, CV Transmission, or the CV Transmission internal controller (valve body) was replaced without being calibrated. With the scan tool perform a TCM relearn procedure.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

P1702-PRIMARY OIL PRESSURE SENSOR / SECONDARY OIL PRESSURE SENSOR CORRELATION

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the correlation between the primary and secondary pressure sensors. If the correlation between the sensors is out of range a DTC will set.

- **When Monitored:**
  Ignition on, system voltage between 9.0 and 16.0 volts.
  Engine running with the transmission in Drive.
  Vehicle speed greater than 10.0 Km/h (6.0 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm.
  No active DTCs from the following:
- Primary or Secondary Pressure Sensor
- Transmission Temperature Sensor
- TCC Lock Up Solenoid
- Step Motor
- Input or Output Speed Sensor
- Transmission Range Sensor (TRS)
- Line Pressure Solenoid
- Secondary Pressure Solenoid
- **Set Condition:**
  Condition one:
  Reported primary pressure is less than the lower limit of the primary pressure correlated with the reported secondary pressure for more than 5.0 seconds.
  Condition two:
  Reported primary pressure is greater than the upper limit of the primary pressure correlated with the reported secondary pressure for more than 5.0 seconds.

Possible Causes
PRIMARY PRESSURE SENSOR
SECONDARY PRESSURE SENSOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK FOR TRANSMISSION DTC(s)

With the scan tool, read Transmission DTCs.

Are any of the following DTC(s) present PO842, PO843, PO847, or PO848?

Yes >> Refer to the Transmission Diagnostic and Testing category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 2

2. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 3

No >> Go To 4

3. CHECK THE TCM

Replace or repair (valve body) the CV Transmission per the Service Information. Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Did the DTC reset during the verification test?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

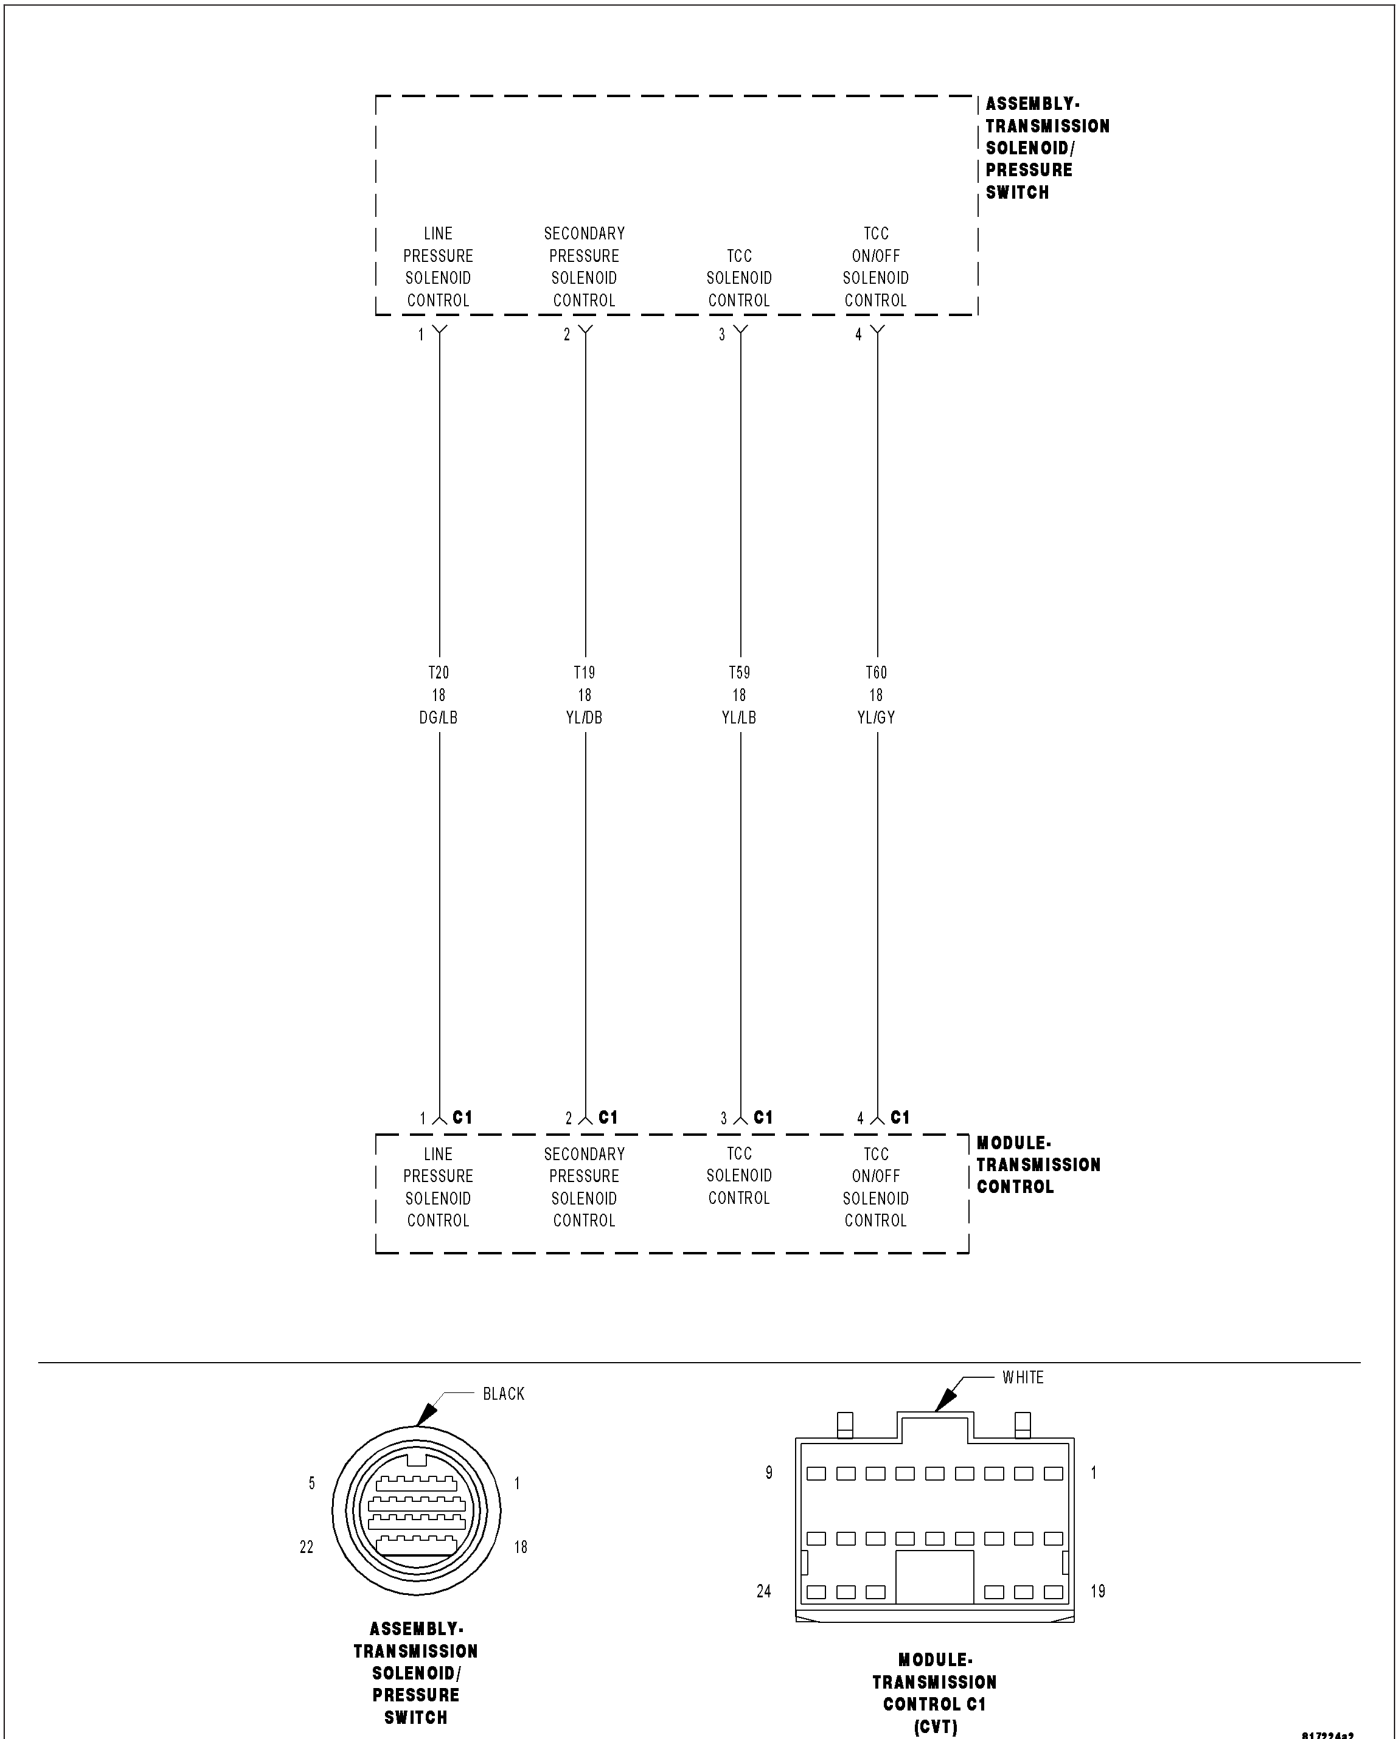
No >> Test Complete.

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P1723-LOCK UP / SELECT CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) monitors the TCC ON/OFF Solenoid Control signal during normal operation. If the TCC ON/OFF Solenoid status does not match the TCM requested ON/OFF status a DTC will set.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  If the TCC ON/OFF Solenoid status does not match the TCM requested ON/OFF status for the period of 200 msec the DTC will set. It takes two consecutive problem identification trips to illuminate the MIL.

Possible Causes
(T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
(T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT OPEN
(T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TCC ON/OFF SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 6

2. CHECK TO SEE IF THE DTC IS ACTIVE

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool actuate the TCC ON/OFF Solenoid.

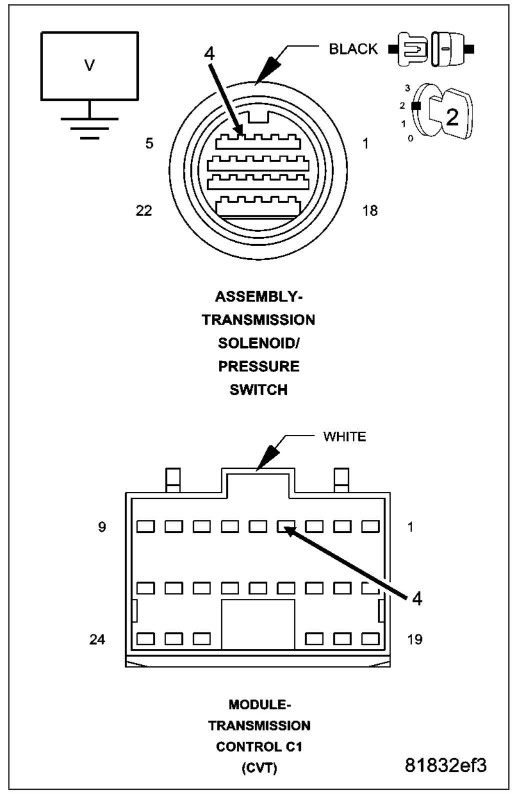
Using a 12-volt test light connected to ground, check the (T60) TCC ON/OFF Solenoid Control circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 4



3. CHECK THE (T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

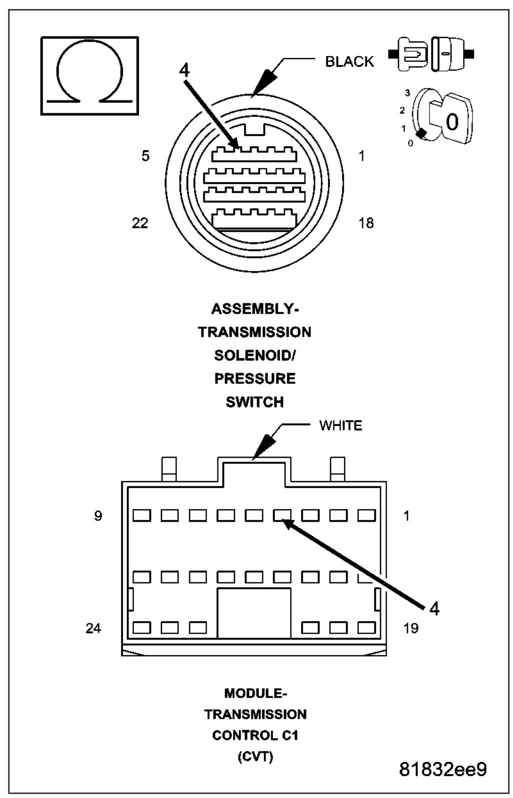
Ignition on, engine not running.

Measure the voltage of the (T60) TCC ON/OFF Solenoid Control circuit.

Is the voltage above .05 volts?

Yes >> Repair the (T60) TCC ON/OFF Solenoid Control circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)



No >> Replace or repair (valve body) the CV Transmission per the Service Information.

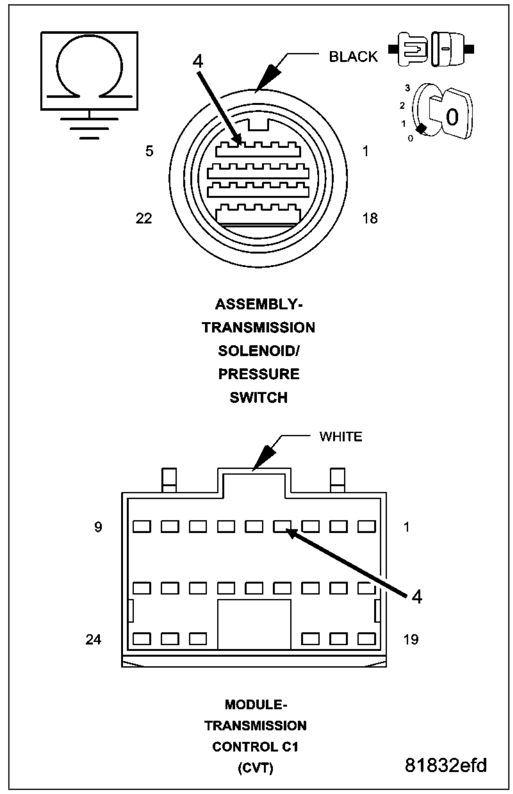
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off to the lock position.

Measure the resistance of the (T60) TCC ON/OFF Solenoid Control circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?



Yes >> Repair the (T60) TCC ON/OFF Solenoid Control circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (T60) TCC ON/OFF SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T60) TCC ON/OFF Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T60) TCC ON/OFF Solenoid Control circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P1729-TRANSMISSION RATIO CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module monitors and controls the gear ratio by the use of a Step motor that transfers electrical power to mechanical movement. The rationality is a continuous test that monitors the Step motor movement. If the Step motor ON/OFF status does not match the TCM requested ON/OFF status a DTC will set.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  If the Step motor ON/OFF status does not match the TCM requested ON/OFF status for the period of 200 msec the DTC will set. It takes two consecutive problem identification trips to illuminate the MIL.

Possible Causes
(T314) A, (T315) B, (T316) C, AND/OR (T317) D STEP MOTOR CONTROL CIRCUIT(S) SHORT TO VOLTAGE
(T314) A, (T315) B, (T316) C, AND/OR (T317) D STEP MOTOR CONTROL CIRCUIT(S) OPEN
(T314) A, (T315) B, (T316) C, AND/OR (T317) D STEP MOTOR CONTROL CIRCUIT(S) SHORT TO GROUND
STEP MOTOR
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

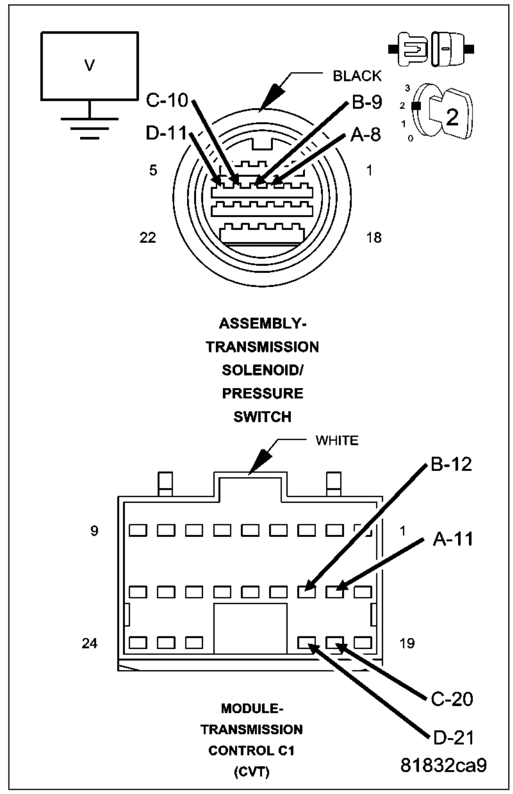
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 6

2. CHECK THE (T314) A, (T315) B, (T316) C, AND (T317) D STEP MOTOR CONTROL CIRCUIT(S) FOR A SHORT TO VOLTAGE



Turn the ignition off to the lock position.

Disconnect the TCM C1 and C2 harness connectors.

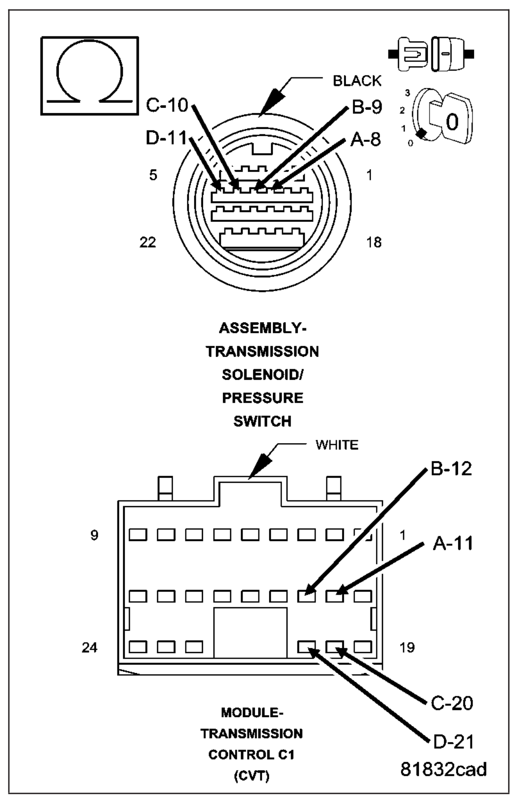
Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure separately the voltage of the (T314) A, (T315) B, (T316) C, and (T317) D Step Motor Control circuits.

Is the voltage above .05 volts for any of the Step Motor Control circuits?

Yes >> Repair the (T314) A, (T315) B, (T316) C, and/or (T317) D Step Motor Control circuit(s) for a short to voltage.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

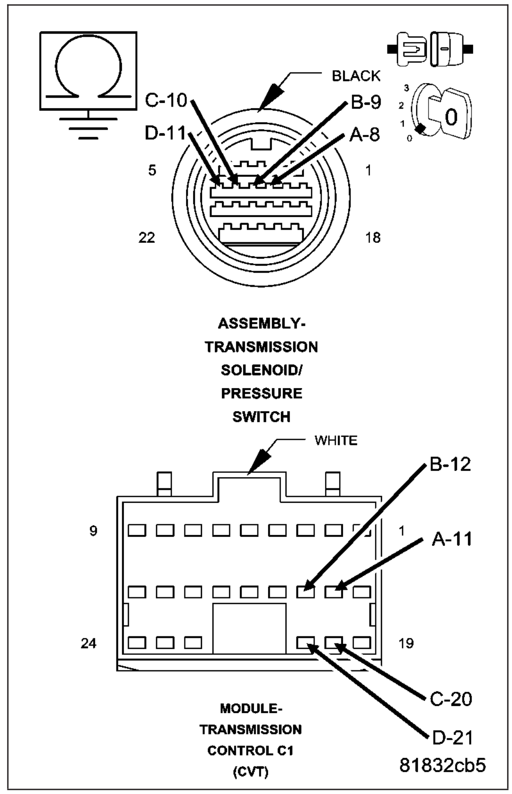
No >> Go To 3

3. CHECK THE (T314) A, (T315) B, (T316) C, AND (T317) D STEP MOTOR CONTROL CIRCUIT(S) FOR AN OPEN

Turn the ignition off to the lock position.

Measure separately the resistance of the (T314) A, (T315) B, (T316) C, and (T317) D Step Motor Control circuits between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch harness connector.

Is the resistance above 5.0 ohms for any of the Step Motor Control circuits?



Yes >> Repair the (T314) A, (T315) B, (T316) C, and/or (T317) D Step Motor Control circuit(s) for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T314) A, (T315) B, (T316) C, AND (T317) D STEP MOTOR CONTROL CIRCUIT(S) FOR A SHORT TO GROUND

Measure separately the resistance between ground and the (T314) A, (T315) B, (T316) C, and (T317) D Step Motor Control circuits.

Is the resistance below 5.0 ohms for any of the Step Motor Control circuits?

Yes >> Repair the (T314) A, (T315) B, (T316) C, and/or (T317) D Step Motor Control circuit(s) for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. TRANSMISSION CONTROL MODULE

Replace the Transmission Control Module per the Service Information. Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

During the verification test did the DTC reset?

Yes >> Replace or repair the CV Transmission (Step Motor) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

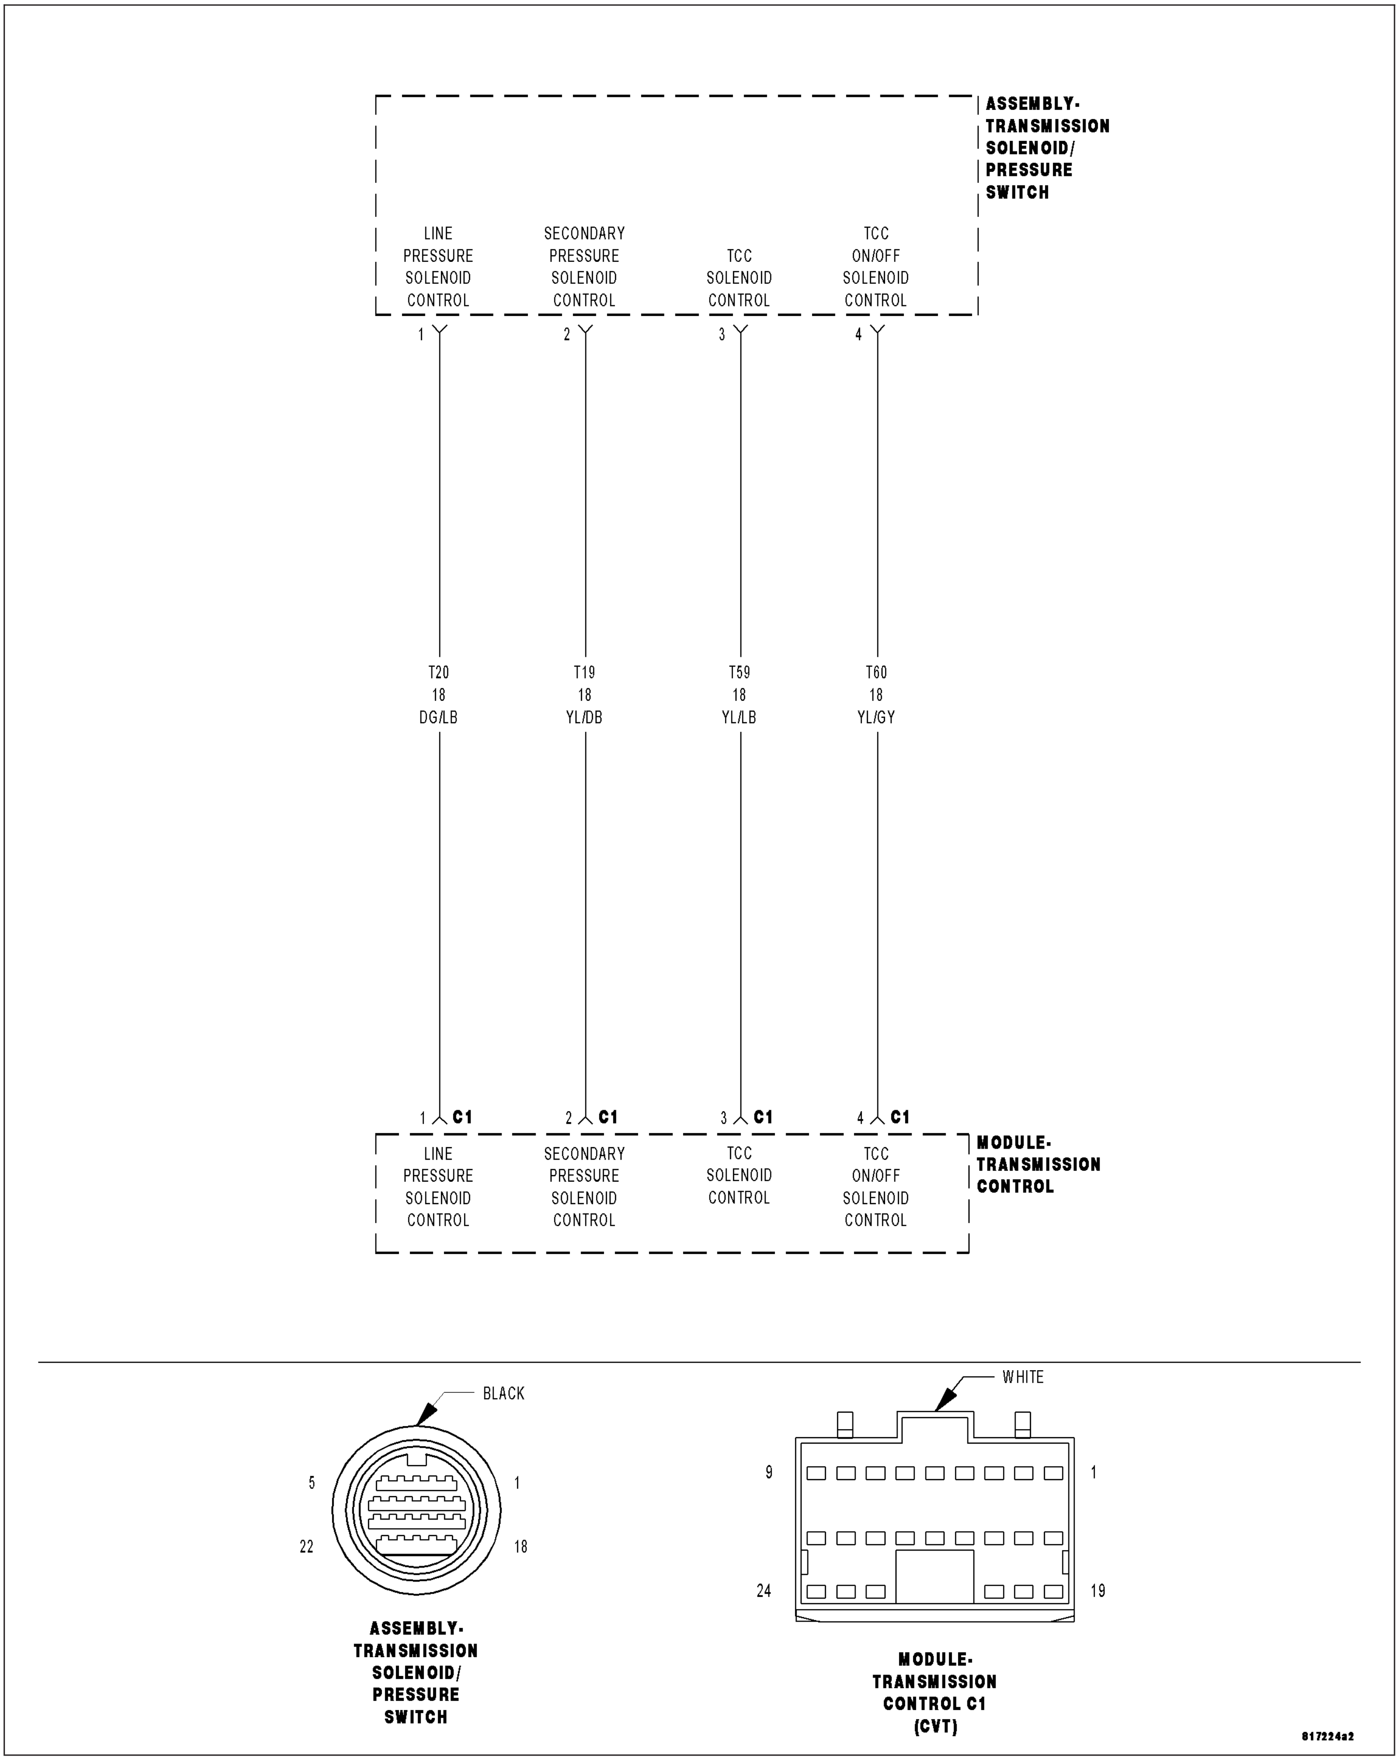
No >> Test Complete.

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P2769-TORQUE CONVERTER CLUTCH CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module monitors two signals from the TCC Solenoid during normal operation. One is the feedback electric current of the TCC Solenoid and the other is the voltage between ground and the TCM termination for the TCC Solenoid.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with TCC lock-up enabled.
  TCC Lock up command is ON (True).
  No DTCs active from the following:
- Step motor
- Line Pressure Solenoid,
- Secondary Solenoid
- Input and Output Speed Sensor
- Primary or Secondary Pressure Sensor
- CAN Bus
- **Set Condition:**
  If the actual voltage is 70% of the target voltage for the period of 1.0 second. It takes two consecutive problem identification trips for the DTC to mature and illuminate the MIL.

Possible Causes
(T59) TCC SOLENOID CONTROL CIRCUIT SHORT TO GROUND
TORQUE CONVERTOR CLUTCH SOLENOID
TORQUE CONVERTOR CLUTCH
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

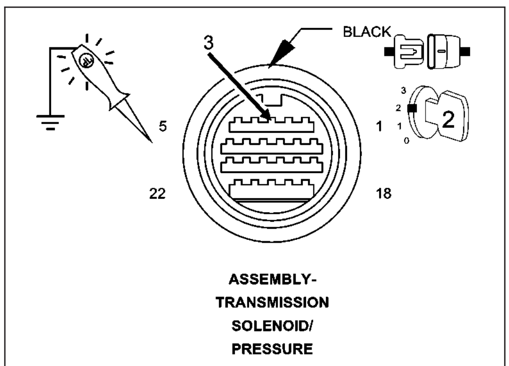
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 5

2. CHECK THE (T59) TCC SOLENOID CONTROL CIRCUIT



Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

With the scan tool, actuate the TCC Solenoid.

Using a 12-volt test light connected to ground, check the (T59) TCC Solenoid Control circuit.

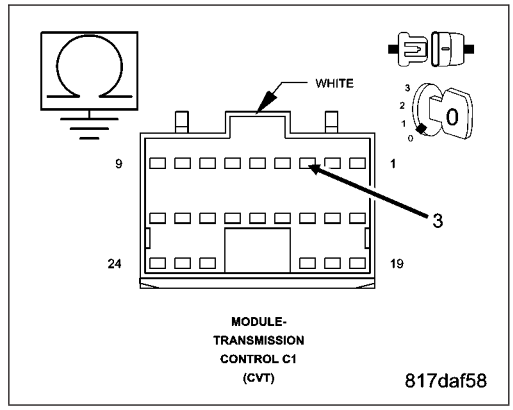
817daf42

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 4



3. CHECK THE TCC SOLENOID

Turn the ignition off to the lock position.

Reconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Disconnect the TCM C1 harness connector.

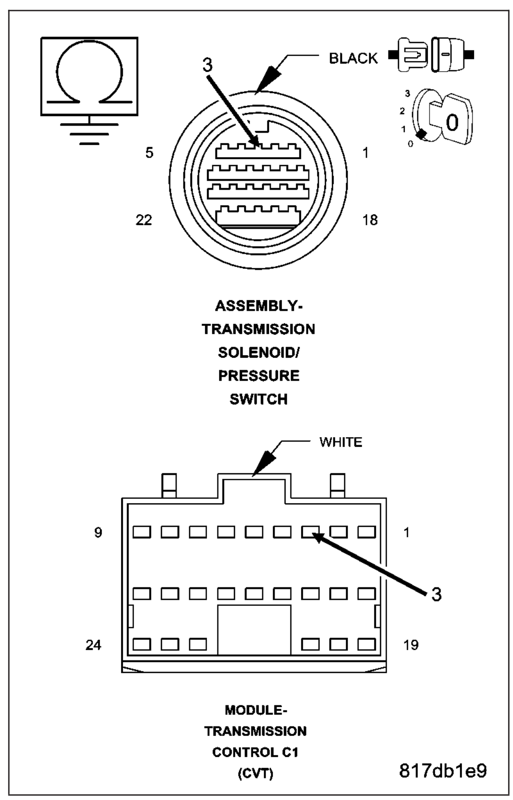
Measure the resistance between ground and the (T59) TCC Solenoid Control circuit in the TCM C1 harness connector.

Is the resistance between 3.0 and 9.0 ohms?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the TCC Solenoid (Valve Body) per the Service Information.



Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. CHECK THE (T59) TCC SOLENOID CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Measure the resistance between ground and the (T59) TCC Solenoid Control circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T59) TCC Solenoid Control circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

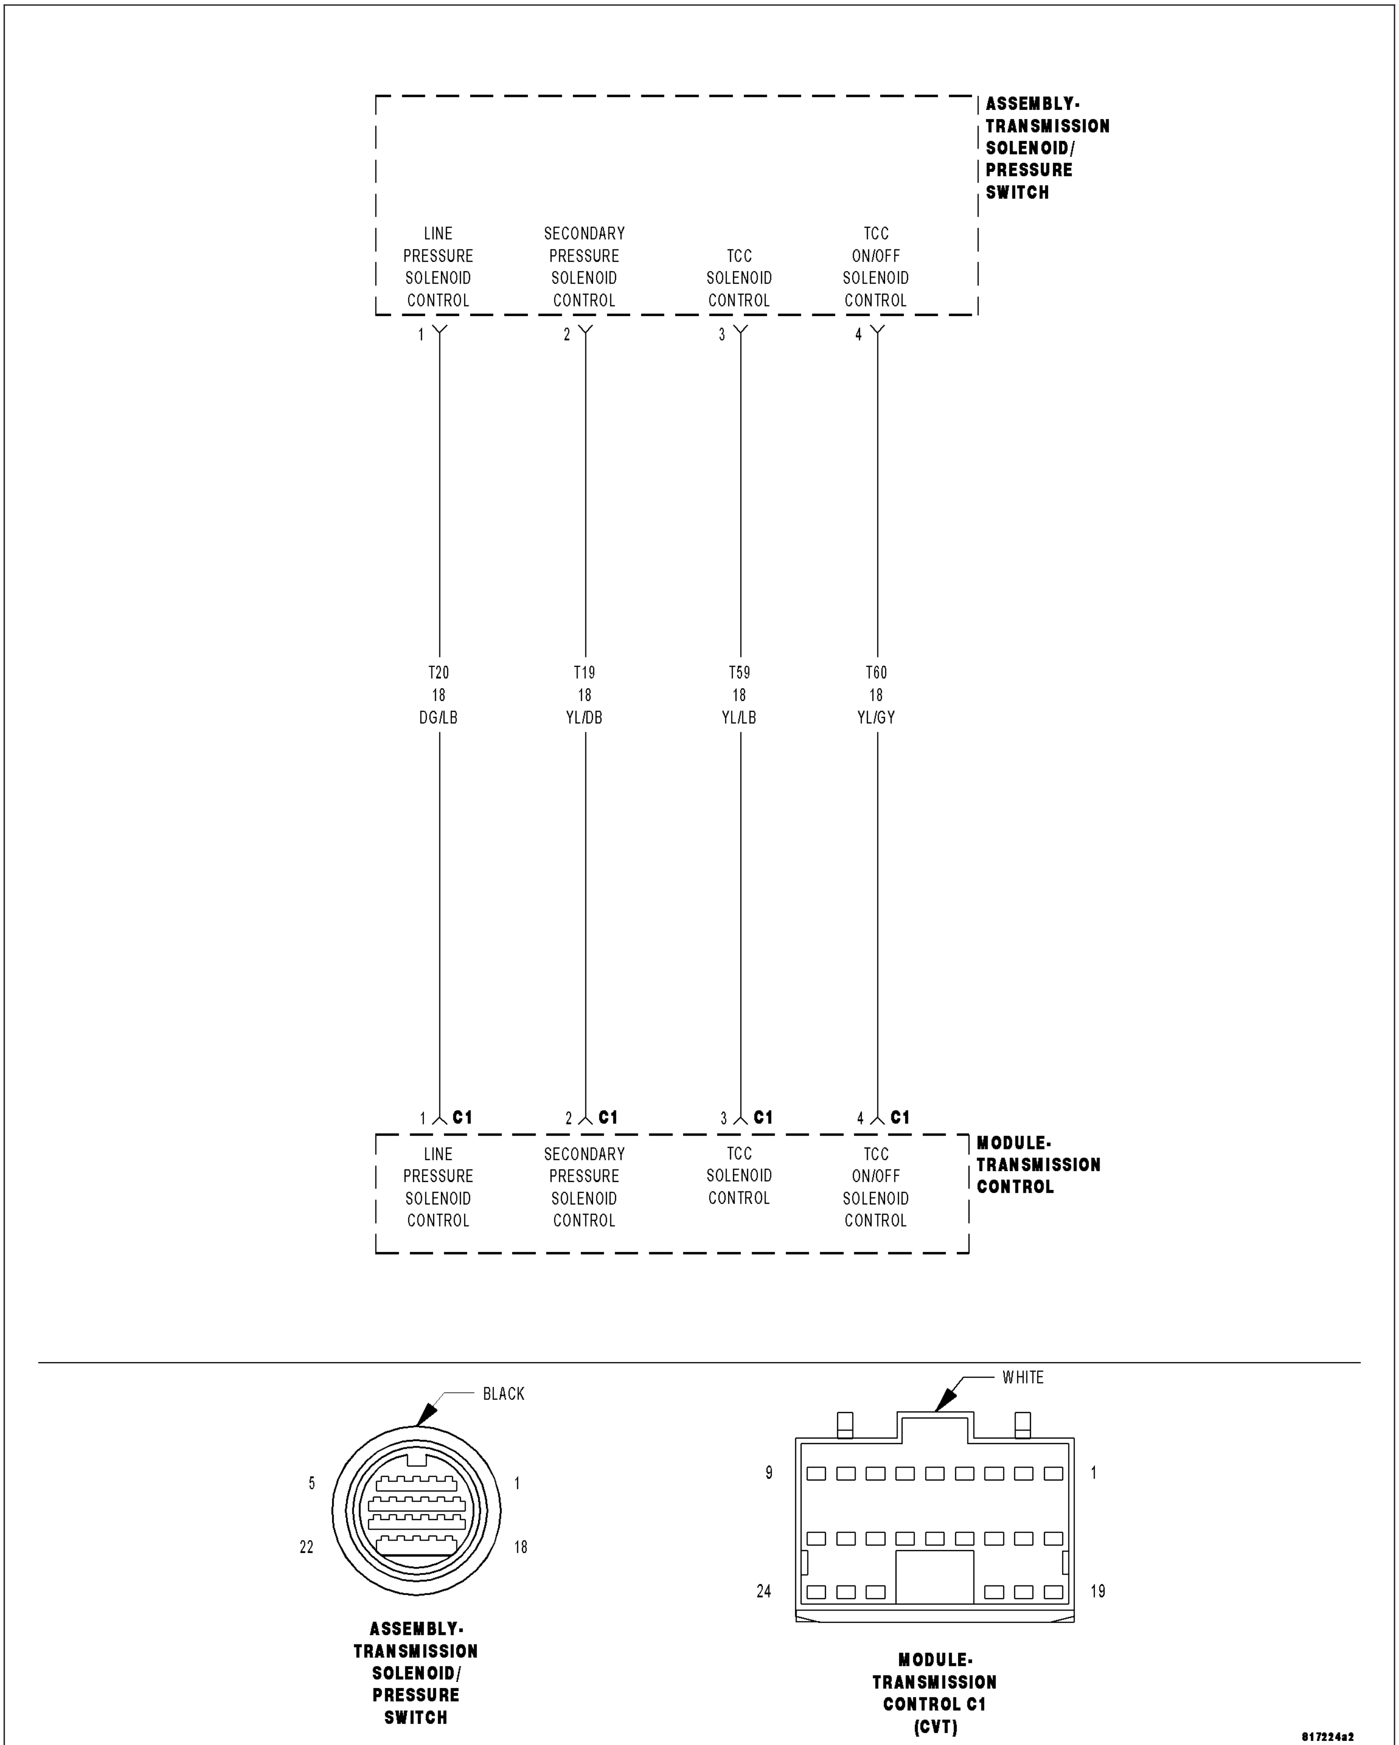
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.



Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

P2770-TORQUE CONVERTER CLUTCH CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module monitors two signals from the TCC Solenoid during normal operation. One is the feedback electric current of the TCC Solenoid and the other is the voltage between ground and the TCM termination for the TCC Solenoid.

- **When Monitored:**
  Ignition on, engine running with the transmission in a valid forward gear.
  Vehicle speed greater than 10 Km/h (6 mph).
  Accelerator Pedal Position (APP) greater than 12.5%.
  Engine rpm greater than 450 rpm with TCC lock-up enabled.
  TCC Lock up command is ON (True).
  No DTCs active from the following:
  Step motor, Line Pressure Solenoid, Secondary Solenoid, Input and Output Speed Sensor, Primary or Secondary Pressure Sensor, or CAN BUS.
- **Set Condition:**
  If the target current is greater than 0.75 amps and the monitored current is less than 0.4 amps for the period of 5 seconds. It takes two consecutive problem identification trips for the DTC to mature and illuminate the MIL.

Possible Causes
(T59) TCC SOLENOID CONTROL CIRCUIT SHORT TO VOLTAGE
(T59) TCC SOLENOID CONTROL CIRCUIT OPEN
TORQUE CONVERTOR CLUTCH SOLENOID
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK TO SEE IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 6

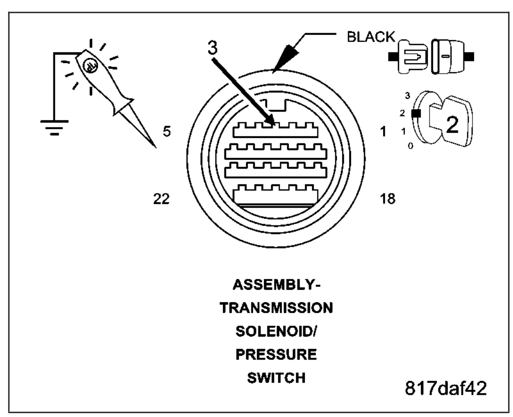
2. CHECK THE (T59) TCC SOLENOID CONTROL CIRCUIT

Turn the ignition off to the lock position.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

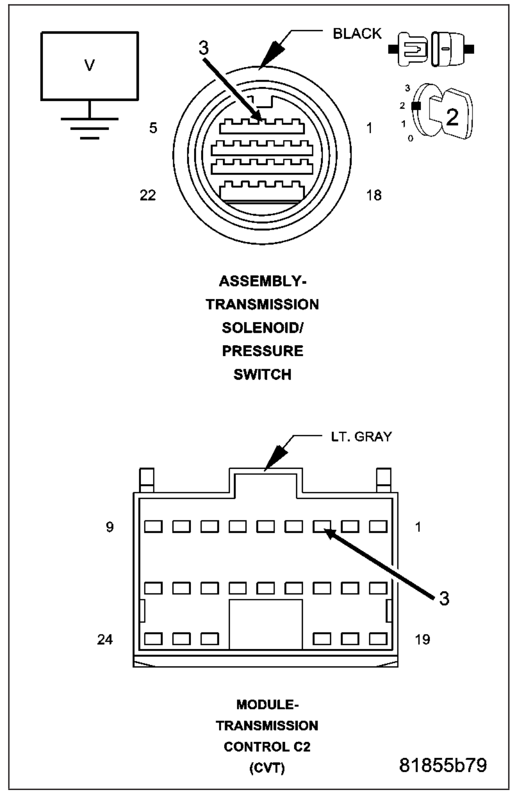
Ignition on, engine not running.

With the scan tool, actuate the TCC Solenoid.



Using a 12-volt test light connected to ground, check the (T59) TCC Solenoid Control circuit.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Go To 3

No >> Go To 5

3. CHECK THE (T59) TCC SOLENOID CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

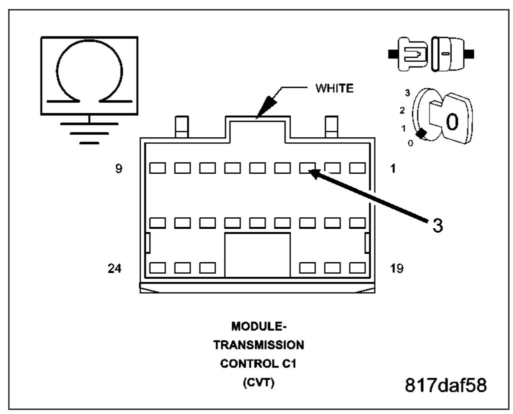
With the scan tool, stop the TCC Solenoid actuator.

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Ignition on, engine not running.

Measure the voltage of the (T59) TCC Solenoid Control circuit.



Is the voltage above 0.5 volts?

Yes >> Repair the (T59) TCC Solenoid Control circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

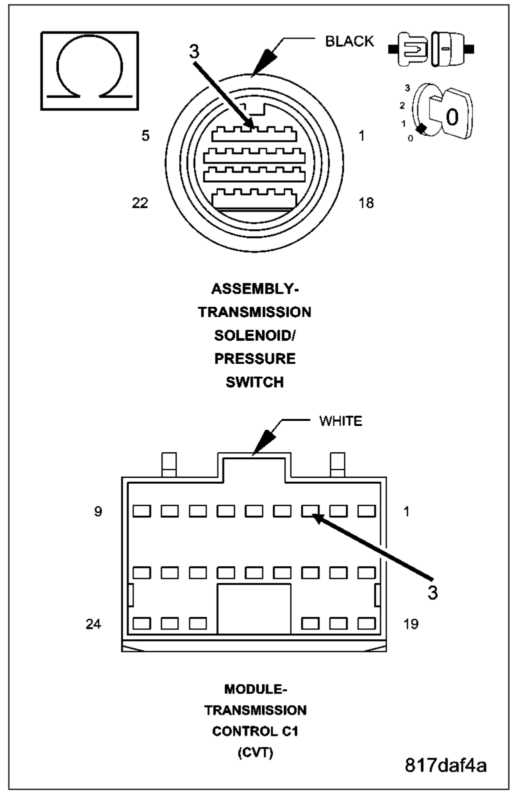
4. CHECK THE TCC SOLENOID

Turn the ignition off to the lock position.

Reconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Measure the resistance between ground and the (T59) TCC Solenoid Control circuit in the TCM C1 harness connector.

Is the resistance between 3.0 and 9.0 ohms?



Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Replace the TCC Solenoid (Valve Body) per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. CHECK THE (T59) TCC SOLENOID CONTROL CIRCUIT FOR AN OPEN

With the scan tool, stop the TCC Solenoid actuator.

Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Ignition on, engine not running.

Measure the resistance of the (T59) TCC Solenoid Control circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the (T59) TCC Solenoid Control circuit for an open.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

6. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U0001-CAN C BUS

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Controller Area Network (CAN) is a high speed serial communication line for multiplex communication between multiple controllers that reside on the network. The Transmission Control Module monitors the transmit and receive message from the CAN BUS.

- **When Monitored:**
  Ignition on in the run position with a system voltage between 9.0 and 16.0 volts.
- **Set Condition:**
  If the Transmit or receive error counter is equal to or greater than 256.

For CAN Bus diagnostic procedures refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

U0100-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Controller Area Network (CAN) is a high speed serial communication line for multiplex communication between multiple controllers that reside on the network. The Transmission Control Module monitors the transmit and receive message from the CAN BUS.

- **When Monitored:**
  Ignition on in the run position with a system voltage between 9.0 and 16.0 volts.
  IOD fuse is installed or vehicle odometer is over 80 kilometers (50 miles).
  No CAN C Bus DTCs present.
- **Set Condition:**
  A loss of CAN Bus communication between the TCM and ECM/PCM for the period of 2.0 seconds.

For CAN Bus diagnostic procedures refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

U0121-LOST COMMUNICATION WITH ANTILOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

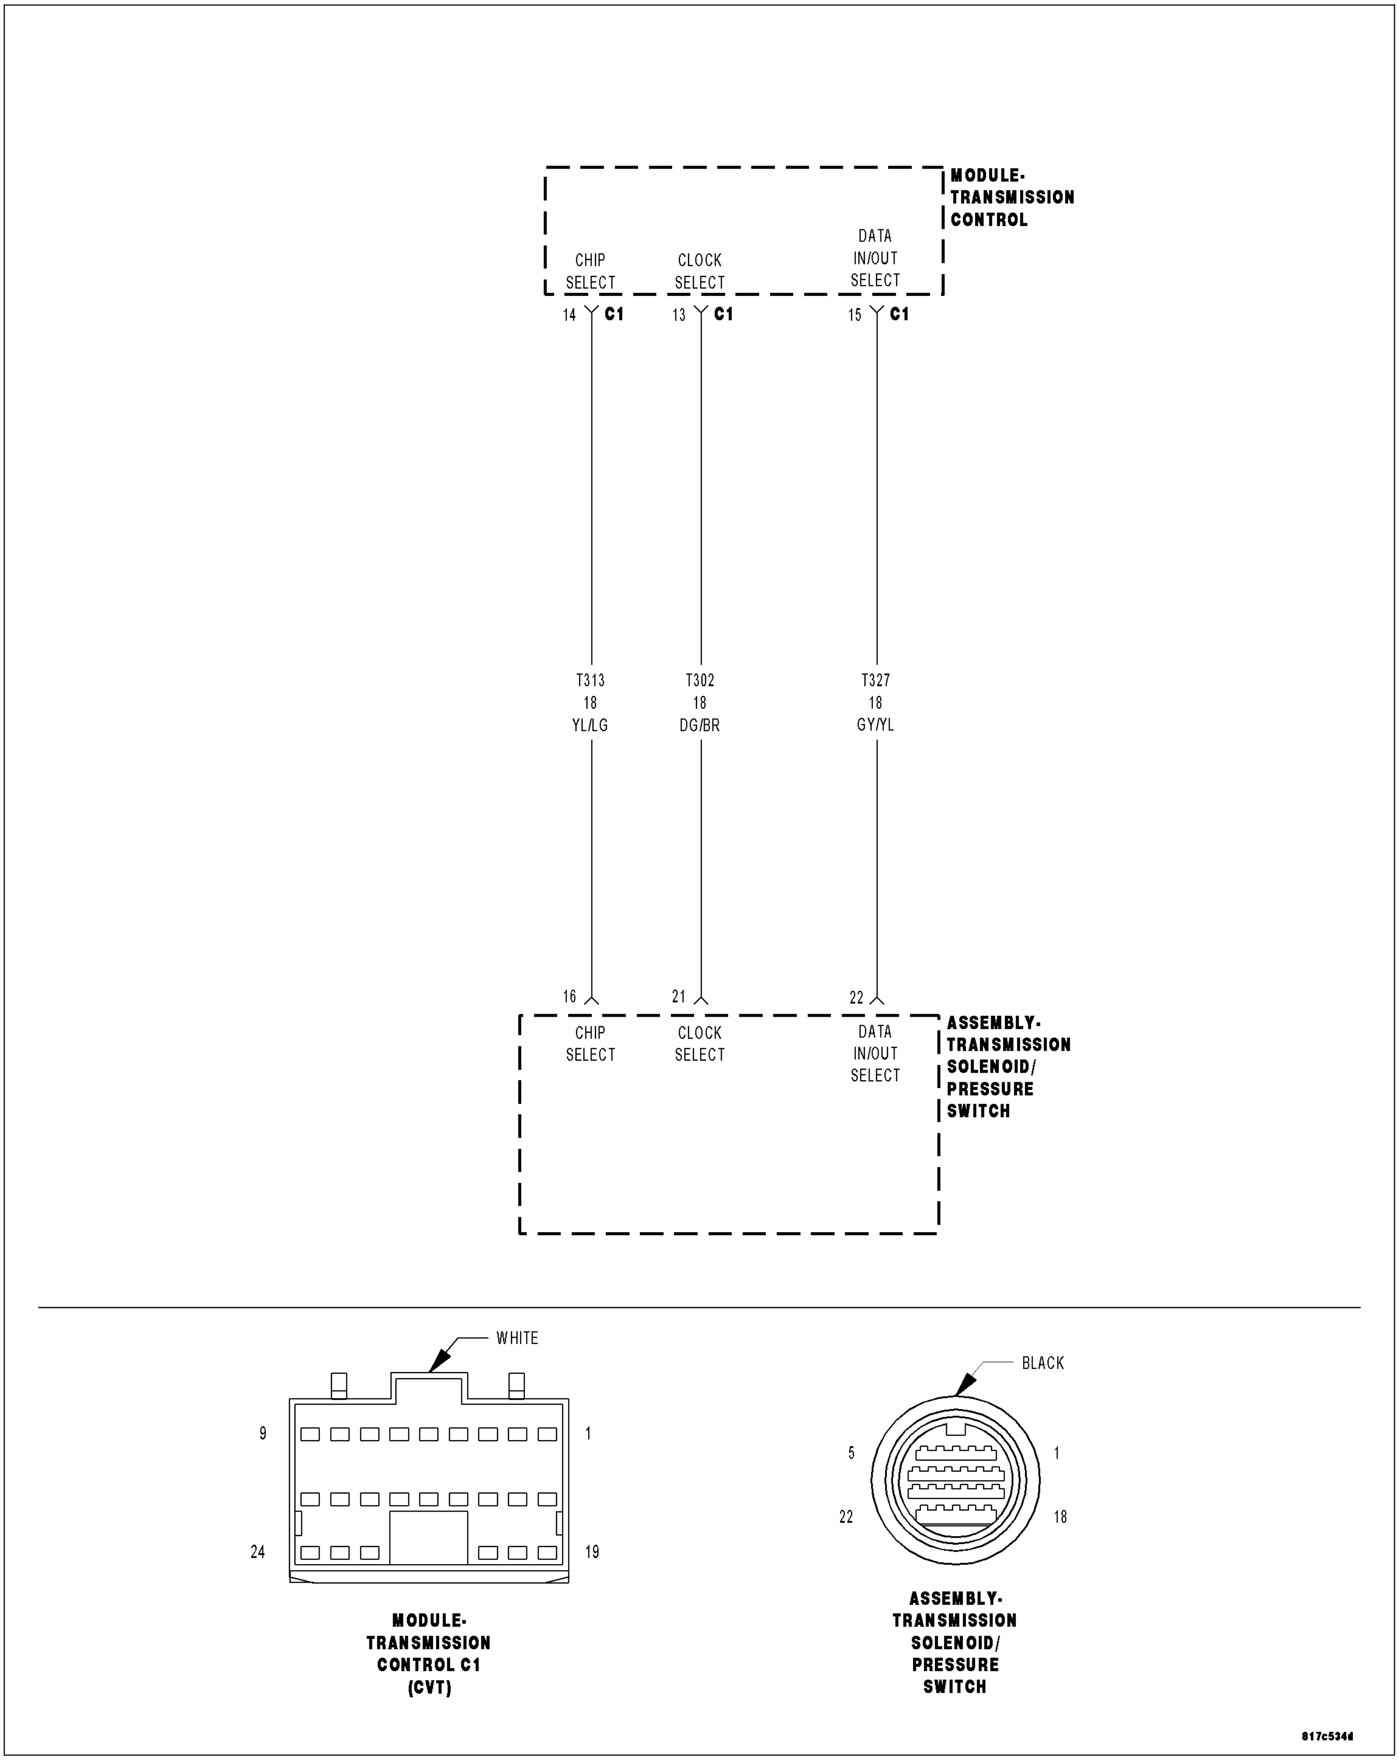
The Controller Area Network (CAN) is a high speed serial communication line for multiplex communication between multiple controllers that reside on the network. The Transmission Control Module monitors the transmit and receive message from the CAN BUS.

- **When Monitored:**
  Ignition on in the run position with a system voltage between 9.0 and 16.0 volts.
  IOD fuse is installed or vehicle odometer is over 80 kilometers (50 miles).
  No CAN C Bus DTCs present.
  Vehicle configuration is completed.
- **Set Condition:**
  A loss of CAN Bus communication between the TCM and ABS for the period of 2.0 seconds.

For CAN Bus diagnostic procedures refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram **Refer to Section 8W**.



Theory of Operation

The Controller Area Network (CAN) is a high speed serial communication line for multiplex communication between multiple controllers that reside on the network. The Transmission Control Module monitors the transmit and receive message from the CAN BUS.

- **When Monitored:**
  Ignition on in the run position with a system voltage between 9.0 and 16.0 volts.
  IOD fuse is installed or vehicle odometer is over 80 kilometers (50 miles).
  No CAN C Bus DTCs present.
- **Set Condition:**
  A loss of CAN Bus communication between the TCM and FCM/TIPM for the period of 2.0 seconds.

For CAN Bus diagnostic procedures refer to (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

U1146-LOST COMMUNICATION WITH EXTERNAL MEMORY

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The first time the vehicle is started, the Transmission Control Module (TCM) receives hydraulic calibration data from an external EEPROM (located in the transmission) and stores this information in the EEPROM of the TCM. If the TCM can not read the external EEPROM in the transmission this DTC will set. It takes two consecutive failures to turn on the MIL.

- **When Monitored:**
  Ignition on in the run position with a system voltage between 9.0 and 16.0 volts.
  Shift lever in Park or Reverse position.
- **Set Condition:**
  Communication between the TCM and the EEPROM in the transmission is not active for the period of 5 seconds.

Possible Causes
(T327) DATA IN/OUT SELECT CIRCUIT SHORT TO VOLTAGE
(T313) CHIP SELECT CIRCUIT SHORT TO VOLTAGE
(T302) CLOCK SELECT CIRCUIT SHORT TO VOLTAGE
(T327) DATA IN/OUT SELECT CIRCUIT OPEN
(T302) CLOCK SELECT CIRCUIT OPEN
(T302) CLOCK SELECT CIRCUIT SHORT TO GROUND
(T327) DATA IN/OUT SELECT CIRCUIT SHORT TO GROUND
INTERNAL TRANSMISSION
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

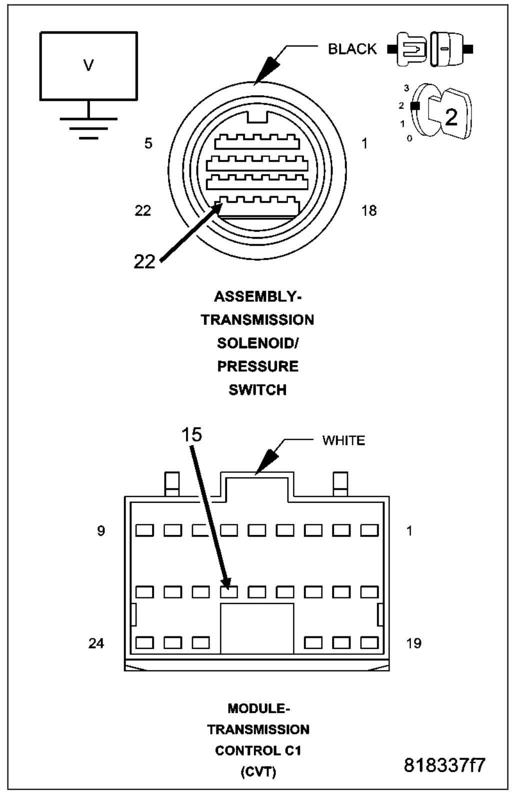
With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 10

2. CHECK THE (T327) DATA IN/OUT SELECT CIRCUIT FOR A SHORT TO VOLTAGE



Turn the ignition off to the lock position.

Disconnect the TCM C1 harness connector.

Disconnect the Transmission Solenoid/Pressure Switch Assembly harness connector.

Ignition on, engine not running.

Measure the voltage of the (T327) Data IN/OUT Select circuit.

Is the voltage above .02 volts?

Yes >> Repair the (T327) Data IN/OUT Select circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK THE (T327) DATA IN/OUT SELECT CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T327) Data IN/OUT Select circuit.

Is the voltage above 0.1 volts?

Yes >> Repair the (T327) Data IN/OUT Select circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE (T302) CLOCK SELECT CIRCUIT FOR A SHORT TO VOLTAGE

Measure the voltage of the (T302) Clock Select circuit.

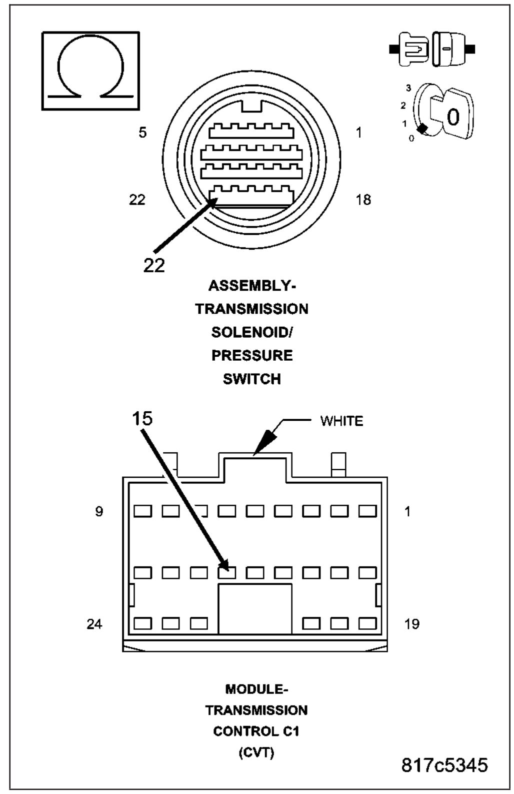
Is the voltage above 0.2 volts?

Yes >> Repair the (T302) Clock Select circuit for a short to voltage.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 5

5. CHECK THE (T327) DATA IN/OUT SELECT CIRCUIT FOR AN OPEN



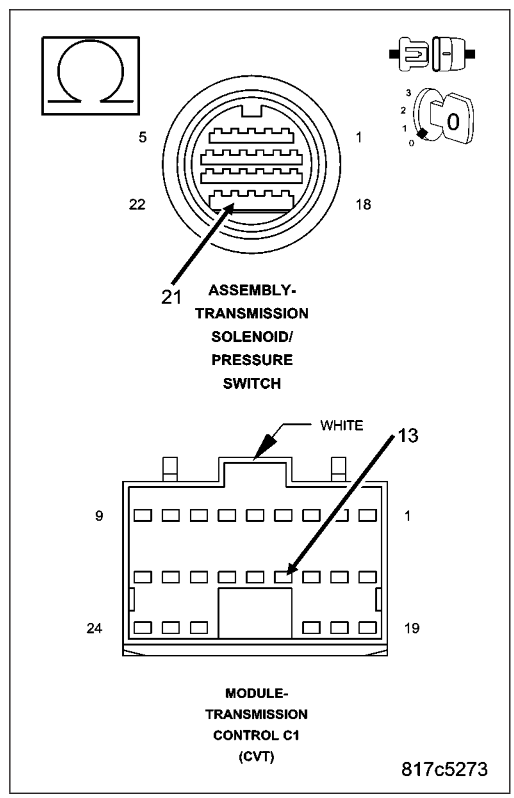
Turn the ignition off to the lock position.

Measure the resistance of the (T327) Data In/OutSelect circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?

Yes >> Repair the (T327) Data IN/OUT Select circuit for an open.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

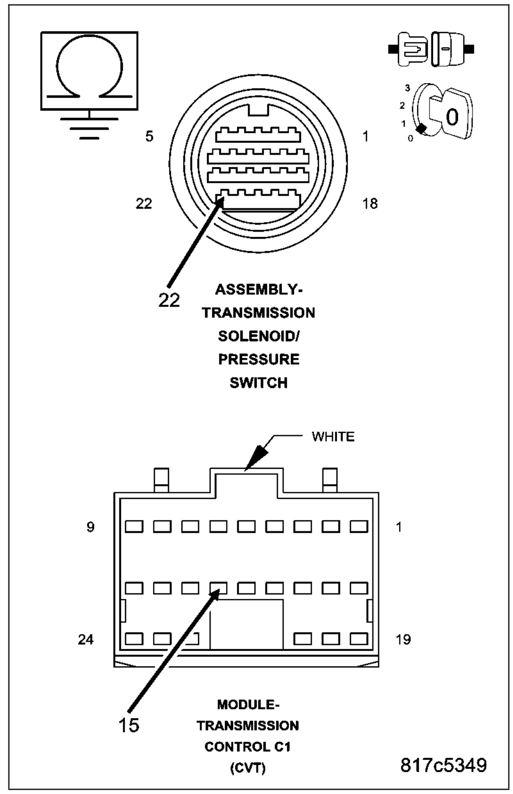
No >> Go To 6



6. CHECK THE (T302) CLOCK SELECT CIRCUIT FOR AN OPEN

Measure the resistance of the (T302) Clock Select circuit between the TCM C1 harness connector and the Transmission Solenoid/Pressure Switch Assembly harness connector.

Is the resistance above 5.0 ohms?



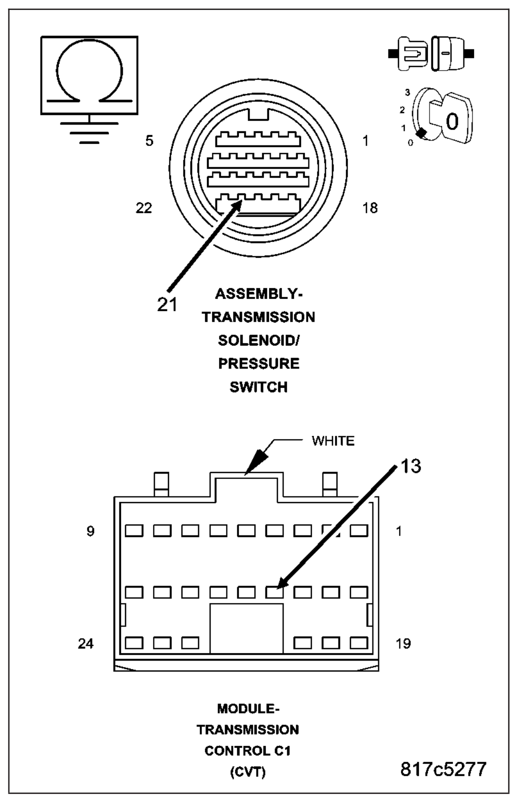
Yes >> Repair the (T302) Clock Select circuit for an open.
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 7

7. CHECK THE (T327) DATA IN/OUT SELECT CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T327) Data IN/OUT Select circuit.

Is the resistance below 5.0 ohms?



Yes >> Repair the (T327) Data IN/OUT Select circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 8

8. CHECK THE (T302) CLOCK SELECT CIRCUIT FOR A SHORT TO GROUND

Measure the resistance between ground and the (T302) Clock Select circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (T302) Clock Select circuit for a short to ground.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 9

9. CHECK THE TCM

Replace or repair the CV Transmission (valve body) per the Service Information. Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE).

Did the DTC reset during the verification test?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

10. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1400-IMPLAUSIBLE TPS SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) receives two throttle position related signals over the CAN Bus. One is the throttle pedal position and the other is a throttle pedal position toggle bit. When the Toggle signal pattern is out of range from a predefined signal pattern a DTC will set.

- **When Monitored:**
  Ignition on with no Lost Communication with ECM/PCM DTCs present.
- **Set Condition:**
  When the throttle pedal position toggle signal pattern is out of range from a predefined signal pattern for the period of 1 second.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ECM/PCM DTCS PRESENT
ECM/PCM
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ECM/PCM DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1401-IMPLAUSIBLE ENGINE SPEED SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module (TCM) receives Engine rpm over the CAN Bus.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts.
  Time since last TRS change greater than 2.0 seconds.
  Condition one:
  TCC ON/OFF in the ON position.
  No Active DTCs from the following:
- Lost Communication with ECM/PCM
- Step Motor
- No CAN Bus DTCs present.
- Transmission Range Sensor
- TCC ON/OFF Solenoid
- Input or Output Speed Sensor
  Condition two:
  No Active DTCs from the following:
- Lost Communication with ECM/PCM
- No CAN Bus DTCs present.
- Step Motor
-
  Condition one:
  All the below conditions must be present for the period of 5 seconds for the DTC to set:
- Engine speed minus Input speed is greater than 1000 rpm for the period of 5 seconds.
- Engine speed minus Secondary speed estimated ratio is greater than 1000 rpm for the period of 5 seconds.
- Secondary speed multiplied by the estimated ratio minus the primary speed is less than 1000 rpm.
  Condition two:
- Engine speed is less than 450 rpm and the Input speed is greater than or equal to 1000 rpm for the period of 20 msec.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 4

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

4. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1407-IMPLAUSIBLE ENGINE TORQUE REQUEST SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on with a system voltage between 9.0 and 16.0 volts with no CAN DTCs detected.
- **Set Condition:**
  When the TCM receives an implausible engine torque request from the PCM over the CAN Bus.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U140F-IMPLAUSIBLE ENGINE VARIANT DATA

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

During the initial ignition on, the Transmission Control Module (TCM) receives the calibrated data from the Engine/Powertrain Control Module (ECM/PCM) over the CAN Bus and stores this information in the EEPROM of the TCM. During normal operation the TCM compares the stored data in the EEPROM to the transmitted data from the ECM/PCM. If the calibration data does not match the DTC will set and the MIL will illuminate after two consecutive failures.

- **When Monitored:**
  Ignition on, engine running with a system voltage between 9.0 and 16.0 volts.
  ECM/PCM variant data received more than twice in a row over the CAN Bus.
- **Set Condition:**
  ECM/PCM has wrong variant data installed.
  ECM/PCM sending wrong or improper CAN message for more than 5.0 seconds.

Possible Causes
FCM/TIPM DTCS PRESENT
WRONG ENGINE CONTROLLER SOFTWARE
WRONG TRANSMISSION CONTROLLER SOFTWARE
ENGINE CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC or is the STARTS SINCE SET counter 2 or less?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF THE ECM/PCM WAS REPLACED

Was the ECM/PCM replaced?

Yes >> Check to make sure the right part number was used that correlates with the engine and transmission using the vehicle identification number. It may be necessary to flash the ECM/PCM to the proper configuration or replace the controller. With the scan tool perform a TCM relearn procedure.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK IF THE TCM WAS REPLACED

Was the TCM replaced?

Yes >> Check to make sure the right part number was used that correlates with engine and transmission using the vehicle identification number. It may be necessary to flash the PCM/TCM to the proper configuration or replace the TCM with the correct configuration. With the scan tool perform a TCM relearn procedure.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM per the Service Information.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1410-IMPLAUSIBLE FCM VARIANT DATA

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module receives vehicle information over the CAN Bus from the FCM/TIPM and stores this information in the EEPROM of the controller. This information is compared information received over the CAN Bus. If the information does not match, the DTC will set.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16.0 volts.
  FCM/TIPM variant data received more than twice in a row over the CAN Bus.
- **Set Condition:**
  One or more FCM/TIPM variant data received over the CAN Bus is not in a valid range for the period of 5.0 seconds.

Possible Causes
FCM/TIPM WAS REPLACED
TCM WAS REPLACED
FCM/TIPM
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK MODULE PART NUMBERS TO VEHICLE IDENTIFICATION NUMBER

View repair

Repair

This DTC is an indication of either the FCM/TIPM was replaced with the wrong configuration (improper tire size), or the TCM was replaced with the wrong configuration. If either controller was replaced, confirm the part numbers to the Vehicle Identification Number (VIN) and program or replace as necessary. With the scan tool perform a TCM relearn procedure.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

U1424-IMPLAUSIBLE ENGINE TORQUE SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Transmission Control Module request from the ECM/PCM to change the torque of the engine to avoid possible damage to the transmission.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16 volts.
  No PCM/ECM CAN Bus DTCs present.
- **Set Condition:**
  When the TCM receives an implausible engine torque signal from the PCM over the CAN Bus for a period of 1.0 second.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).
Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1425-IMPLAUSIBLE PEDAL POSITION SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on with system voltage between 9.0 and 16.0 volts.
  No PCM/ECM CAN Bus DTCs present.
- **Set Condition:**
  When the TCM receives an implausible throttle pedal position over the CAN Bus from the PCM/ECM.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1426-IMPLAUSIBLE TCC SLIP REQUEST SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on with no PCM/ECM CAN Bus DTCs present.
- **Set Condition:**
  When the TCM receives an implausible Torque Converter Clutch slip request (EMCC) from the PCM/ECM.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1428-RECEIVED ENGINE TORQUE REQUEST SIGNAL STUCK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on with no CAN DTCs detected.
- **Set Condition:**
  When the TCM receives an engine torque request from the PCM over the CAN Bus that does not change for the period of 1.0 second.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

U1429-RECEIVED ENGINE TORQUE SIGNAL STUCK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on with no CAN DTCs detected.
- **Set Condition:**
  When the TCM receives an engine torque request from the PCM over the CAN Bus that does not change for the period of 1.0 second.

Possible Causes
FCM/TIPM CAN BUS DTCS PRESENT
ENGINE MODULE DTCS PRESENT
POWERTRAIN CONTROL MODULE
TRANSMISSION CONTROL MODULE

Always perform the CVT Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Diagnostic Test

1. CHECK IF THE DTC IS ACTIVE

With the scan tool, read Transmission DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Go To 5

2. CHECK FOR FCM/TIPM CAN BUS DTCS

With the scan tool, read FCM/TIPM DTCs.

Are there any FCM/TIPM CAN BUS DTCs present?

Yes >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 3

3. CHECK IF ENGINE DTCS ARE PRESENT

With the scan tool, read engine DTCs.

Are there any engine DTCs present?

Yes >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) category and perform the appropriate symptom(s).

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Go To 4

4. CHECK THE PCM

Replace and program the PCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

Does the DTC reset?

Yes >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - REMOVAL)

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

5. INTERMITTENT WIRING AND CONNECTORS

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

Were there any problems found?

Yes >> Repair as necessary.

Perform CVT VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Test Complete.

STANDARD PROCEDURE

CVT - PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

Perform the following pre-diagnostic troubleshooting procedures prior to performing any diagnostic test.

Always perform diagnostics with a fully charged battery to avoid false symptoms. The Transmission Control Module (TCM) requires a system voltage between 9 and 16 volts.

1. Many transmission symptoms can be caused by a low fluid level. If the fluid level is low, locate and repair any leaks and fill the transmission to the proper fluid level. Refer to the Service Information for the proper repair and fluid fill procedures.

CAUTION: The CVT Transmission uses a specific green transmission fluid that is substantially different from standard ATF used in other automatic transmissions. Failure to use the proper fluid will result in excessive transmission damage or total failure. Refer to the Service Information for the proper fluid type.

2. With the scan tool, read Engine DTCs. If Engine DTCs are present, refer to the Engine (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) and perform to the appropriate diagnostic procedure(s) before proceeding.
3. With the scan tool, read Transmission (TCM) DTCs. Record all Stored, Active, and Pending DTC information. Diagnose any Pending DTC as a matured DTC.
4. Use the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and repair as necessary.
5. Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, driving under specific conditions, and after controller diagnostic monitors have run or otherwise know as a Good Trip.
6. Check for any Service Information Tune-ups or Service Bulletins for any possible causes that may apply. Check for controller software update information. Some conditions can be corrected by upgrading the Engine (PCM) or Transmission (TCM) controller software.

1.

Did any of the above procedures repair the vehicle?

Yes >> Testing is complete.

Perform CVT TRANSMISSION VERIFICATION TEST. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - STANDARD PROCEDURE)

No >> Refer to the identified category and perform the appropriate symptom(s). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - DIAGNOSIS AND TESTING)

CVT VERIFICATION TEST

Perform the following after completion of a diagnostic repair:

1. Reconnect any disconnected components.
2. With the scan tool, erase all Transmission and Engine DTCs.
3. If the Transmission Control Module or the Transmission has been repaired or replaced, it is necessary to perform the scan tool Quick Learn Procedure.
4. With the scan tool, display Transmission Temperature. Start and run the engine until the transmission temperature is HOT, above 43° C or 110° F.
5. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.

CAUTION: The CVT uses a specific transmission fluid type that is green in color. Do not use a standard ATF fluid. Doing so can damage the transmission. Make sure to follow the Service Information fluid type and fill procedure.

6. Road test the vehicle. With the scan tool, monitor the engine rpm and throttle angle. Drive the vehicle from a standing start to 45 mph with a constant throttle opening of 20 to 25 degrees with an engine speed above 450 rpm.
7. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set condition to verify the DTC is repaired.
8. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.

NOTE: Use the OBDII task manager to run a Good Trip. This will confirm the repair(s) made and to ensure the DTC has not re-matured.

9. Check for any Diagnostic Trouble Codes (DTCs) during and after the road test.

1.

Did any Diagnostic Trouble Codes set during the road test?

Yes >> Repair is not complete. Refer to the Transmission category and perform the appropriate symptom(s). (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - DIAGNOSIS AND TESTING)

No >> Repair is complete.

AUTOMATIC - CVT-SERVICE INFORMATION

TABLE OF CONTENTS

AUTOMATIC - CVT-SERVICE INFORMATION

DESCRIPTION

The continuously variable transmission (CVT) has a torque converter which allows optimal limitless driving force in response to the accelerator pedal operation, therefore giving us smooth driving without shift shock. The CVT also has a manual mode function for both smooth driving without shift shock, and enjoyable driving with manual gear selection.

The CVT allows for maximum driving force and performance when compared to a conventional A/T. When the throttle is fully opened, driving force for the conventional automatic transmission changes unevenly because the gear is shifted in steps. On the other hand, driving force for the CVT changes smoothly because it is possible for it to accelerate while keeping it in the peak power range of the engine. Therefore, CVT avoids the loss of driving force, and enables smooth and shock free driving.

Coordinated control of the engine and the multifaceted shift diagram have made it possible to realize both, smooth and powerful driving with a good gear change response and an improvement in fuel consumption.

OPERATION

PARK POWERFLOW

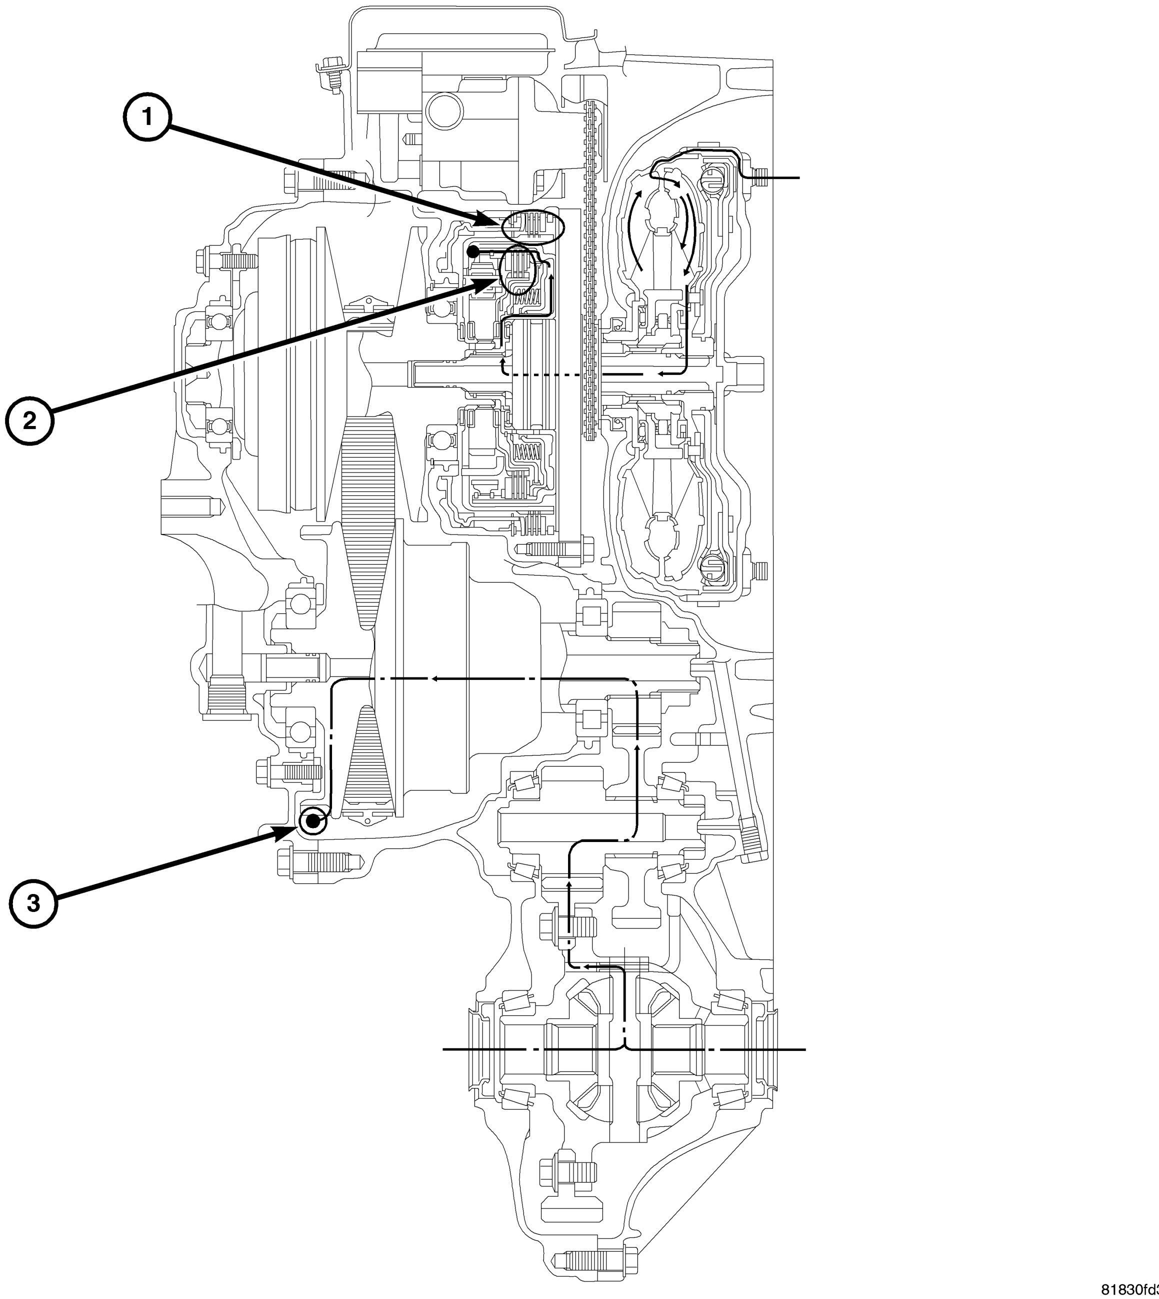


Fig. 1 PARK

1 - REVERSE BRAKE (RELEASED)
2 - FORWARD CLUTCH (RELEASED)
3- PARKING GEAR (FIXED)

When the forward clutch and the reverse brake are released, the driving force from the engine runs idly and power is not transmitted to the primary pulley.

When the parking gear is fixed, the torque load from the tires is not transmitted up to the primary pulley.

REVERSE POWERFLOW

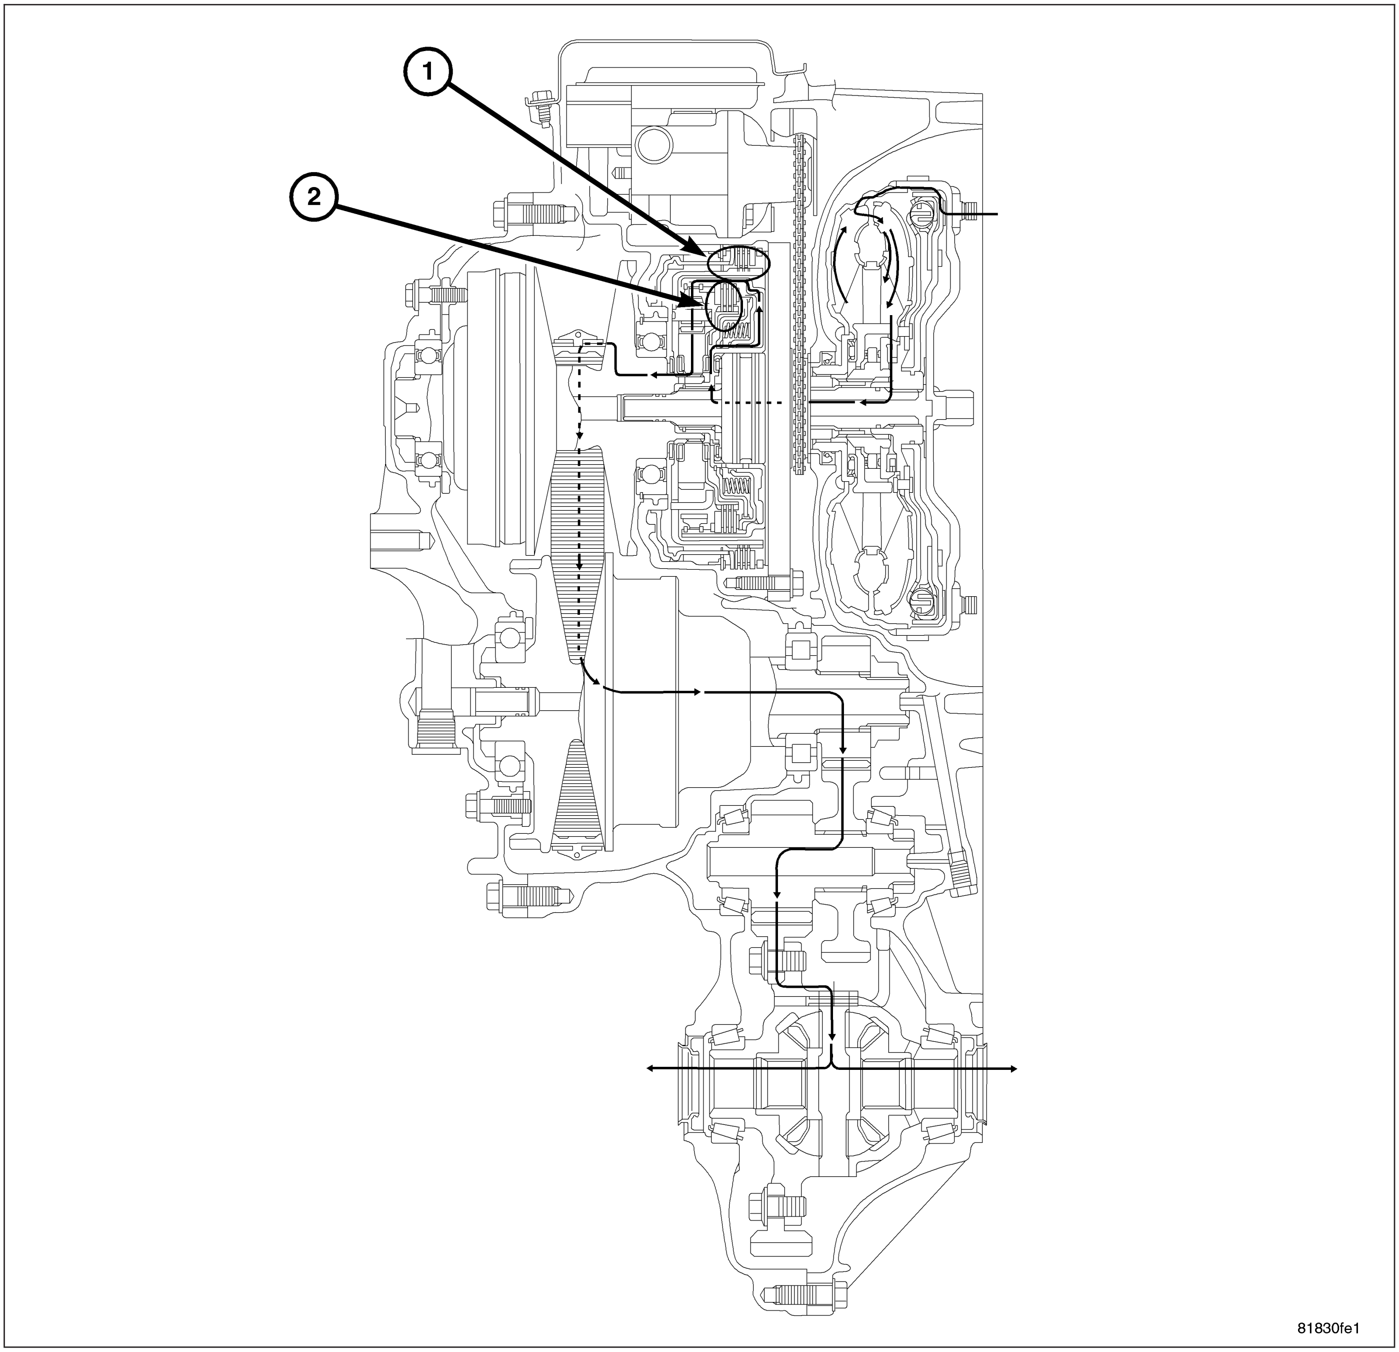

Fig. 2 REVERSE

1 - REVERSE BRAKE (ENGAGED)
2 - FORWARD CLUTCH (RELEASED)

When the reverse brake is engaged, the planetary carrier is fixed and the driving force from the engine rotates the sun gear reversely.

Therefore, the primary pulley is rotated reversely and the driving force is outputted in the reverse rotating direction.

NEUTRAL POWERFLOW

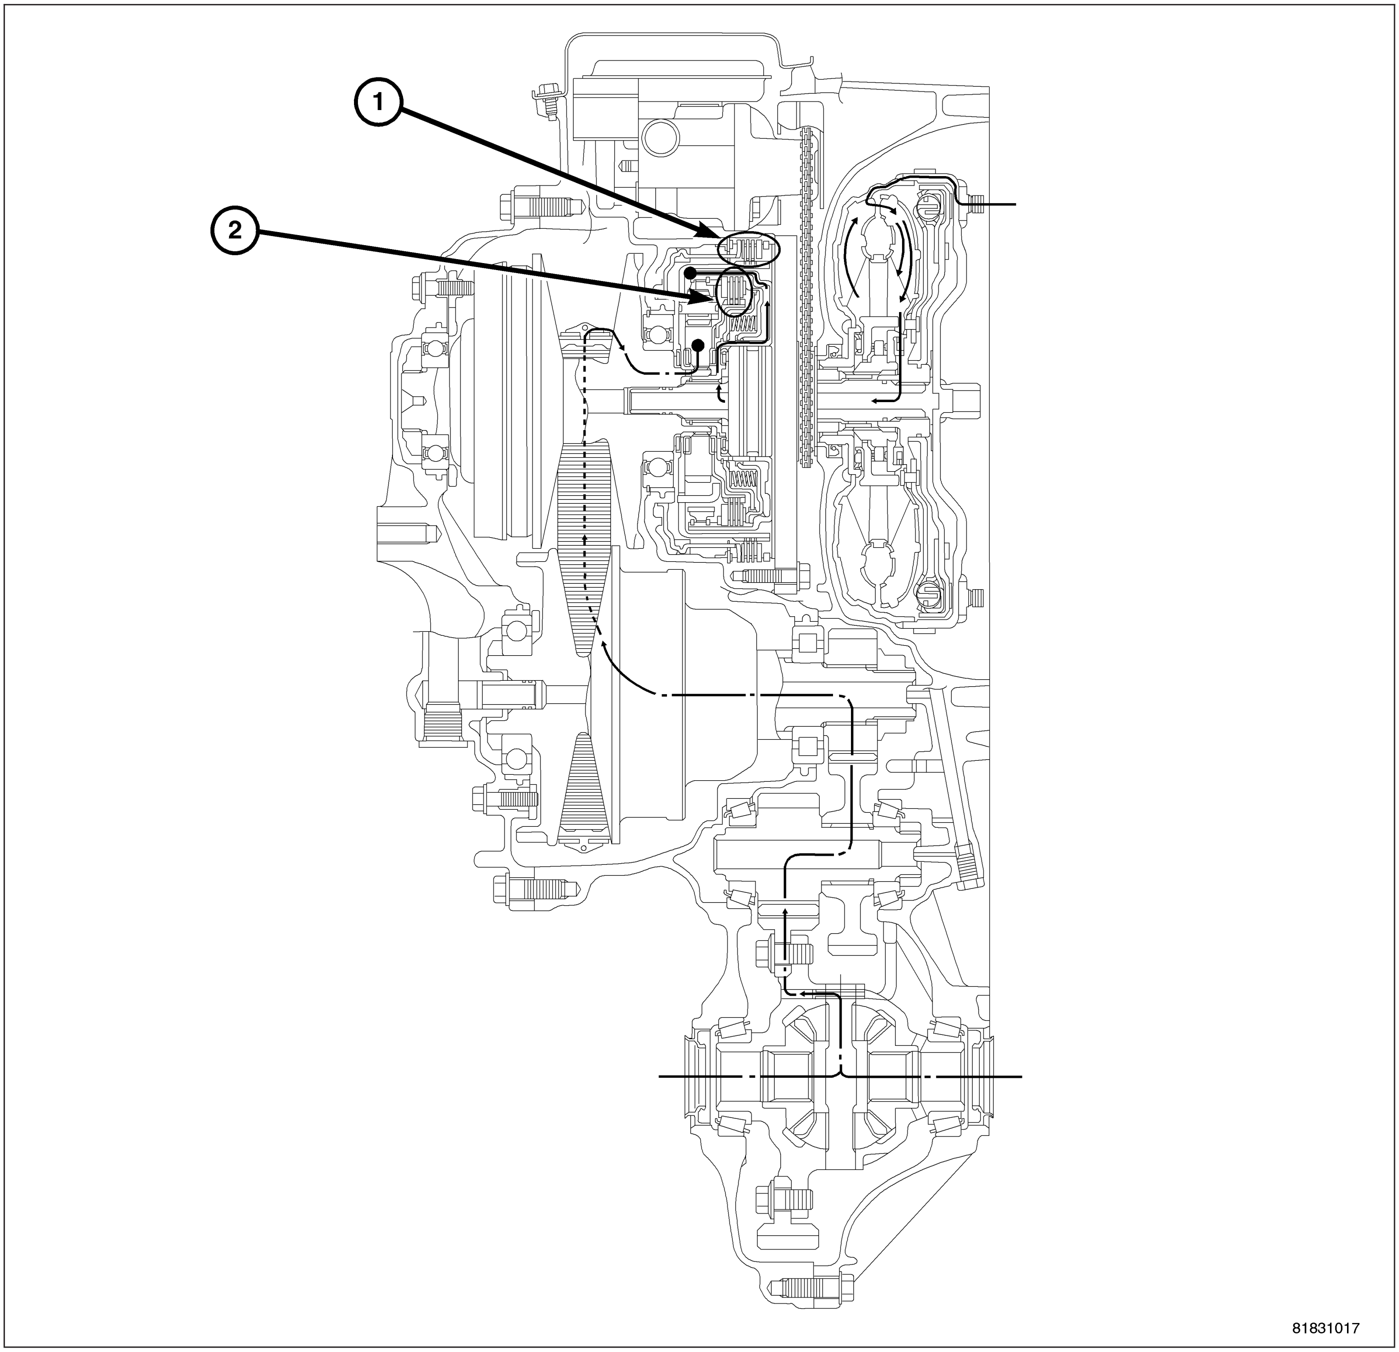

Fig. 3 NEUTRAL

1 - REVERSE BRAKE (RELEASED)
2 - FORWARD CLUTCH (RELEASED)

When the forward clutch and the reverse brake are released, the driving force from the engine runs idly and is not transmitted to the primary pulley.

When the forward clutch and the reverse brake are released, the planetary carrier runs idly and the torque from the tires are not transmitted.

DRIVE POWERFLOW

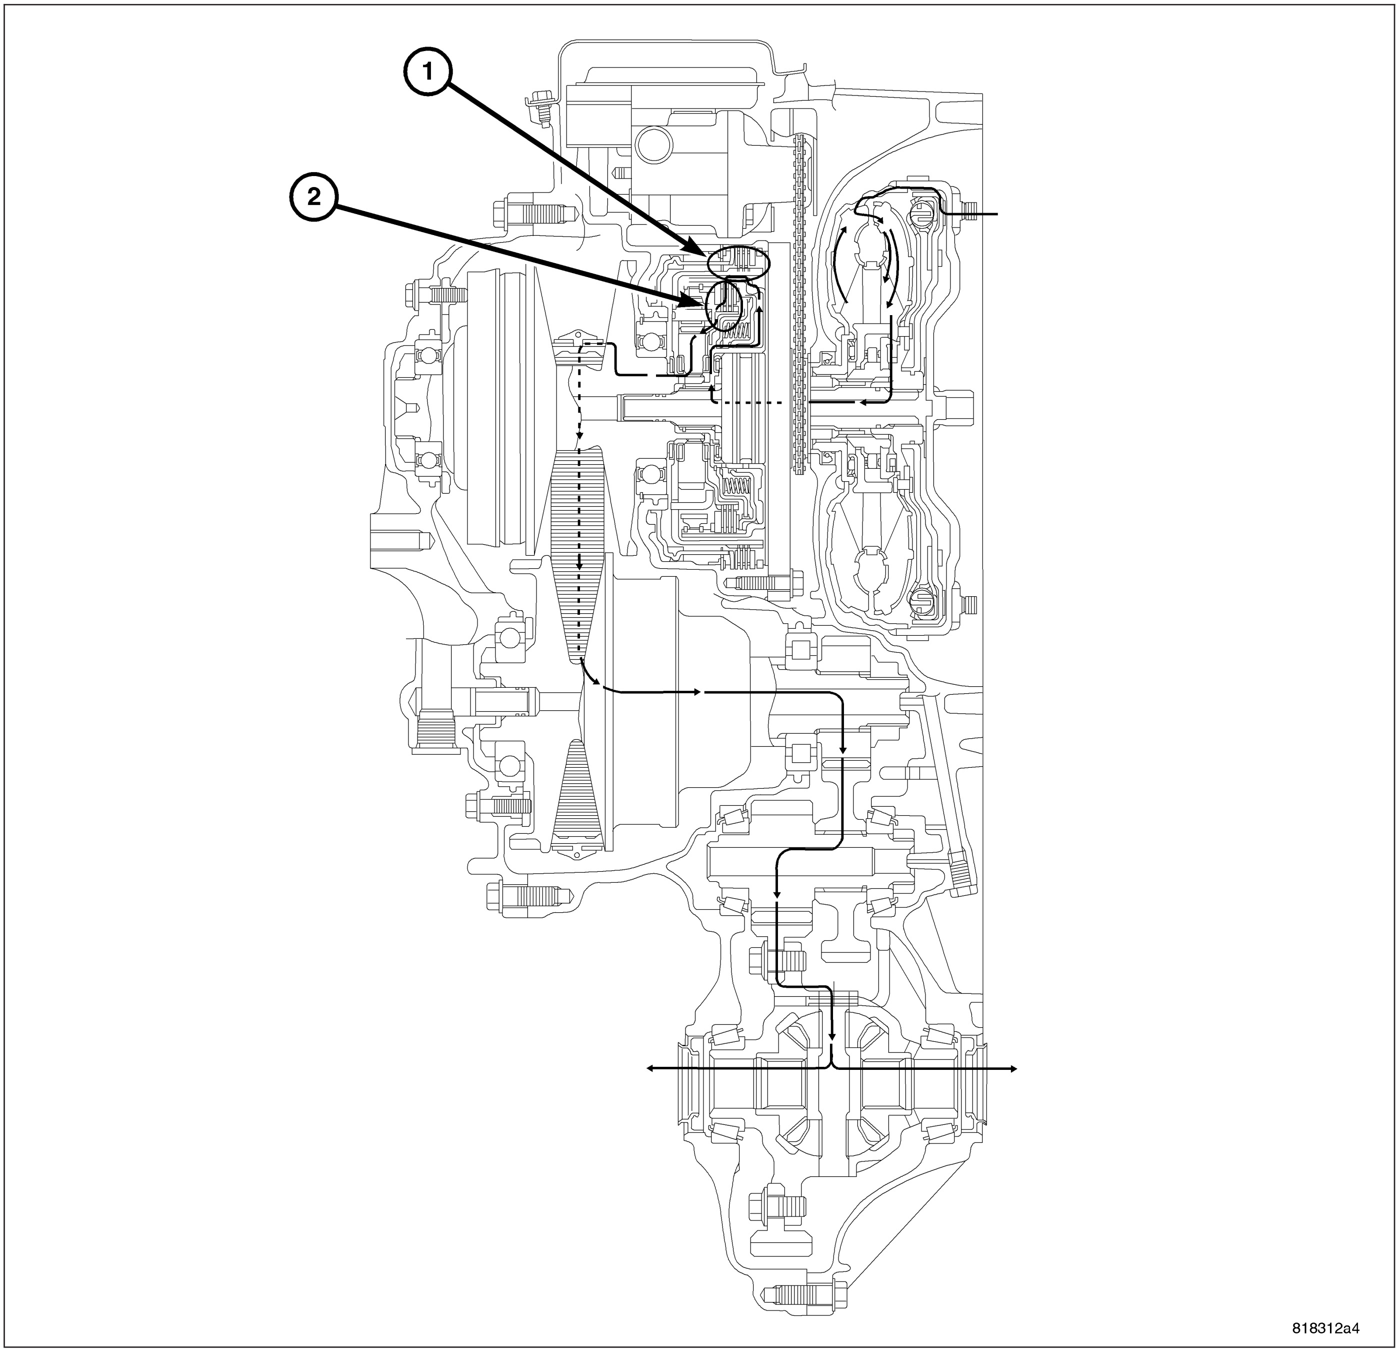

Fig. 4 DRIVE

1 - REVERSE BRAKE (RELEASED)
2 - FORWARD CLUTCH (ENGAGED)

When the forward clutch is engaged, the driving force from the engine rotates the sun gear normally through the forward clutch.

Therefore, the primary pulley is rotated normally and the driving force is outputted in the normally rotated direction.

SHIFT LOW TO HIGH - PHASE 1

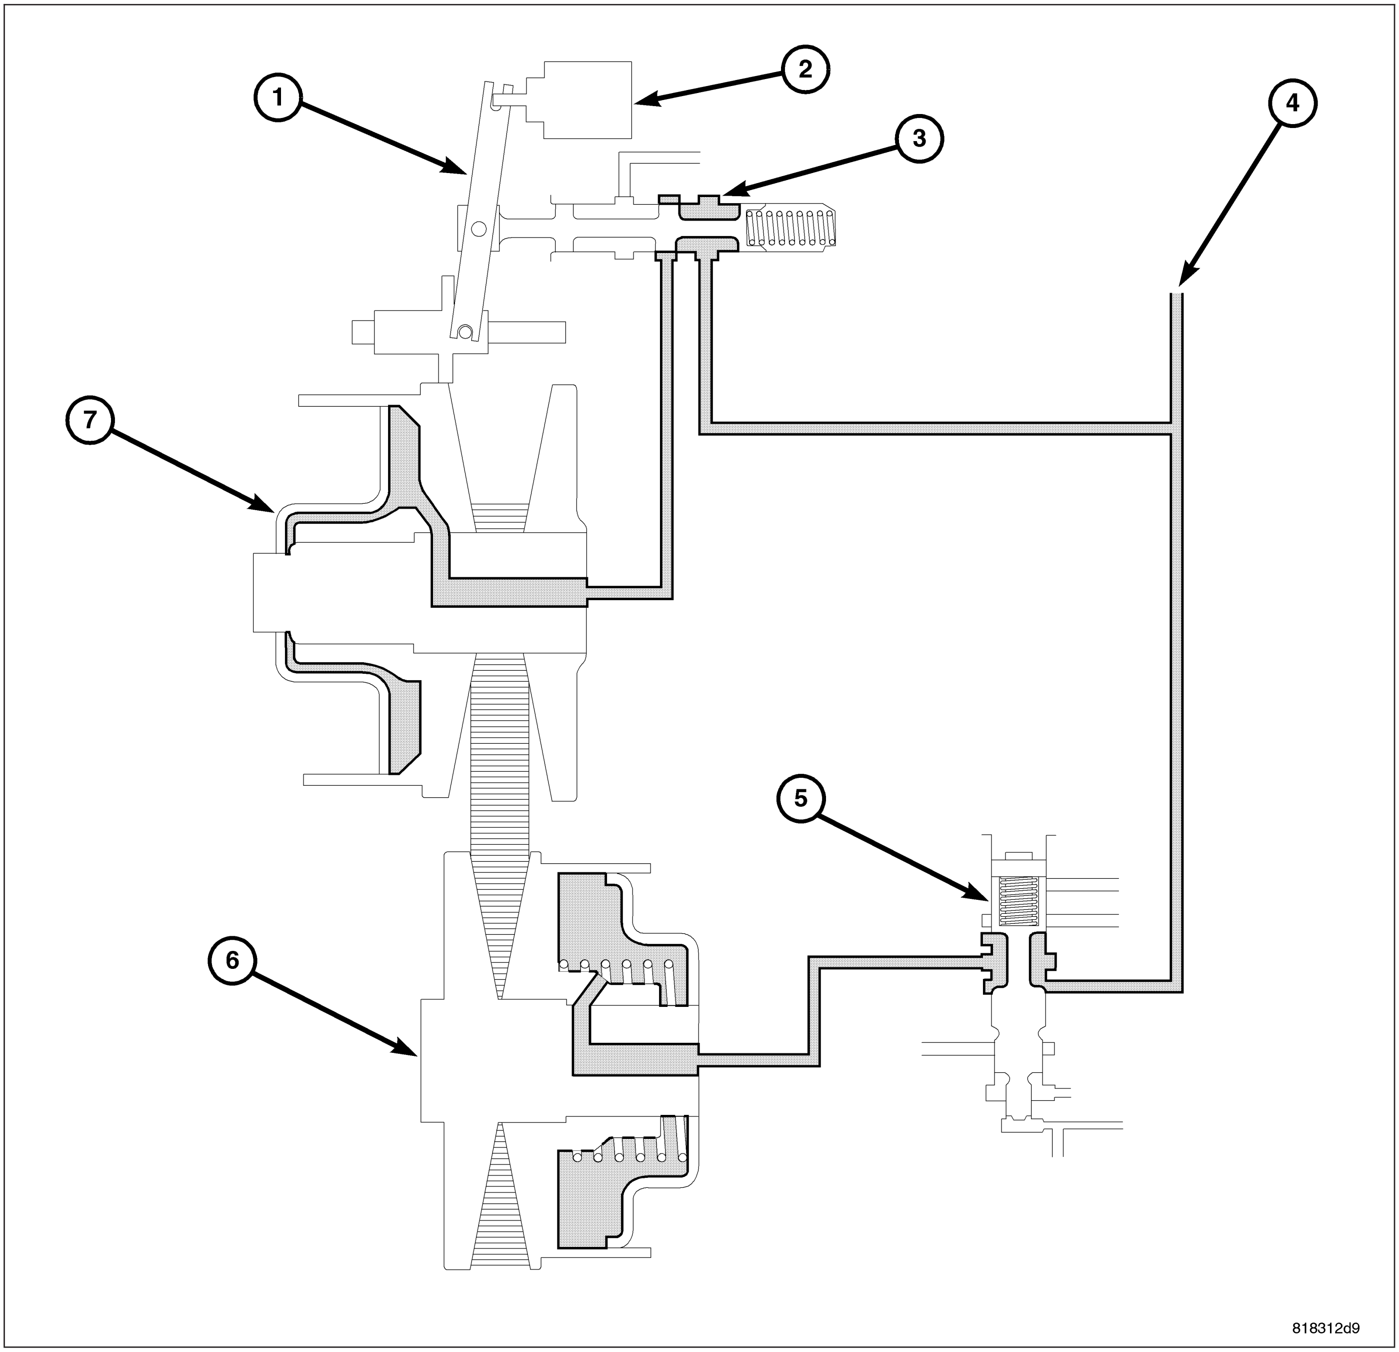

Fig. 5 SHIFT LOW TO HIGH

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

When the line pressure circuit is closed by the ratio control valve, the line pressure is not applied to the primary pulley.

When the secondary valve moves downwards, line pressure is applied to the secondary pulley.

SHIFT LOW TO HIGH - PHASE 2

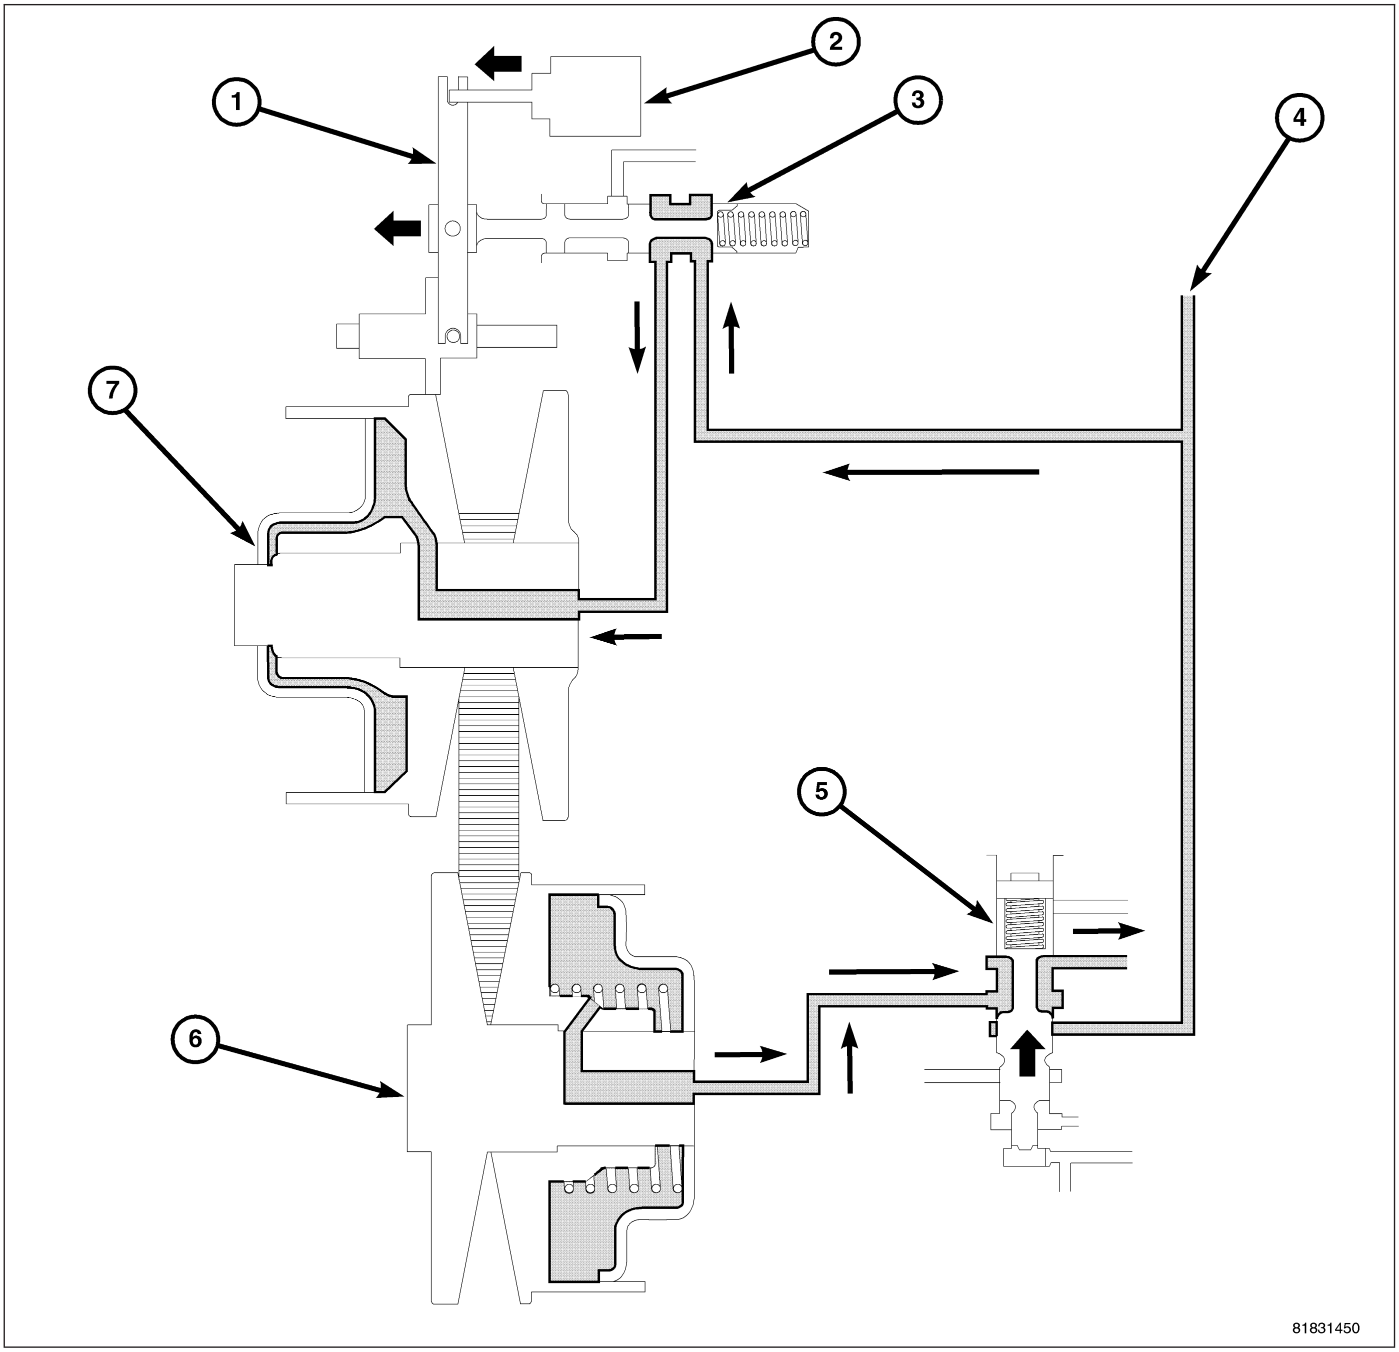

Fig. 6 SHIFT LOW TO HIGH 2

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

The pulley ratio linkage moves to the left direction of the stepper motor. The line pressure circuit opens due to the movement of the ratio control valve which links to the pulley linkage, and line pressure is applied to the primary pulley.

The secondary valve moves to open and fluid in the secondary pulley is drained.

SHIFT LOW TO HIGH - PHASE 3

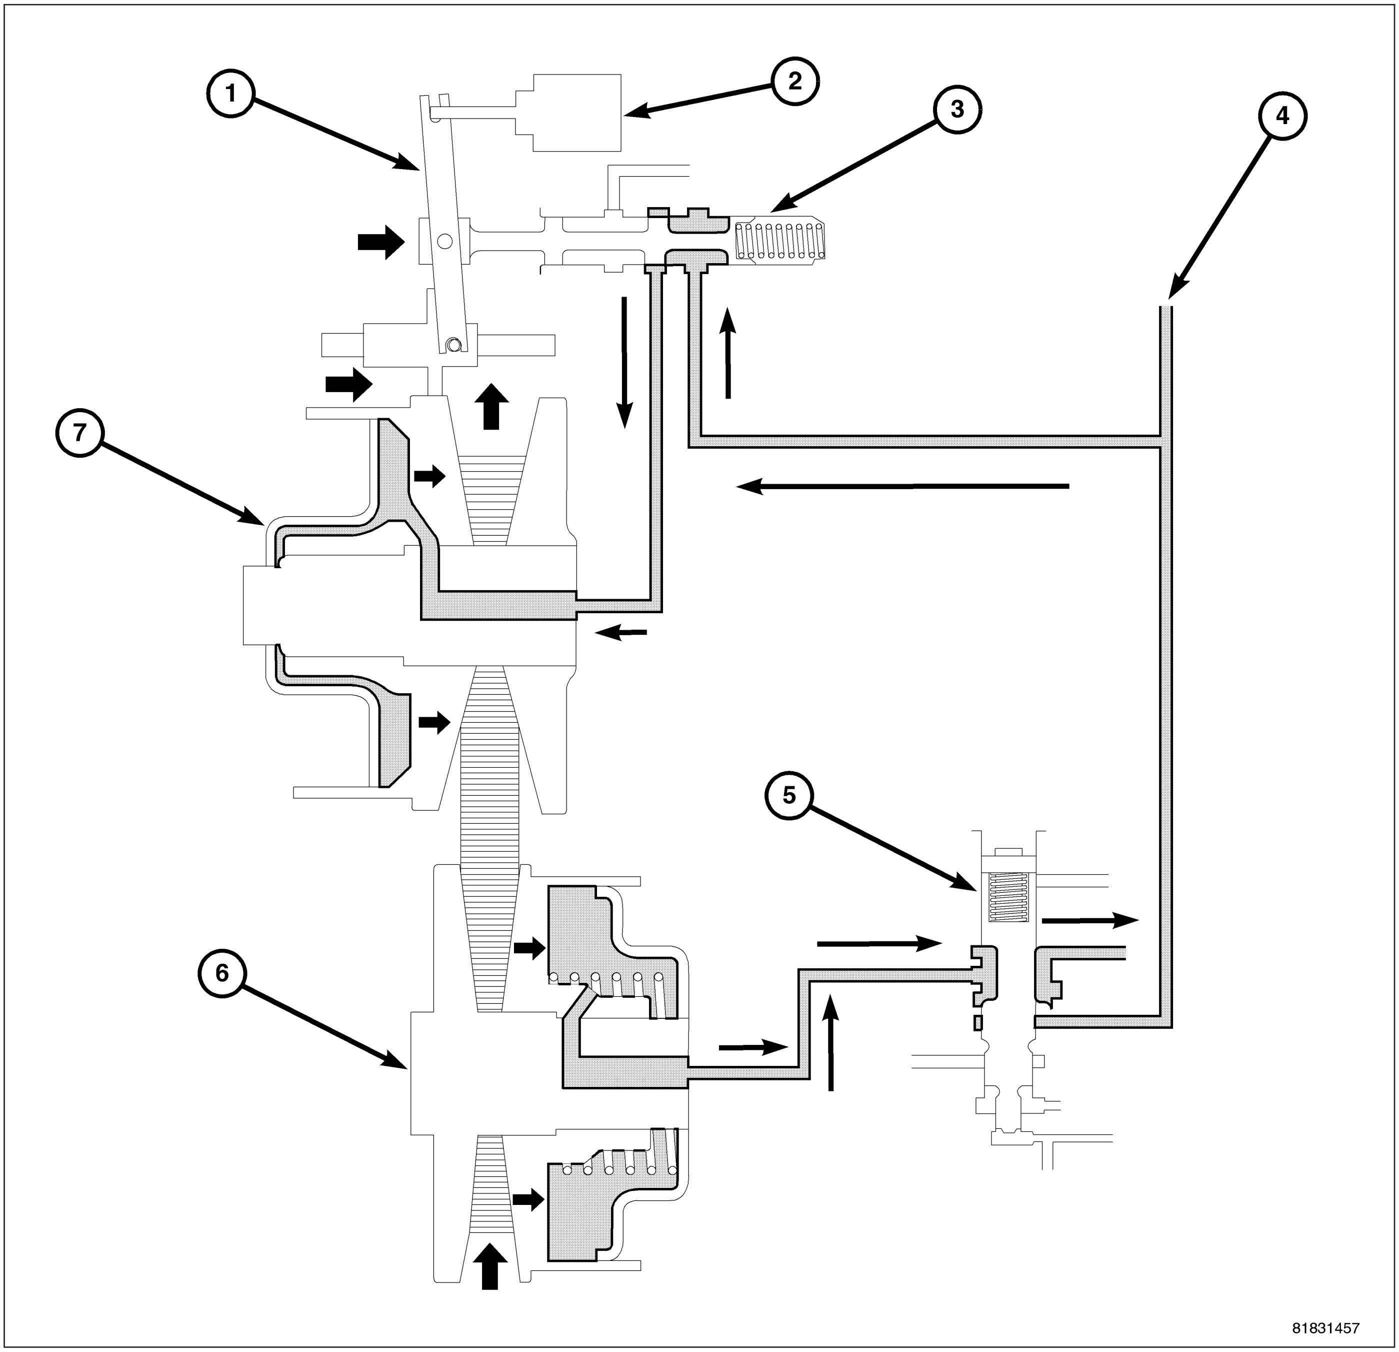

Fig. 7 SHIFT LOW TO HIGH 3

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

By applying line pressure to the primary pulley, the sliding element moves to the right direction and the steel belt is pushed outside.

By actuating the “moving-pulley” of the primary pulley to the right direction, the ratio control valve starts to move to the right direction through the pulley ratio linkage which is driven by the sliding element.

By pulling the steel belt to the primary pulley side, the moving-pulley of the secondary pulley moves to the right side also.

SHIFT LOW TO HIGH - PHASE 4

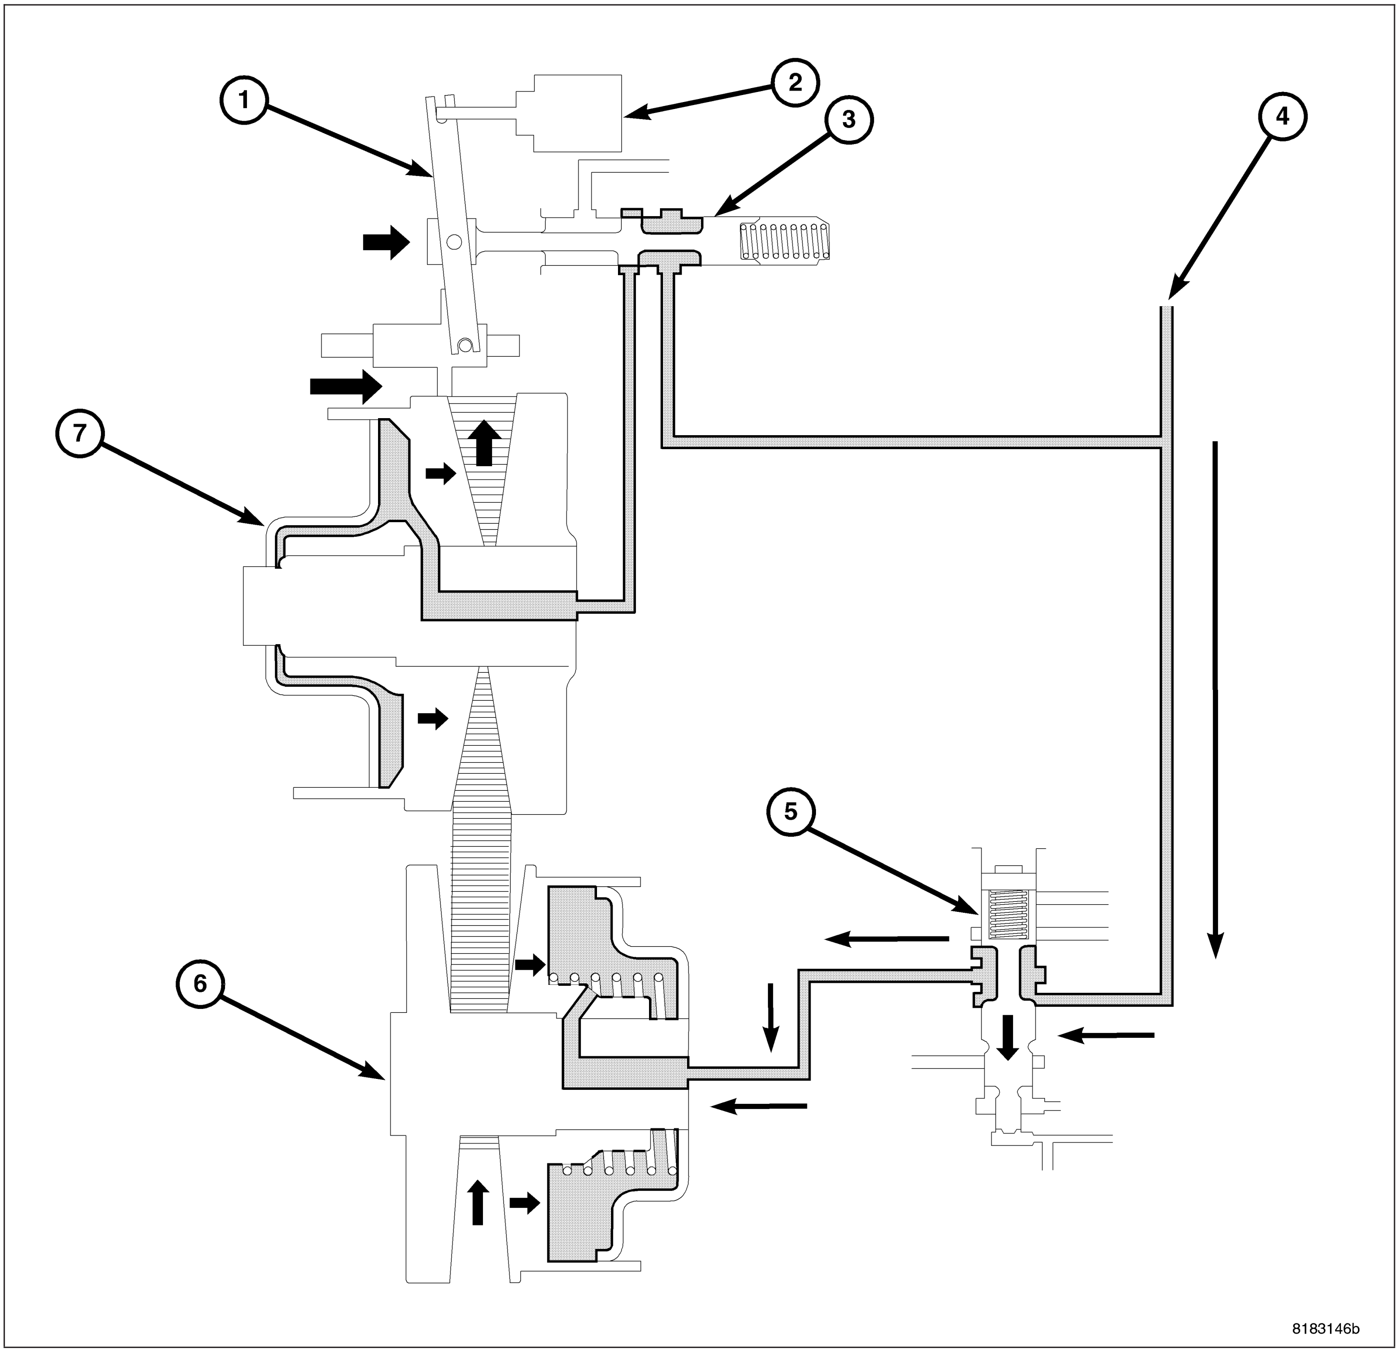

Fig. 8 SHIFT LOW TO HIGH 4

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

Additionally, the sliding element of the primary pulley moves to the right direction and the ratio control valve also moves to the right side and closes the line pressure circuit; this is a completion of the shift.

The secondary valve moves downwards to apply the line pressure to the secondary pulley in order to apply clamping force to the steel belt.

SHIFT HIGH TO LOW - PHASE 1

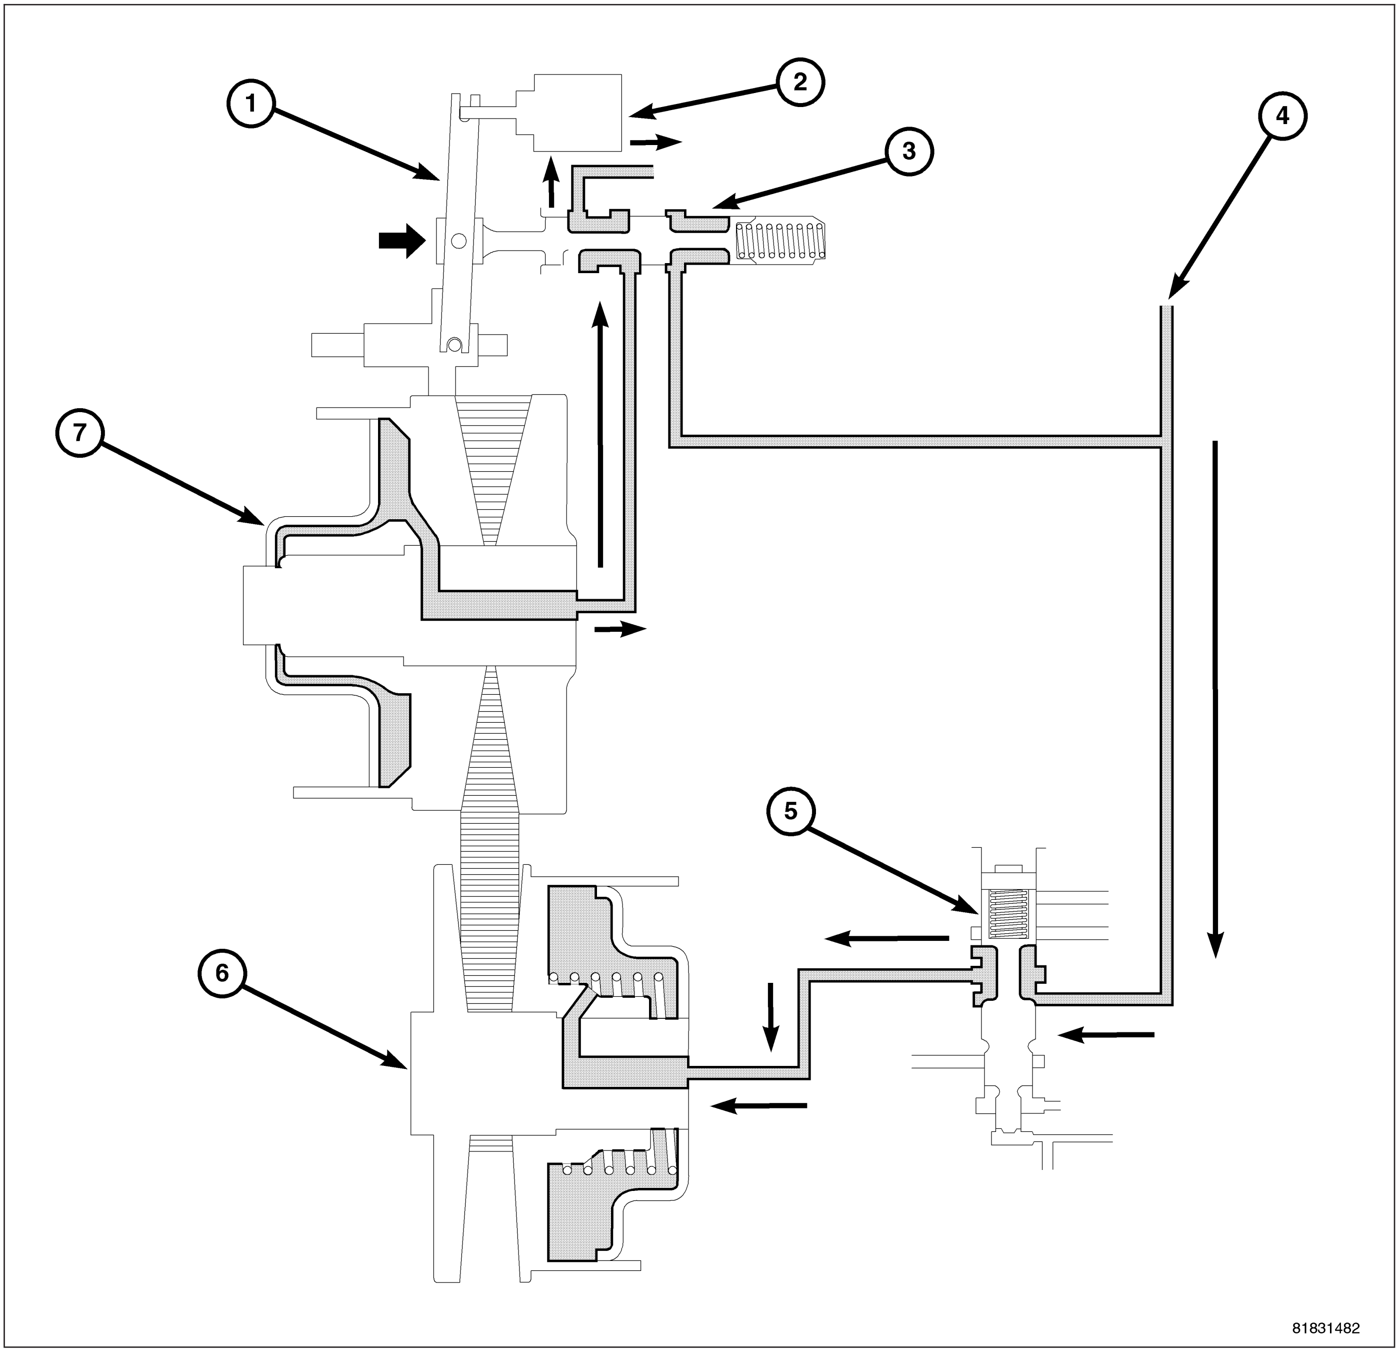

Fig. 9 SHIFTING HIGH TO LOW

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

The pulley ratio linkage moves to the right direction in the stepper motor. As the ratio control valve which links to the pulley ratio linkage, moves fluid and the primary pulley is drained.

Because the secondary valve is moving downwards, line pressure is applied to the secondary pulley.

SHIFT HIGH TO LOW - PHASE 2

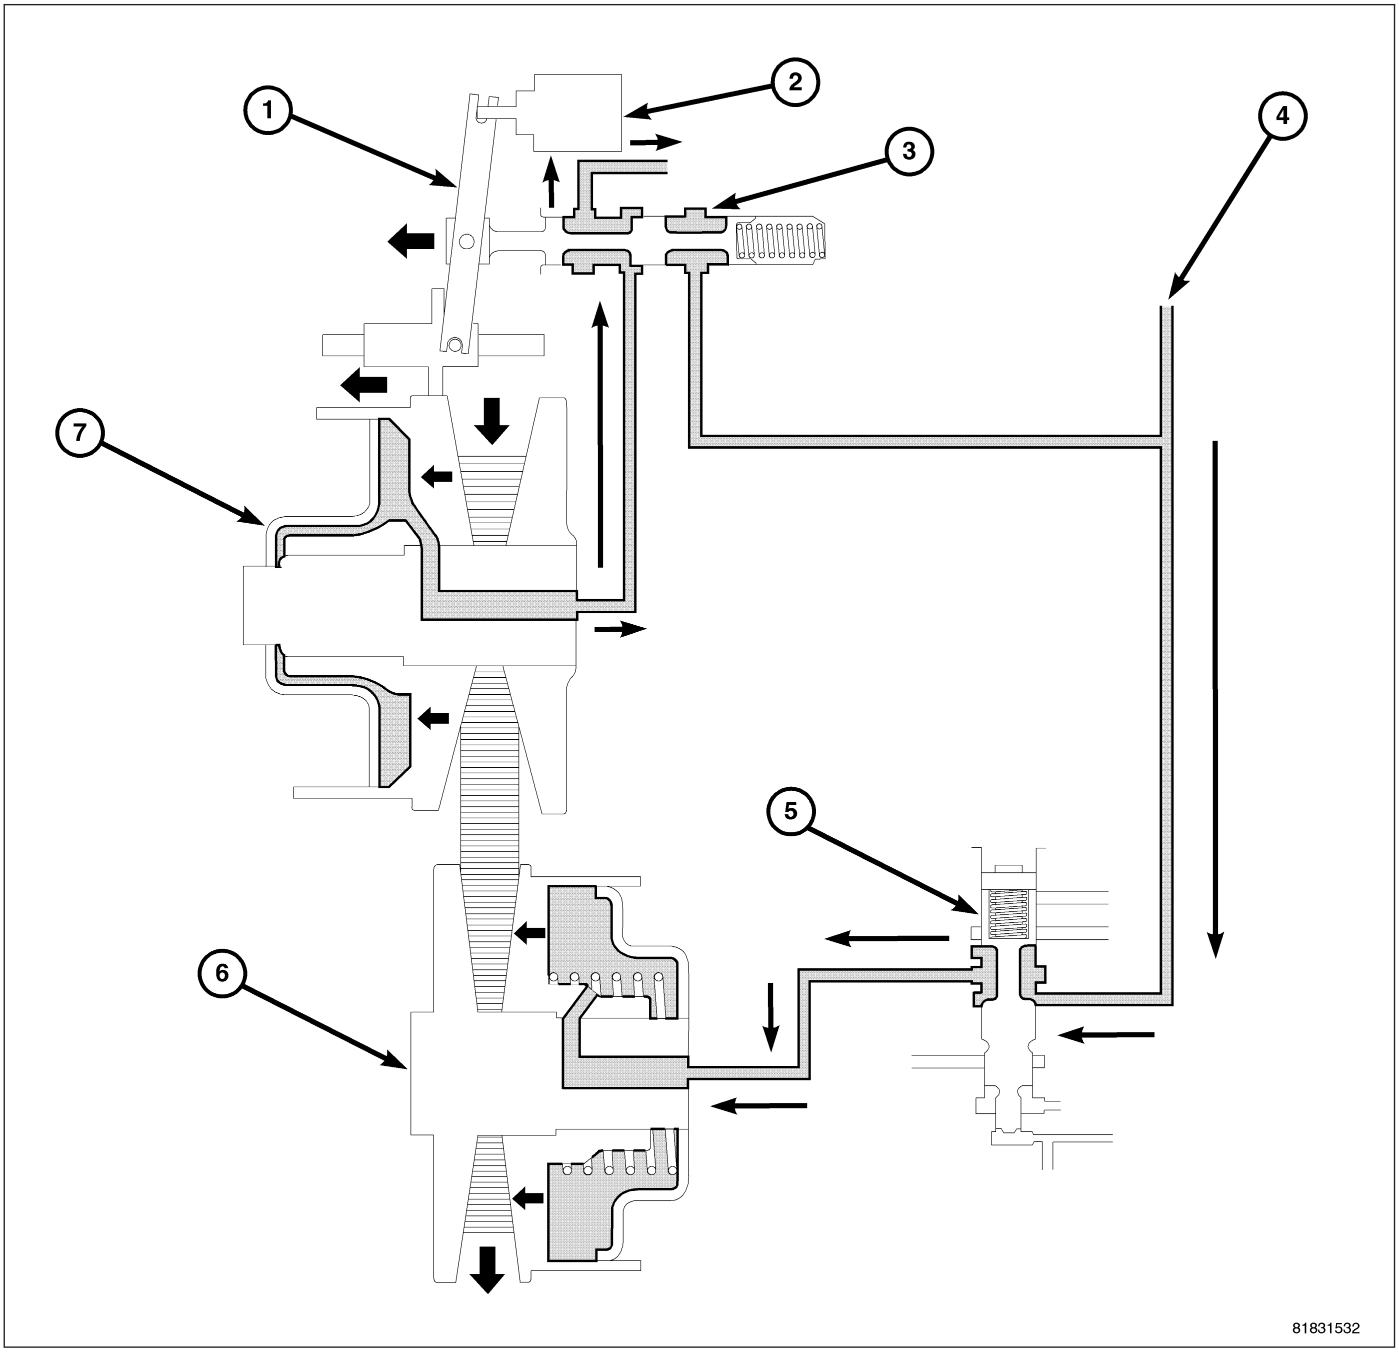

Fig. 10 SHIFTING HIGH TO LOW 2

1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

By applying line pressure to the secondary pulley, the sliding element moves to the left direction and the steel belt is pushed outside.

By pulling the steel belt to the secondary pulley side, the moving-pulley of the primary pulley moves to the left side.

By actuating the “Sliding element” of the primary pulley moves to the left side, the ratio control valve starts to move to the left side through the pulley ratio linkage which is linked to the sliding element.

SHIFT HIGH TO LOW - PHASE 3

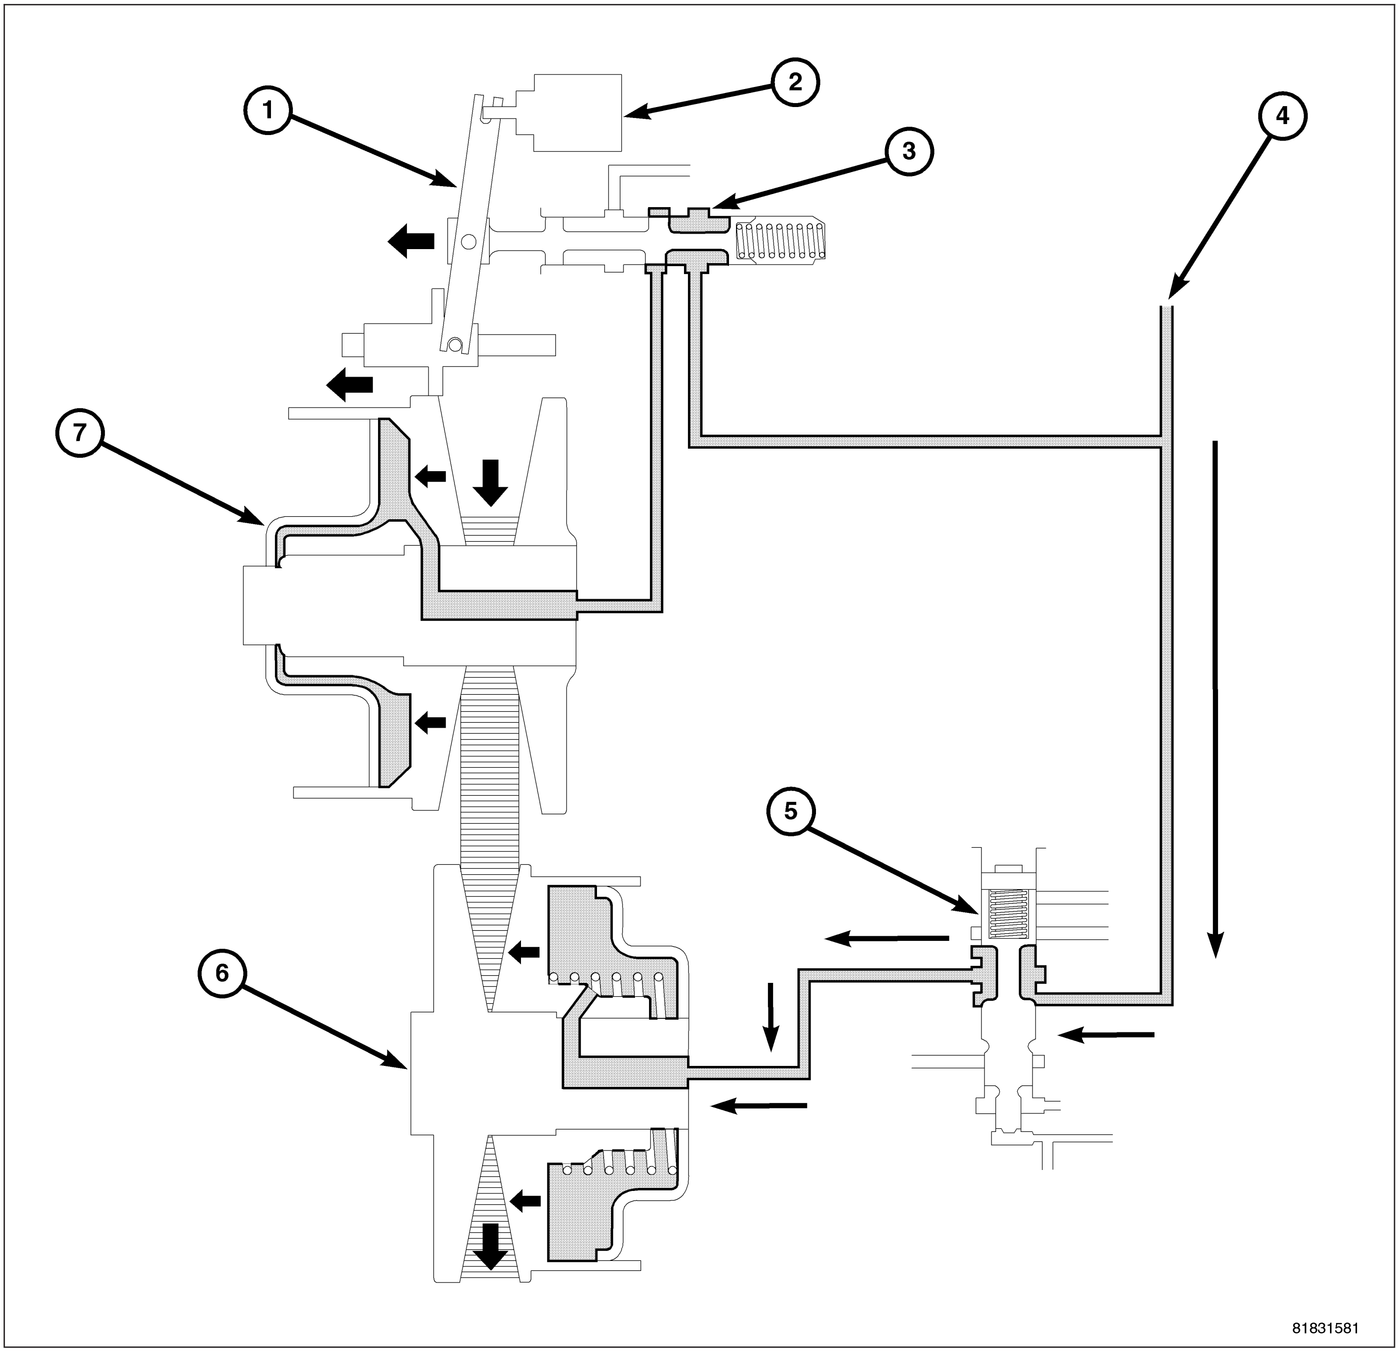

Fig. 11 SHIFTING HIGH TO LOW 3

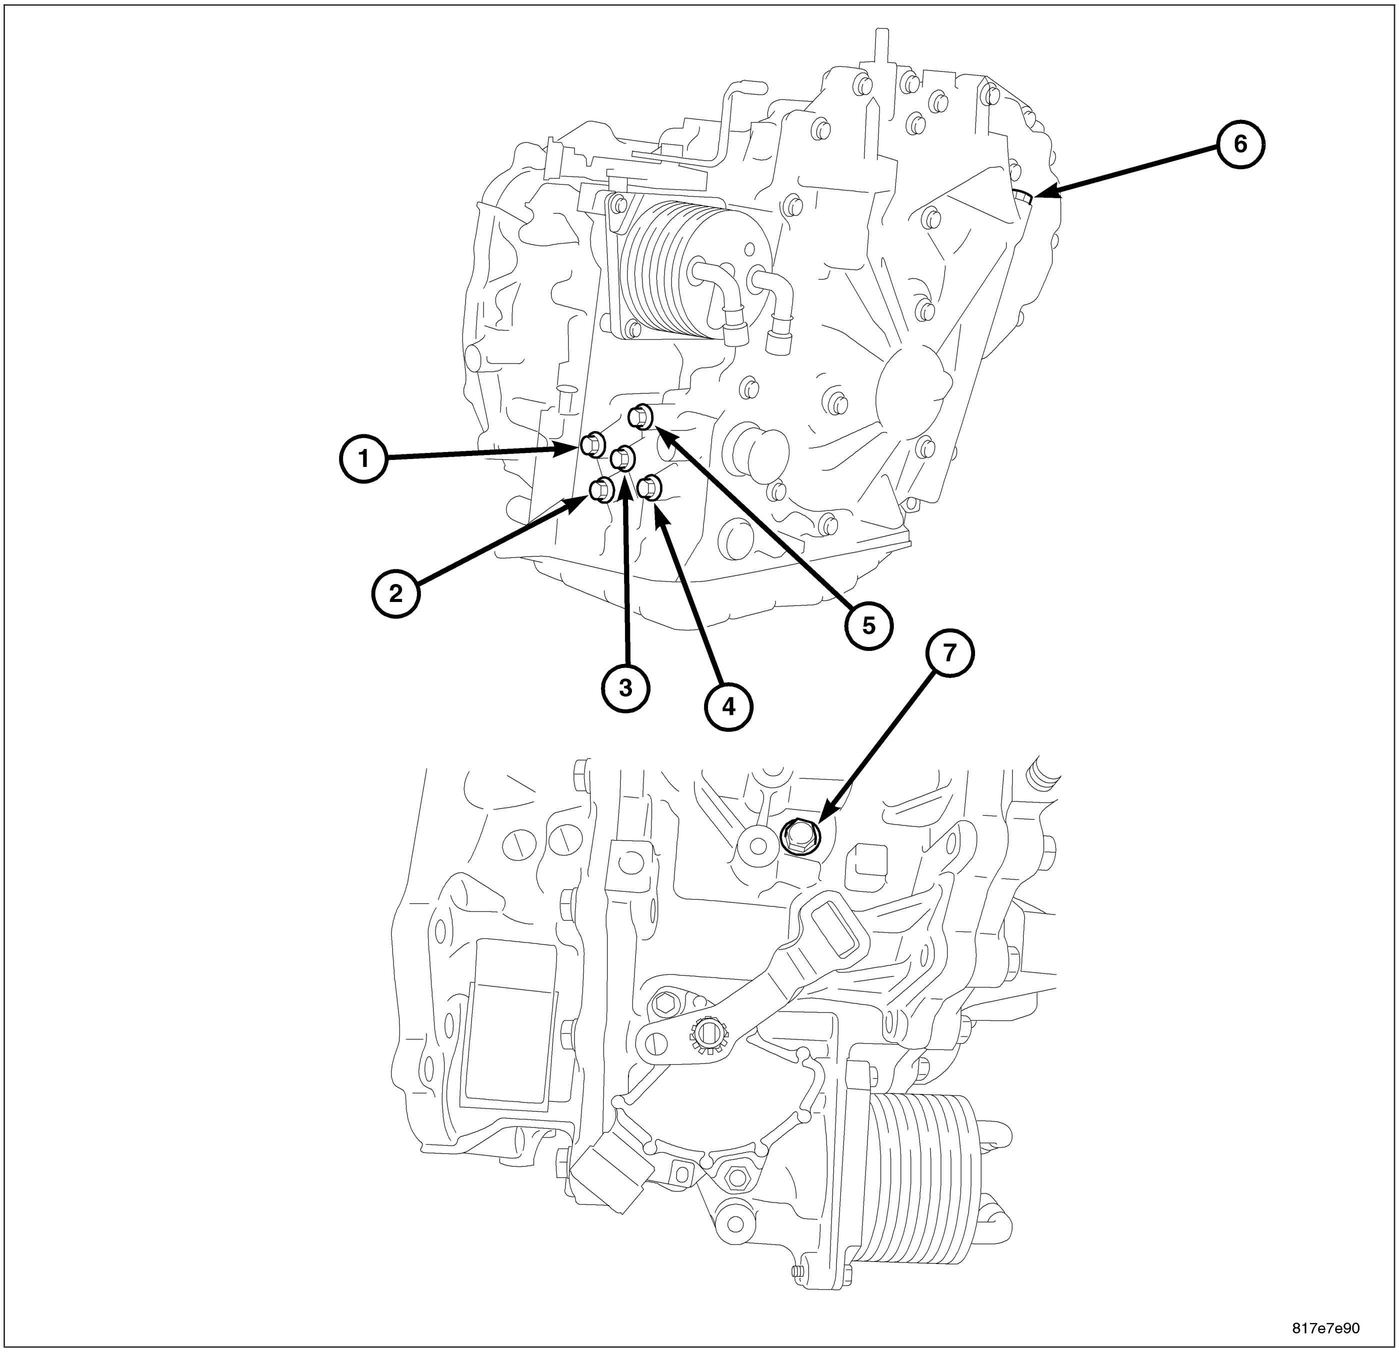
1 - PULLEY RATIO LINKAGE
2 - STEPPER MOTOR
3 - RATIO CONTROL VALVE
4 - LINE PRESSURE
5 - SECONDARY VALVE
6 - SECONDARY PULLEY
7 - PRIMARY PULLEY

Additionally, the moving-pulley of the secondary pulley moves to the left direction and the steel belt is pushed outside. In accordance with this, the sliding element of the primary pulley moves to the left side.

The moving-pulley of the primary pulley moves to the right direction, then the ratio control valve also moves to the left direction and closes the drain circuit; this is a completion of the shift.

DIAGNOSIS AND TESTING

TEST PORTS



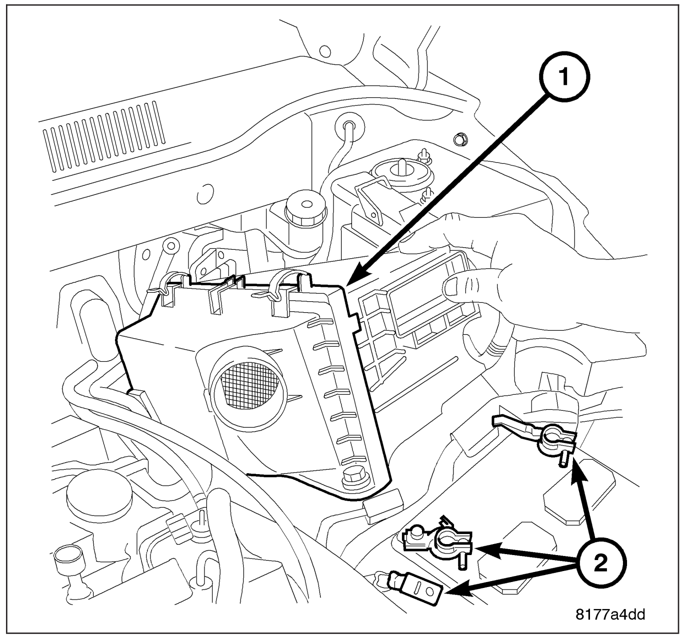


Fig. 12 TEST PORTS

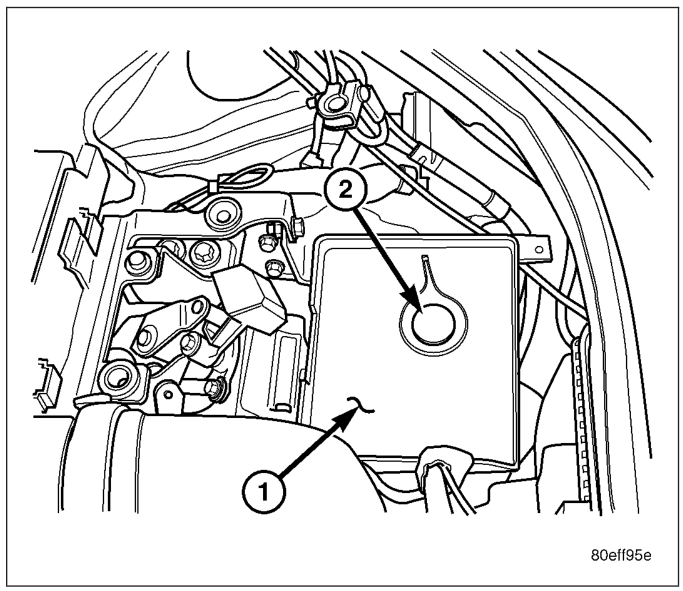
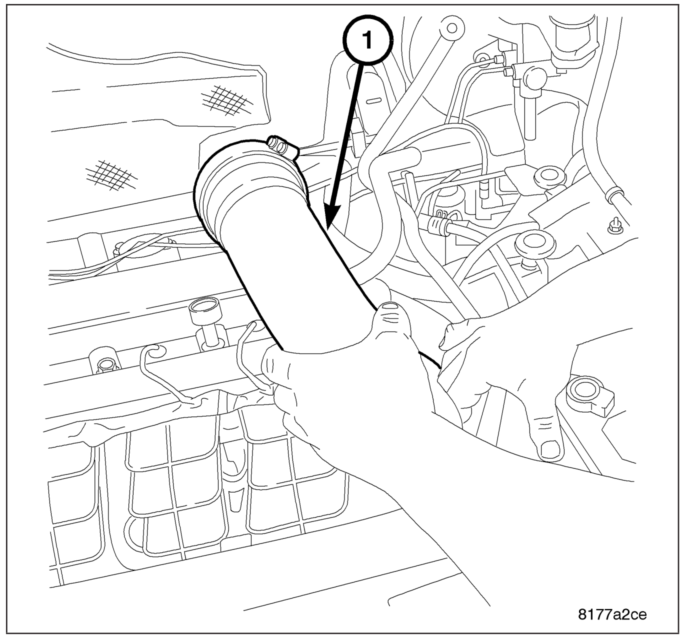
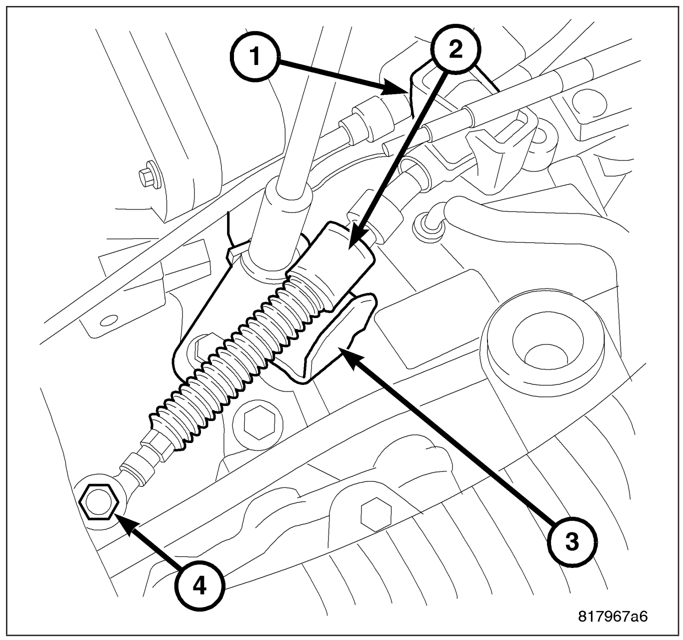


1 - Line Pressure
2 - Forward Clutch Pressure
3 - Primary Pressure
4 - Torque Converter Apply Pressure
5 - Torque Converter Release Pressure
6 - Secondary Pressure
7 - Reverse Brake Pressure

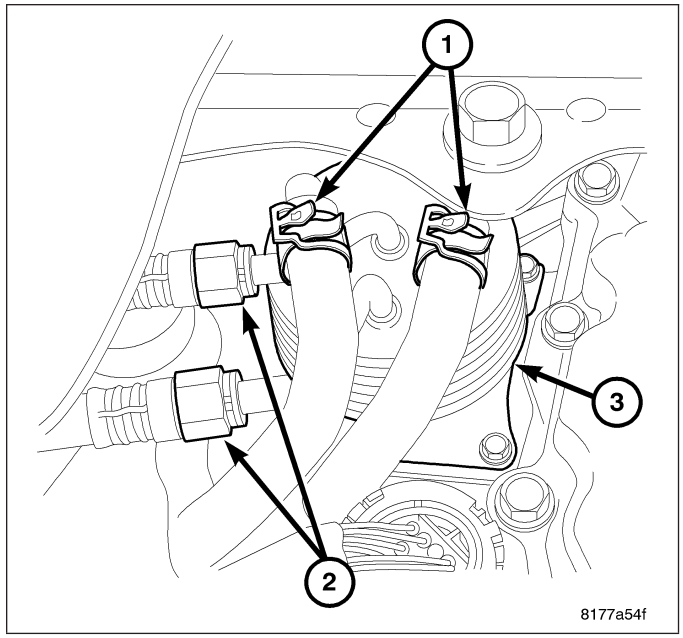
REMOVAL



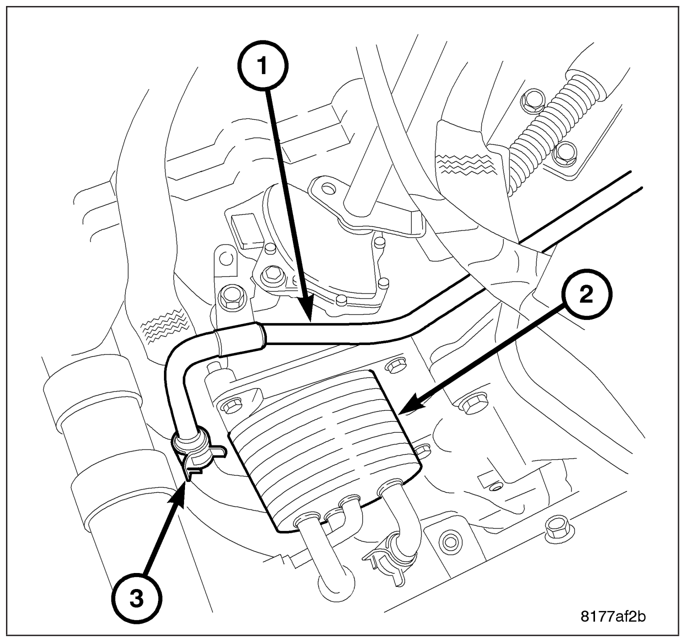
1. Disconnect battery cables (2).
2. Remove air cleaner assembly (1).
3. Remove battery.



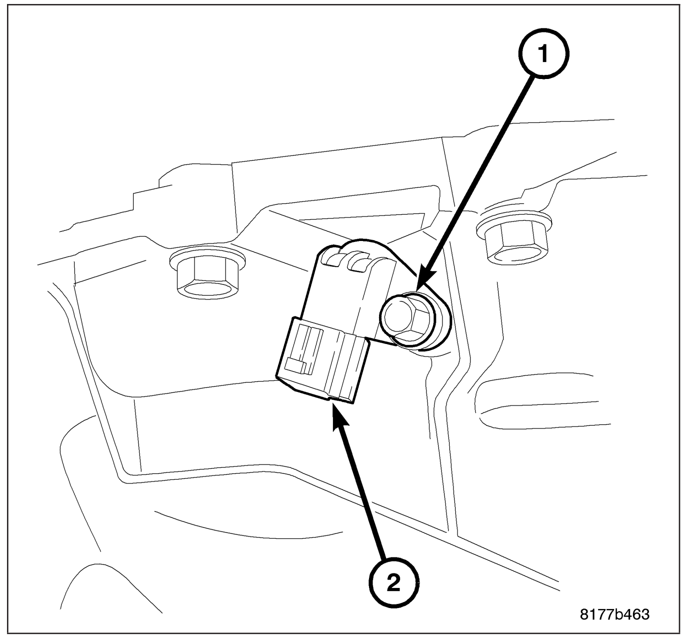
4. Remove battery tray (1).
5. Drain coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE)



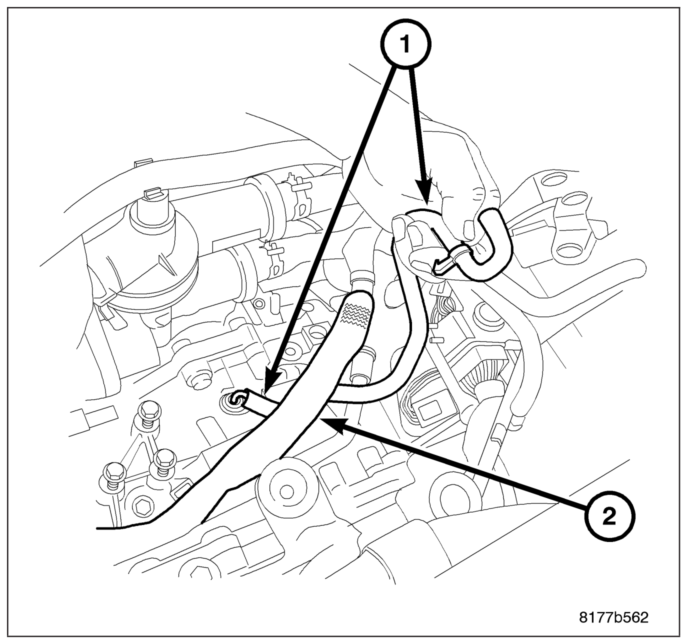
6. Remove inlet air tube (1).
7. Remove vacuum supply lines.



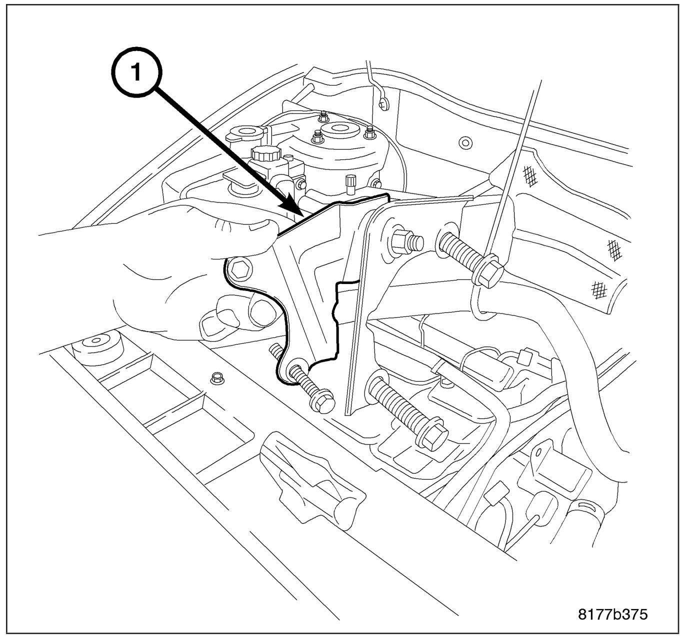
8. Remove the shiftier cable (2) and bracket (3).



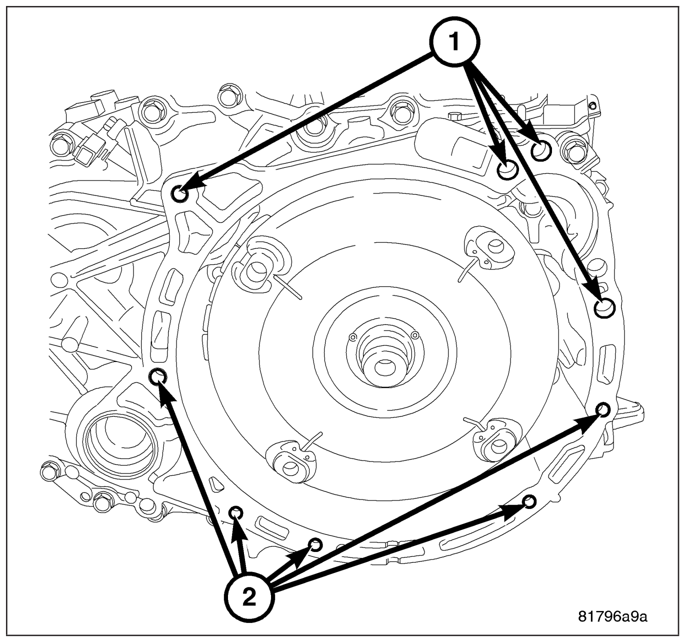
9. Remove coolant lines (1) at CVT fluid cooler.



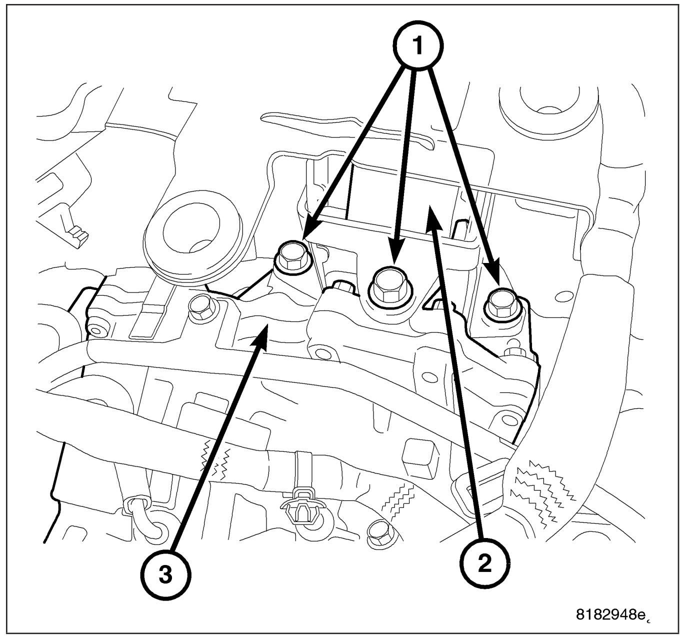
10. Remove heater hose (3) at CVT fluid cooler.



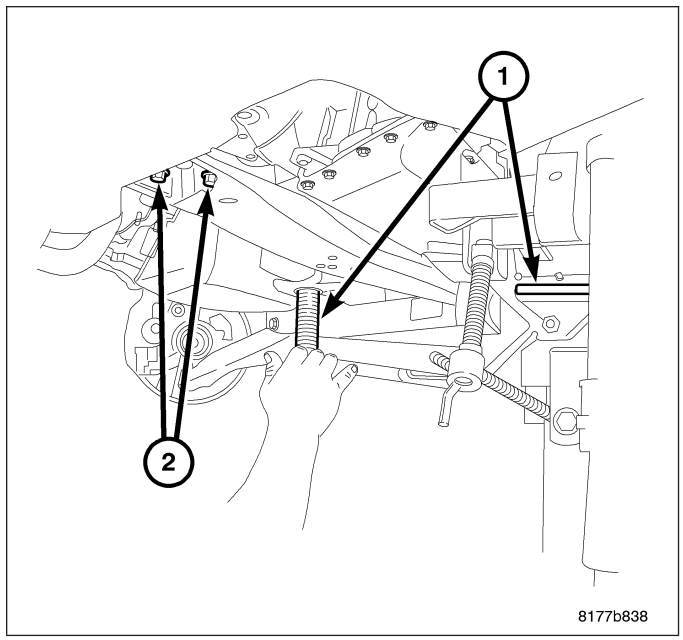
11. Remove the speed sensor connector (1).



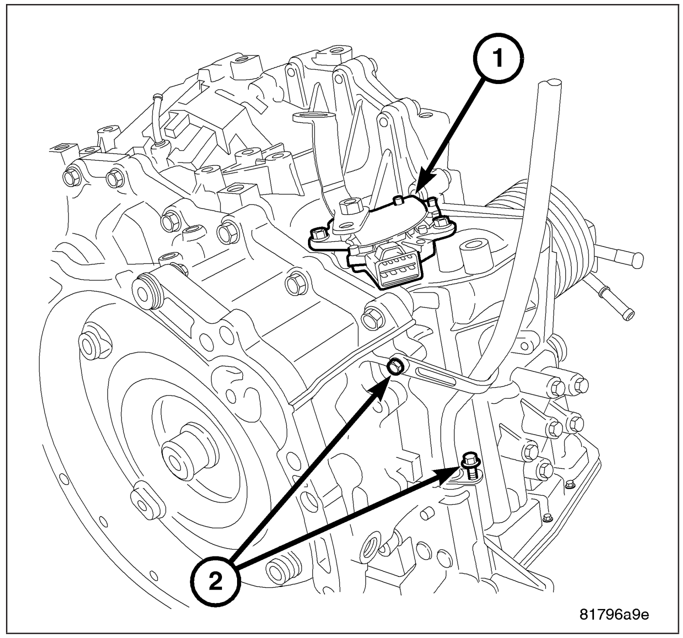
12. Remove the wiring harness from the top of the transmission (2).
13. Remove the transmission vent tube (1).



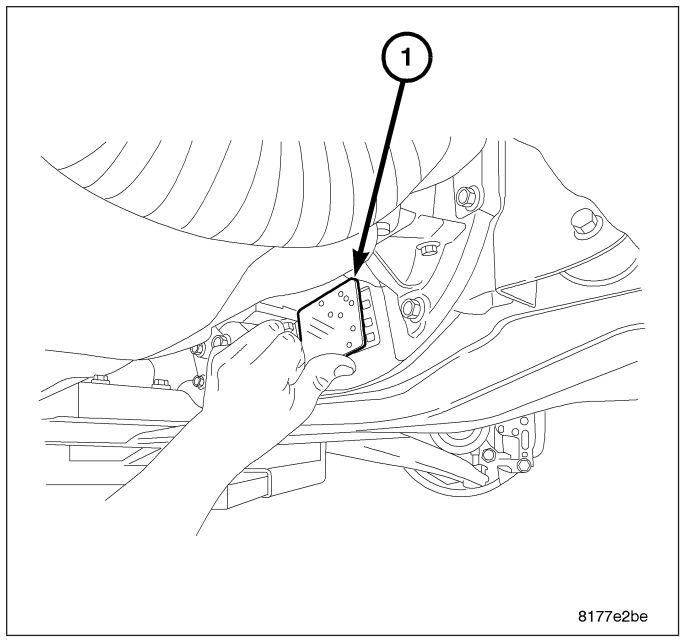
14. Remove the throttle body support bracket (1).



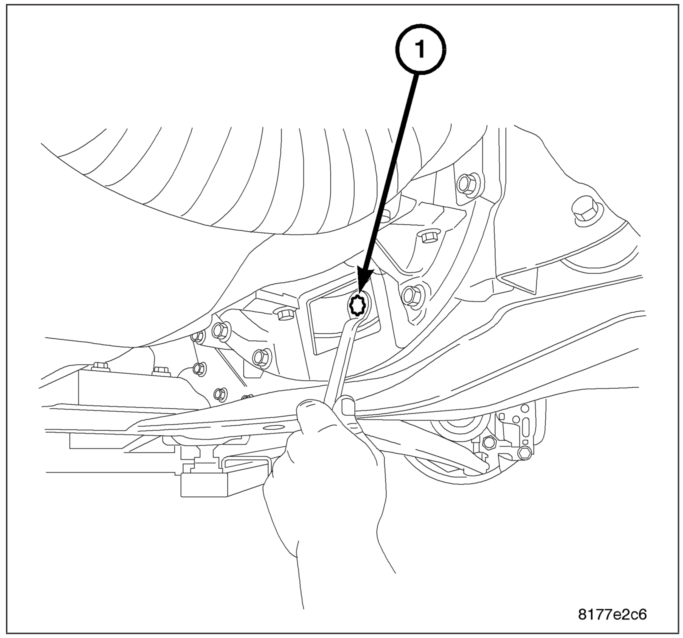
15. Remove the upper bell housing bolts (1).



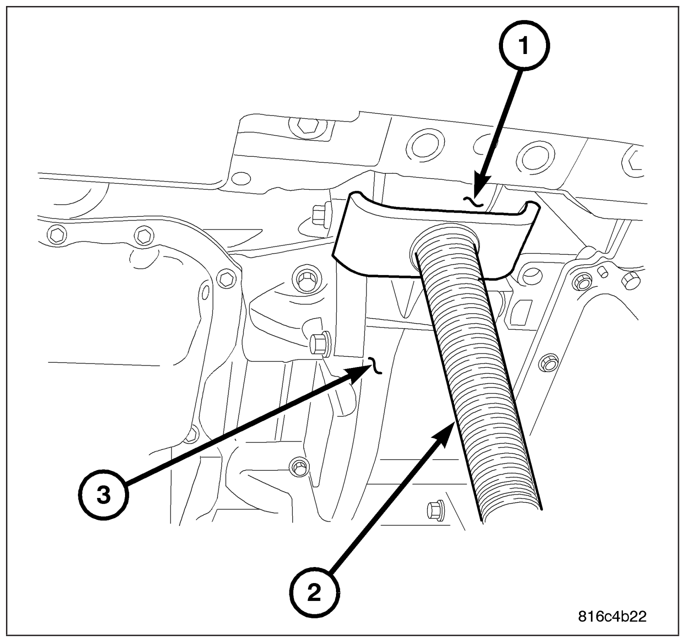
16. Remove the upper transmission mount bolts (1).
17. Remove the upper transmission mount through bolt.
18. Remove the upper transmission mount (2).
19. Raise vehicle on a hoist.
20. Drain transmission fluid.
21. Remove the left front lower splash shield.
22. Remove the right front lower splash shield.
23. Remove lower splash shield (if equipped).



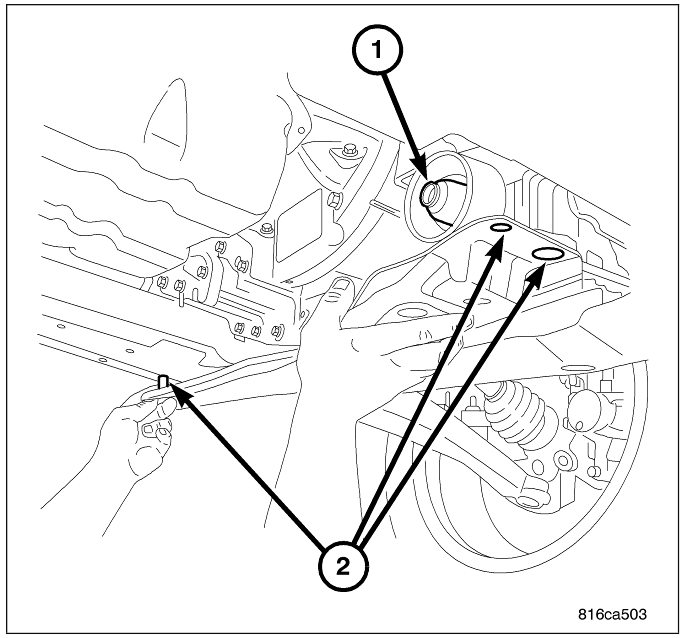
24. Support the transmission with a jack (1).
25. Remove the starter (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
26. Lower transmission jack.



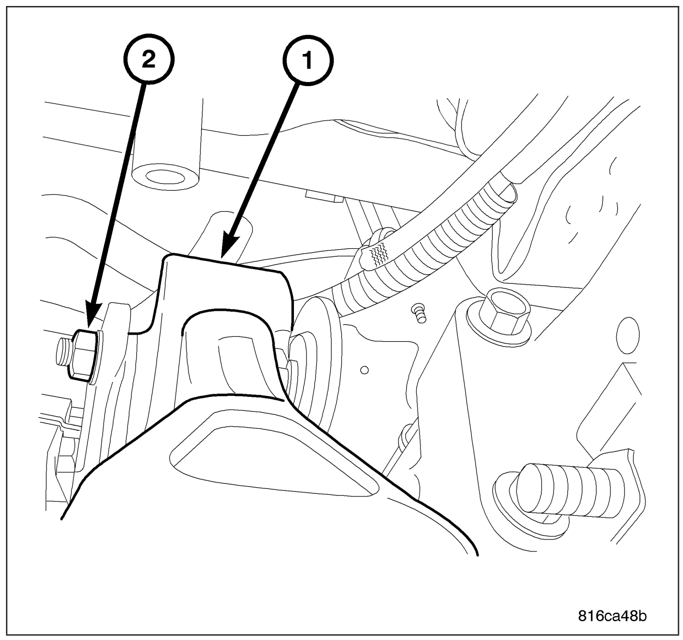
27. Remove the two transmission fill tube bolts (2) and remove the fill tube.
28. Drain the transmission fluid.
29. Remove both front wheels.
30. Remove the right and left halfshafts (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALFSHAFT - REMOVAL).



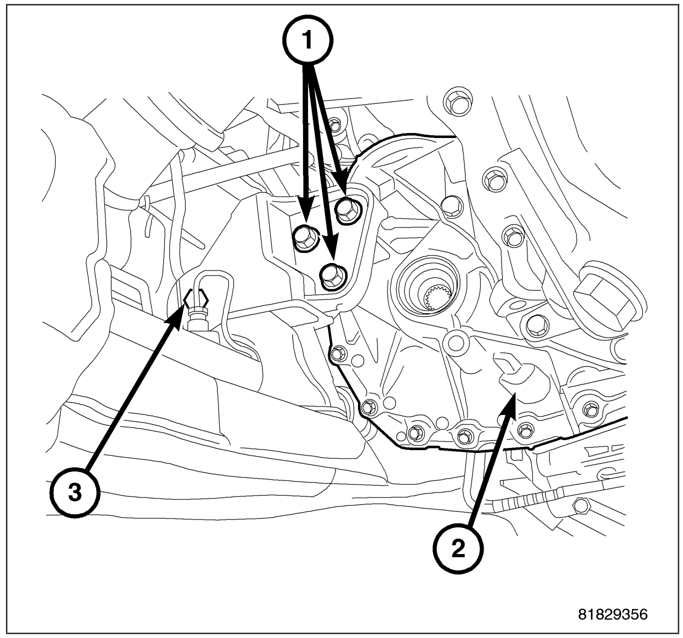
31. Remove inspection cover (1).
32. Mark the torque converter to the flex plate for alignment upon installation.



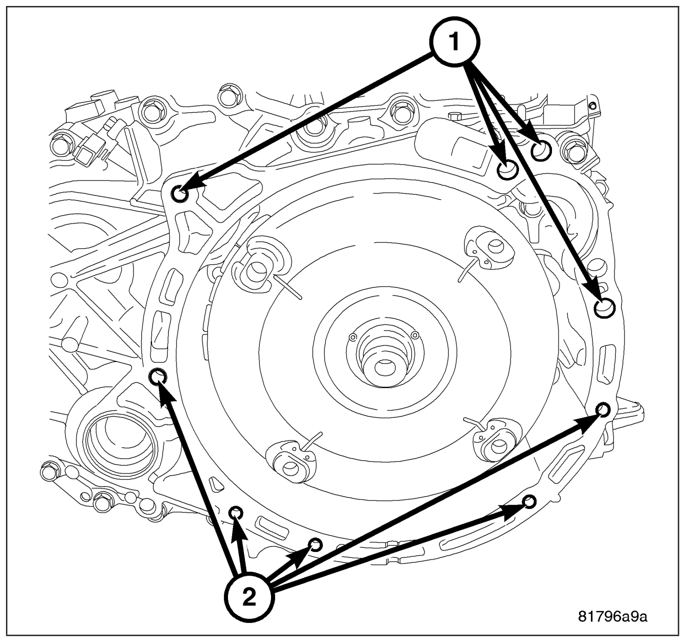
33. Remove torque converter bolts (1).



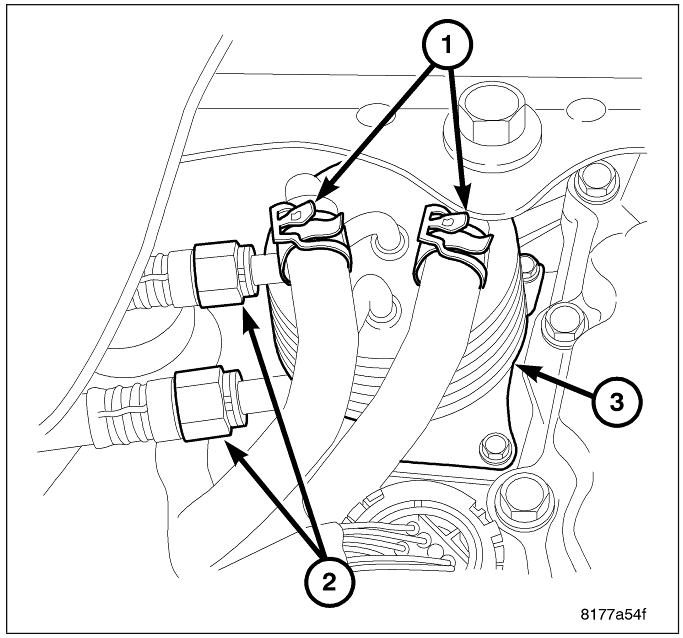
34. Support the engine with a screw jack (2).



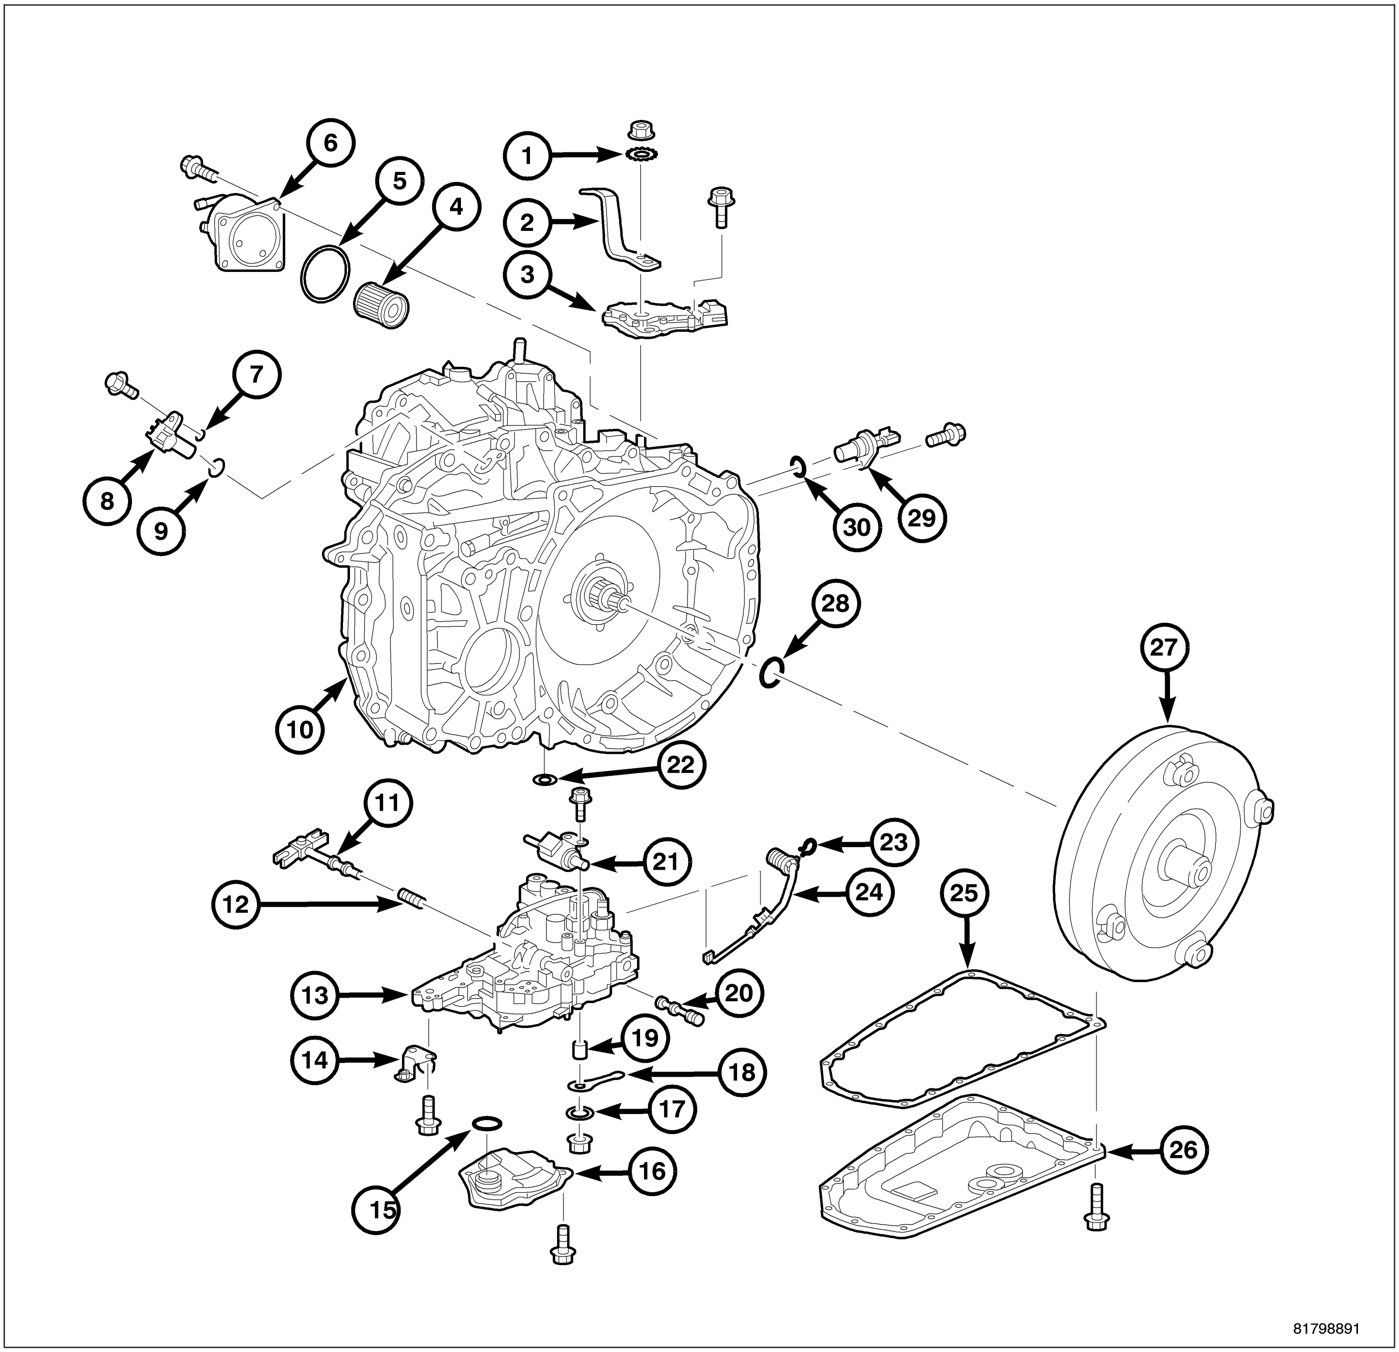
35. Remove the through bolt (1) at the front transmission mount.
36. Remove bolts (2) at the transmission cross member.
37. Remove the transmission cross member.



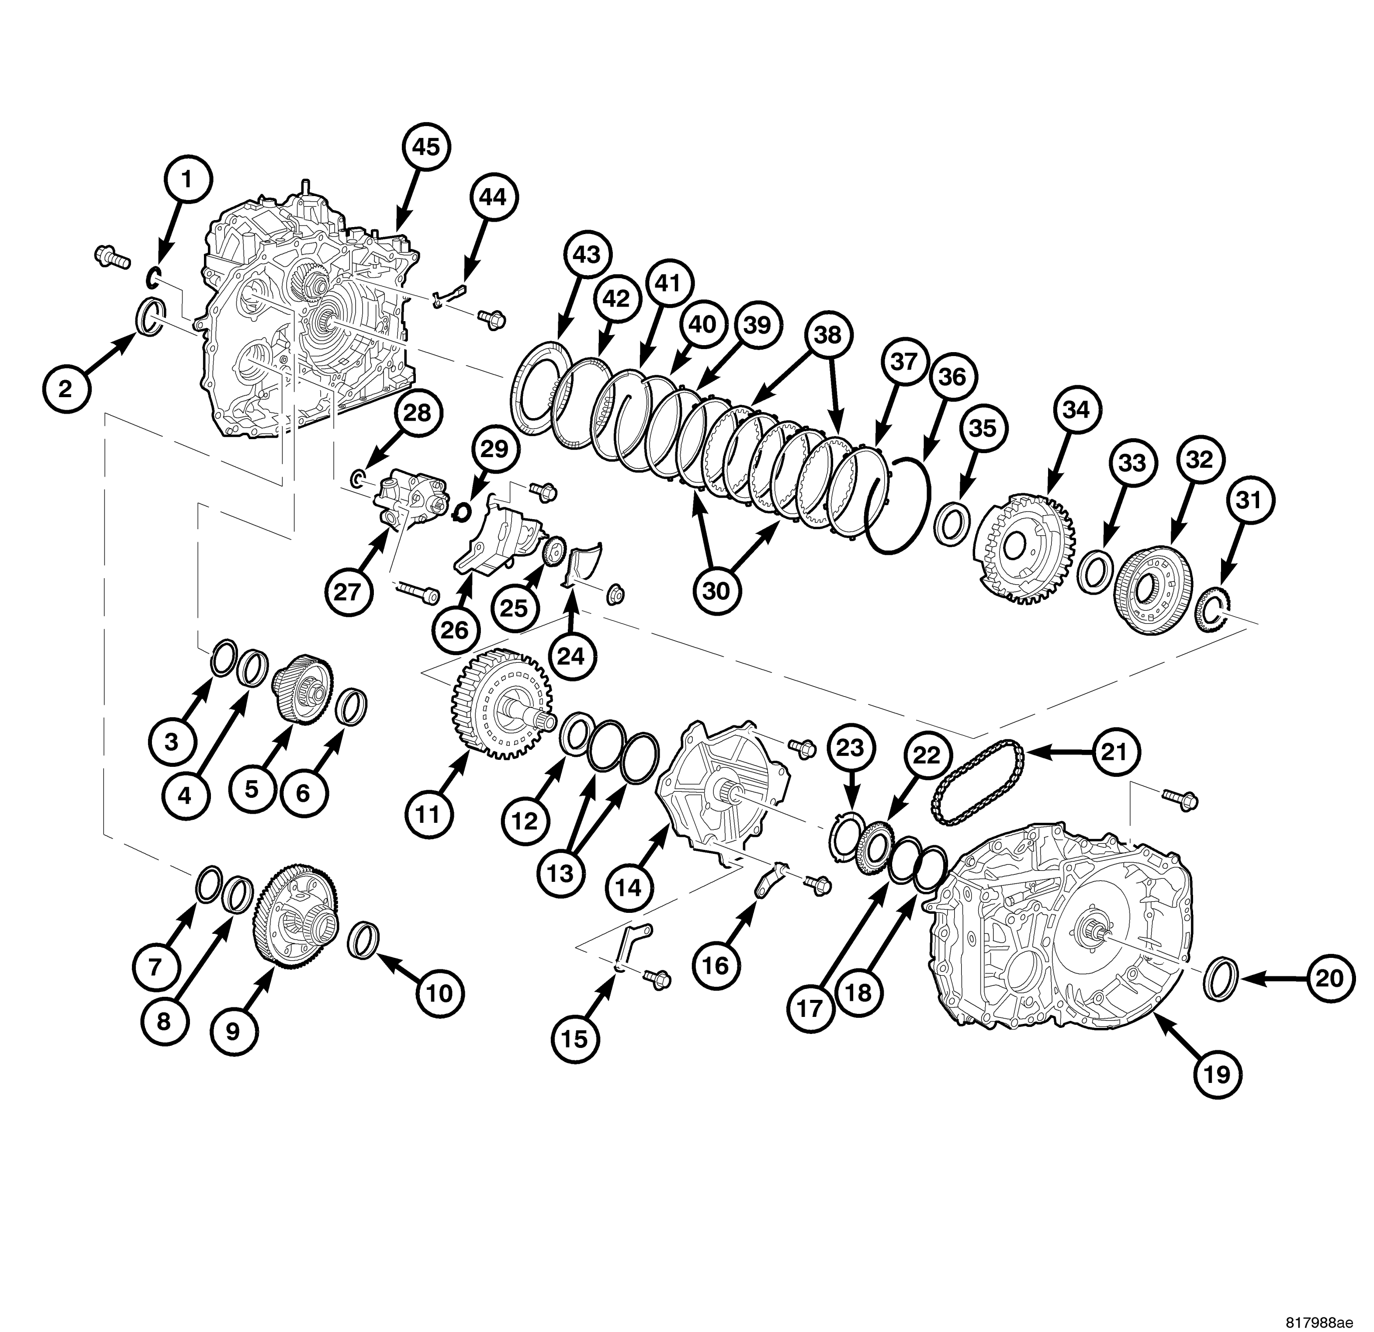
38. Remove the transmission rear mount thorough bolt (2).



39. Remove the rear mount to transaxle bolts (1).
40. Remove the PTU if equipped (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).



41. Remove the lower transmission bell housing bolts (2).



42. Lower the transmission to gain access to remaining transmission cooler lines.
43. Remove the remaining transmission cooler lines.
44. Lower transmission.

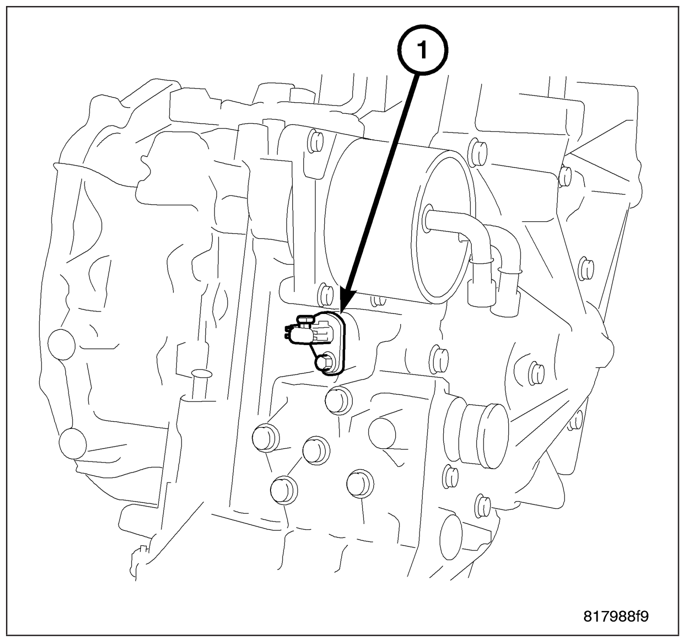
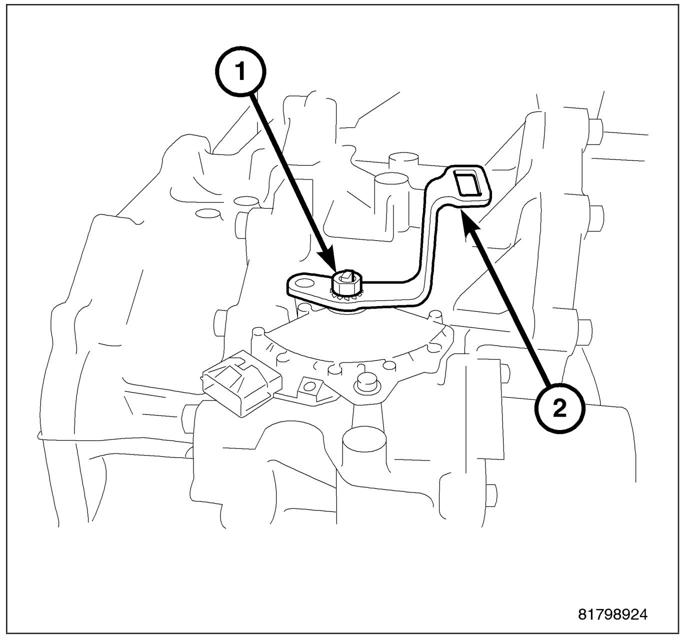
39 - DISH PLATE
40 - SNAP RING
41 - RETAINING PLATE
42 - SPRING RETAINER ASSEMBLY
43 - REVERSE PLATE PISTON
44 - DETENT SPRING
45 - TRANSAXLE CASE

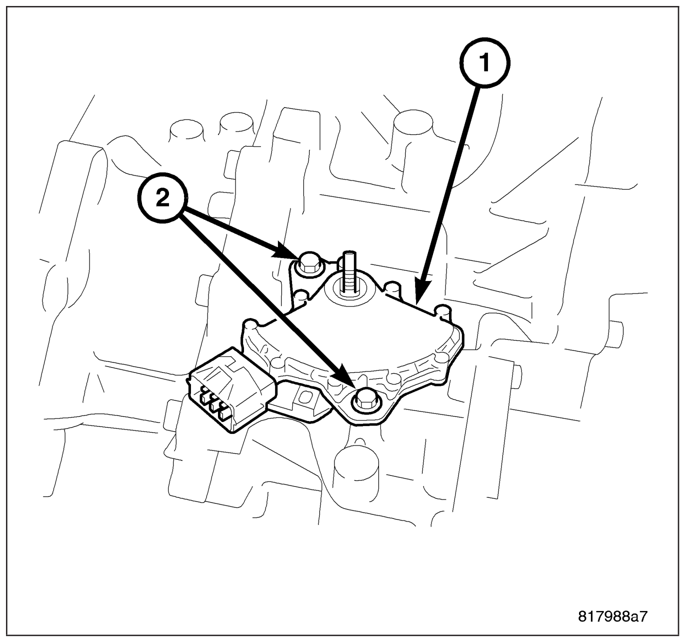
1. Refer to the exploded views as necessary when performing the following steps.
2. Drain the CVT fluid from the transaxle assembly.
3. Remove the power transfer unit assembly and o-ring (4WD only).
4. Remove the torque converter (1) from the transaxle.



5. Remove the output speed sensor (1) from the converter housing. Remove and discard the o-ring from the output speed sensor.

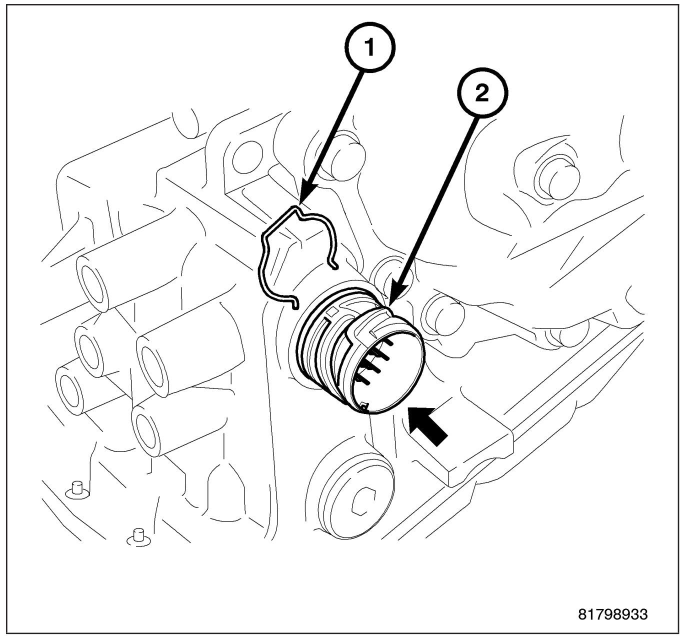


CAUTION: Set aside and reuse any adjusting shim found between the output speed sensor and the converter housing.

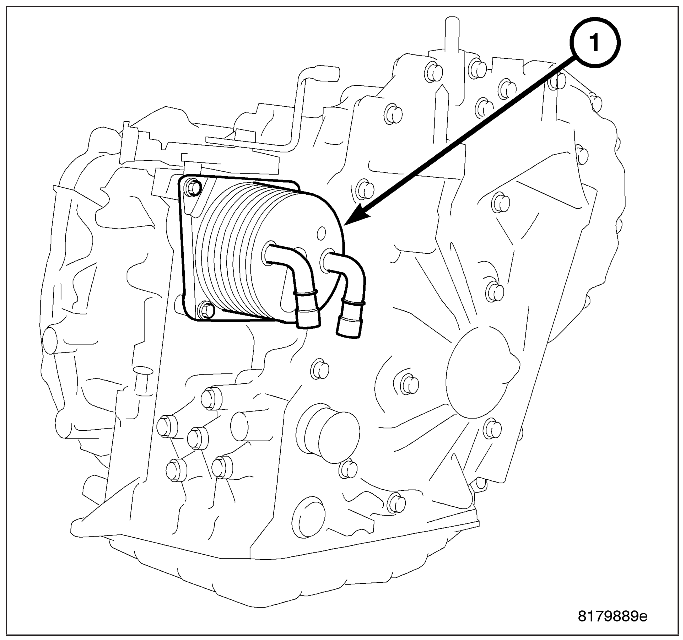


6. Remove the input speed sensor (1) from the transaxle case. Remove and discard the o-ring from the input speed sensor.

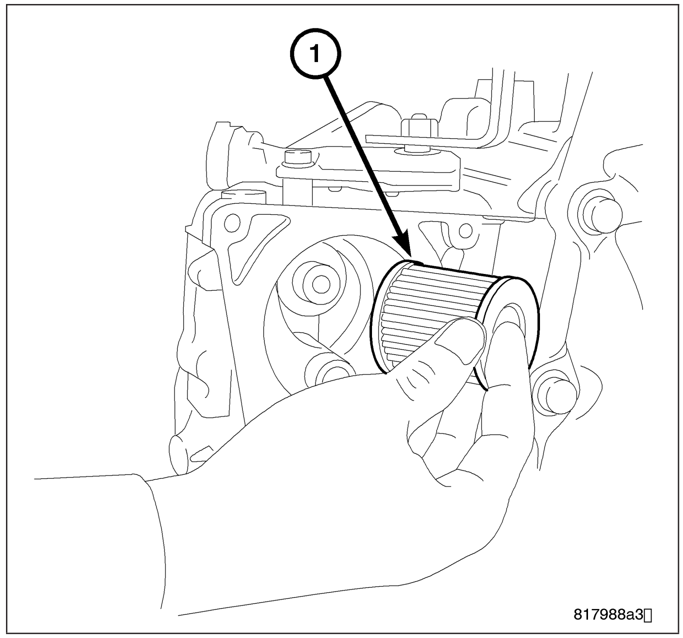
7. Remove the nut (1) holding the shift lever (2) to the manual shaft.
8. Remove the shift lever from the manual shaft.



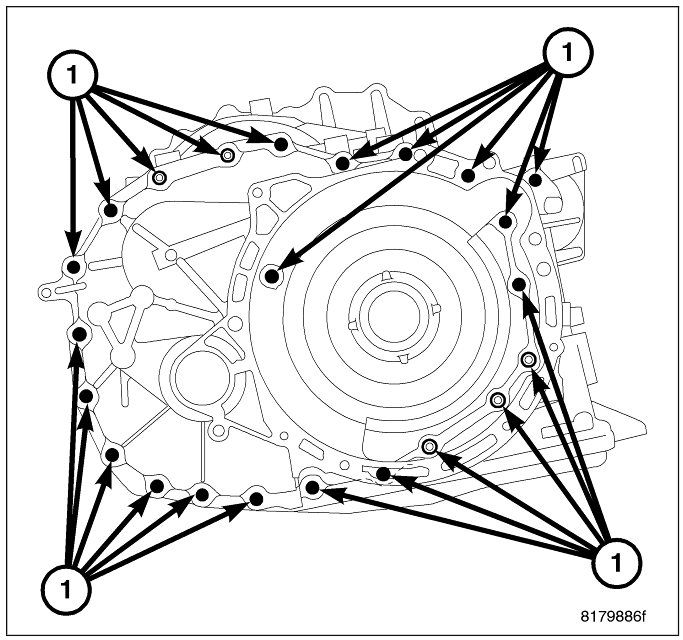
9. Remove the bolts (2) holding the transmission range sensor (TRS) (1) to the transaxle case.
10. Remove the (TRS) transmission range sensor (1) from the transaxle case and the manual shaft.



11. Remove the snap ring (1) from the terminal body (2) and press the terminal body into the transaxle case.

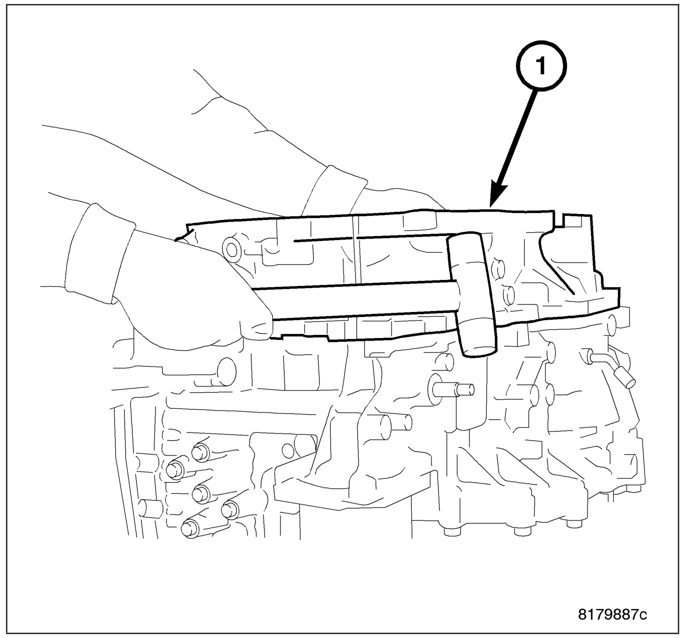


CAUTION: Be careful not to cause damage to the terminal body.

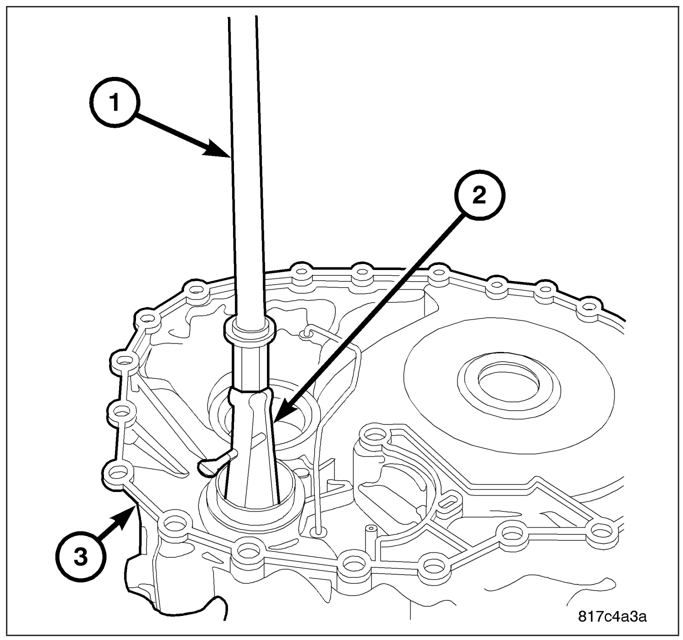


12. Remove CVT fluid cooler (1) from transaxle case. Remove and discard the CVT fluid cooler o-ring.

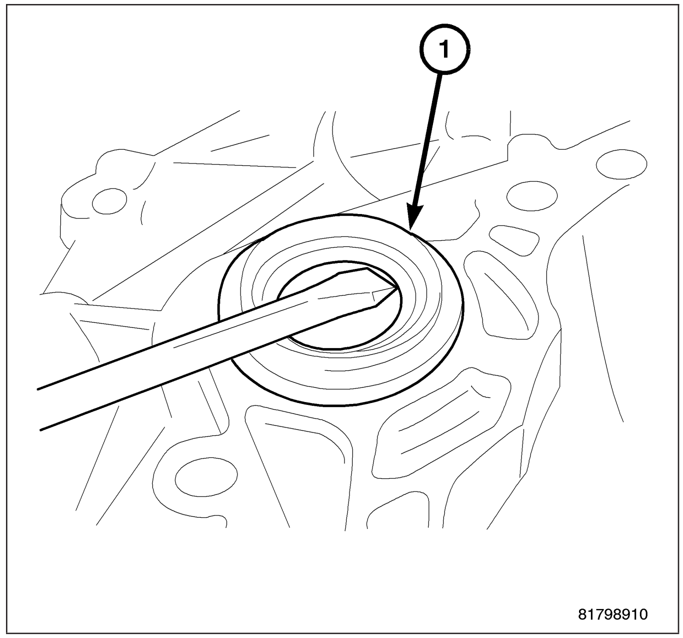
13. Remove the bolts holding the CVT fluid filter to the transaxle case.
14. Remove the CVT fluid filter (1) from the transaxle case.



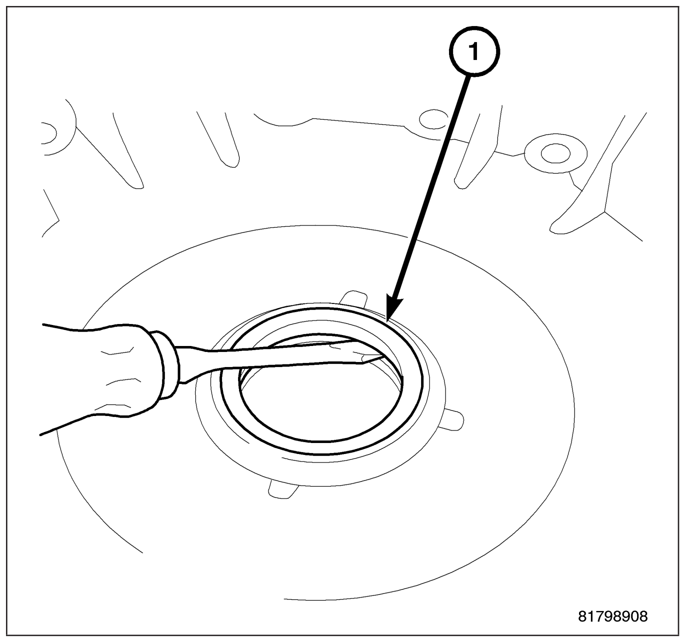
15. Remove the converter housing mounting bolts.



16. Remove the converter housing (1) by tapping with plastic hammer.

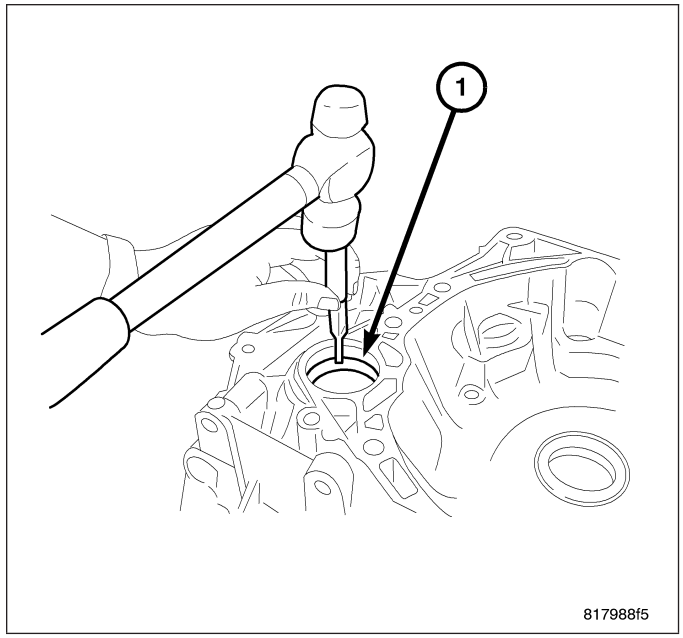


CAUTION: There is a possibility that the drive sprocket adjusting shim may be dislodged and fall out.

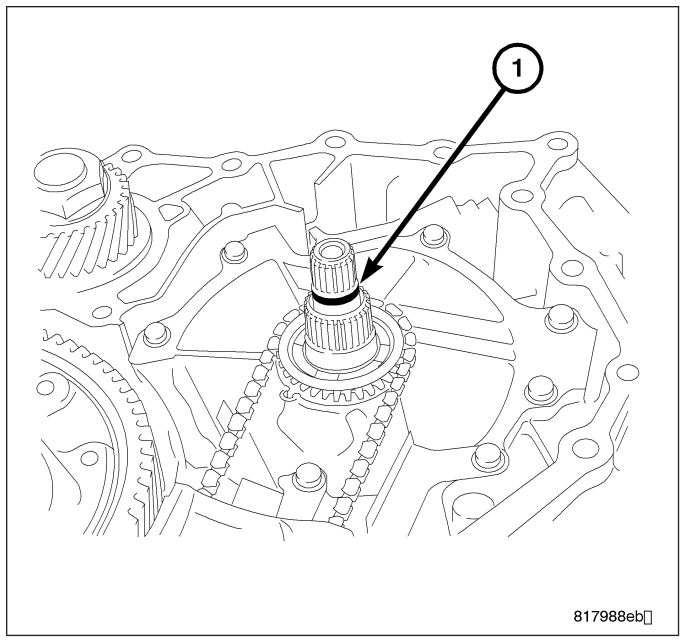


17. Remove outer race of reduction gear bearing (1) from the converter housing using Puller 7794-A and Slide Hammer C-637.

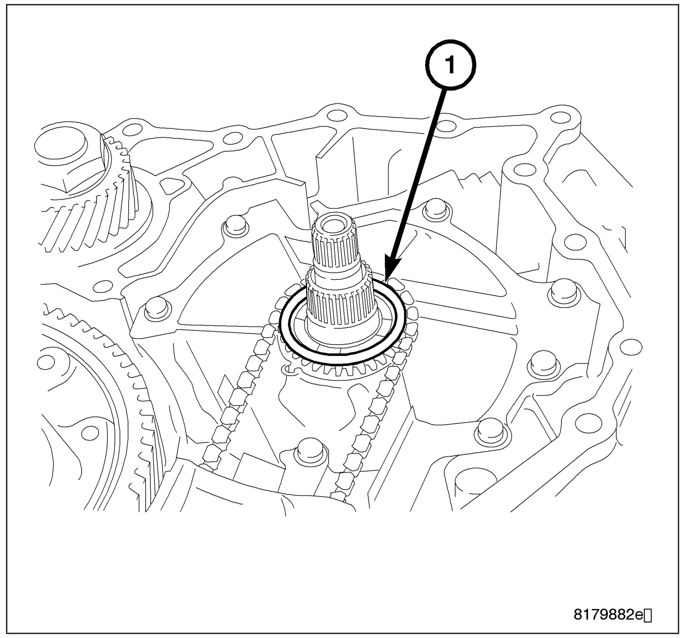
18. Remove differential side oil seal (1) from converter housing using a screwdriver. (2WD)



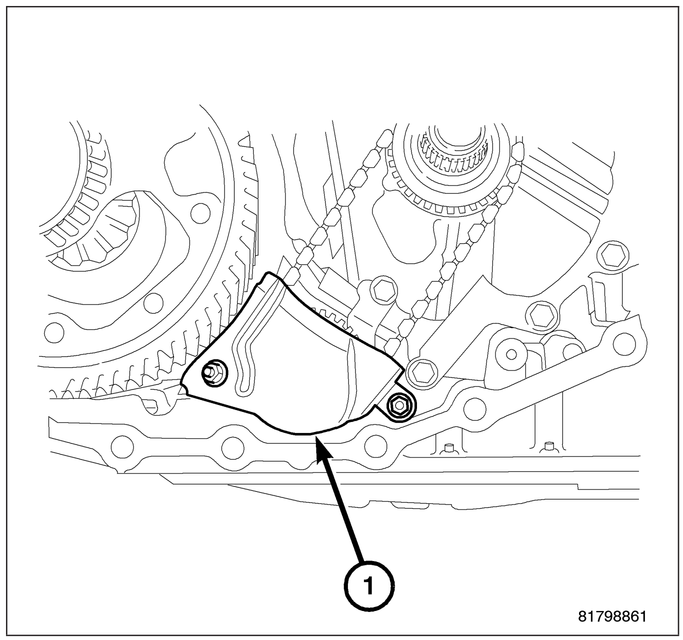
19. Remove converter housing oil seal (1) from converter housing using a screwdriver.



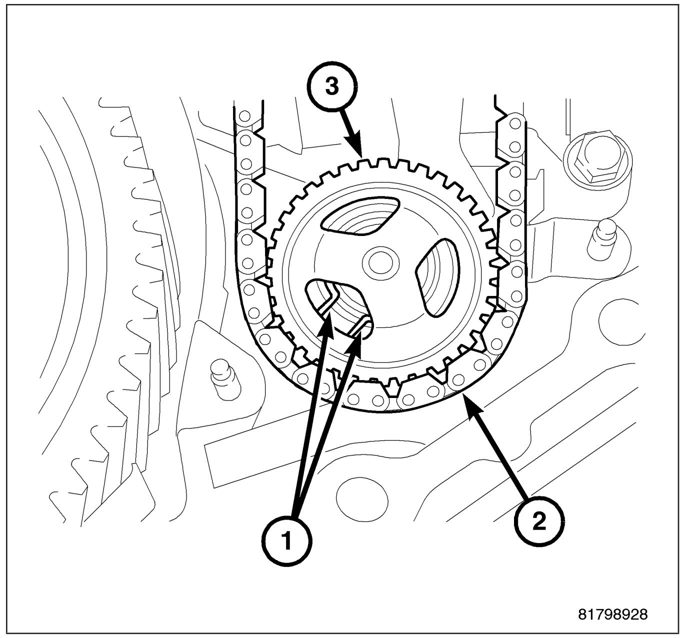
20. Remove outer race (1) of differential side bearing from converter housing using a suitable punch.



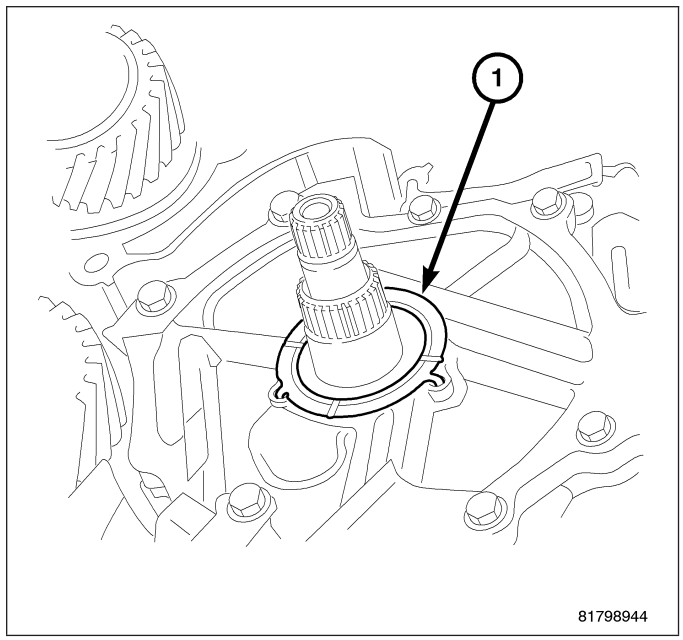
CAUTION: When removing the outer race, tap the outer race on both sides evenly. When removing the outer race, do not damage the converter housing.



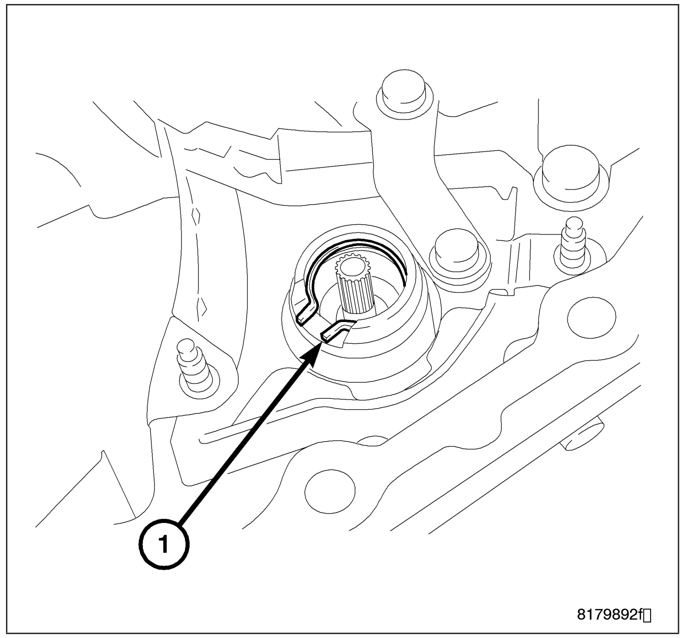
21. Remove and discard the O-ring (1) from the input shaft.



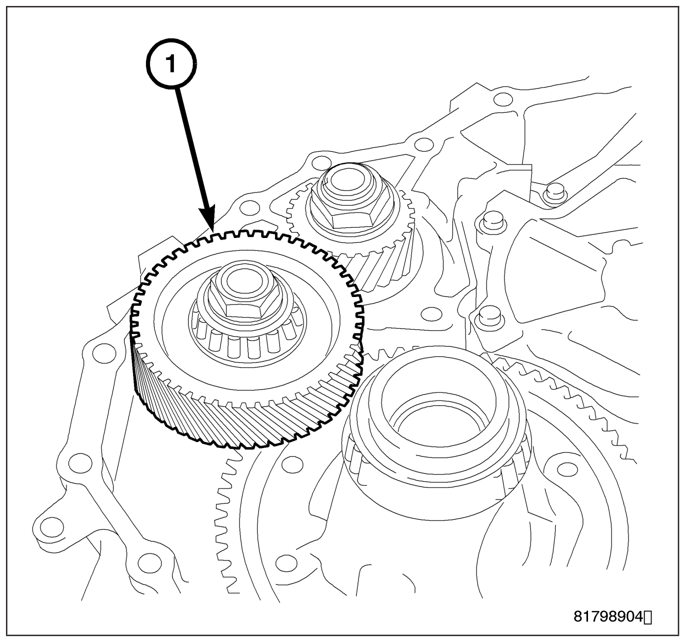
22. Remove the adjusting shim (1) from the drive sprocket, if necessary.



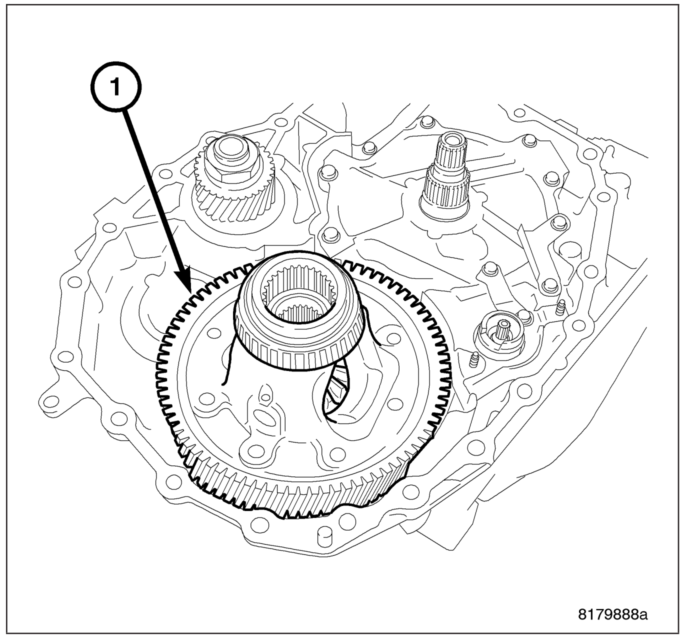
23. Remove the nuts holding the baffle plate (1) to the transaxle.
24. Remove the baffle plate.



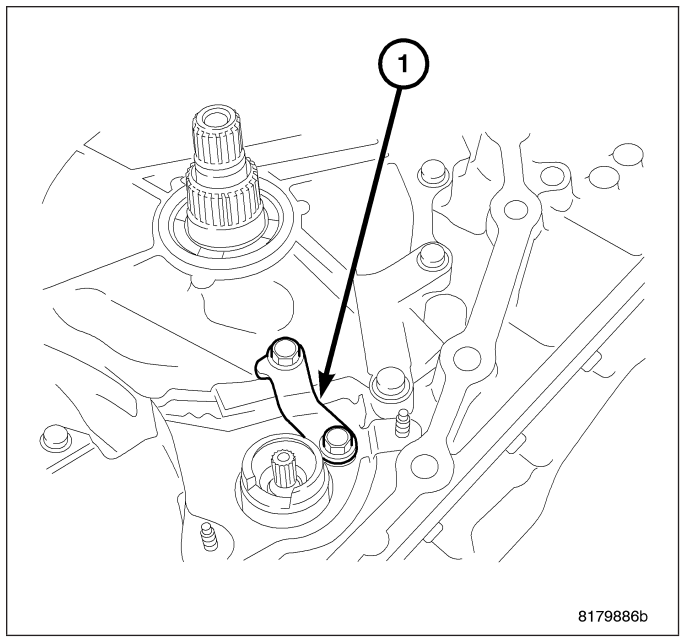
25. Expand the snap ring (1), and remove the driven sprocket (3), the oil pump chain (2), and the drive sprocket.



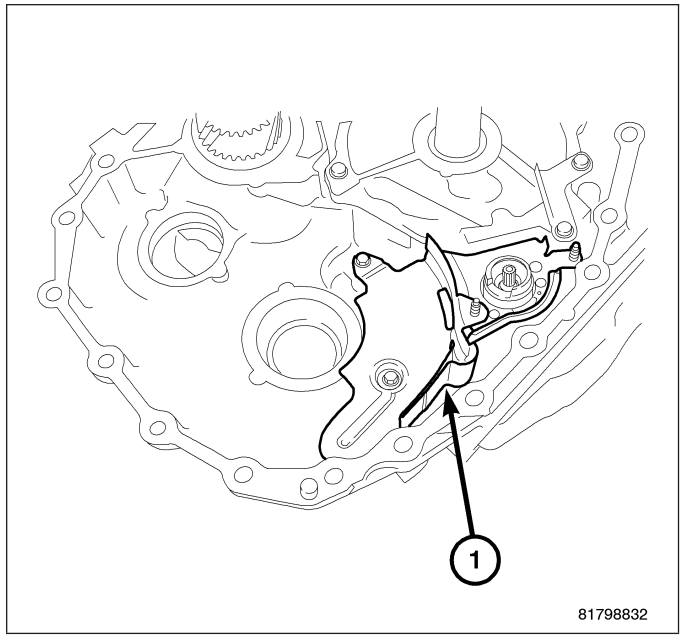
26. Remove the thrust washer (1) from the oil pump cover.



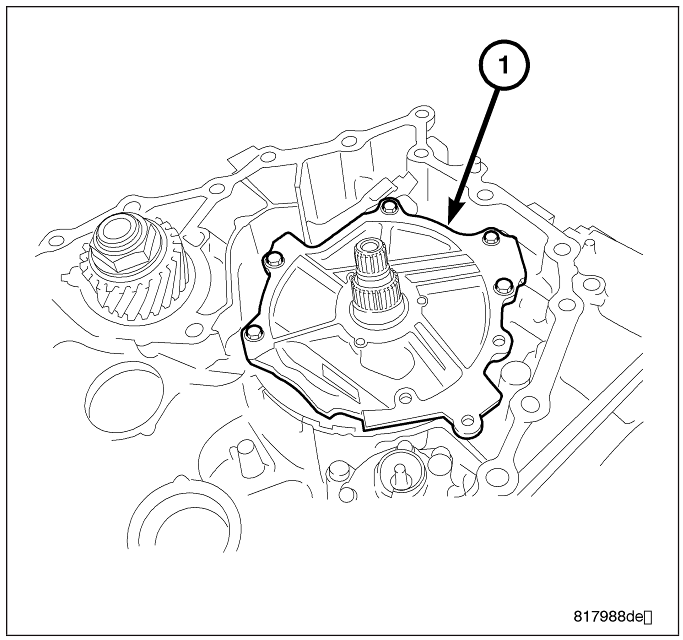
27. Remove the snap ring (1) from the oil pump.



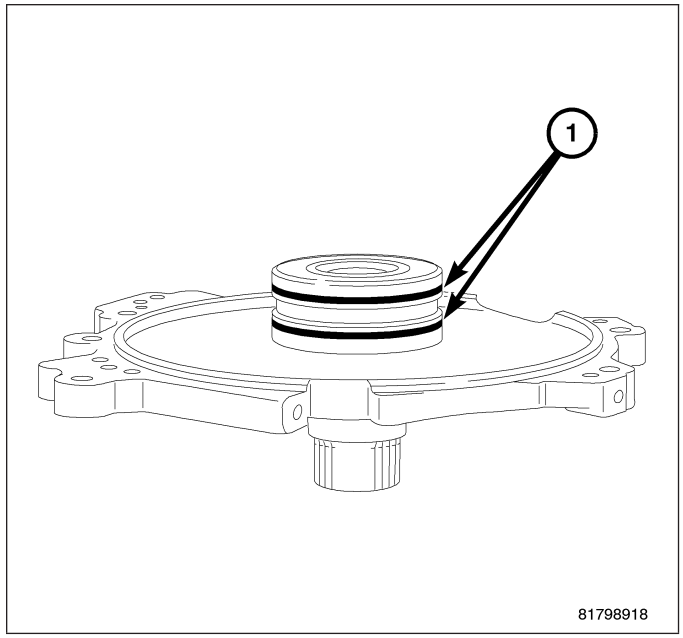
28. Remove the reduction gear assembly (1) from the transaxle case.



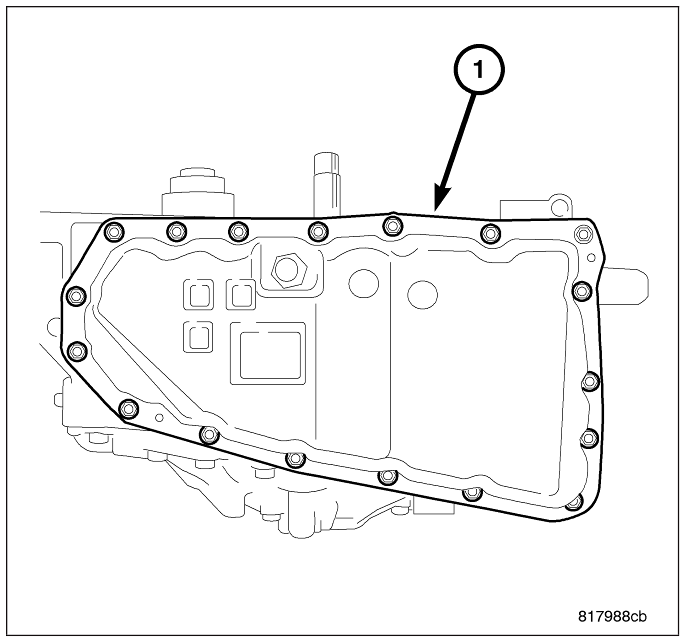
29. Remove the differential assembly (1) from the transaxle case.



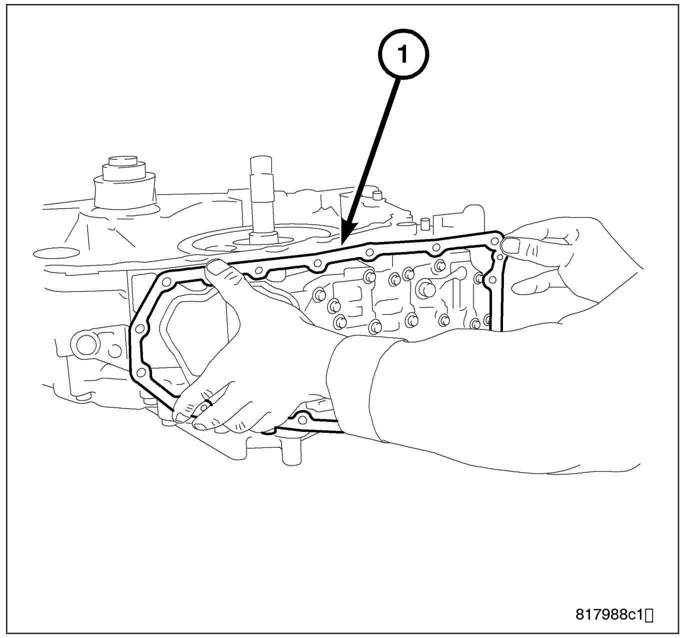
30. Remove the bolts holding the bracket (1) to the oil pump cover and the transaxle.
31. Remove the bracket (1).



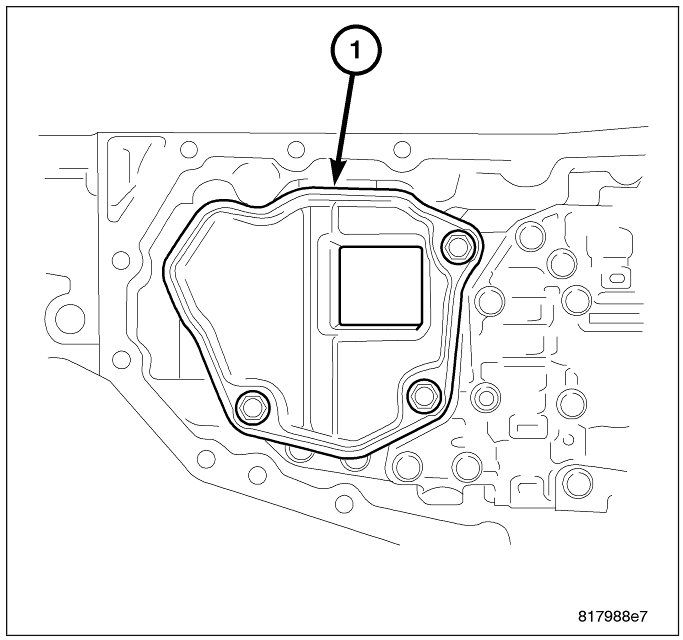
32. Remove the bolts holding the baffle plate (1) to the transaxle.
33. Remove the baffle plate.



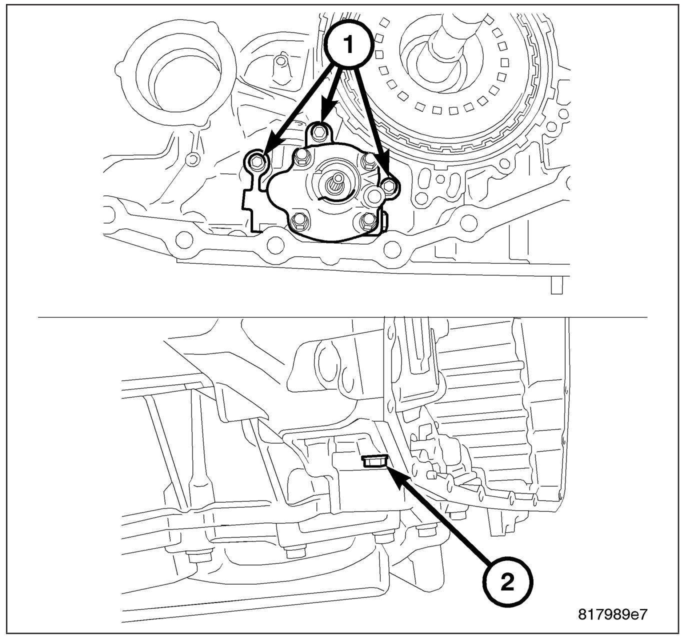
34. Remove the bolts holding the reaction shaft support (1) to the transaxle.
35. Remove the reaction shaft support from the transaxle case.



36. Remove and discard the seal rings (1) from the reaction shaft support.

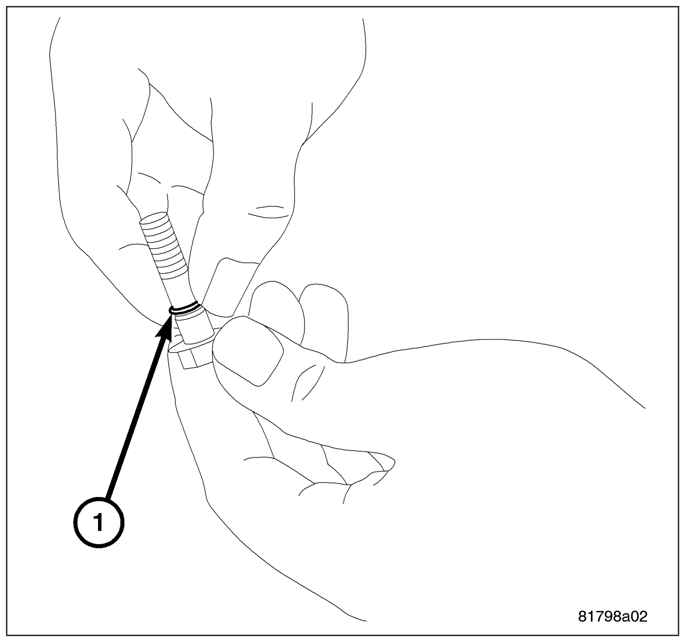


37. Remove the bolts holding the oil pan (1) to the transaxle case.
38. Remove the oil pan from the transaxle case.

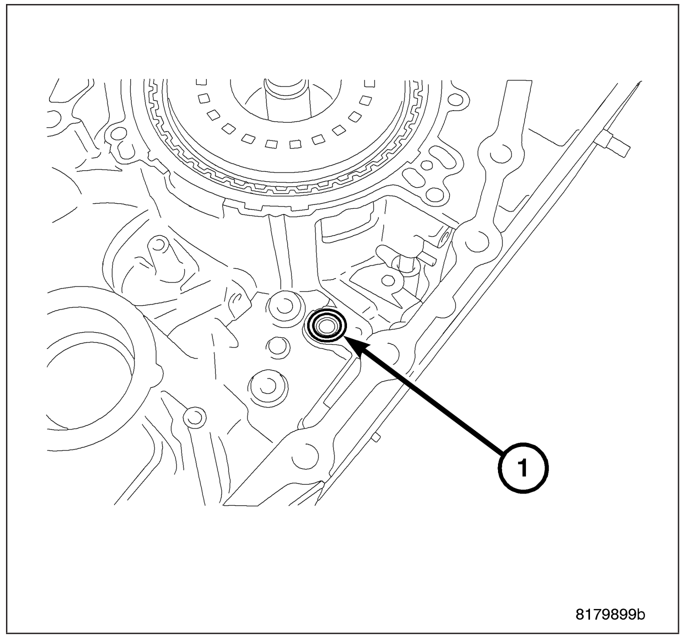


39. Remove the oil pan gasket (1) from the transaxle case.

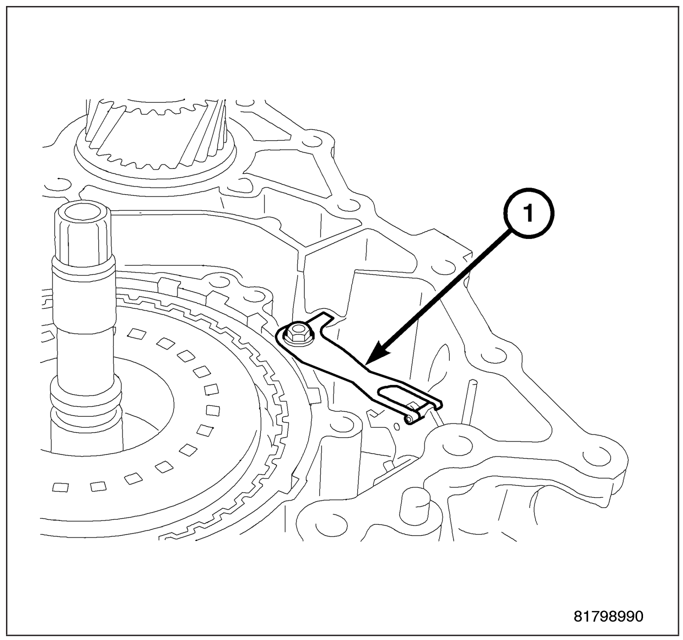
40. Remove the bolts holding the oil strainer (1) to the valve body.
41. Remove the oil strainer.
42. Remove and discard the oil strainer o-ring.



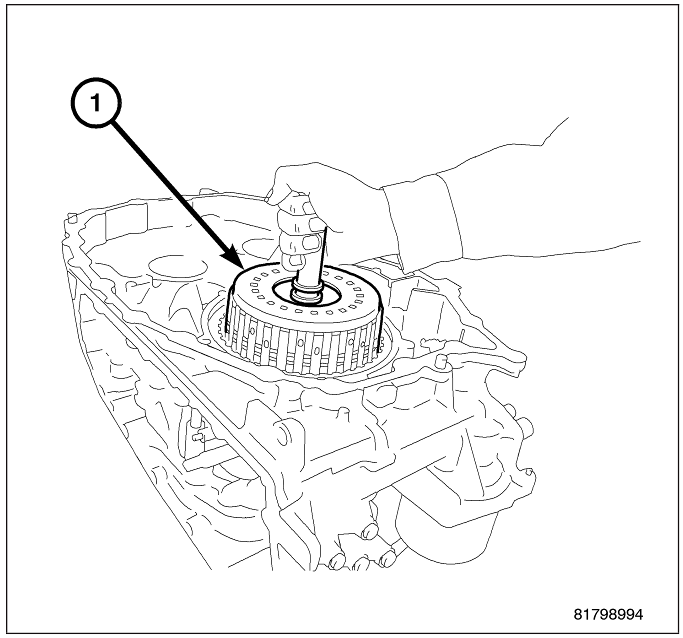
43. Remove the bolt (2) holding the oil pump to the transaxle case from the rear of the transaxle.
44. Remove the bolts (1) holding the oil pump to the transaxle case from inside the transaxle.
45. Remove the oil pump from the transaxle case.



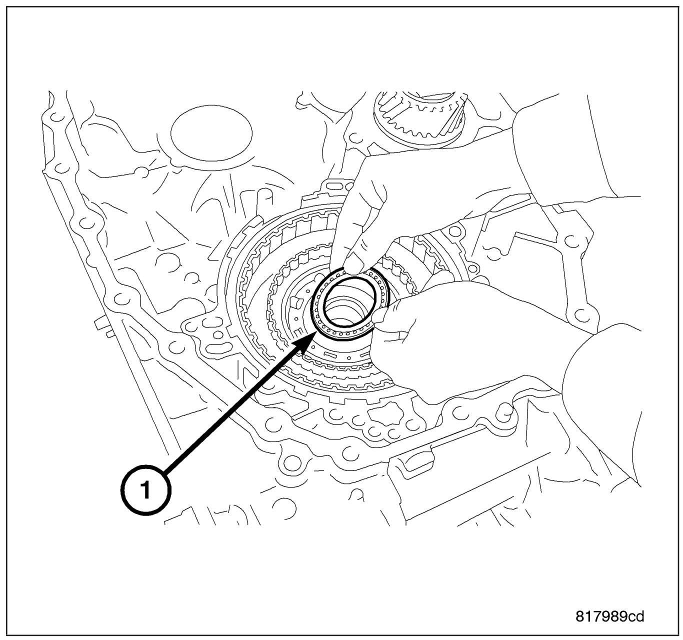
NOTE: One of the oil pump retaining bolts is installed from the outside of the transaxle case into the rear part of the oil pump.



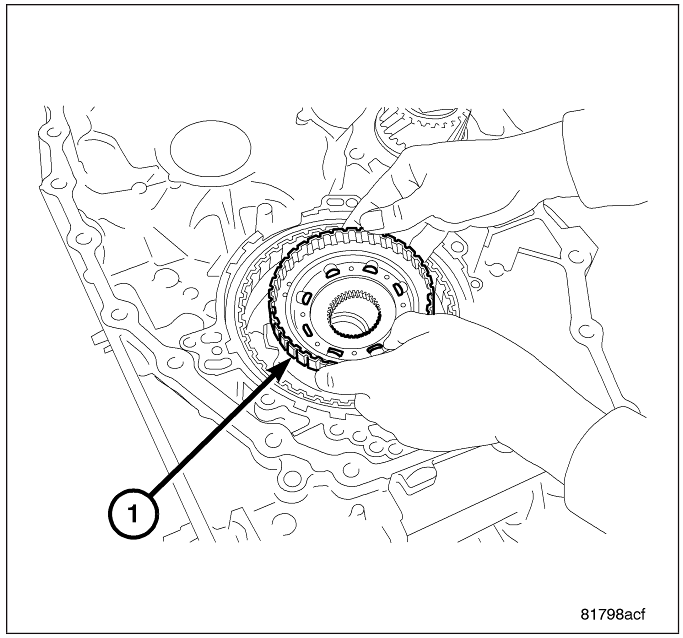
46. Remove and discard the o-ring (1) from the oil pump mounting bolt. (Only on bolt installed from the outside of the transaxle case)



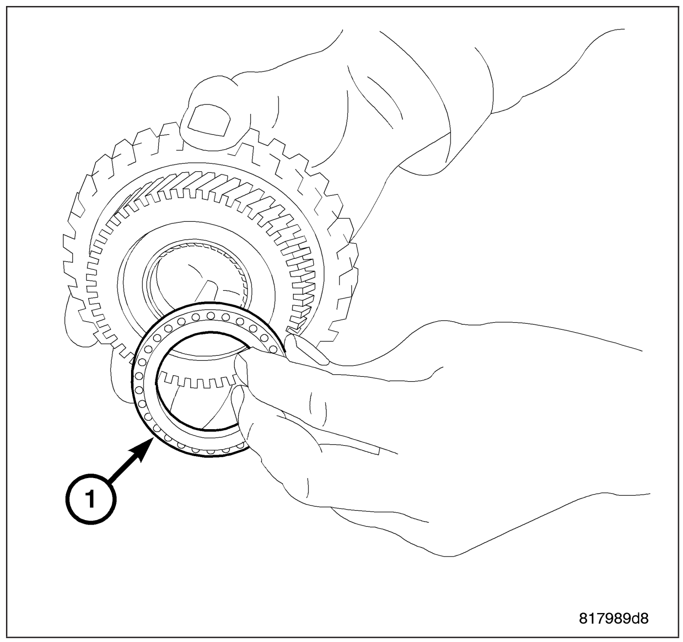
47. Remove and discard the lip seal (1) from the transaxle case.



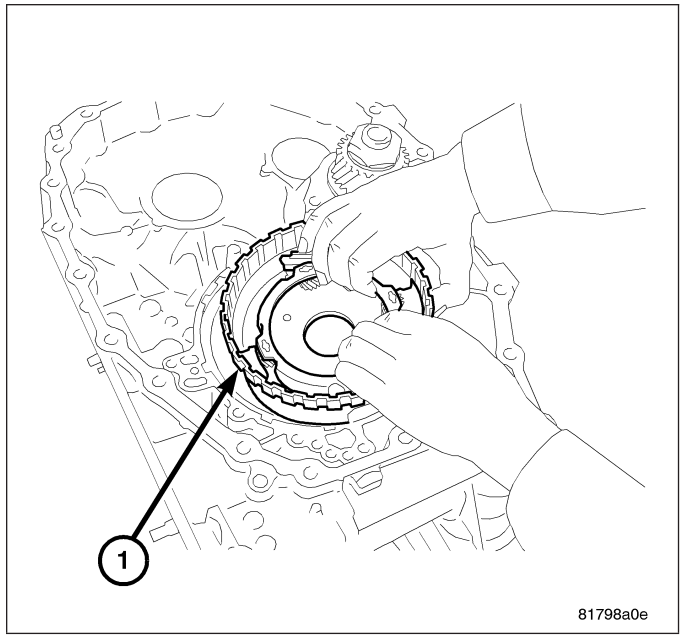
48. Remove the bolt holding the detente spring (1) to the transaxle case.
49. Remove the detente spring from the transaxle case.



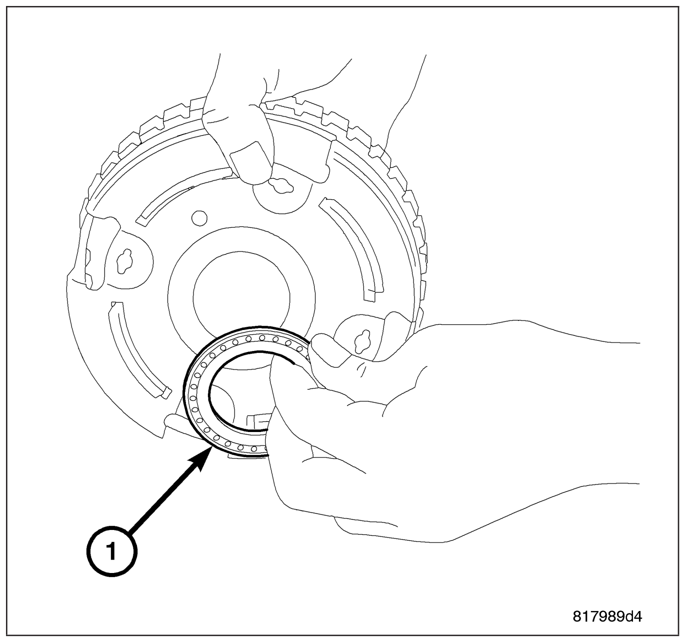
50. Remove the forward clutch assembly (1) from the transaxle case.



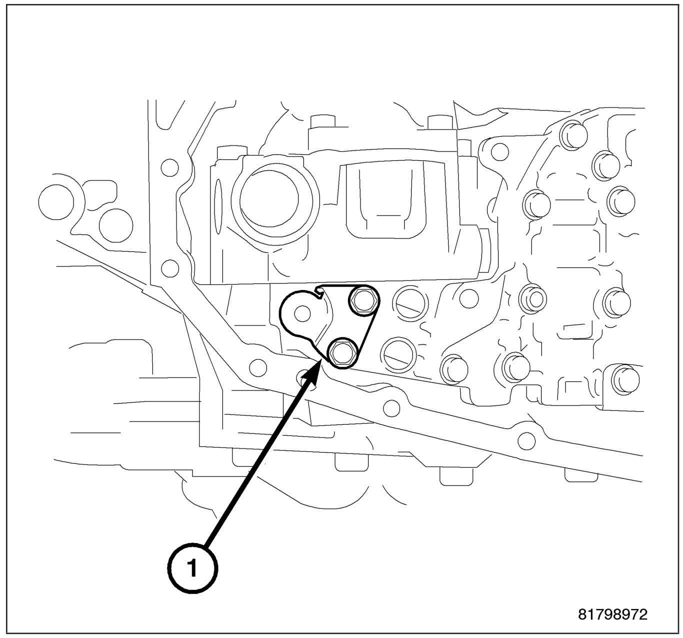
51. Remove needle bearing (1) from forward clutch drum side of the sun gear.



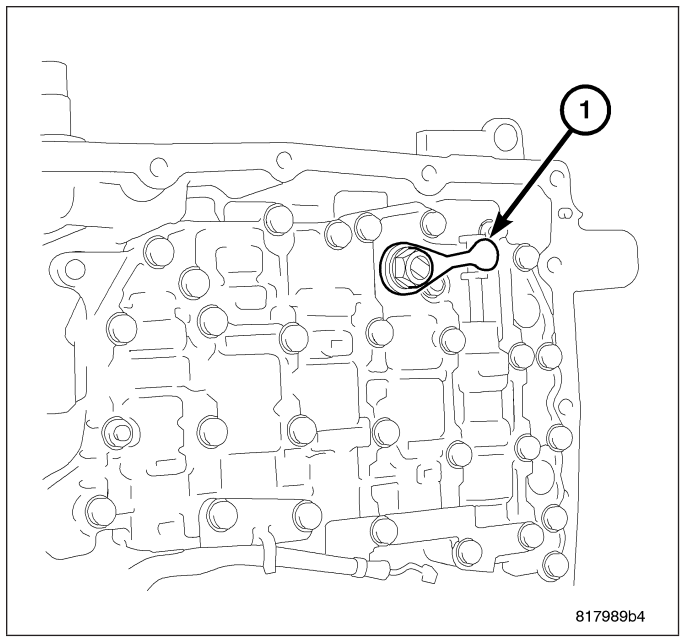
52. Remove the sun gear (1) from the planetary carrier.



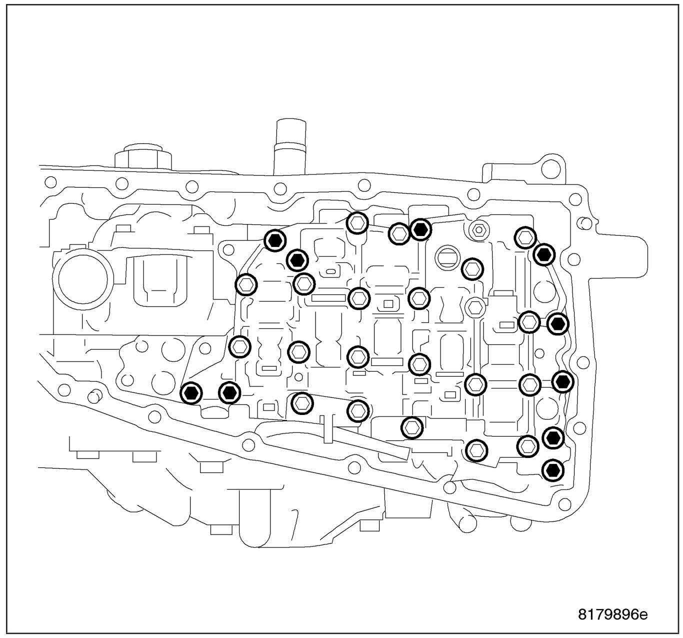
53. Remove the needle bearing (1) from the sun gear.



54. Remove the planetary carrier assembly (1) from the transaxle case.

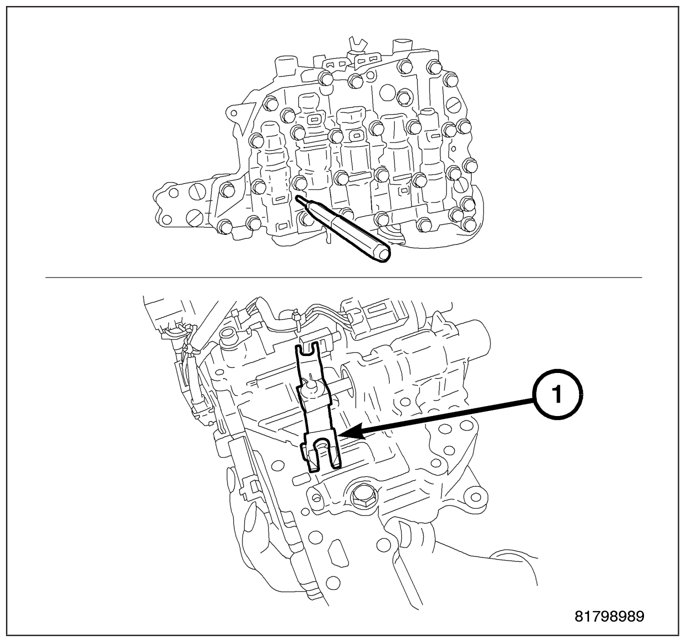


55. Remove the needle bearing (1) from the planetary carrier.

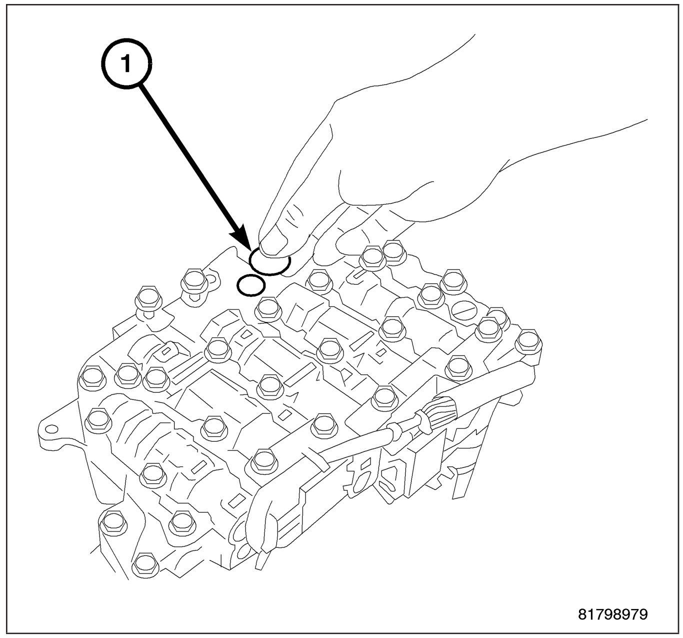


56. Remove the bolts holding the bracket (1) to the valve body assembly.
57. Remove the bracket from the valve body assembly.

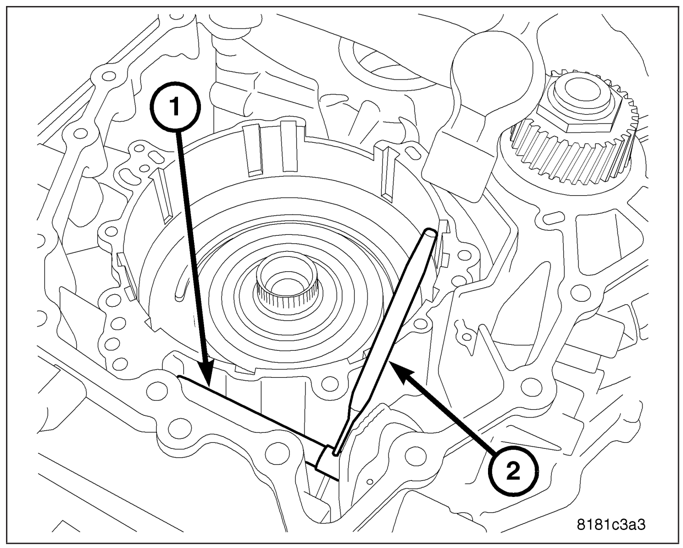
58. Remove the nut holding the manual lever (1) to the manual shaft.
59. Remove the manual lever.



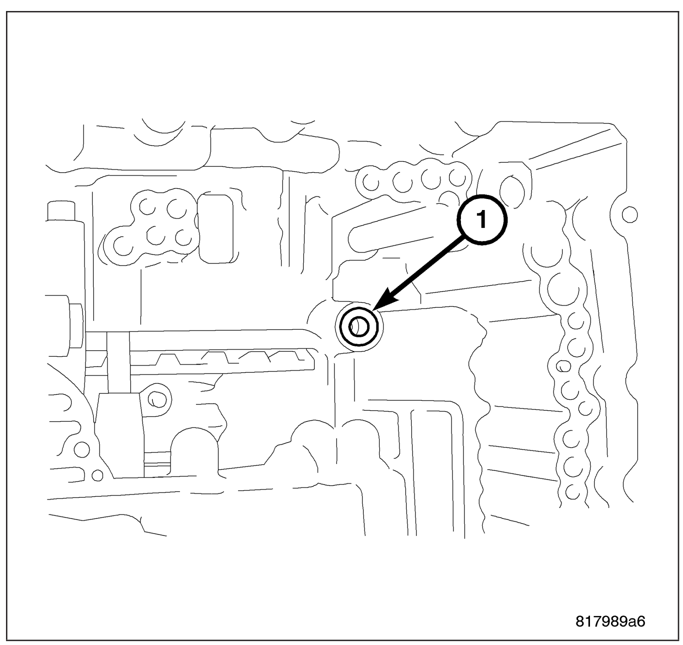
60. Use this picture when removing valve body attaching bolts.



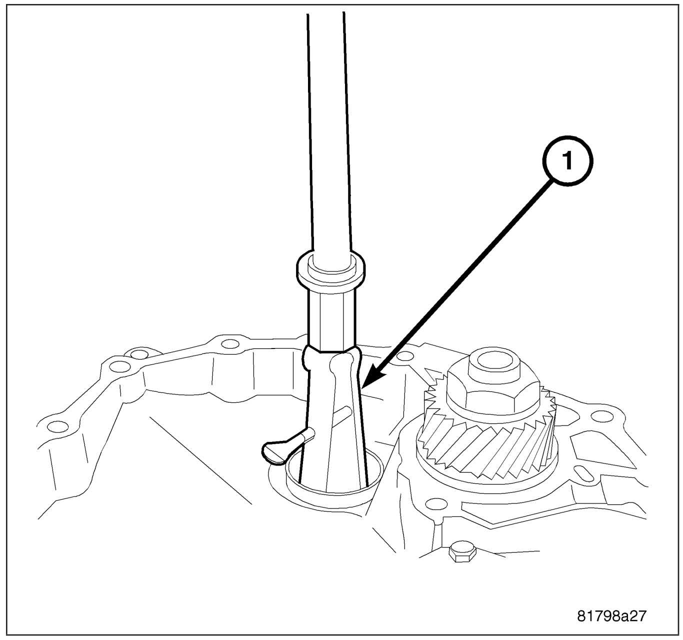
CAUTION: Tilt the valve body assembly away from the transaxle case on the manual shaft side to ease removal. Pay attention to completely remove the terminal body from the transaxle case.



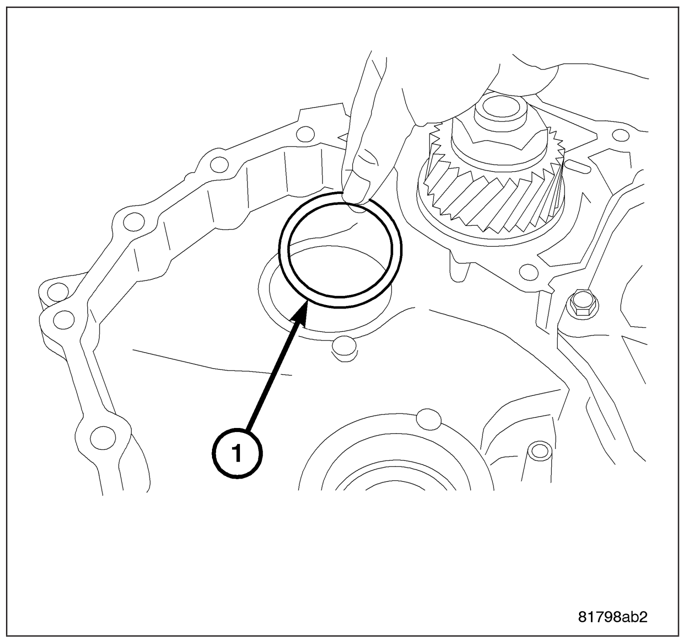
61. Remove the valve body assembly from the transaxle case as follows:
    a. Insert a 75 mm (3 in.) long 3 mm (0.118 in.) rod or wire into the linkage stopper hole of the valve body assembly to fix the pulley ratio linkage (1).
    b. Remove the bolts holding the valve body assembly to the transaxle case.
    c. Remove the valve body assembly from the transaxle case.



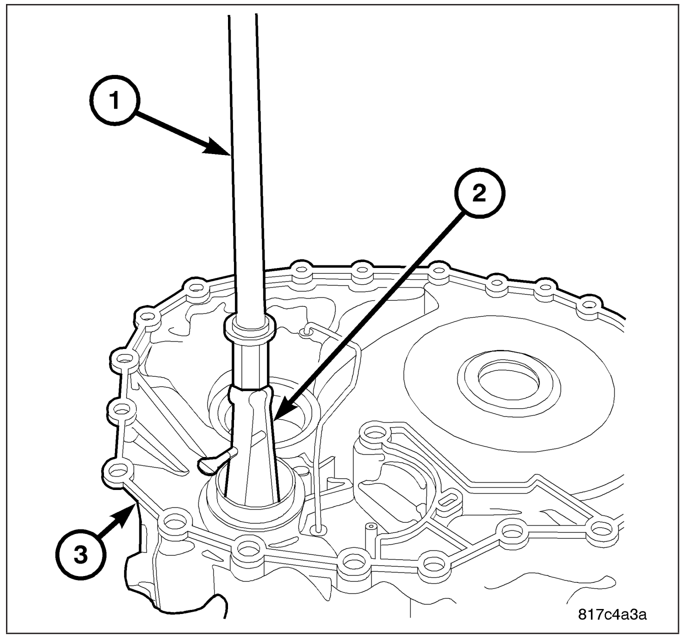
62. Remove and set aside the bushing (1) from the valve body.



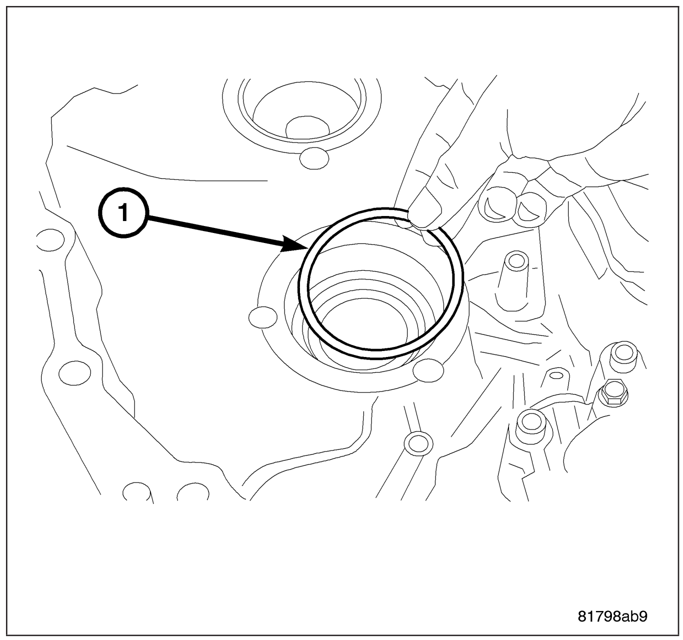
63. Remove the pin at the manual shaft using a punch (2).
64. Remove the manual shaft from case.



65. Remove and discard the lip seal (1) from the transaxle case.

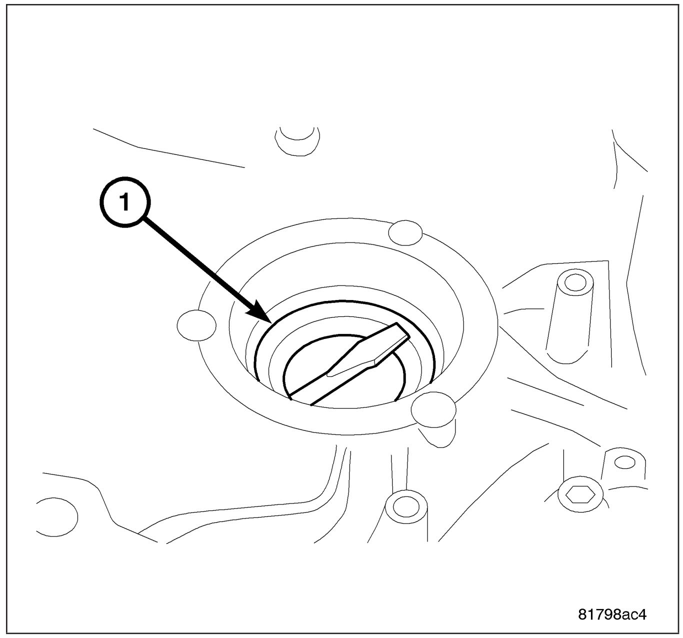


66. Remove outer race (1) of differential side bearing from converter main housing using Puller 9664 and Slide Hammer C-637.

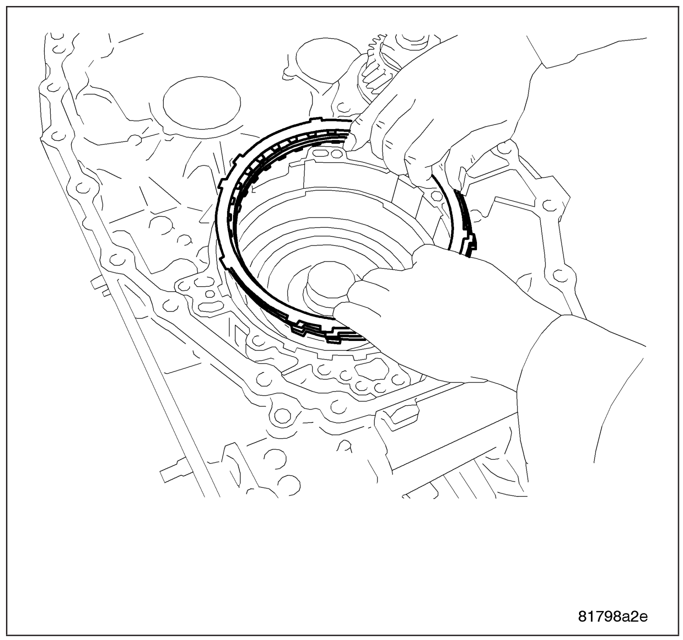


67. Remove the selective shim (1) from the transaxle case.

68. Remove outer race of reduction gear bearing (1) from transaxle case using Slide Hammer C-637 and Remover 7794-A.

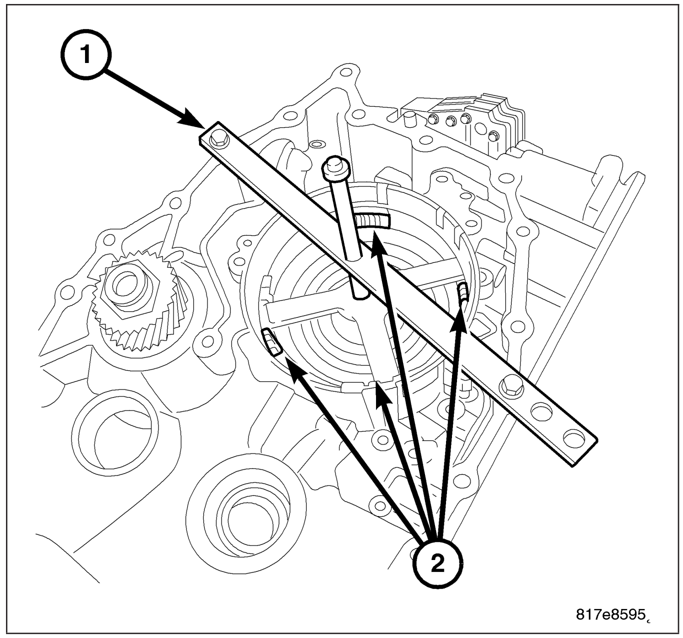


69. Remove the selective shim (1) from the transaxle case.



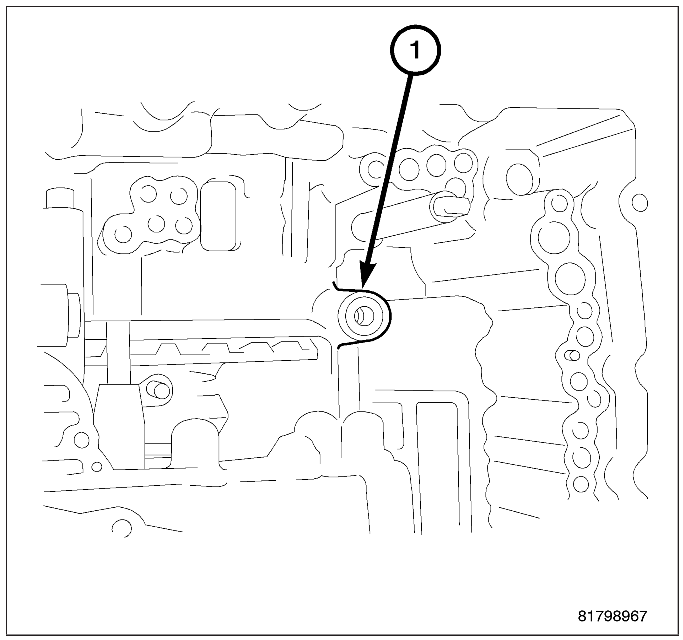
CAUTION: When removing the side oil seal, do not damage to the transaxle case.

70. Remove side oil seal (1) from transaxle case using a screwdriver.



CAUTION: Check if there is damage, deformation, or burning on the surface of any of the drive or driven plates. Check for permanent fatigue of the dish plate, driven plates, retaining plate, snap ring, and the drive plates. Replace all reverse brake components if any of these conditions exist.

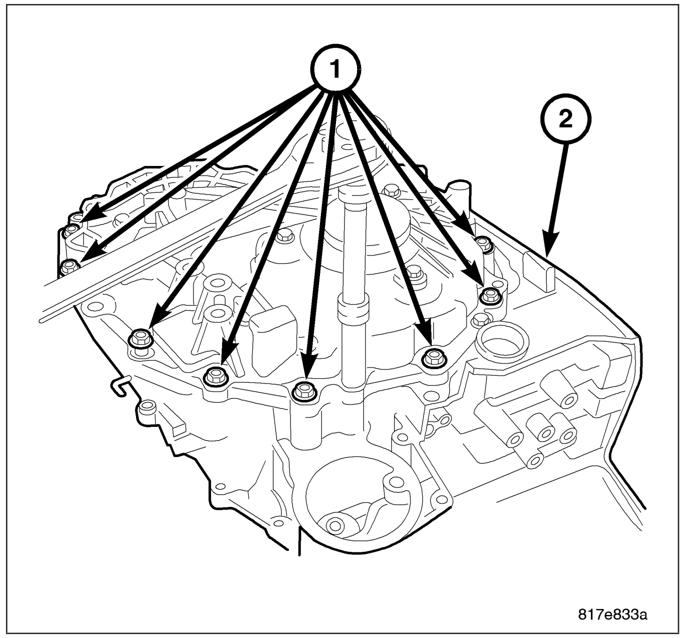
71. Remove the reverse brake snap ring using a screwdriver. Then remove the reverse brake retaining plate, the drive plates, the driven plates, and the dish plate from the reverse brake drum.



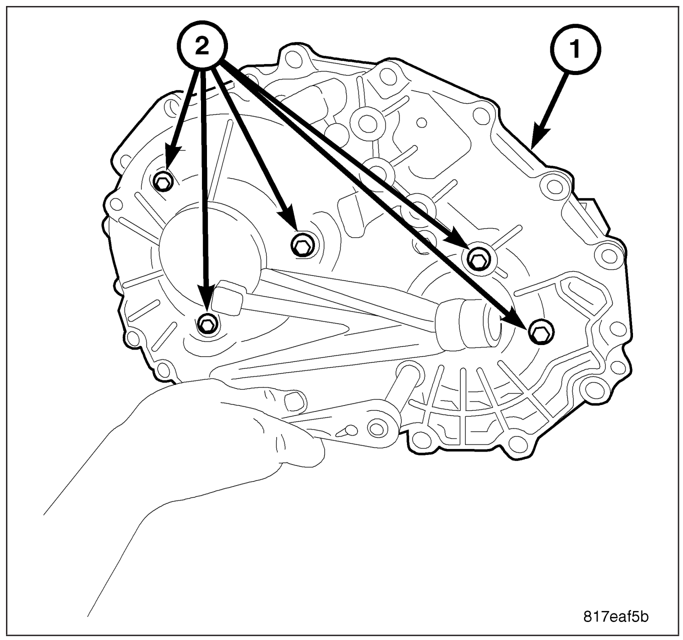
CAUTION: Set the spring compressor right on top of the return spring of the spring retainer assembly. Do not remove the return springs from the spring retainer assembly.

72. Compress the reverse brake return spring using Spring Compressor 5058A (1) and Reverse Piston Compressor 9875. Remove the snap ring (2) from the transaxle case.
73. Remove the retaining plate and the spring retainer assembly.

CAUTION: There is a possibility that the reverse brake piston might be stuck if excessive pressure is required to remove.



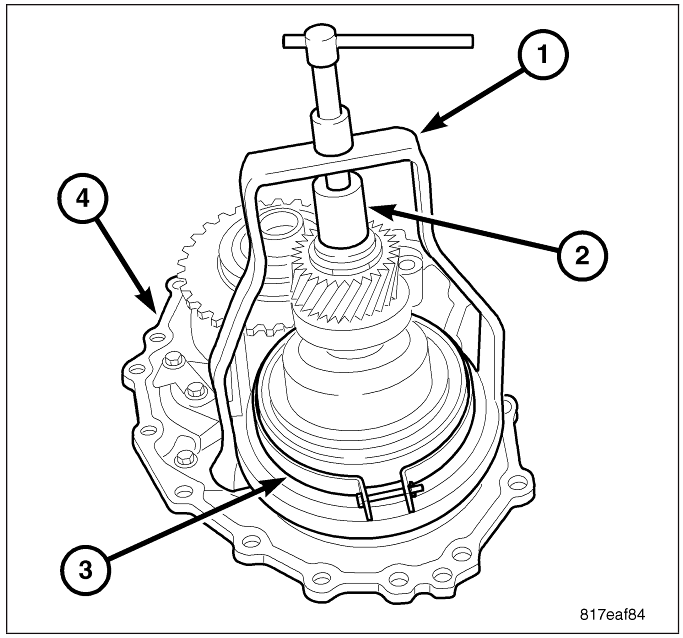
74. Try removing the reverse brake piston from the transaxle case by hand, apply compressed air to the fluid passage (1). and remove the reverse brake piston from the transaxle case if unable to remove by hand.



75. Remove the case bolts (1) at the drive belt assembly (2).

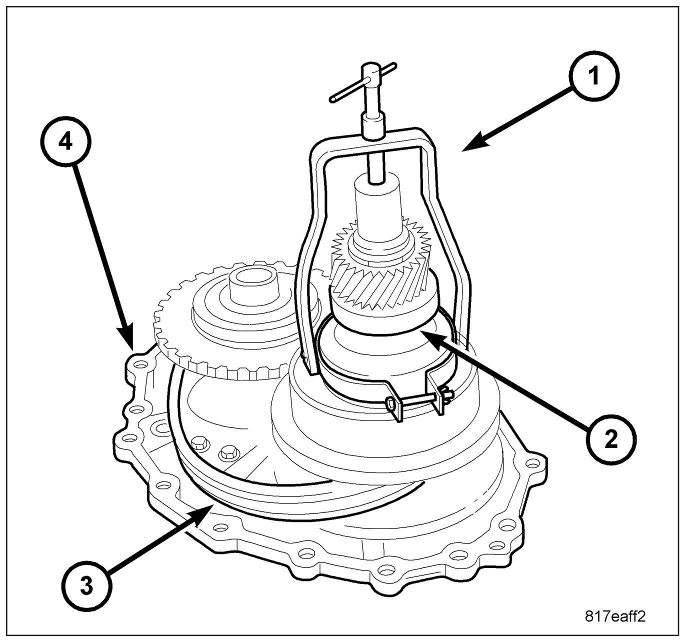
NOTE: Pin at pulley sensor stays with drive belt assembly case

76. Separate drive belt assembly case from main housing.



77. Remove the bolts (2) that hold both sheaves to the case (1).

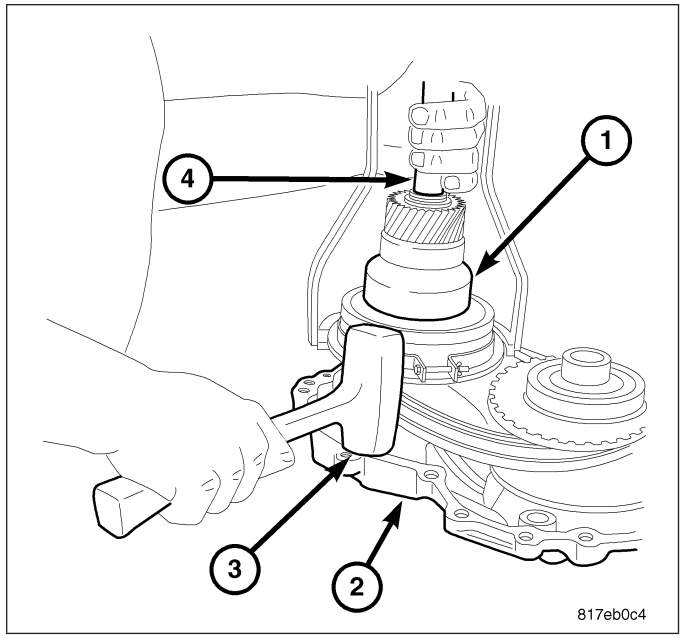
CAUTION: Do not allow the Sheave Compressor 9874 to come in contact with the belt at any time



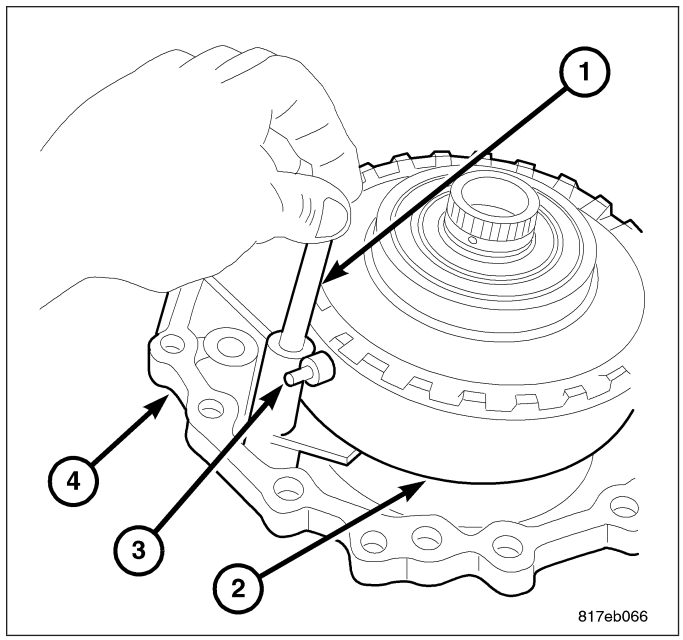
78. Install the Sheave Compressor 9874 (1) and Press Insert 8513A (2) onto the secondary sheave (3).

CAUTION: Do not over tighten the compressor tool. Tighten to no more than 7 N·m (50 in. lbs.)

NOTE: The belt is directional, look for an arrow indicating the direction of the belt for installation

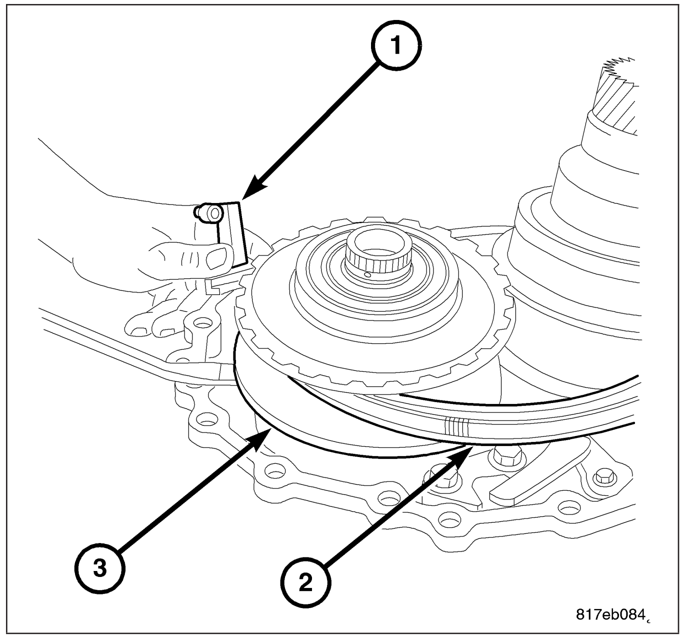


79. Compress sheave (2) to the stop.

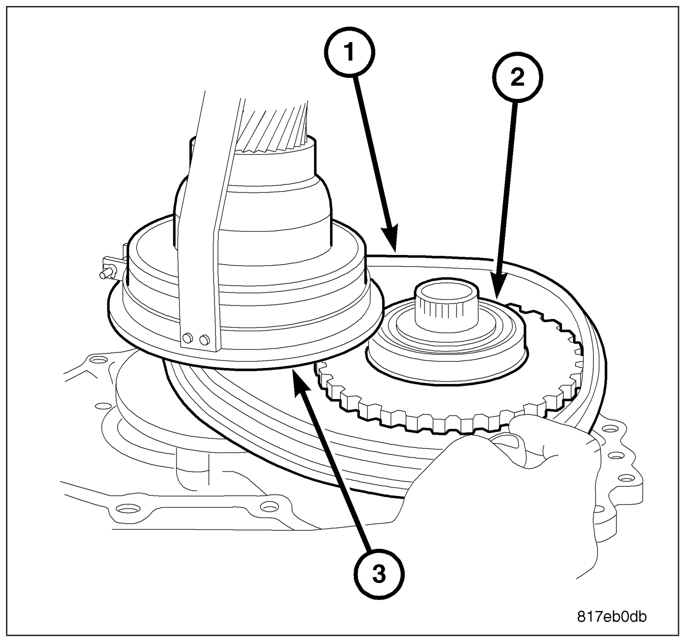


CAUTION: Do not allow the primary sheave to contact the drive surface of the secondary sheave.

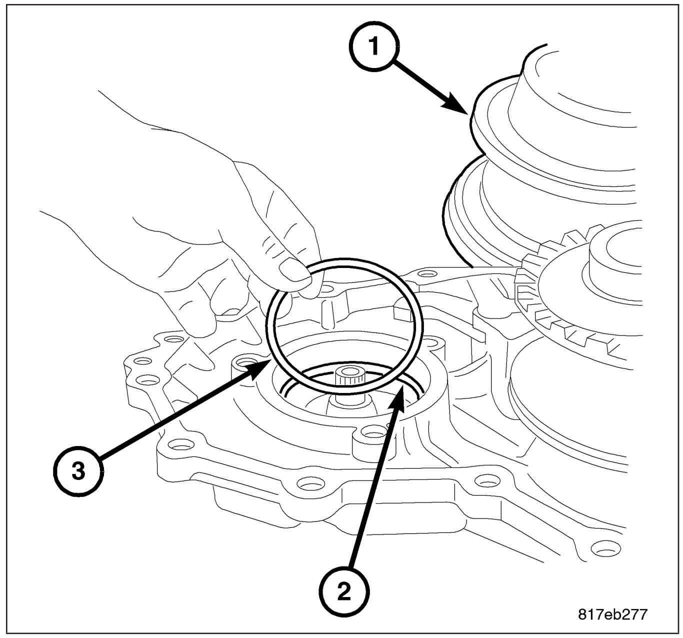
NOTE: You may need to lightly tap case while holding secondary sheave.



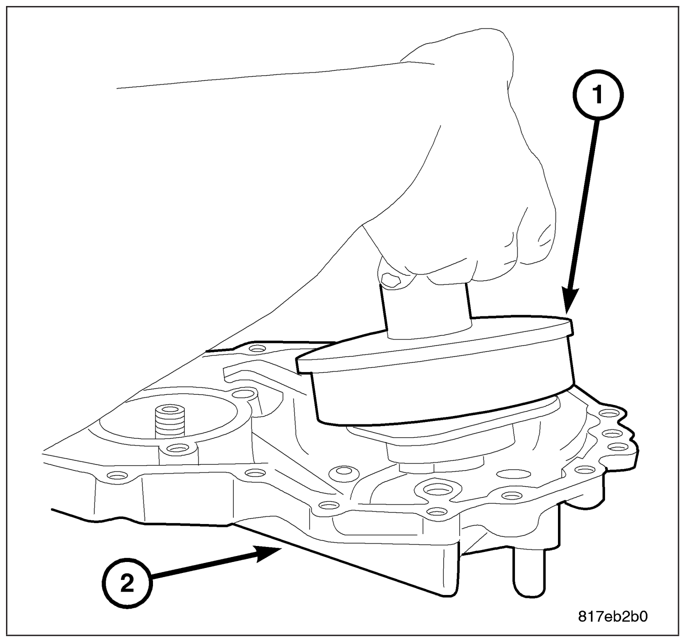
80. Lift and move the secondary sheave (1) closer to the primary sheave.



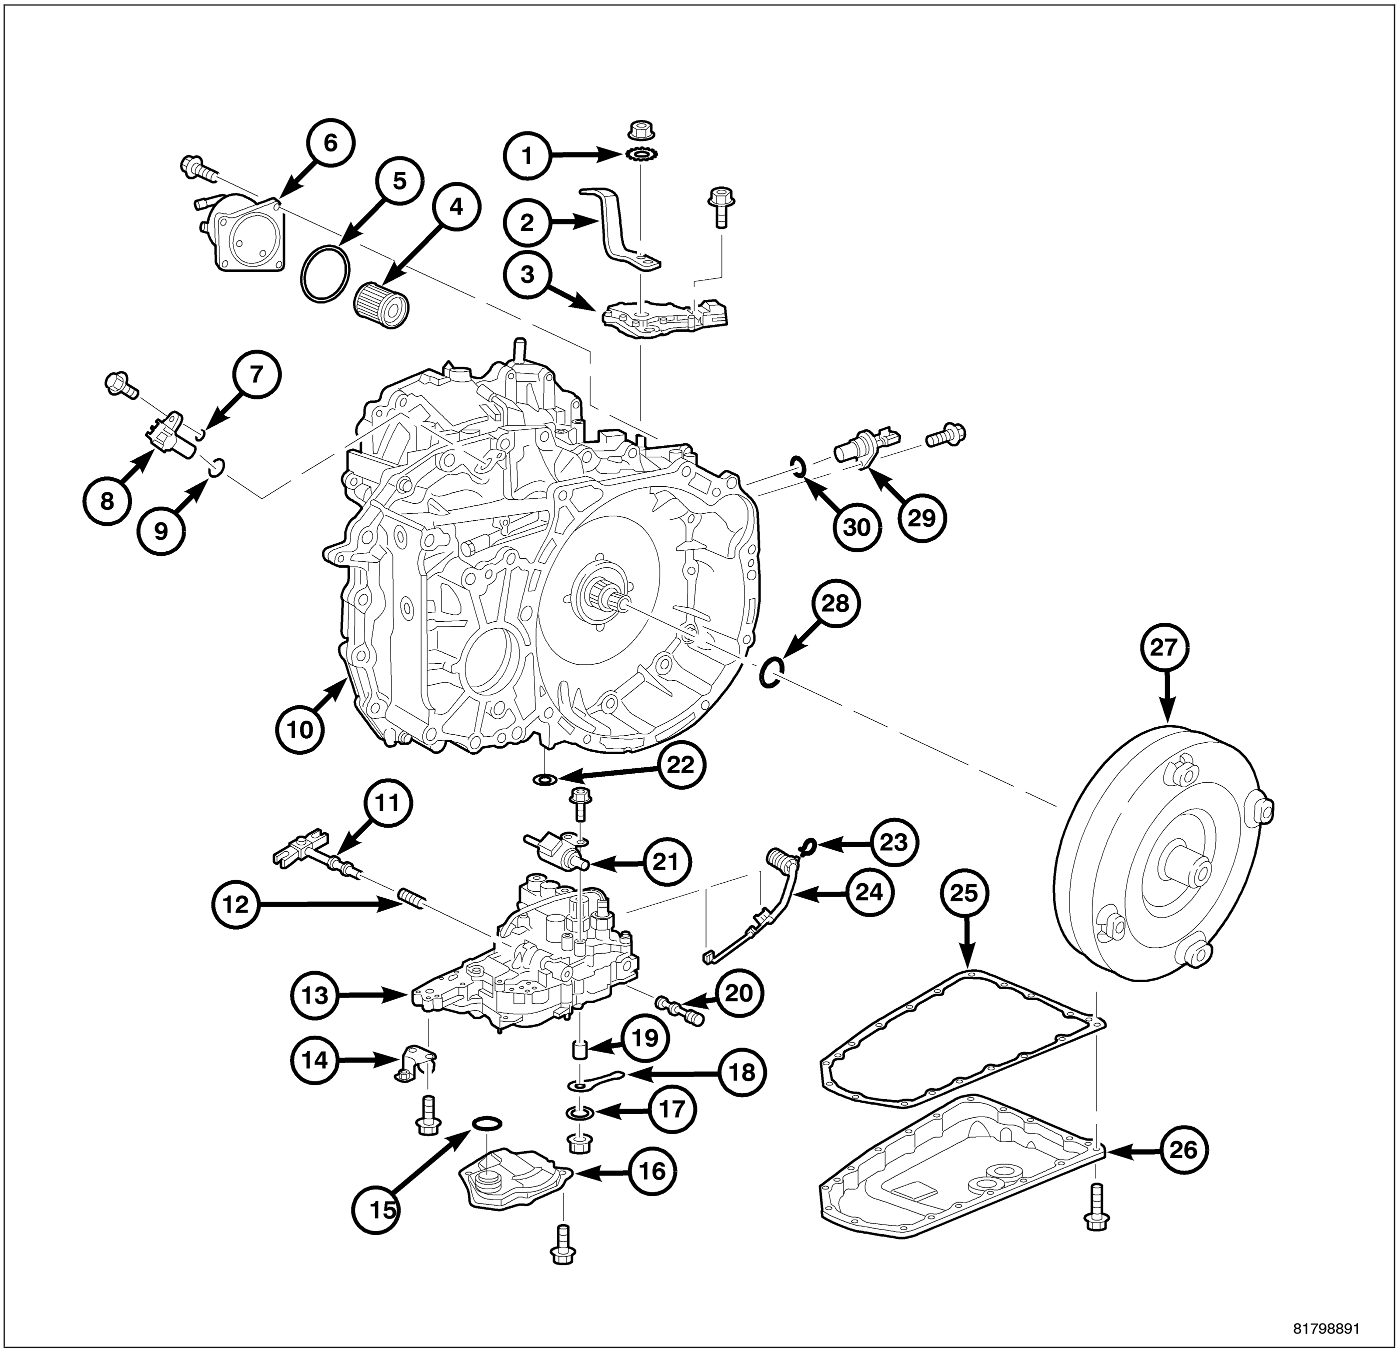
81. Remove the pin (1) from the sheave height sensor (3).



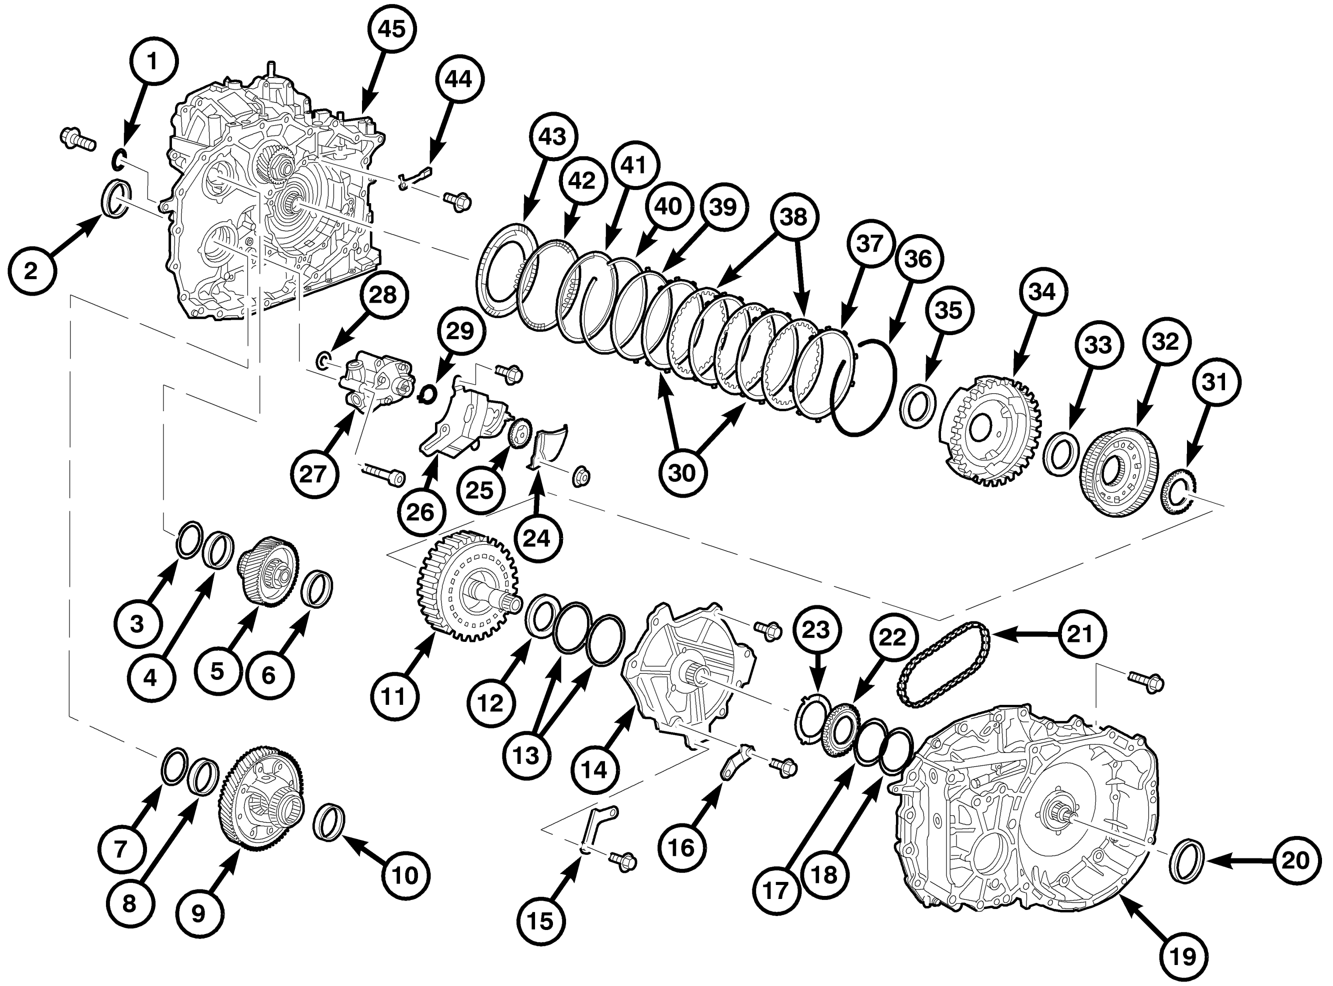
82. Lift the primary sheave (3) enough to remove the sheave height sensor (1).



83. Remove the drive belt (1) from both secondary (3) and primary sheaves (2).
84. Remove the secondary sheave.



85. Remove the shim (3) under the secondary sheave (1).



86. Remove the primary sheave.
87. Remove bolts at the park pawl.
88. Remove the park pawl.

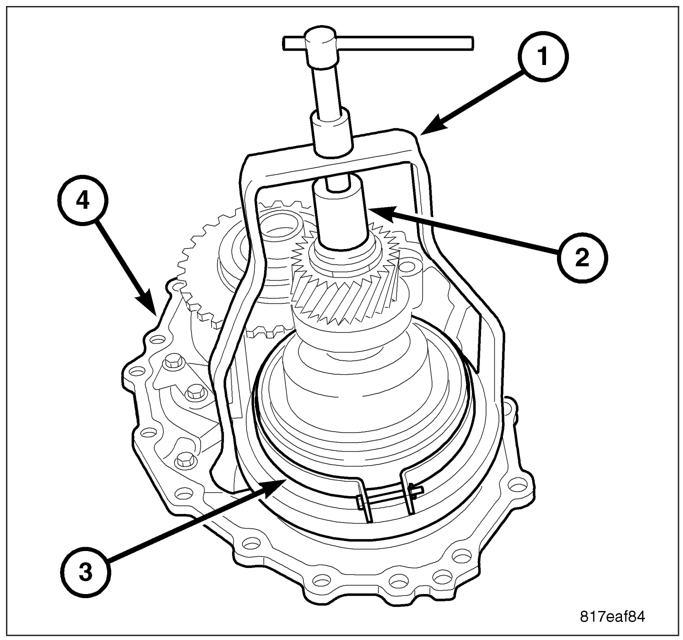
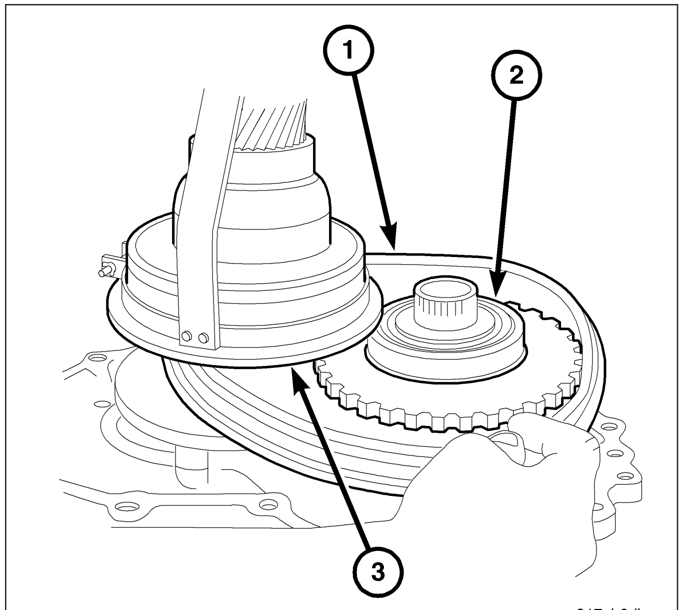
45 - TRANSAXLE CASE



1. Refer to the exploded views as necessary when performing the following steps.
2. Install the primary sheave (2) with the sheave height sensor, (3) spring and pin (1) into the belt side case.

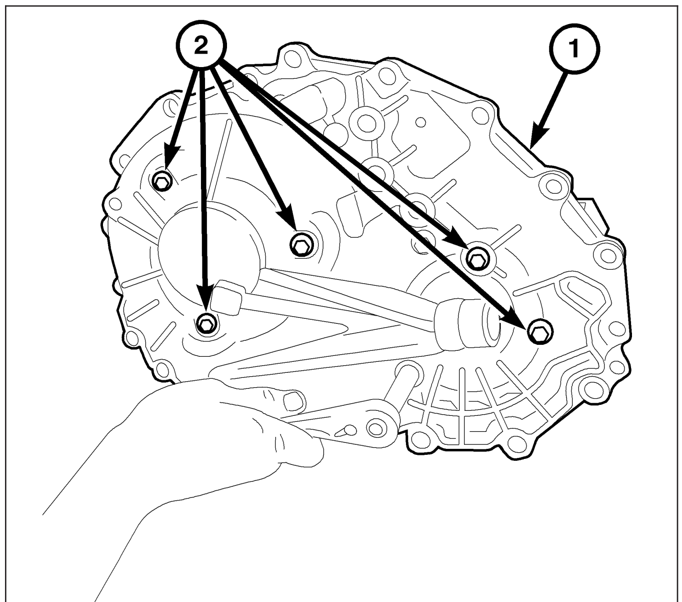
3. Install the secondary sheave positioning shim (3) into the belt side cover.

4. Install Sheave Compressor 9874 (1) and Press Insert 8513 A, (2) onto secondary sheave.



5. Move the secondary sheave (3) close enough to the primary (2) sheave to allow the drive belt (1) to be put around both secondary and primary sheaves.

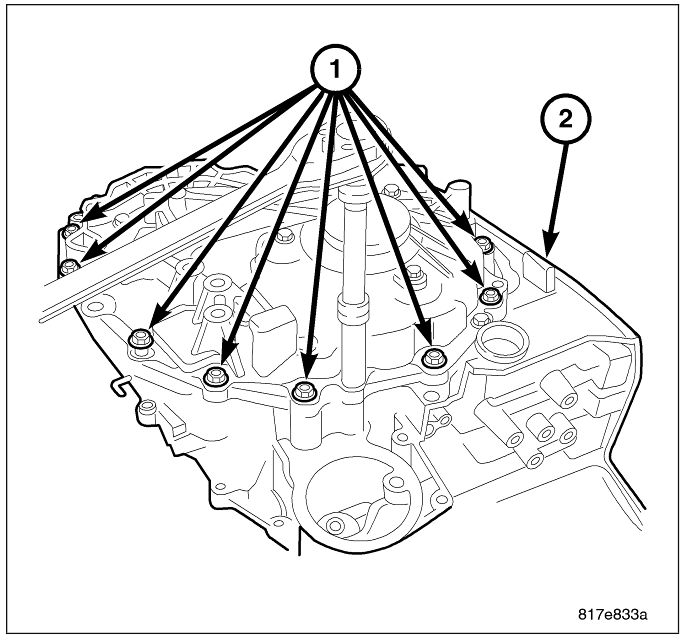
NOTE: The drive belt is directional and will need to be installed in the same direction as noted in disassembly, if installed incorrectly failure will accrue



6. Install the drive belt (1).

CAUTION: Do not over tighten the compressor tool. Tighten to no more than 7 N·m (50 in. lbs.)

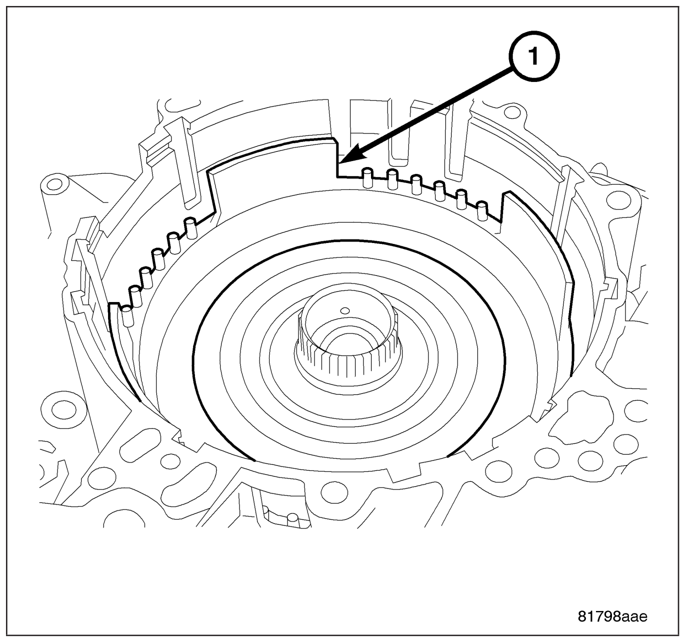
7. Compress the secondary (3) sheave to the stop.
8. Install the drive belt (1) around both secondary (3) and primary (2) sheaves.
9. Install the primary sheave into place.
10. Remove Sheave Compressor 9874 and Press Insert 8513A from the primary sheave.
11. Install the bolts (2) that hold both sheaves to the case (1).



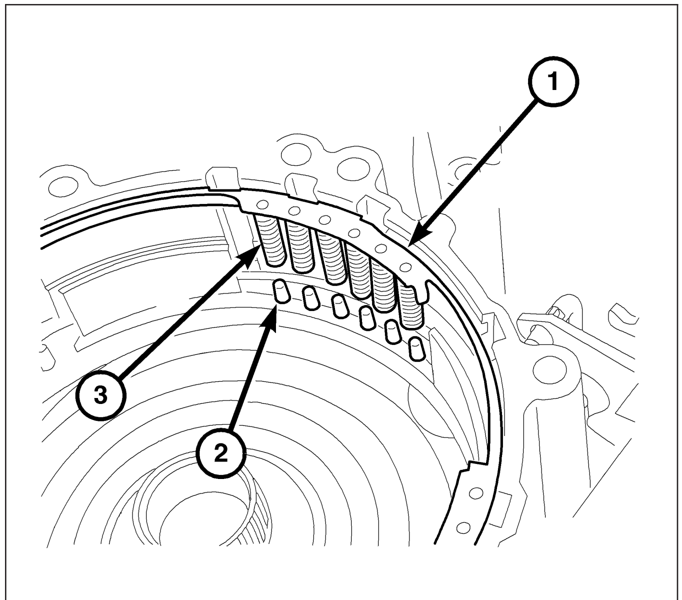
817eb0db

817eaf5b

CAUTION: Remove moisture, oil, and used sealant from the sealant application surface. Make sure that the starting point and the ending point are between two bolt holes.



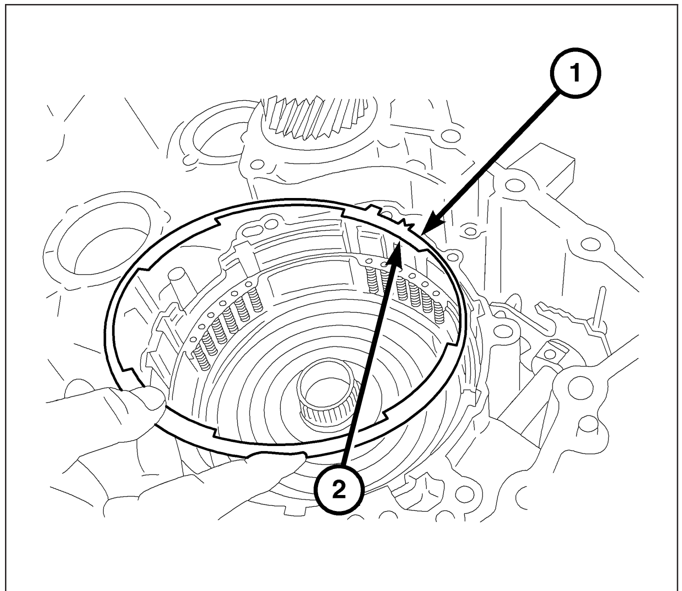
12. Apply Loctite 509 sealer onto the belt side of the transaxle case.
13. Install the belt side assembly to the transaxle case.
14. Install the case bolts (1) to hold the drive belt assembly (2) to the transaxle. Torque to 45 N·m (33 ft.lbs.).



CAUTION: Inspect the reverse brake piston and, if damaged, replace it before installation. Apply CVT fluid to the seal when installing the reverse brake piston.

NOTE: Rotate reverse brake piston into place

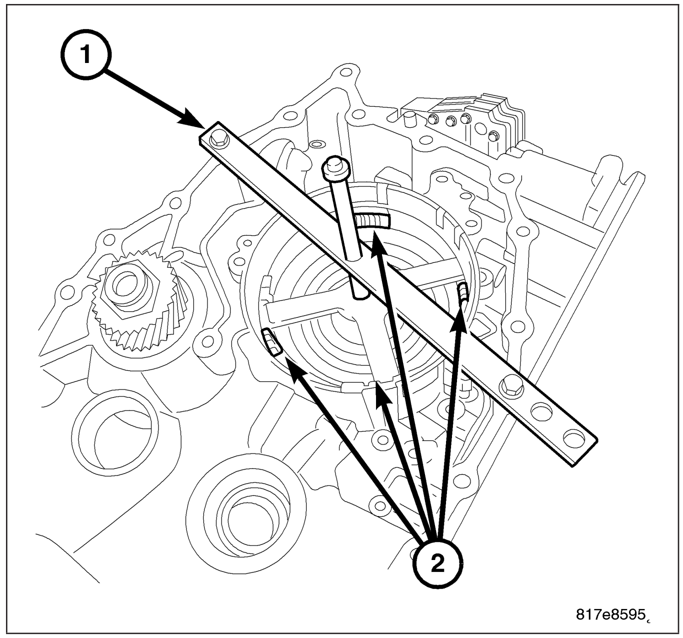
15. Rotate and install the reverse brake piston (1) into the transaxle case.



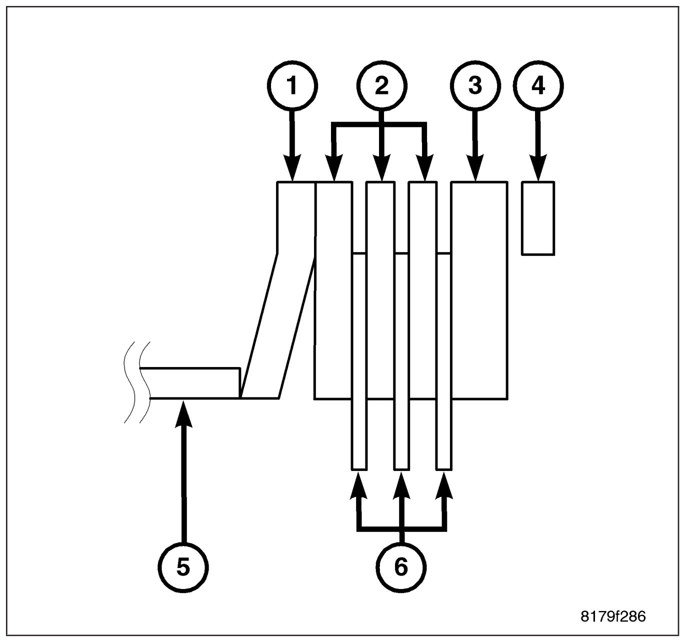
16. Align the return springs (3) of the spring retainer assembly (1) to the locating posts (2) of the reverse clutch piston.

817a34b9

NOTE: There is a notch in the retaining plate that points to the top of the case



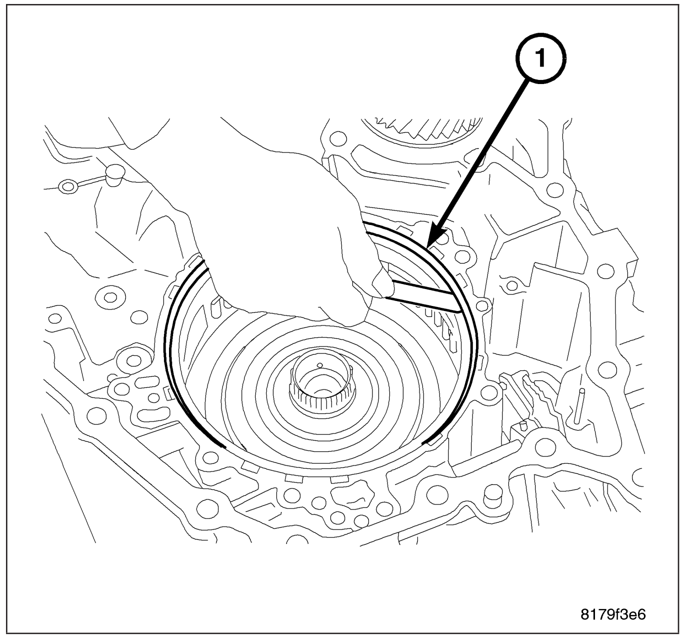
17. Install the retaining plate (1) into the transaxle case with the notch on the plate to the top (2).



817a34fe

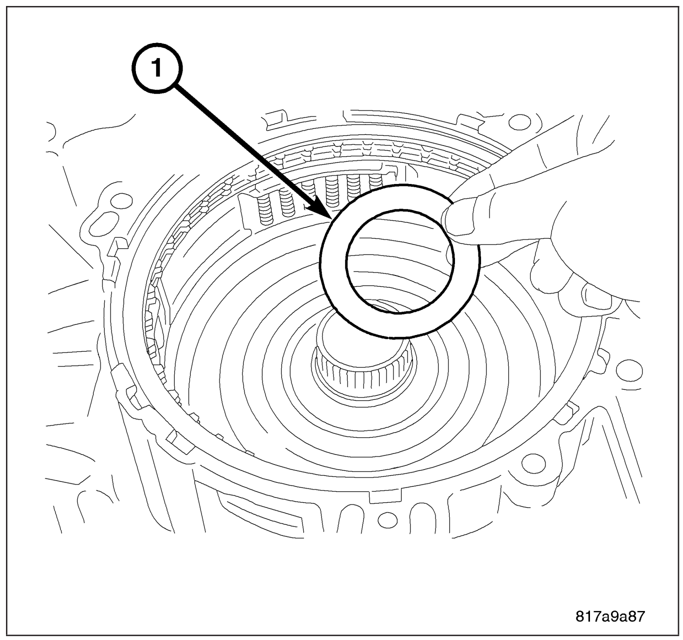
CAUTION: Set the spring compressor on top of the spring of the spring retainer assembly.

18. Compress the reverse brake return spring using Spring Compressor 5058 A (1) and Reverse Piston Compressor 9875 and install the snap ring into the transaxle case using a screwdriver.



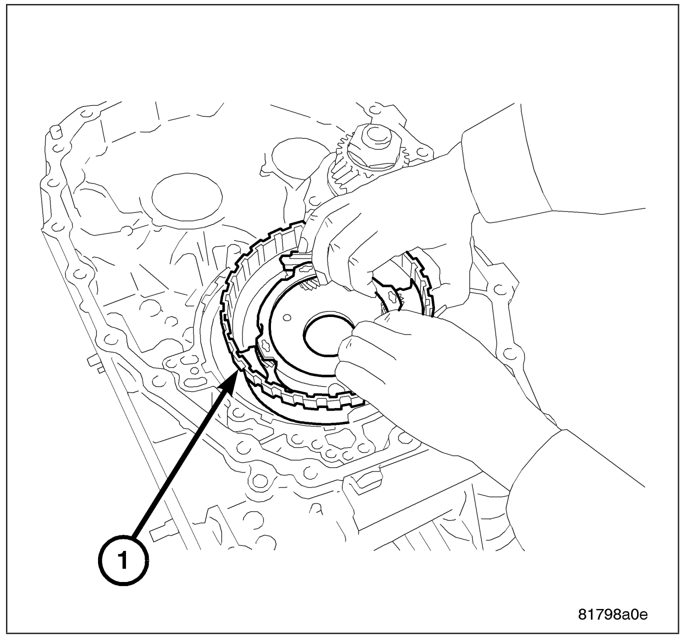
19. Install the dish plate (1) with the convex side down onto the reverse brake piston.
20. Install driven plate (2) and then a drive plate (6) until all the driven and drive plates are installed.
21. Install the retaining plate (3) into the reverse brake assembly.
22. Install the reverse brake snap ring (4) into the transaxle case.

CAUTION: When conducting measurements, measure two or more places and calculate the average value.



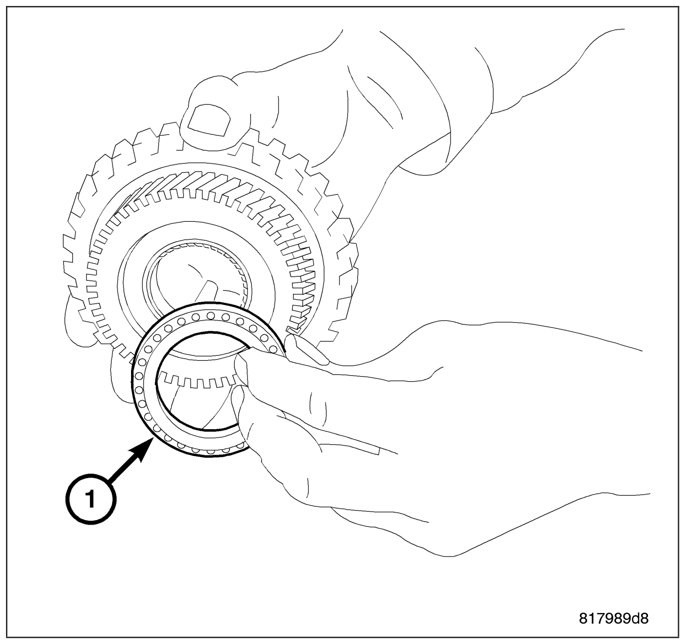
23. Measure the clearance between the snap ring and the retaining plate (1). The correct clutch clearance is 1.2-1.5 mm (0.047-0.059 in.). If the clutch clearance is not within specifications, measure the existing retaining plate and select the correct retaining plate.

CAUTION: Apply Vaseline or assembly lube when installing the needle bearing. Be careful to verify correct orientation of the needle bearing when installing it.



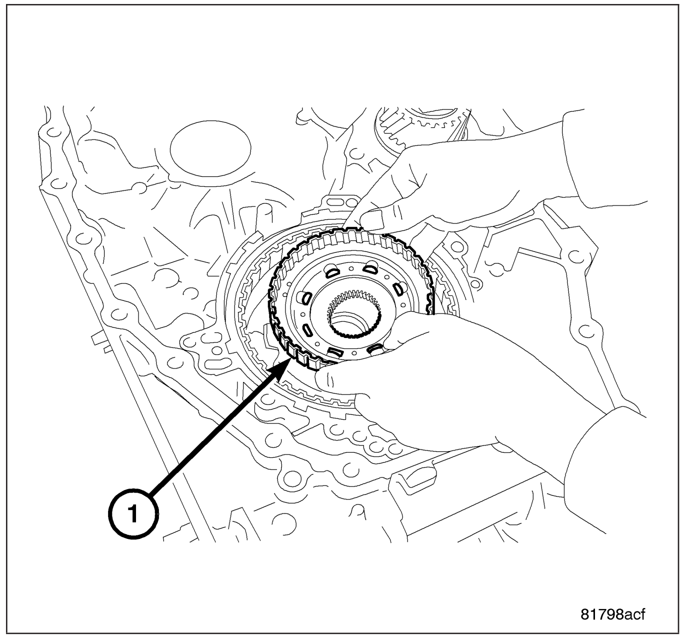
NOTE: The inner race will need to face down

24. Install the needle bearing (1) onto the reverse brake piston. Check for the direction of the needle bearing while installing.



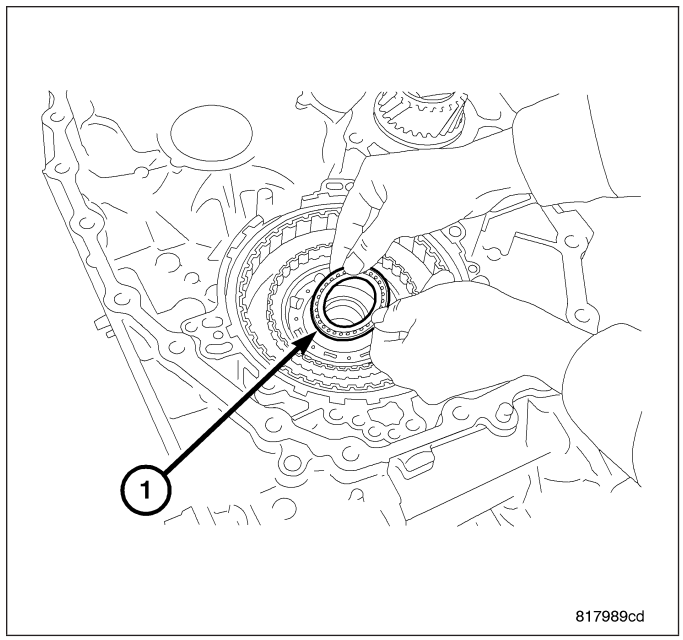
NOTE: The inner race will need to face down

25. Install the planetary carrier assembly (1) onto the reverse brake.

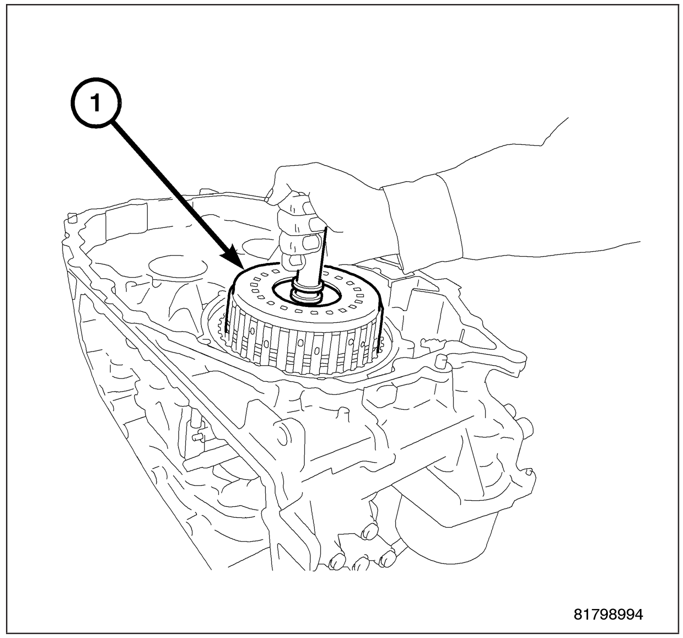


CAUTION: Apply Vaseline or assembly lube when installing the needle bearing. Be careful to verify correct orientation of the needle bearing when installing it.

26. Install the needle bearing (1) onto the primary pulley side of the sun gear.

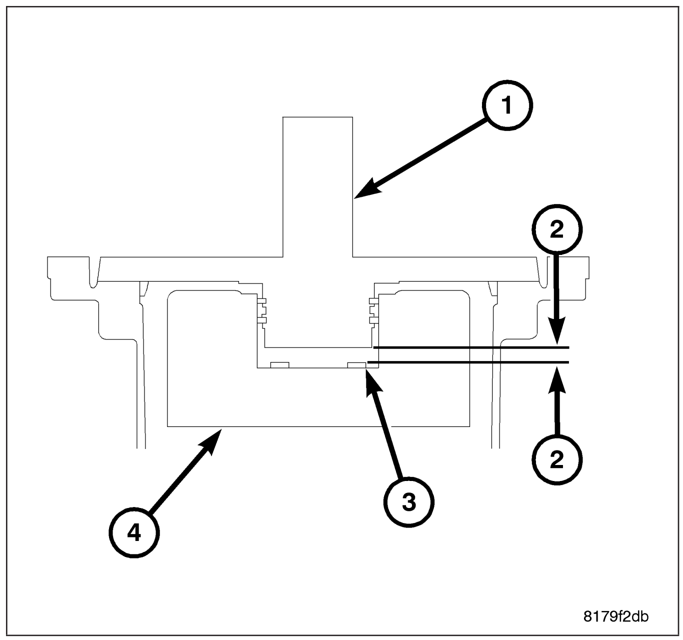


27. Install the sun gear (1) onto the planetary carrier.



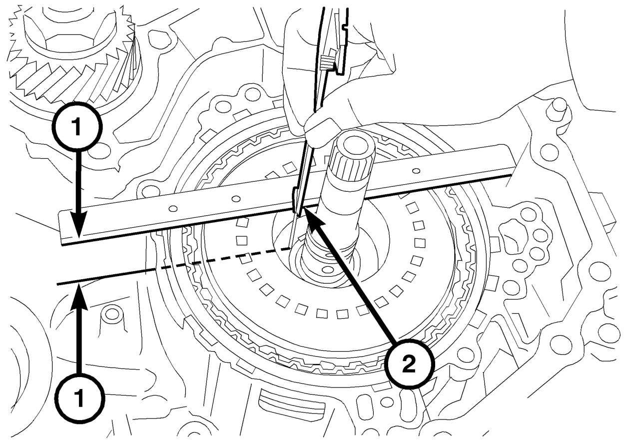
CAUTION: Apply Vaseline or assembly lube when installing the needle bearing. Be careful to verify correct orientation of the needle bearing when installing it.

NOTE: The inner race will need to face up



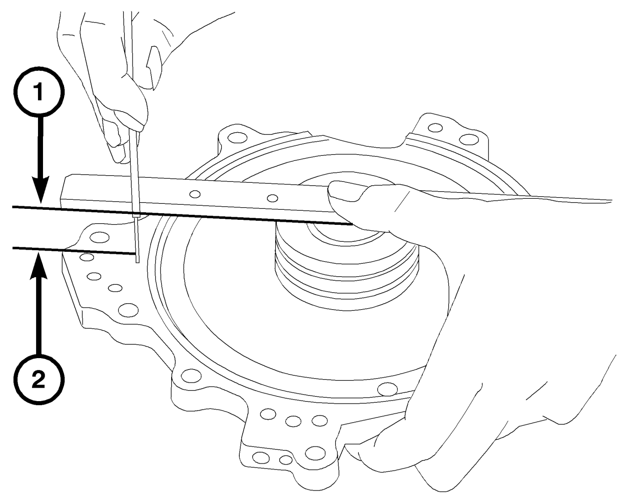
28. Install the needle bearing (1) on the forward clutch drum side of the sun gear.

29. Install the forward clutch assembly (1) into the transaxle case.



30. Measure the total end play (2) in the following steps. Total end play should be 0.25 - 0.55 mm (0.010 - 0.022 in).

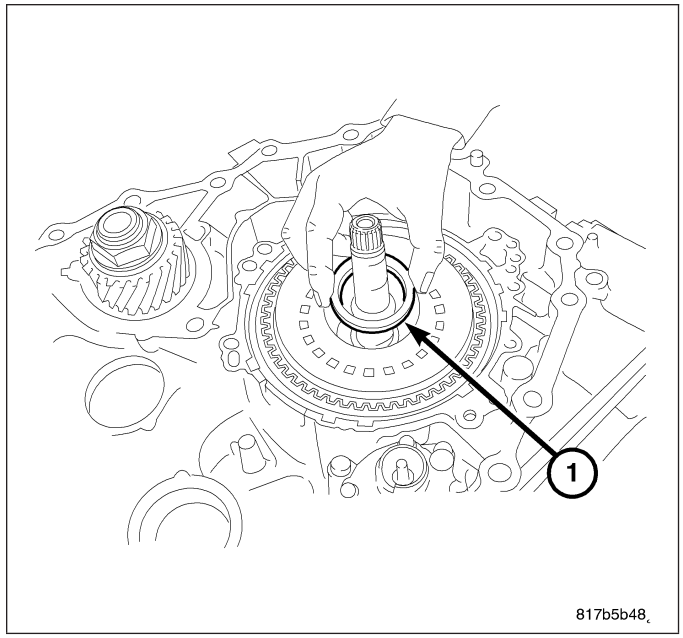
NOTE: Gauge bar 6311 can be used for doing the following measurement



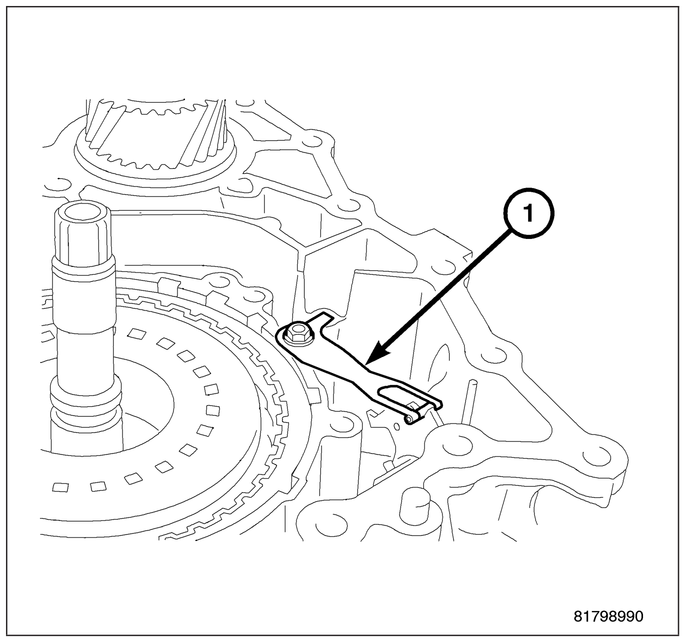
31. Measure the distance (1) from the oil pump cover installation surface of the transaxle case to the needle bearing installation surface of the forward clutch drum. Call this measurement one.

8179f453

NOTE: Gauge bar 6311 can be used for doing the following measurement

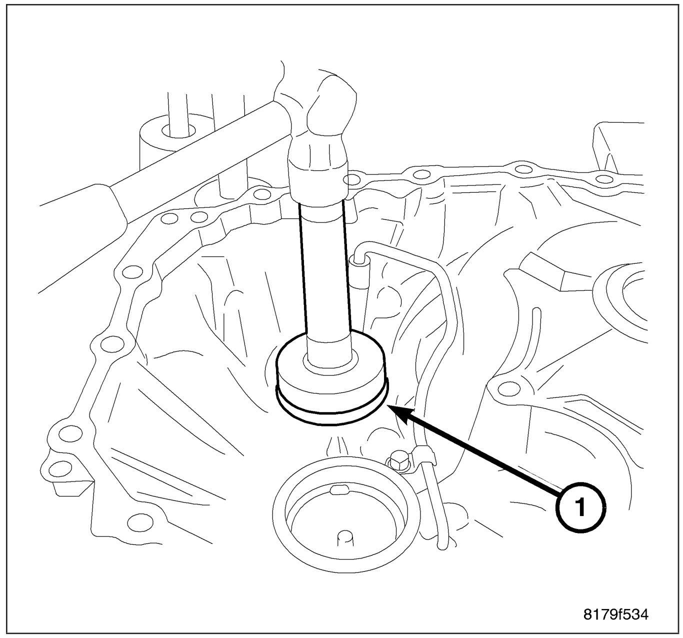


32. Measure the distance (1 to 2) as shown. Call this measurement two.
33. Calculate the bearing thickness required to achieve the necessary end play with the following formula. The bearing thickness is equal to measurement one, minus measurement two minus the nominal end play (0.40 mm or 0.016 “in).



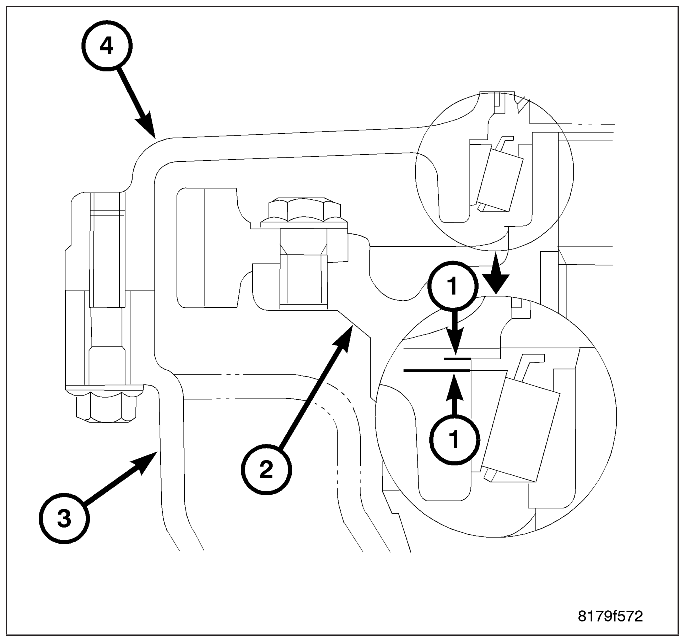
8179f477

CAUTION: Apply Vaseline or assembly lube when installing the needle bearing. Be careful to verify correct orientation of the needle bearing when installing it.



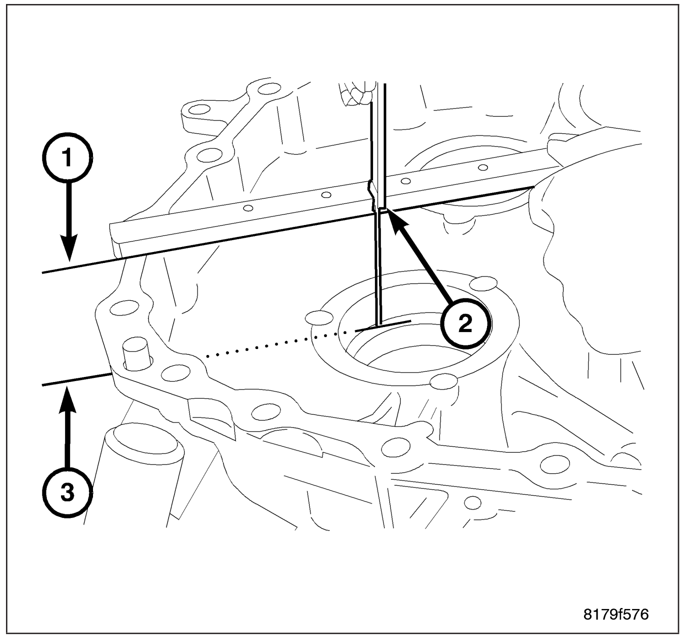
34. Install the selected needle bearing (1) on the forward clutch assembly.

35. Install the detente spring (1) onto the transaxle case. Install the bolt to hold the detente spring to the transaxle case and Torque the mounting bolt to 7 N·m (61 in.lbs.).



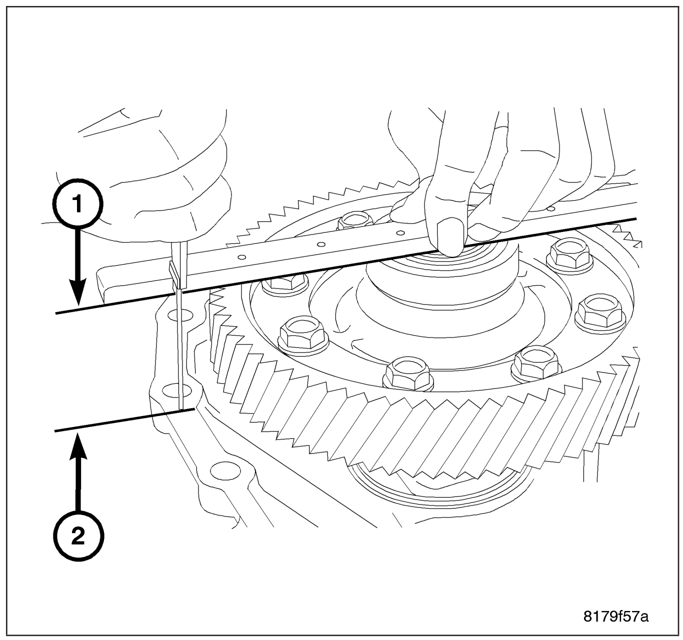
36. Install the outer race of the differential bearing (1) into the converter housing using Installer 9668 and Installer 46628 on 4WD, use Installer 46628 on 2WD and Driver Handle C- 4171.

CAUTION: When adjusting the preload, apply CVT fluid on the bearing to make it roll smoothly. When conducting measurements, measure two or more places and calculate the average value.



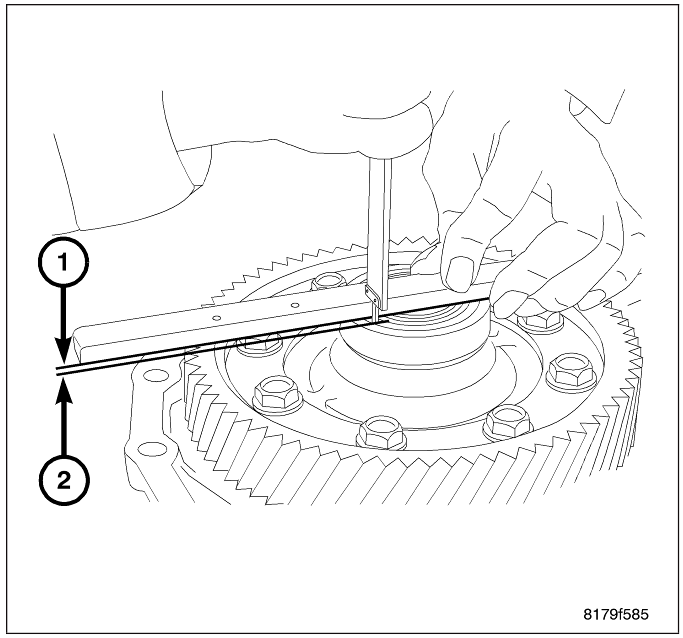
37. Measure for the differential preload shim (1) in the following steps. Refer to the graphic as necessary when performing the steps.

1 - PRELOAD SHIM
2 - DIFFERENTIAL ASSEMBLY
3 - TRANSAXLE CASE
4 - CONVERTER HOUSING



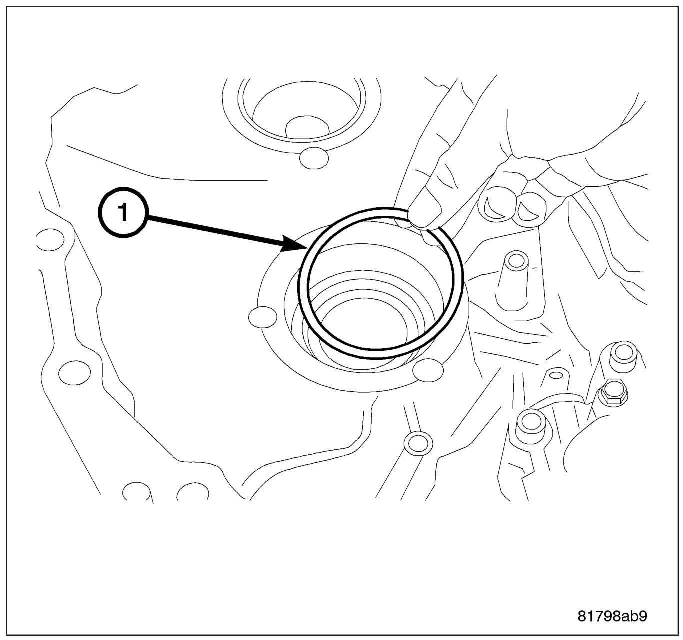
NOTE: Gauge bar 6311 can be used for doing the following measurement

38. The required differential preload is 0.17 mm (0.007 in).
39. Measure the distance (1-3) from the edge of the transaxle case to the select shim installation surface. This is differential measurement one.



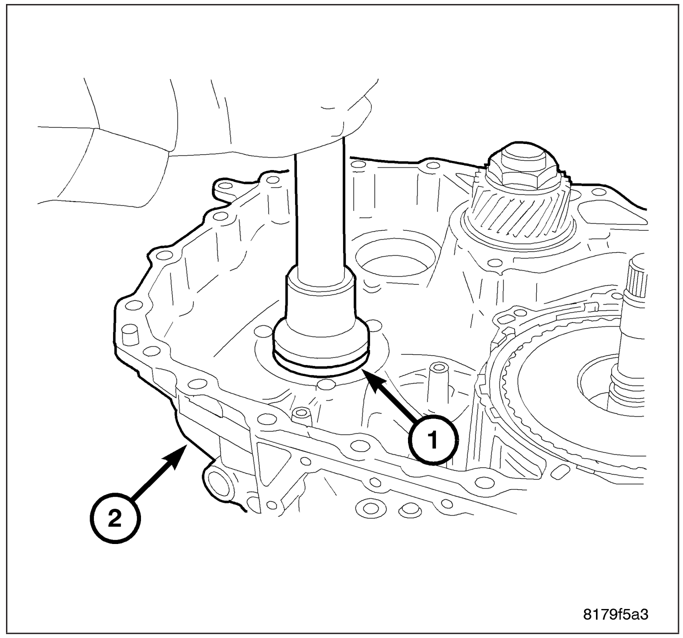
NOTE: Gauge bar 6311 can be used for doing the following measurement

40. Install the differential assembly on the converter case and measure the distance (differential measurement two) (1-2) from the differential hub to the surface of the converter housing.

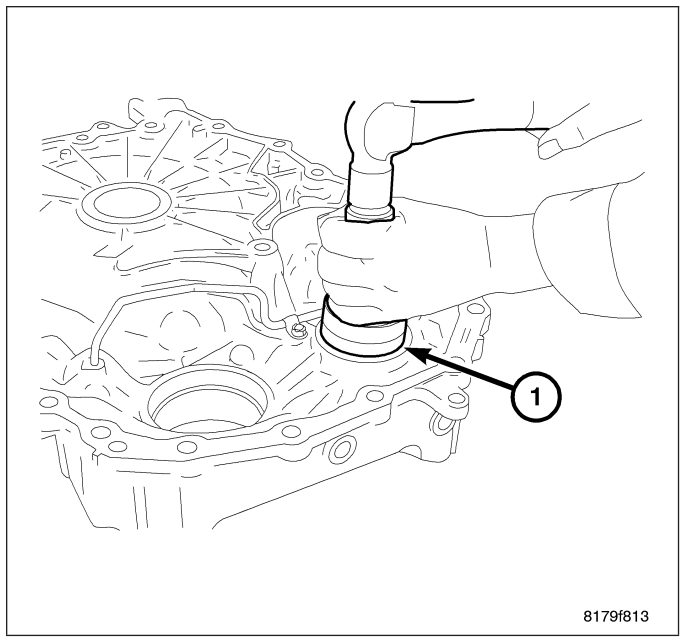


NOTE: Gauge bar 6311 can be used for doing the following measurement

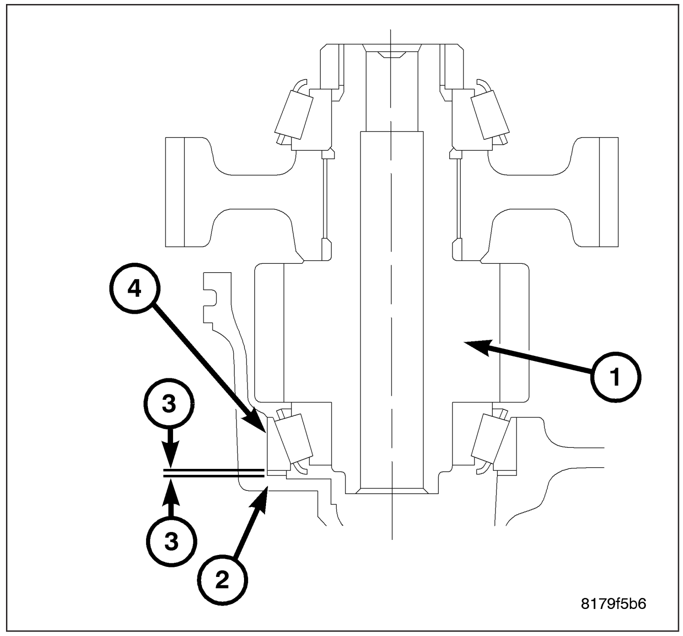
41. Install the outer race for the differential side bearing and measure the distance (differential measurement three) (1-2) from the differential case to the outer race of the differential side bearing.
42. The thickness of the required select shim is calculated as follows: differential measurement one, minus differential measurement two, plus differential measurement three, plus 0.17 mm (0.007 in).



CAUTION: Do not re-use the select shim.

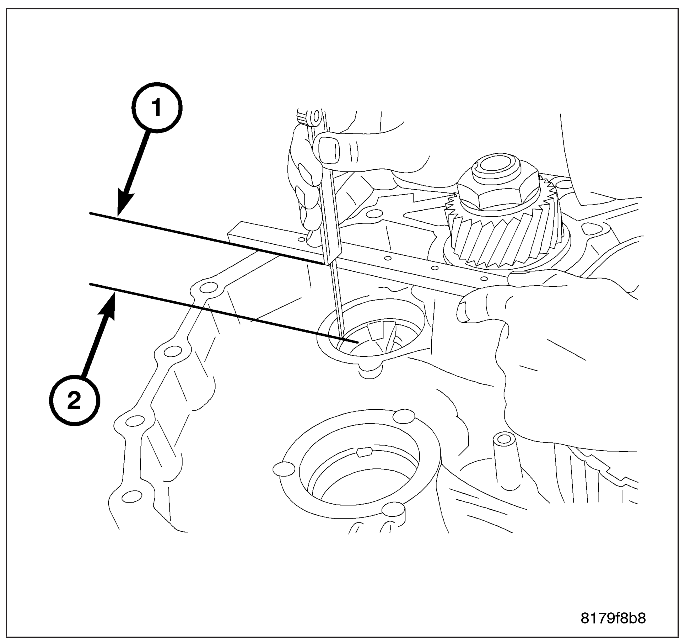


43. Install the chosen select shim (1) into the transaxle case.



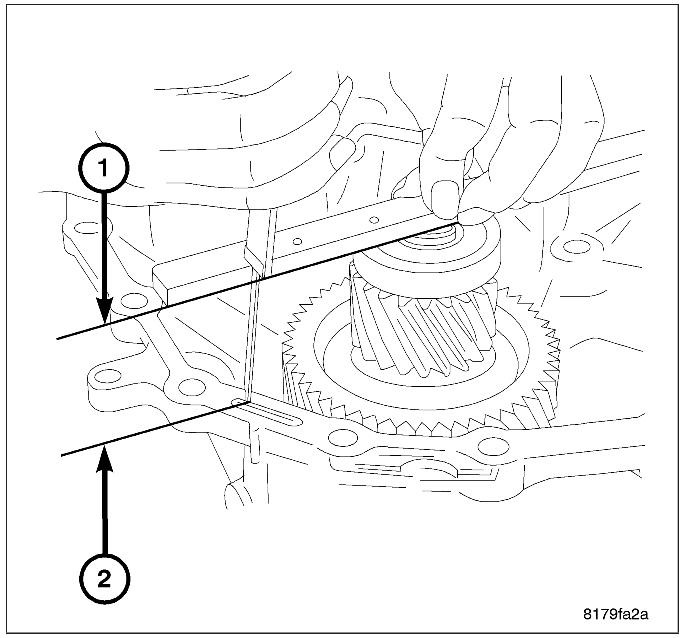
44. Install the outer race (1) of the differential bearing on the transaxle case using the Installer D-129 and Drive Handle C-4171.

45. Install the outer race (1) of the reduction gear bearing into the converter housing using Installer C-4628 and Driver Handle C-4171.



46. The required preload on the reduction gear assembly is 0.13-0.19 mm (0.005-0.0075 in). Measure for the required preload shim (3) as follows:

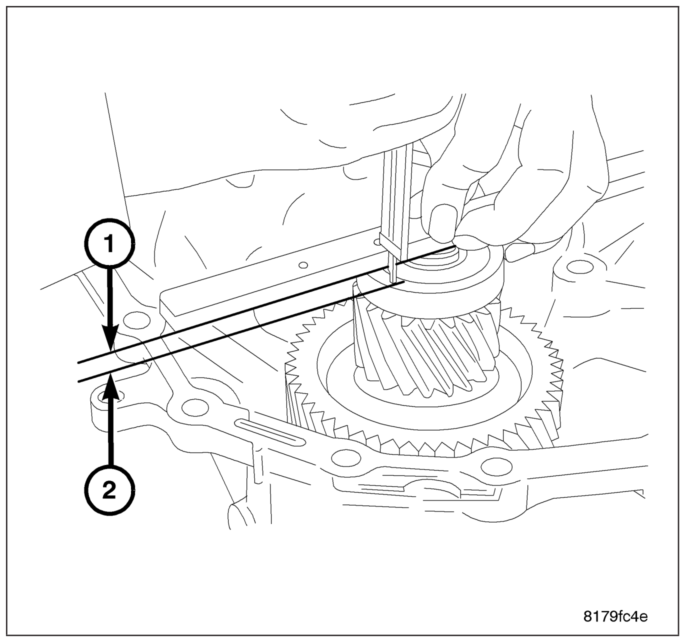
1 - REDUCTION GEAR
2 - TRANSAXLE CASE
3 - PRELOAD SHIM
4 - BEARING OUTER RACE



NOTE: Gauge bar 6311 can be used for doing the following measurement

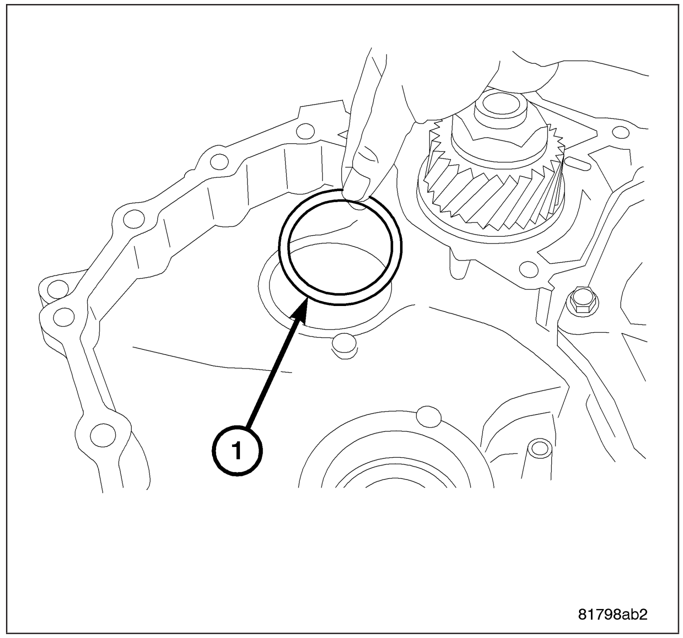
47. Measure the distance (reduction assembly measurement one) (1-2) from the edge of the transaxle case to the select shim installation surface.

NOTE: Gauge bar 6311 can be used for doing the following measurement



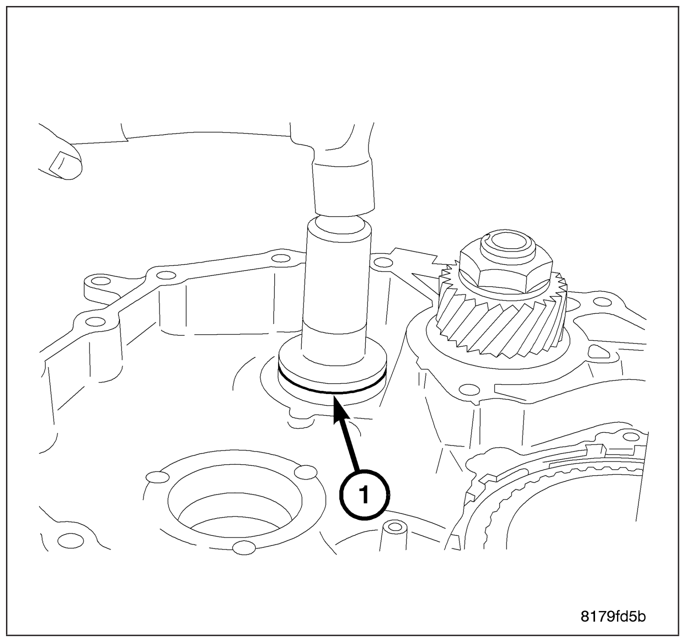
48. Install the reduction gear assembly on the converter housing and measure the distance (reduction assembly measurement two) (1-2) from the top of the reduction gear assembly to the edge of the converter housing.

CAUTION: When adjusting the preload, apply CVT fluid on the bearing to make it roll smoothly. When conducting measurements, measure two or more places and calculate the average value.



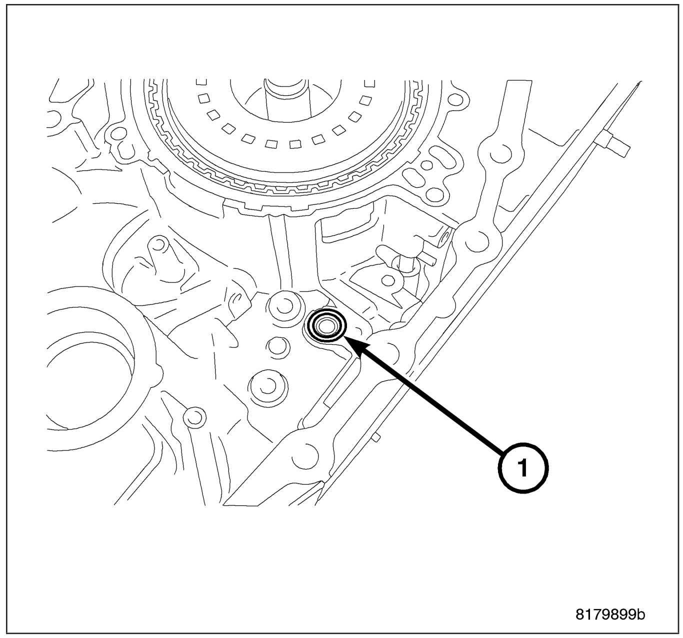
NOTE: Gauge bar 6311 can be used for doing the following measurement

49. Install the outer race of the reduction gear bearing and measure the distance (reduction assembly measurement three) (1-2) from the top of the reduction gear assembly to the outer race of the reduction gear bearing.
50. The thickness of the required select shim is calculated as follows: reduction assembly measurement one, minus reduction assembly measurement two, plus reduction assembly measurement three, plus 0.16 mm (0.006 in).

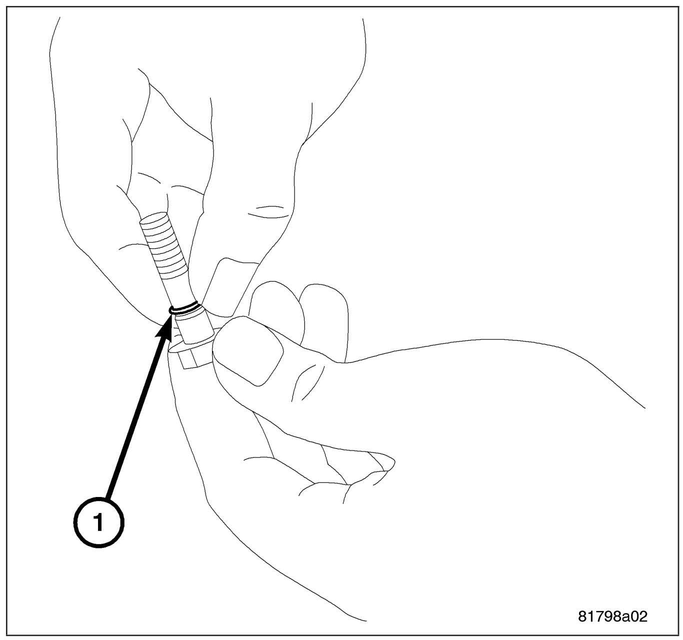


CAUTION: Do not re-use the select shim.

51. Install the chosen select shim (1) into the transaxle case.

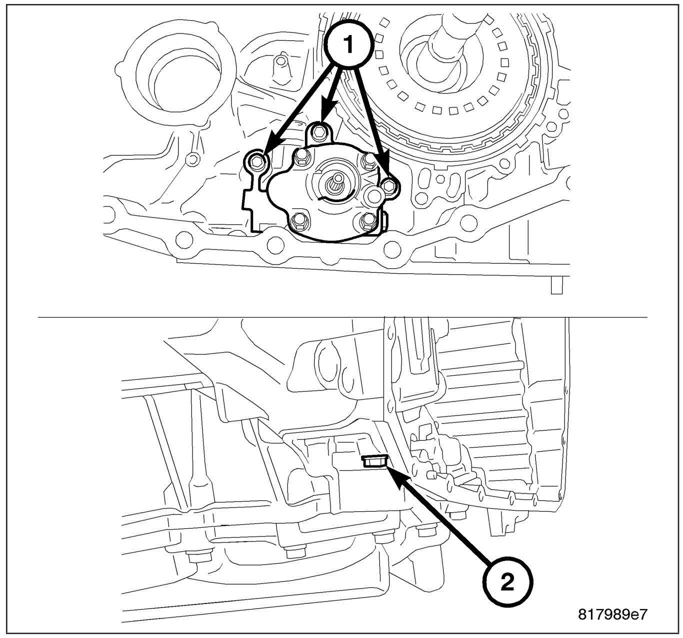


52. Install the outer race (1) of the reduction gear bearing on the transaxle case using Installer C-4628 and Driver Handle C-4171.



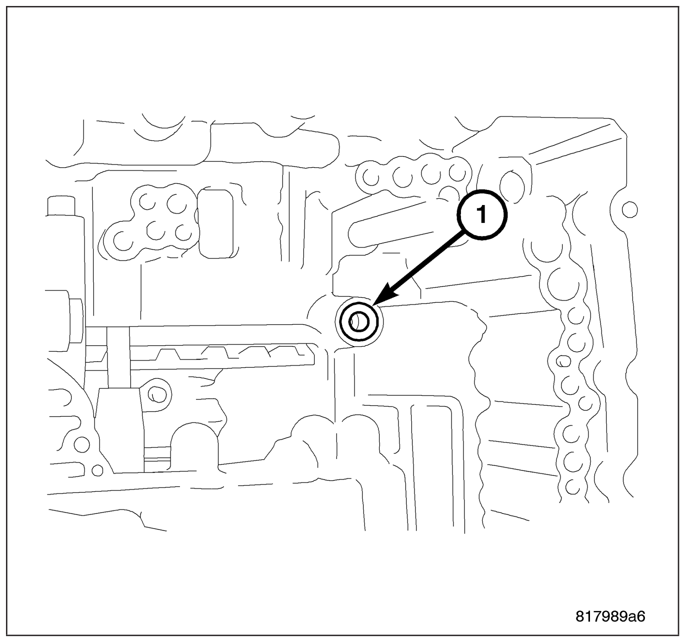
CAUTION: Do not re-use the lip seal. Apply CVT fluid when installing the lip seal.

53. Install the new lip seal (1) on the transaxle case.



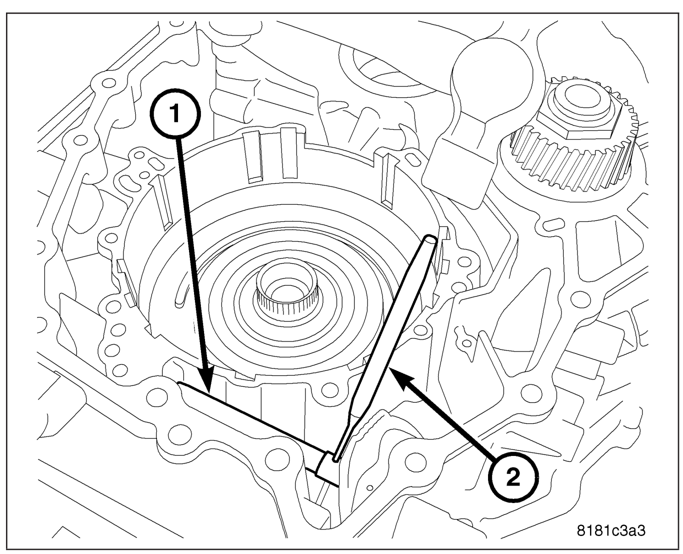
CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the O-ring.

54. Install the new o-ring (1) onto the oil pump mounting bolts. (Only for bolts installed from the outside of the transaxle case).



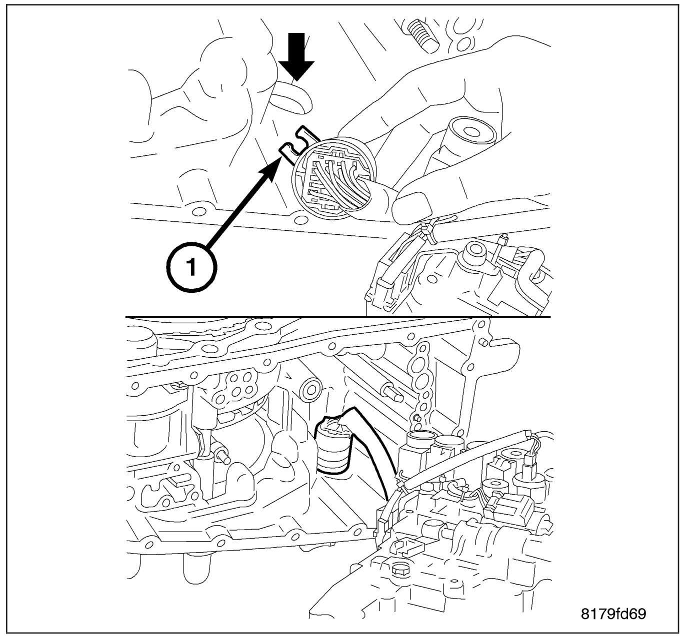
NOTE: One of the oil pump retaining bolts is installed from the outside of the transaxle case in the rear part of the oil pump.

55. Install the oil pump on the transaxle case. Install and tighten the mounting bolts (1) to 19 N·m (14 ft.lbs.) Install and torque the mounting bolt (2) to 28 N·m (20 ft.lbs.).

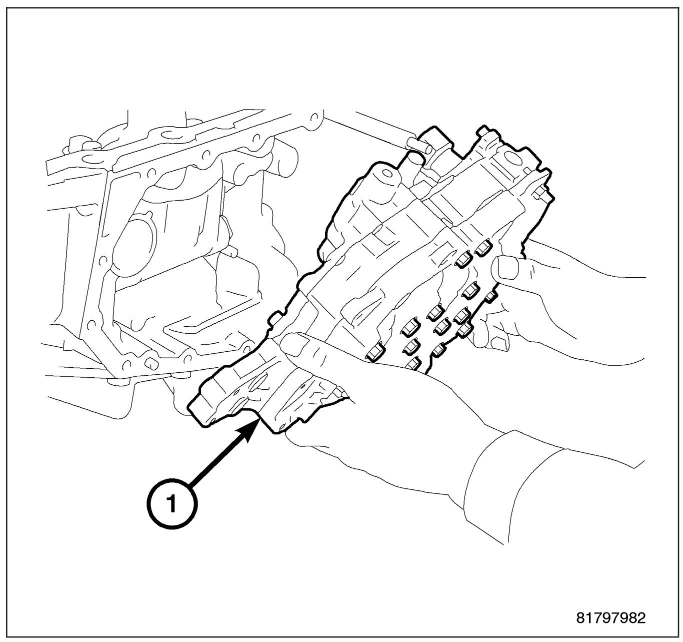


CAUTION: Do not re-use the lip seal. Apply CVT fluid when installing the lip seal.

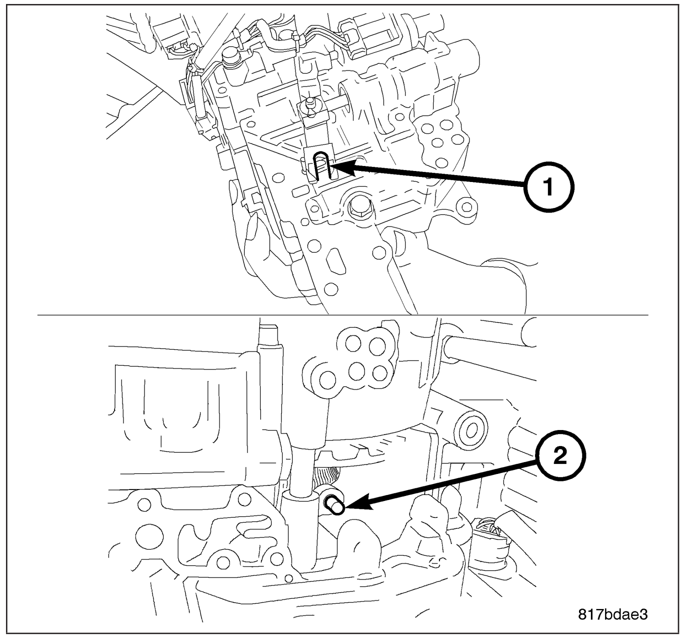
56. Install the new lip seal (1) into the transaxle case.



57. Install the manual shaft (1) into the case.
58. install the pin at the manual shaft using a punch (2)

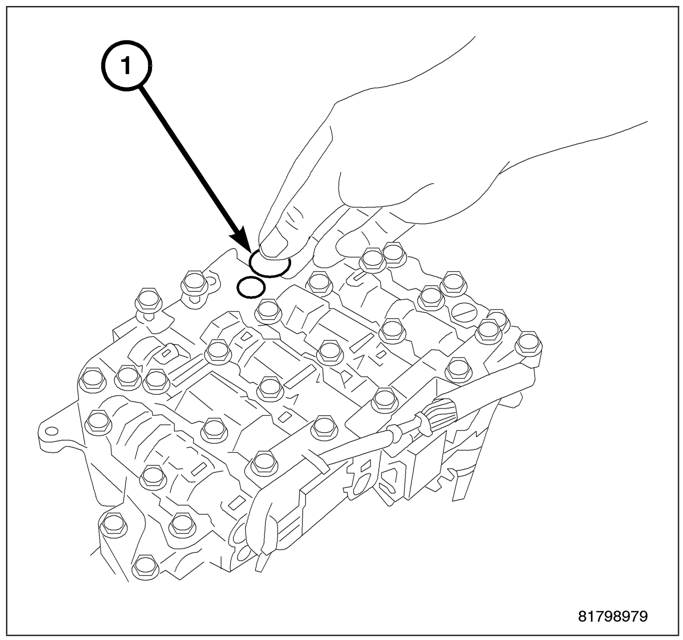


59. To install the valve body assembly on to the transaxle case, insert a 75 mm (3 in.) long 3 mm (0.118 in.) rod or wire into the linkage stopper hole of the valve body assembly to set the pulley ratio linkage (1) in position.

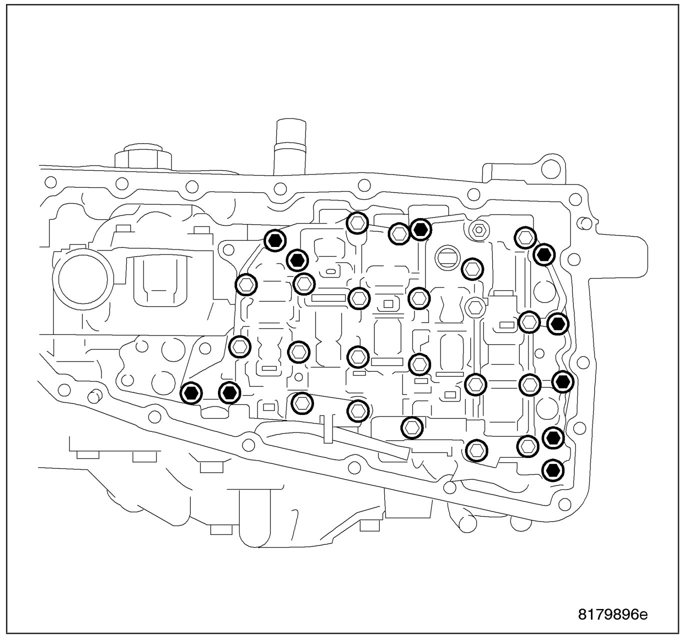


60. Position the locating tab (1) of the terminal body and install the terminal body into the transaxle case.

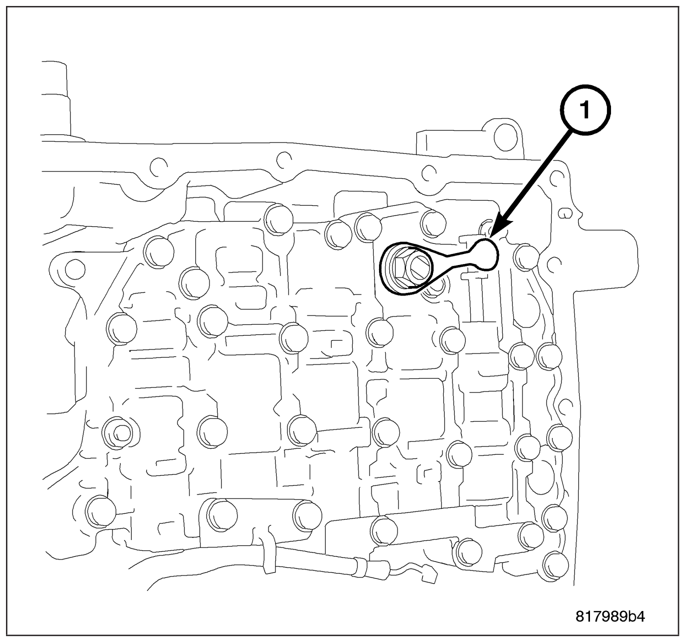
61. Install the valve body assembly (1) up from the bottom side and install it into the transaxle case.



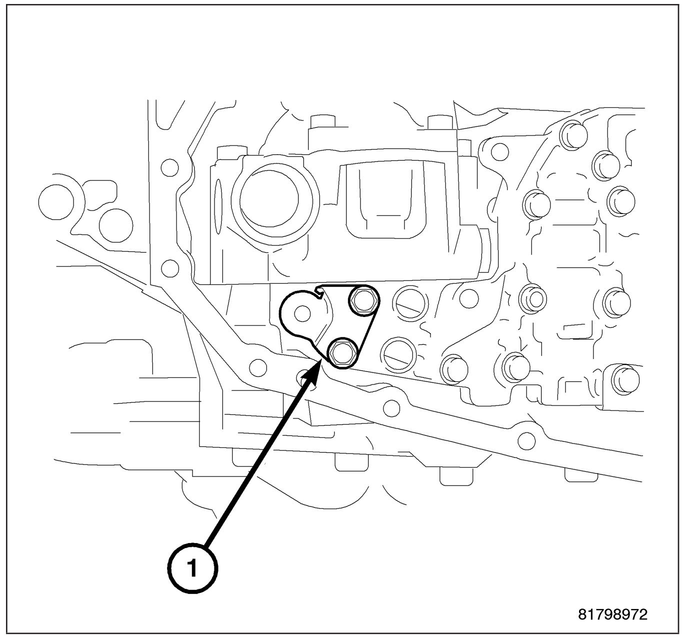
62. Align the notch (1) of the pulley ratio linkage with the sheave position sensor (2).



CAUTION: Apply CVT fluid when installing the bushing.

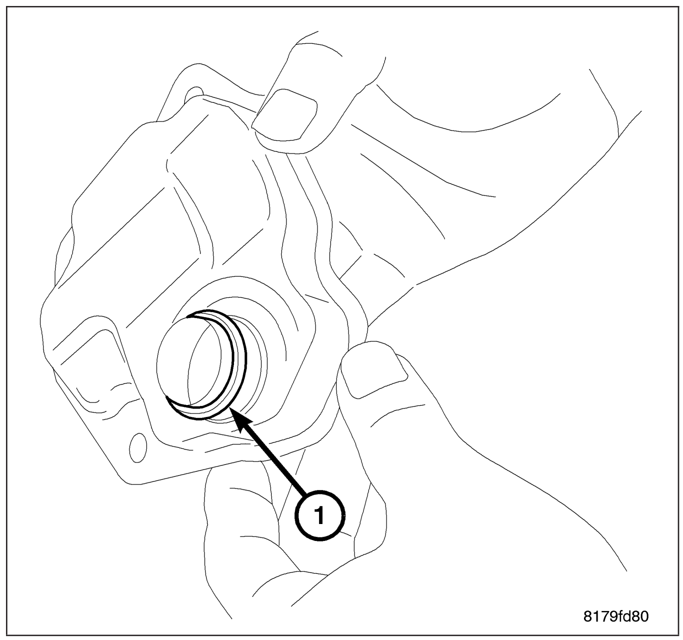


63. Install the bushing (1) into the valve body assembly.

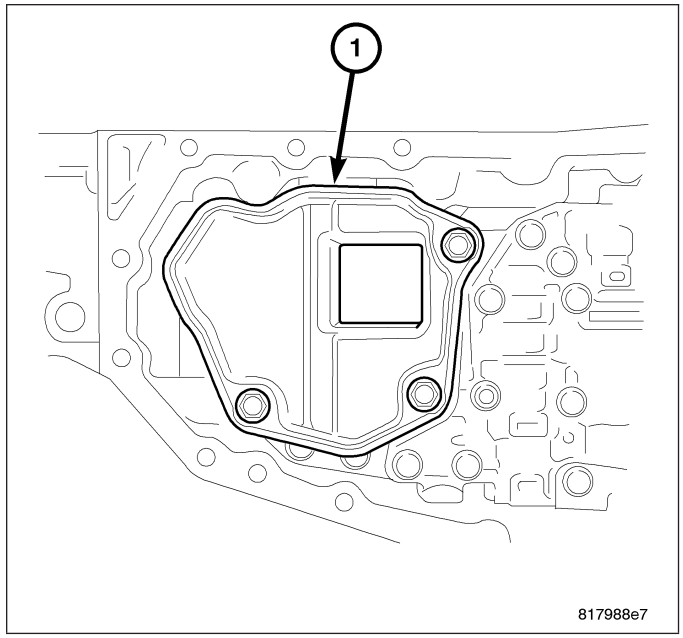


64. Torque the mounting bolts of the valve body assembly to 8 N·m (70 in.lbs).

65. Install the manual lever (1) onto the manual shaft. Install and Torque the mounting nut to 22 N·m 194 in.lb.

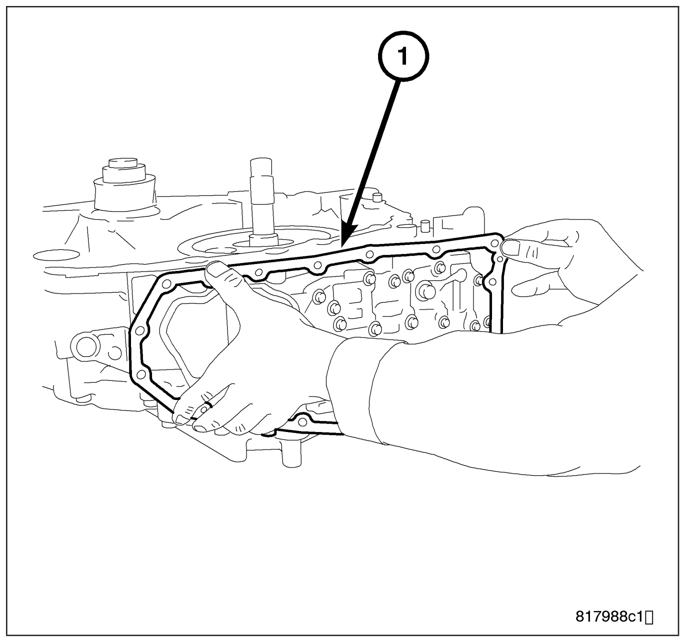


66. Install the bracket (1) onto the valve body assembly. Install and Torque the mounting bolts to 8 N·m (70 in.lbs.).

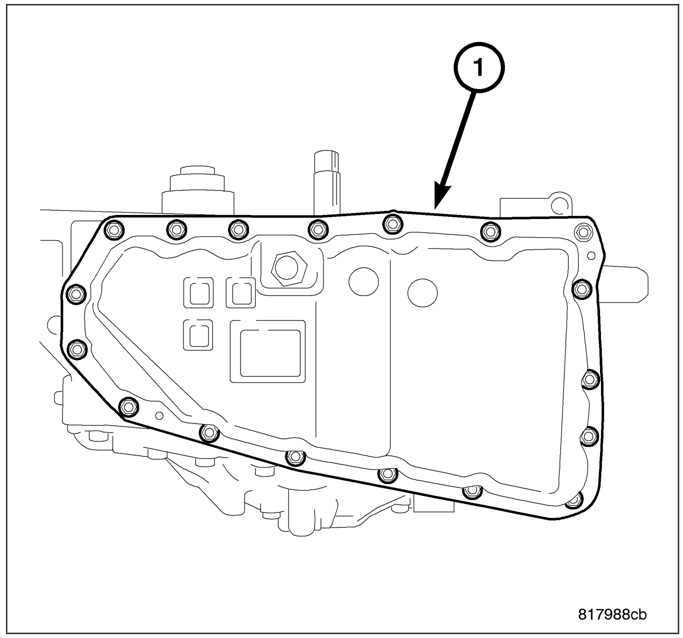


CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

67. Install the new o-ring (1) onto the new oil strainer.

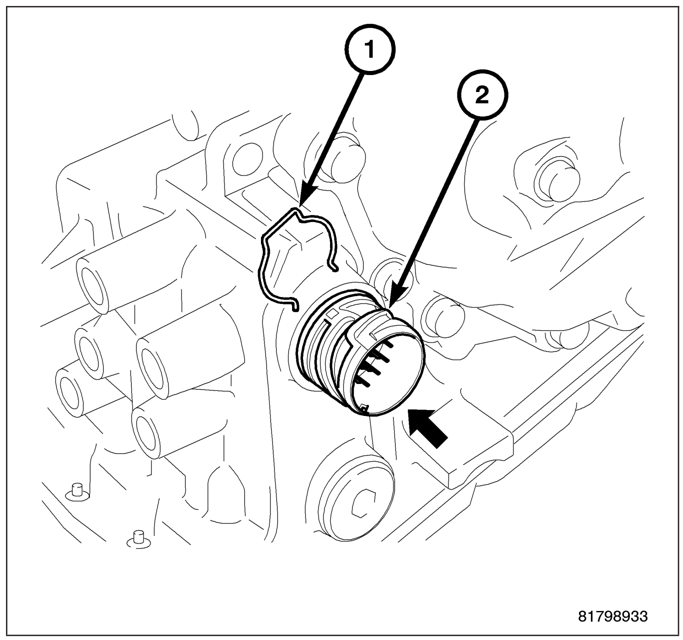


68. Install the new oil strainer (1) onto the valve body assembly. Install and Torque the mounting bolts to 8 N·m (70 in.lbs.).



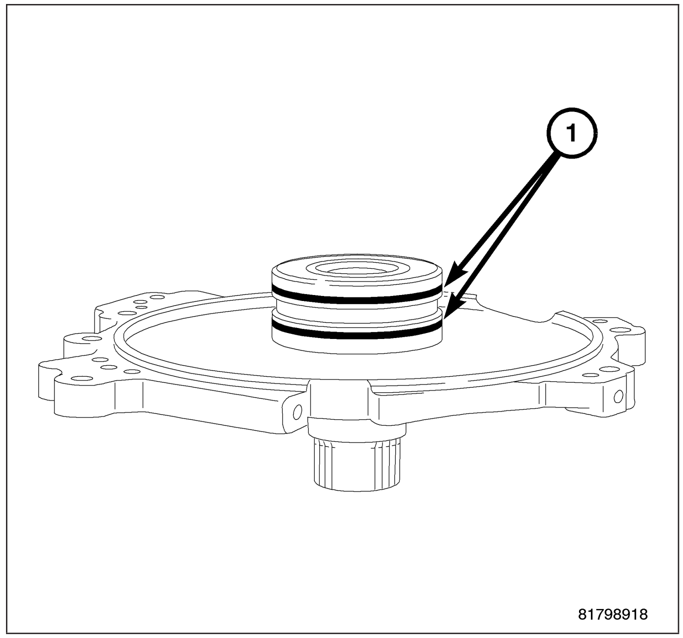
CAUTION: Do not re-use the oil pan gasket. Remove any moisture, oil, and used gasket material from the surface where the new gasket is to be installed. When installing the oil pan gasket, align the dowel pin with the dowel pin hole in the oil pan gasket.

69. Install the oil pan gasket (1) onto the transaxle case.

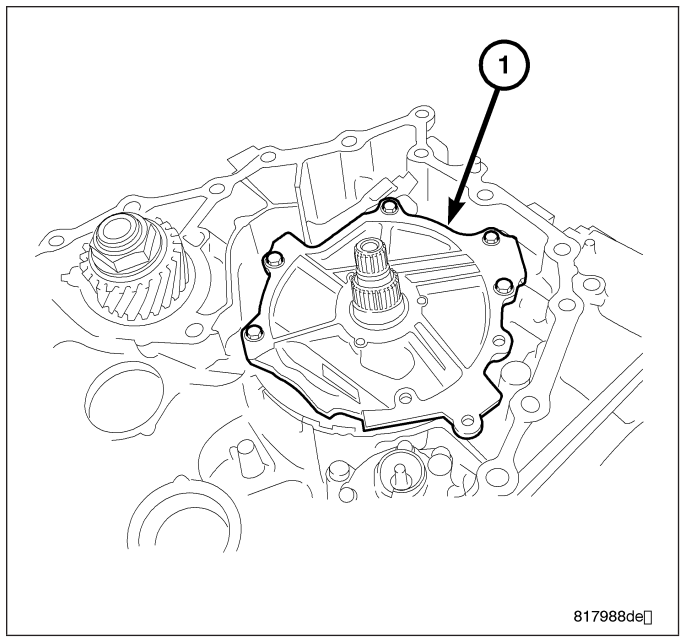


CAUTION: When installing the oil pan, align the dowel pin of the transaxle case with the dowel pin hole of the oil pan.

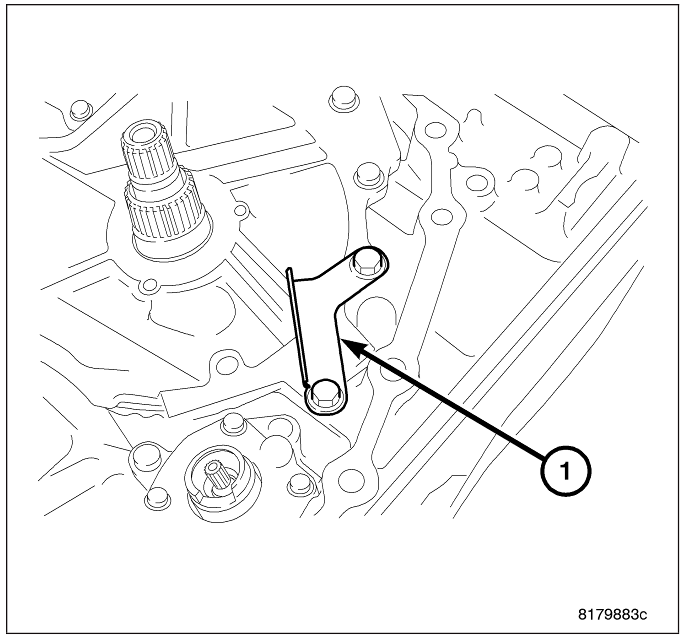
70. Install the oil pan on the transaxle case (1). Install and Torque the mounting bolts to 8 N·m (70 in.lbs.).



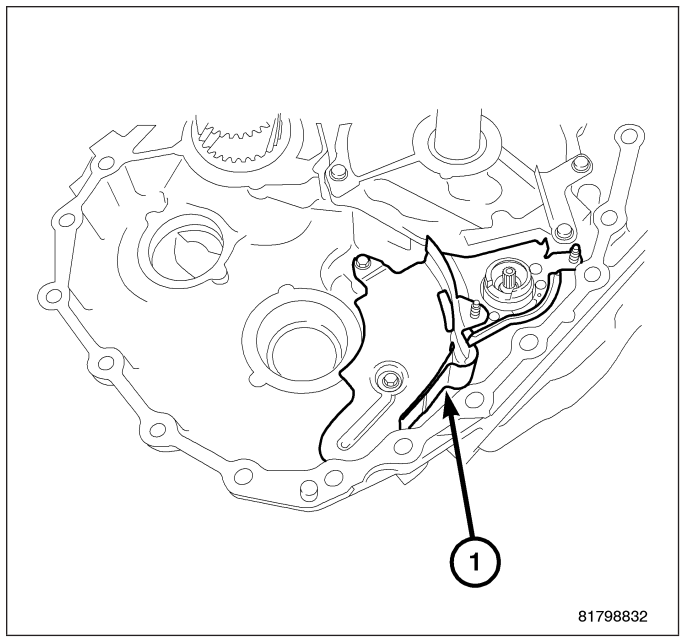
71. Install the snap ring (1) onto the terminal body.



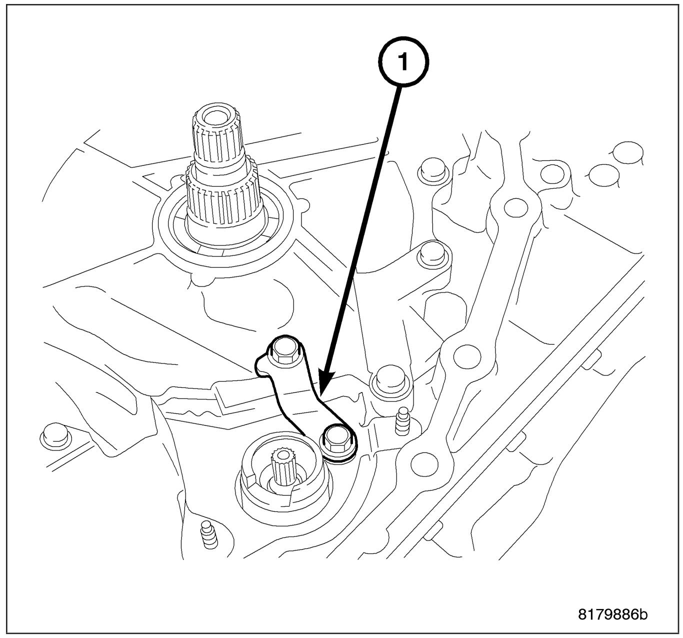
CAUTION: Do not re-use the seal rings. Apply Vaseline or assembly lube when installing the seal rings.



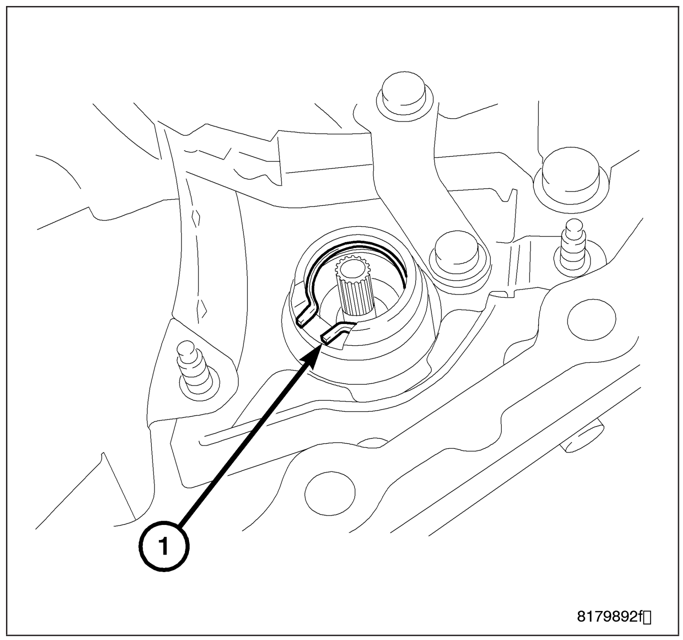
72. Install the new seal rings (1) onto the reaction shaft support.



73. Install the reaction shaft support (1) onto the transaxle case temporarily with the mounting bolts.

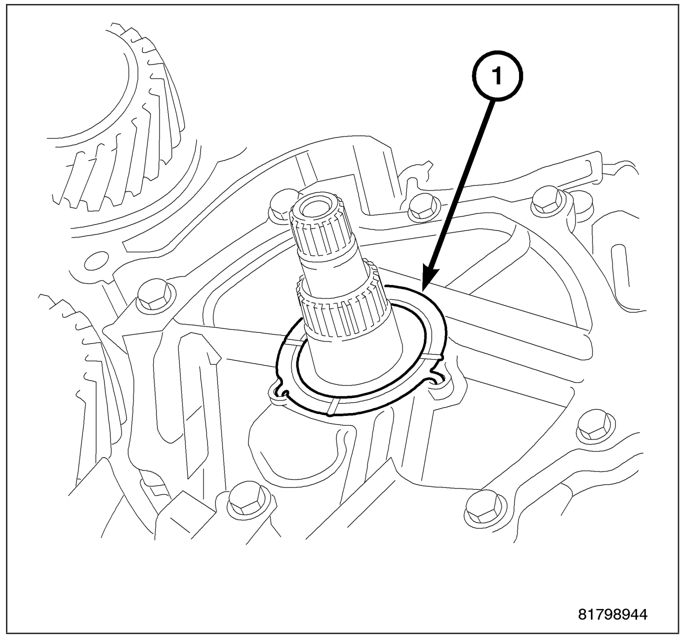


74. Install the baffle plate (1) temporarily with the mounting bolts.

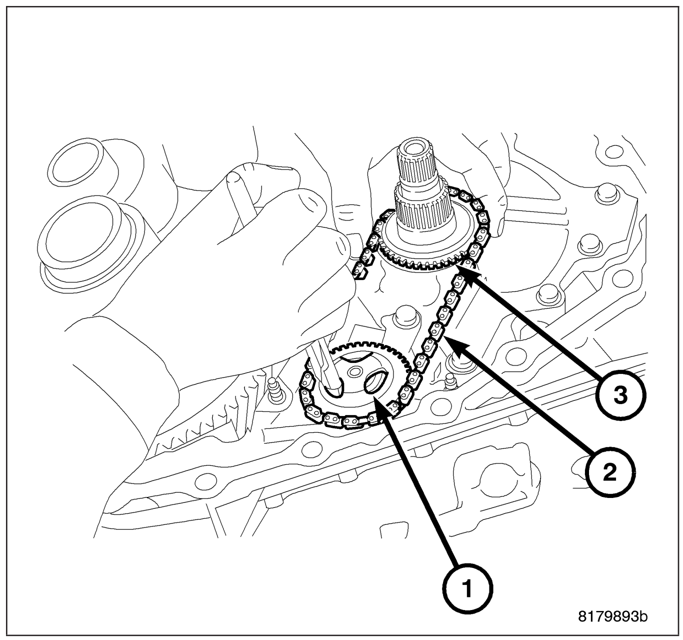


75. Install the baffle plate (1). Install and Torque the mounting bolts to 6 N·m (52 in.lbs.).

76. Install the bracket (1) as shown. Torque the mounting bolts of the oil pump cover, baffle plate, and brackets to 26 N·m (19 in.lbs.).

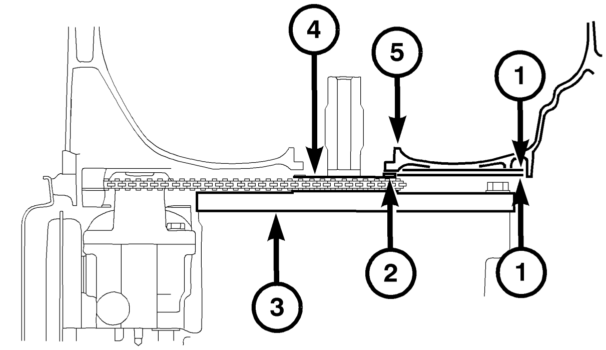


77. Install the snap ring (1) into the oil pump.



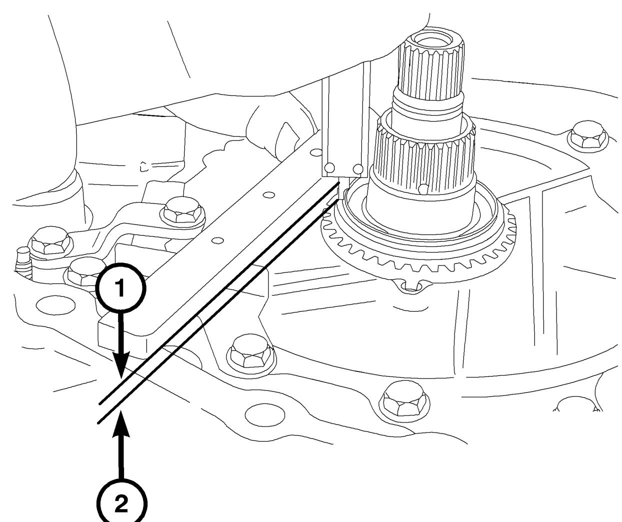
CAUTION: Be sure to align the pawl of the thrust washer with the alignment hole of the oil pump cover. Apply Vaseline or assembly lube when installing the thrust washer.

78. Install the thrust washer (1) onto the oil pump cover.



CAUTION: When necessary to replace any of the driven sprocket, oil pump chain, or drive sprocket, replace all components as a matched set. Pull the driven sprocket up softly and check that the driven sprocket is securely installed.

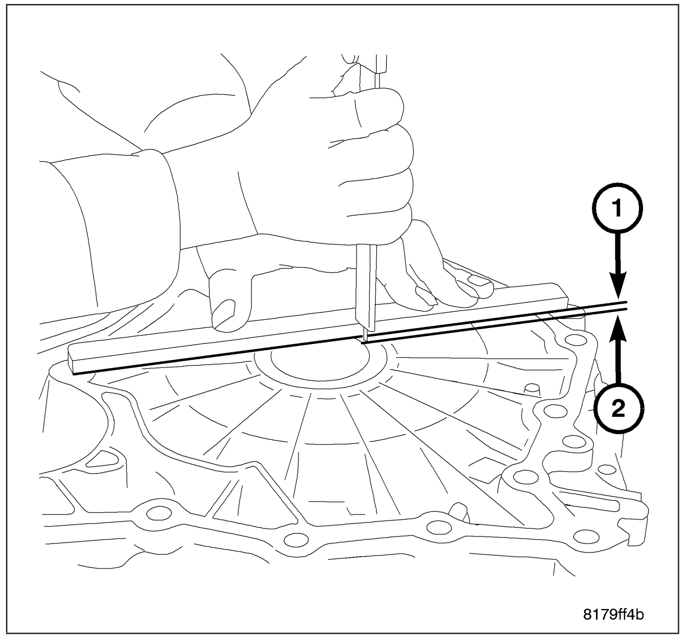
79. Expand the snap ring (1).
80. Install the driven sprocket, oil pump chain (2) and drive sprocket (3).



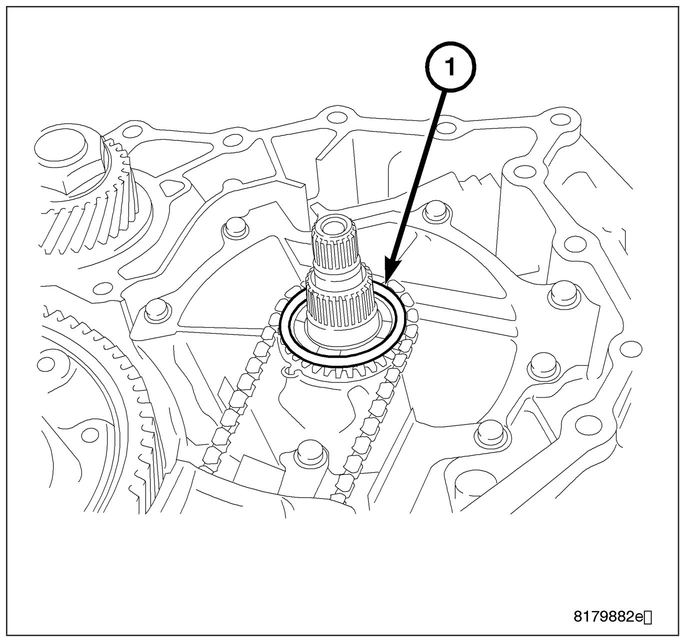
81. The required clearance for the oil pump drive sprocket is 0.10-0.23 mm (0.004-0.009 in.). Measure the clearance (1) between the oil pump drive sprocket (4) and the converter housing (5) in the following procedure:

817c36a1

NOTE: Gauge bar 6311 can be used for doing the following measurement

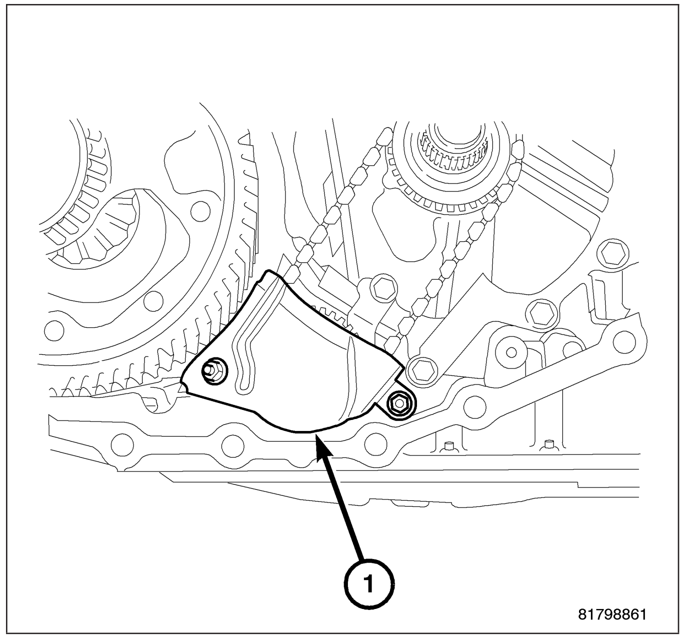


82. Measure the distance (1-2) from the edge of the transaxle case to the select shim installation surface of the drive sprocket. This is the oil pump drive sprocket measurement one.



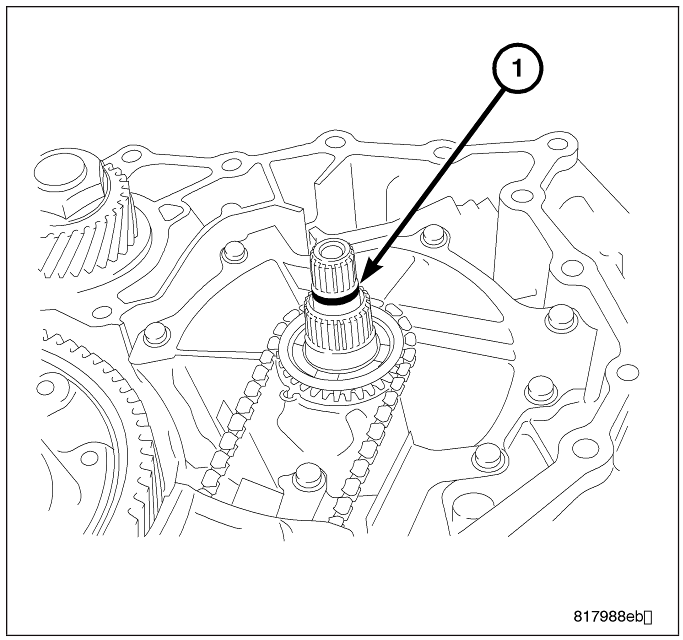
8179fead

NOTE: Gauge bar 6311 can be used for doing the following measurement

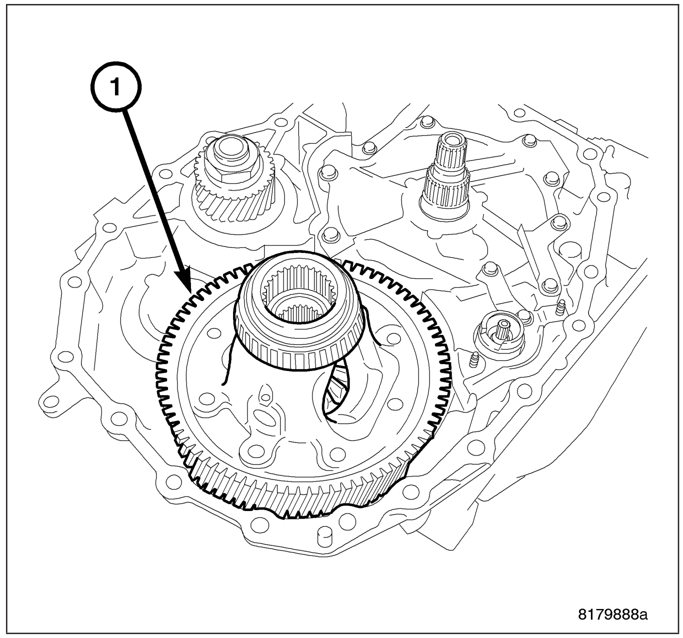


83. Measure the distance (1-2) from the edge of the converter housing to the surface touching the select shim contact surface. This is the oil pump drive sprocket measurement two.
84. Calculate the thickness of the required select shim with the following formula: The select shim is equal to the oil pump drive sprocket measurement one, plus the oil pump drive sprocket measurement two, minus 0.16 mm (0.0065 in.).

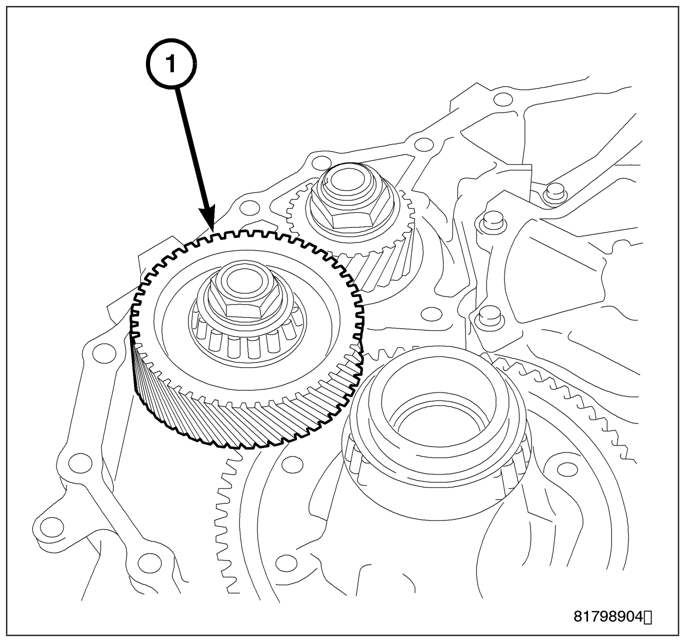
85. Install the chosen select shim (1) onto the drive sprocket.



86. Install the baffle plate (1) over the oil pump driven sprocket. Install and torque the mounting nut to 6 N·m (52 in.lbs.).

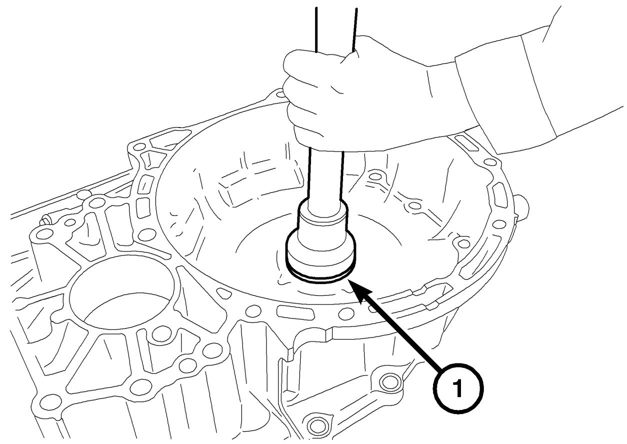


CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.



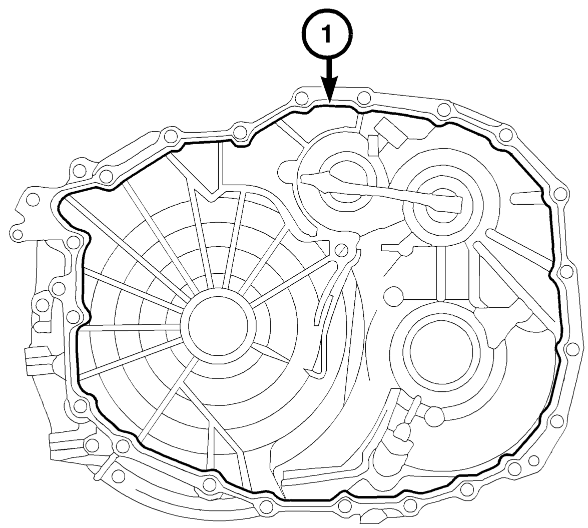
87. Install the new o-ring (1) onto the input shaft.

88. Install the differential assembly (1) into the transaxle case.



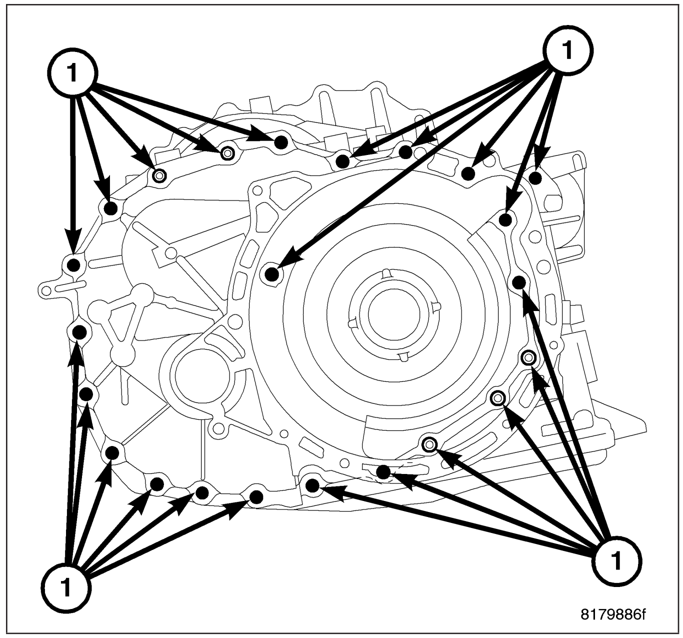
89. Install the reduction gear assembly (1) into the transaxle case.

CAUTION: Do not re-use the converter housing oil seal (1). Apply CVT fluid when installing the converter housing oil seal (1).



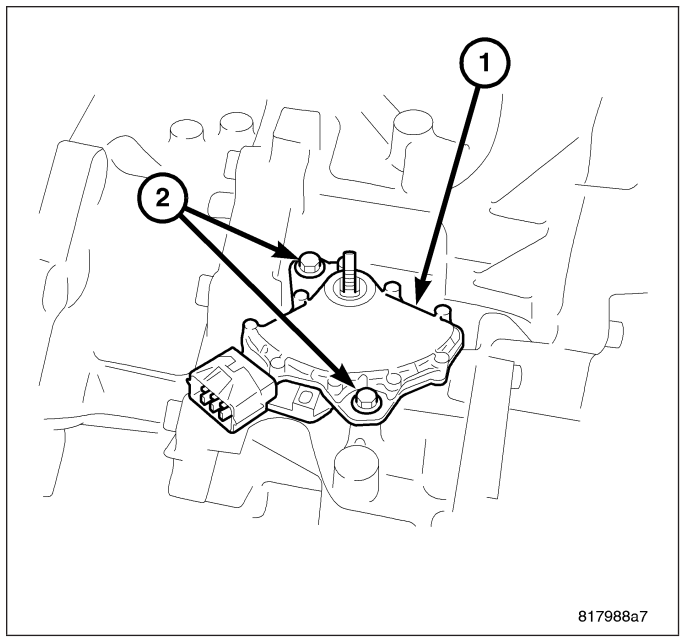
90. Install the converter housing oil seal (1) into the converter housing with Installer 9858.

817a0329



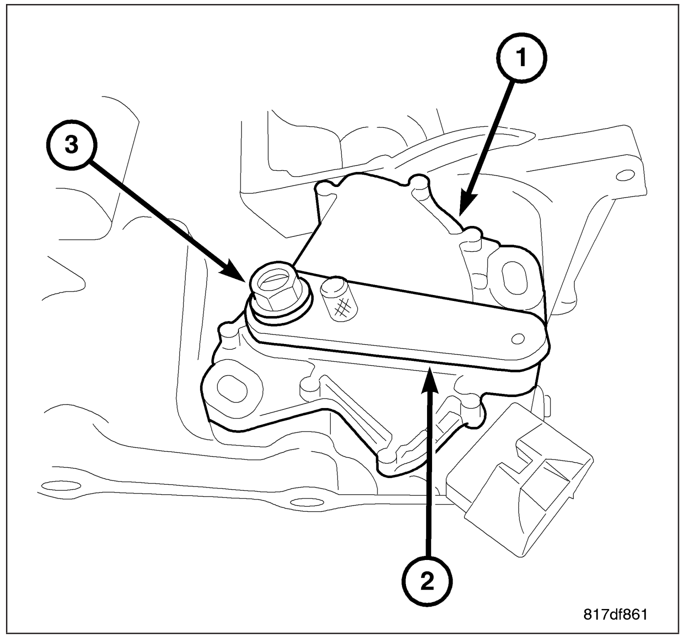
91. Apply MOPAR gasket sealer (1) on the converter housing installation surface of the transaxle case.

CAUTION: Remove moisture, oil, and used sealant from the sealant application surface. Make sure that the starting point and the ending point are between two bolt holes.

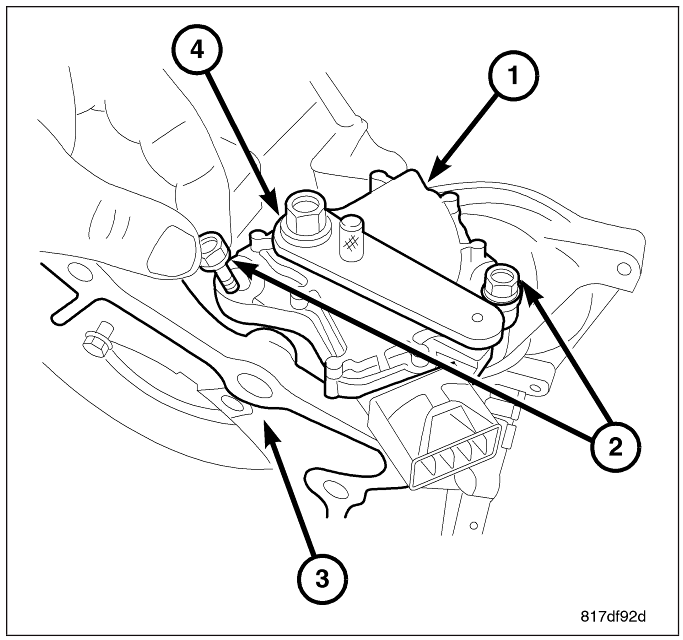


817a0547

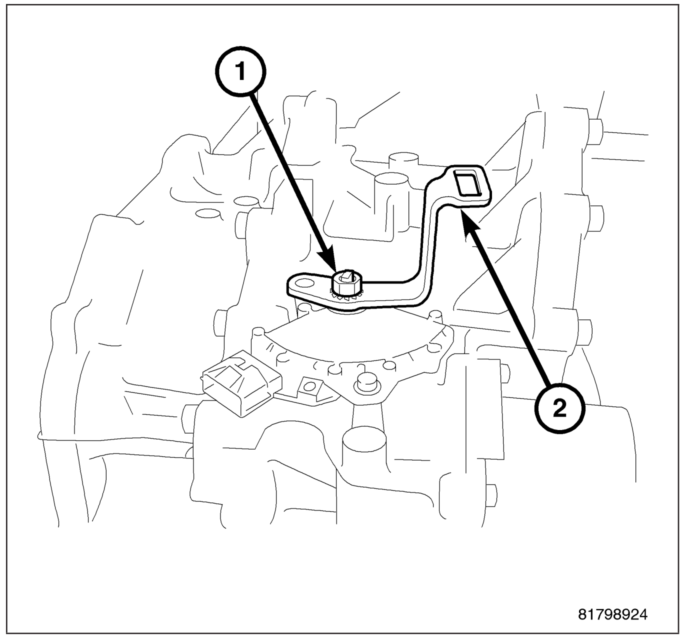
92. Install the converter housing on the transaxle case and Torque the bolts to 45 N·m (33 ft.lbs.).



93. Install the transmission range sensor (TRS) (1) over the manual shaft and onto the transaxle case.

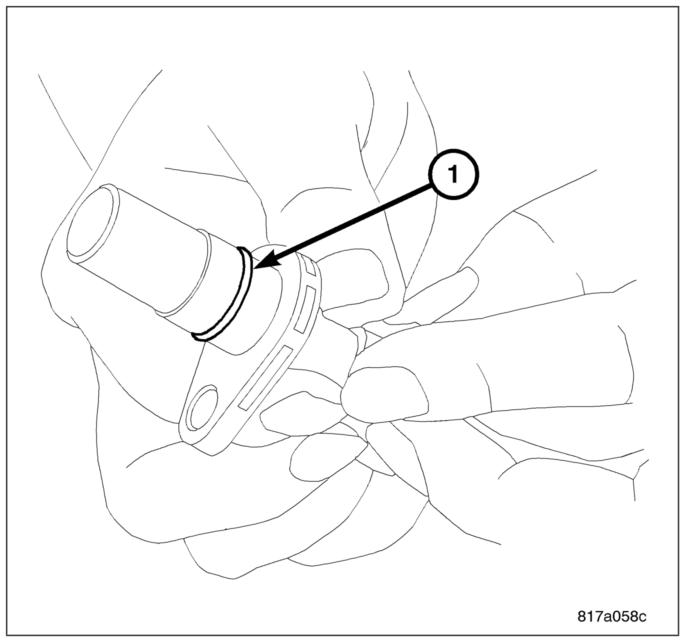


CAUTION: Do not re-use the TRS transmission range sensor.

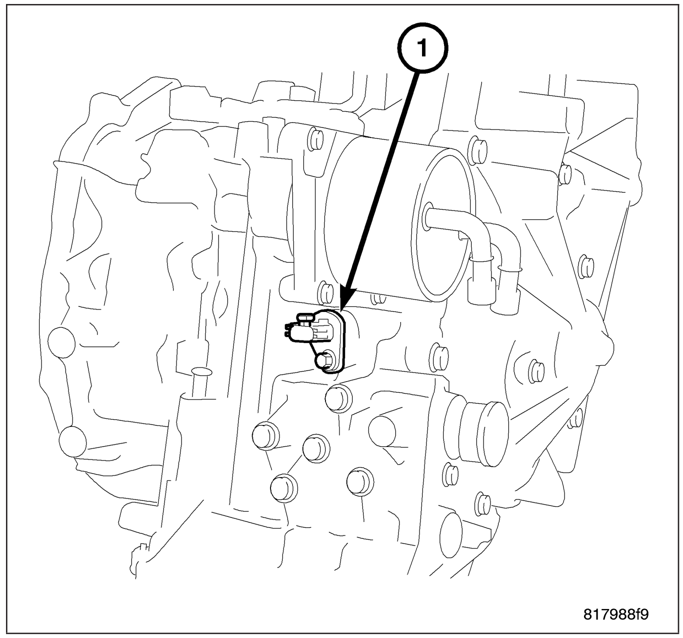


94. Put the manual shaft in the N position (3). Install Alignment Tool 9876 (2) and adjust the position of the TRS (1).

95. Install and Torque the mounting bolts of the TRS to 6 N·m (49 in.lbs.).
96. Remove the TRS alignment tool from the TRS.

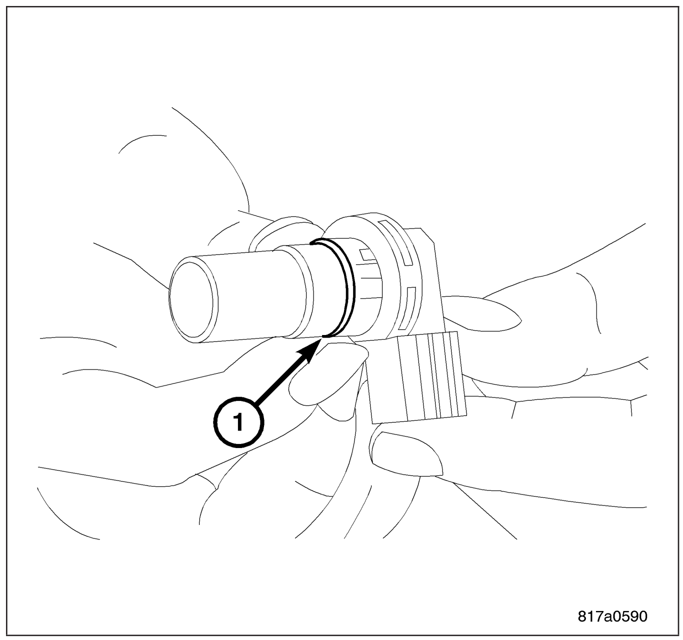


97. Install the shift lever (1) onto the manual shaft. Install and Torque the mounting nut to 17 N·m (150 in.lbs.).

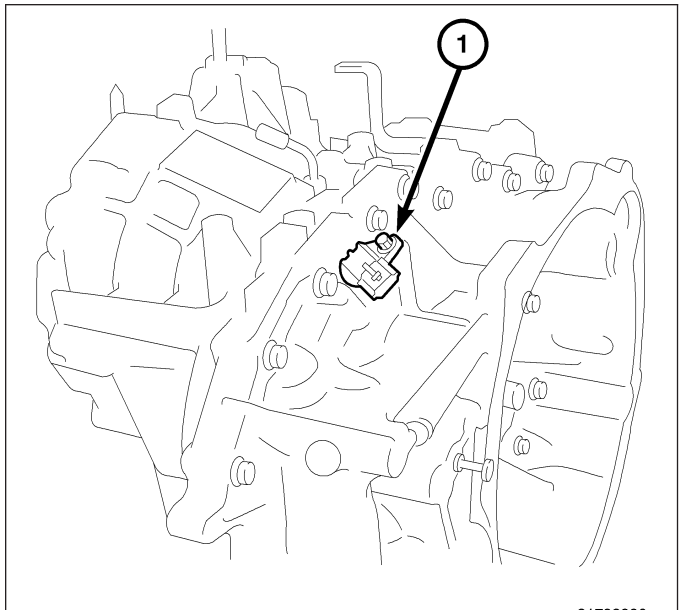


CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

98. Install the o-ring (1) onto the input speed sensor.



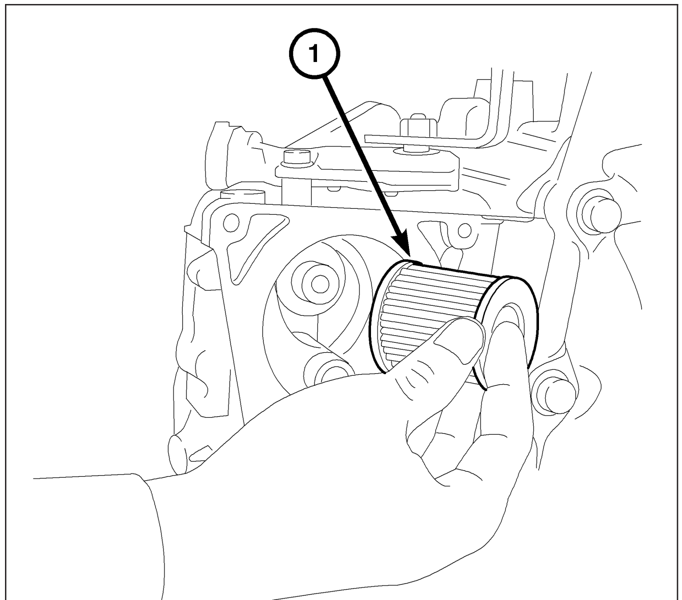
99. Install the input speed sensor (1) into the transaxle case. Install and Torque the mounting bolt to 6 N·m (52 in.lbs.).



CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

100. Install the new o-ring (1) onto the output speed sensor.

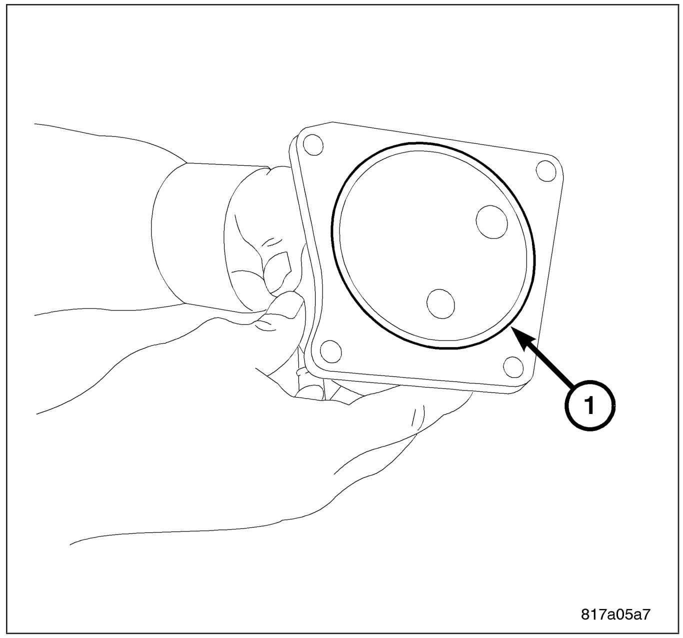
CAUTION: Be sure to install the select shim between the secondary speed sensor and the converter housing before installing the secondary speed sensor.



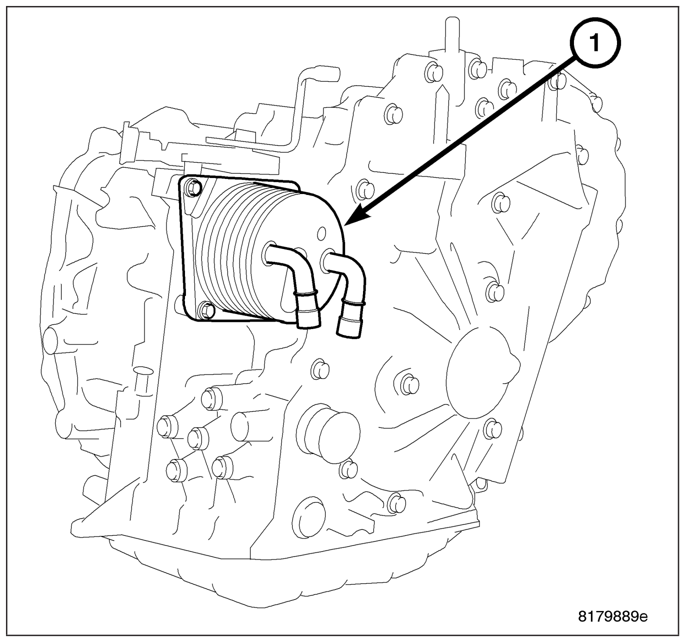
101. Install the output speed sensor (1) into the converter housing. Install and Torque the mounting bolt to 6 N·m (52 in.lbs.).

81798920

CAUTION: Apply CVT fluid on the seal part when installing the CVT fluid filter.



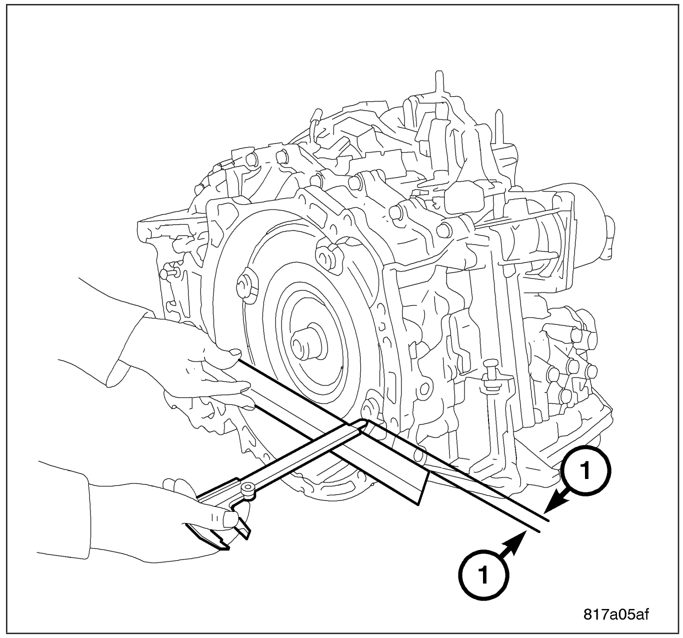
102. Install the CVT fluid filter (1) into the transaxle case.



817988a3

CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

103. Install the new o-ring (1) onto the CVT fluid filter.

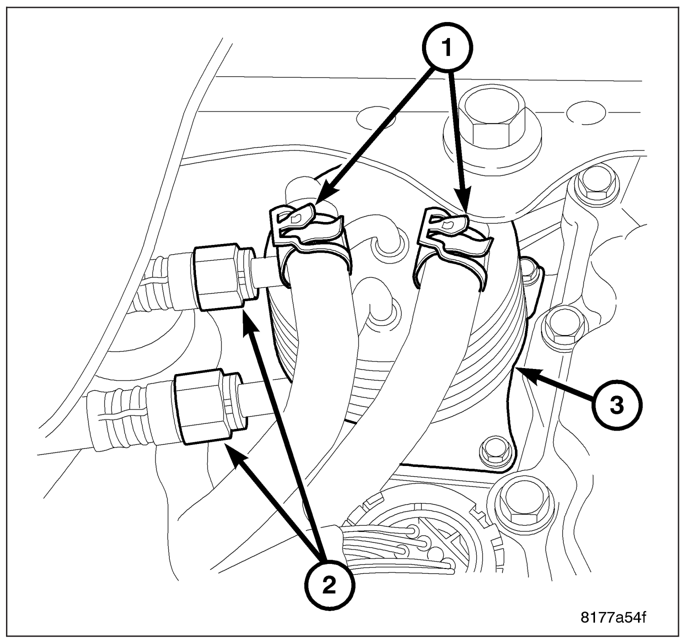


104. Install the CVT fluid cooler (1) onto the transaxle case. Install and Torque the mounting bolts to 4 N·m (37 in.lbs.).

NOTE: Gauge bar 6311 can be used for doing the following measurement

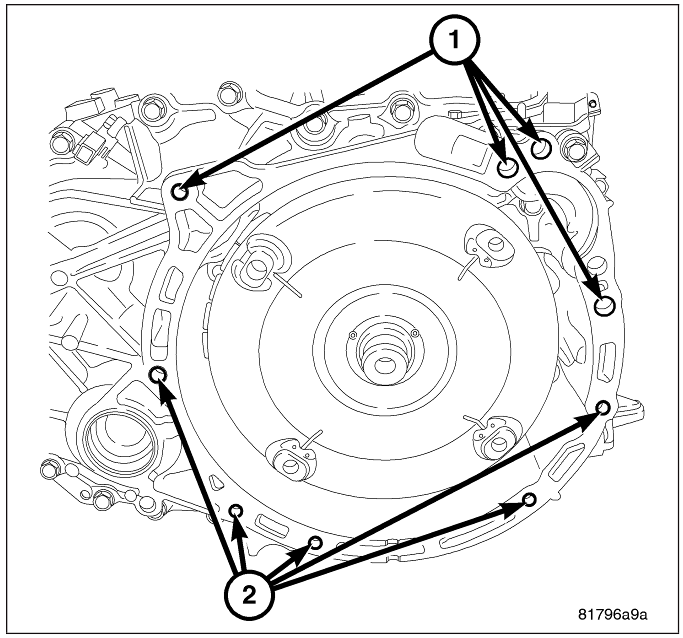
NOTE: When conducting measurements, measure two or more places and calculate the average value.

105. Install the torque converter on the transaxle and measure the dimension (1) to see if it is at least 13 mm. If the measurement is less than 13 mm, the torque converter is not fully installed.



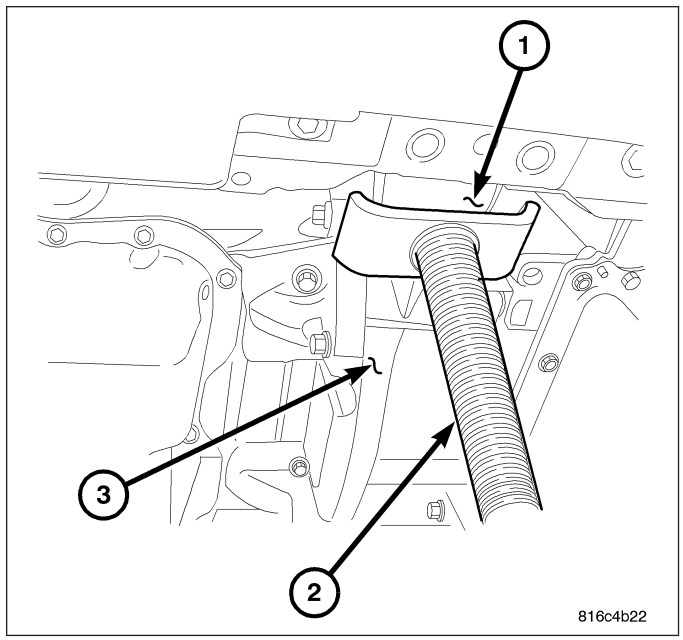
NOTE: Use the designated brand of CVT fluid. Use of other brands of CVT fluid other than the designated brand will deteriorate the driveability and the durability of the CVT, and will cause damage to the CVT.

106. Fill the transaxle with CVT fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/FLUID - STANDARD PROCEDURE)

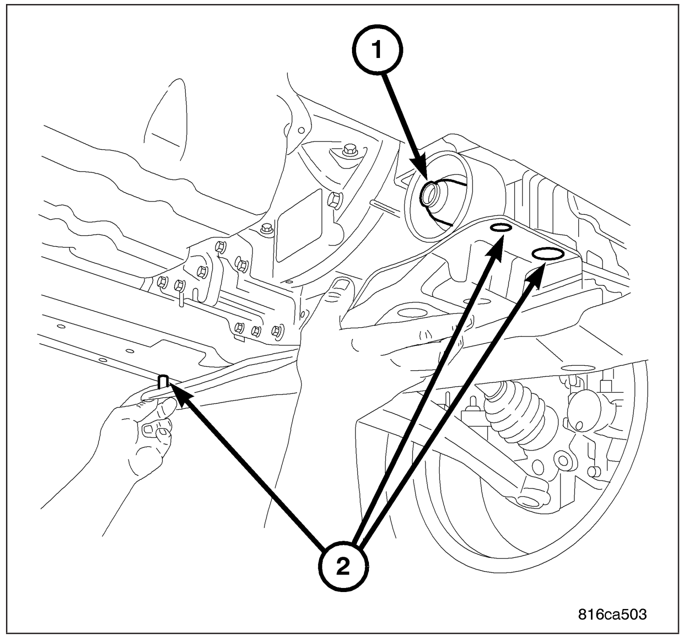


INSTALLATION

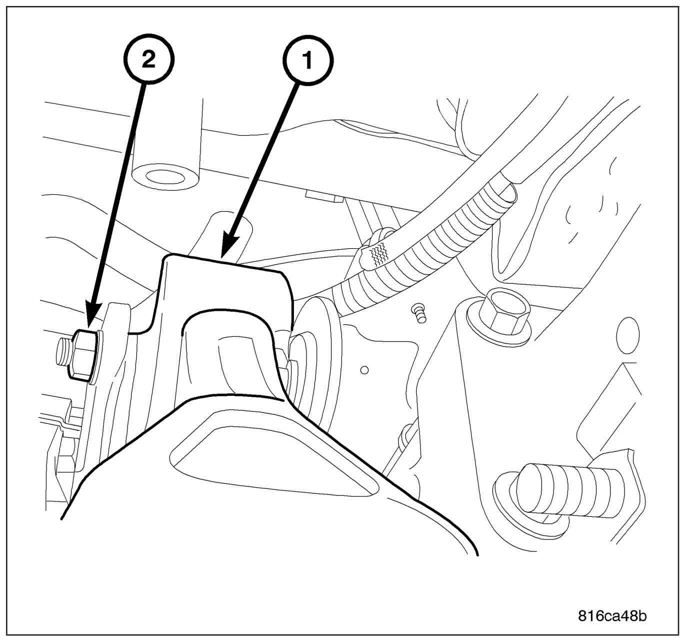
NOTE: Verify that both dowel pins are present in the engine before installing the transmission.



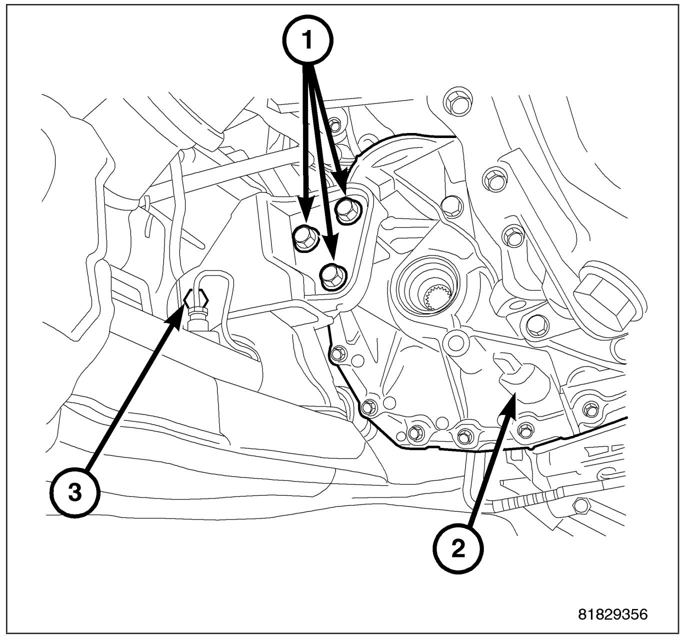
1. Raise transmission into place.
2. Install the transmission cooler lines (1, 2).



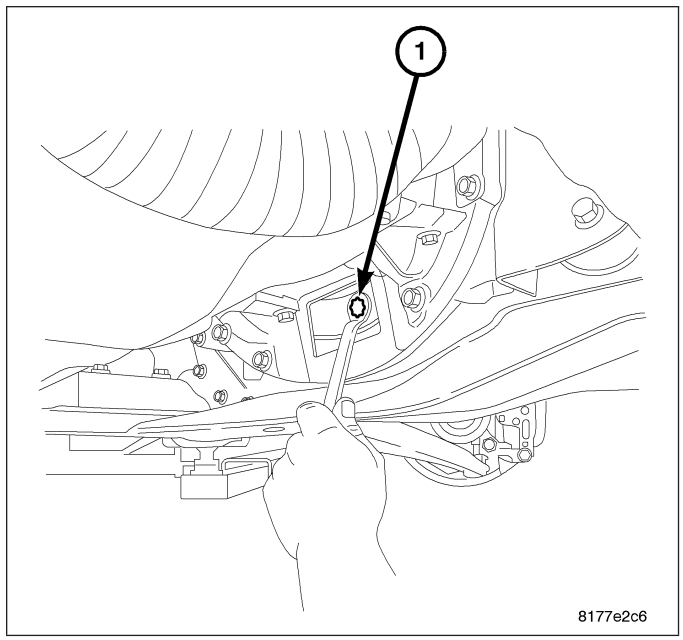
3. Install the lower transmission bell housing bolts (2) and torque to 108 N·m (80 ft. lbs.).



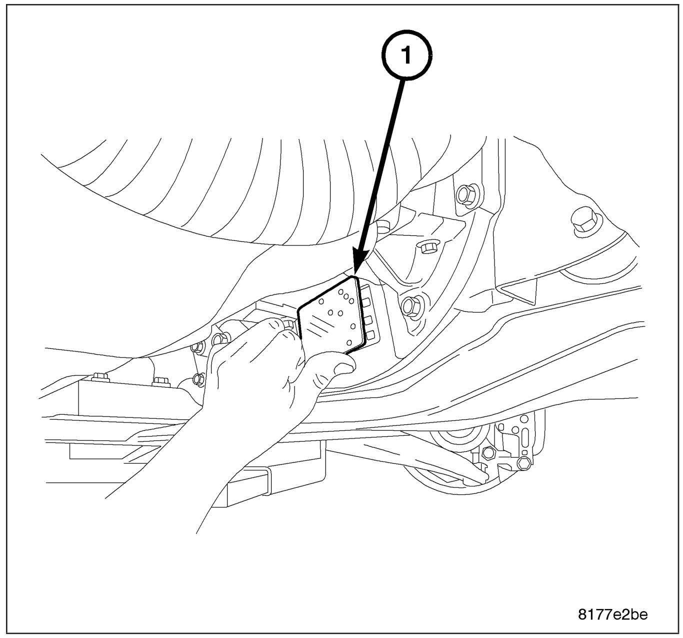
4. Raise the transmission using a screw jack (2).



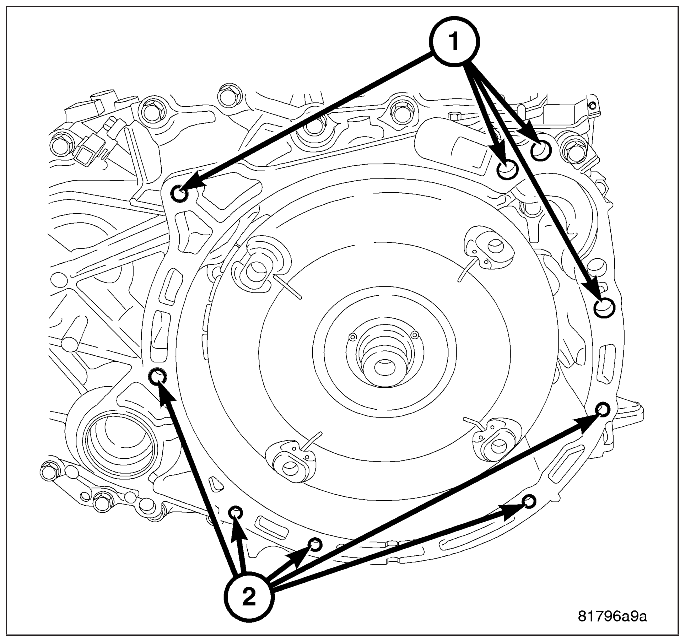
5. Install the transmission crossmember and bolts, (2) torque to 75 N·m (55 ft lbs.).
6. Install the through bolt at the front transmission mount (1) and torque to 75 N·m (55 ft lbs.).



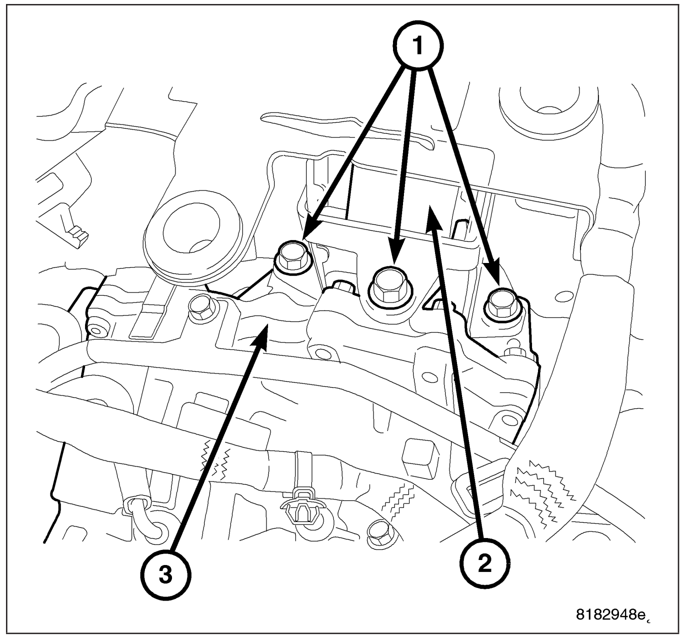
7. Install rear mount through bolt (1) and torque bolt to 75 N·m (55 ft lbs.).



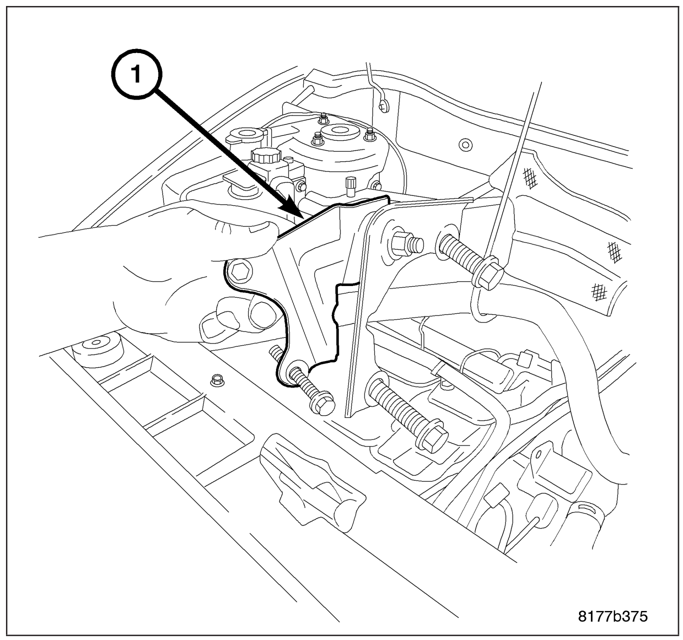
8. Install rear mount to transaxle and torque bolts (1) to 75 N·m (55 ft lbs.).



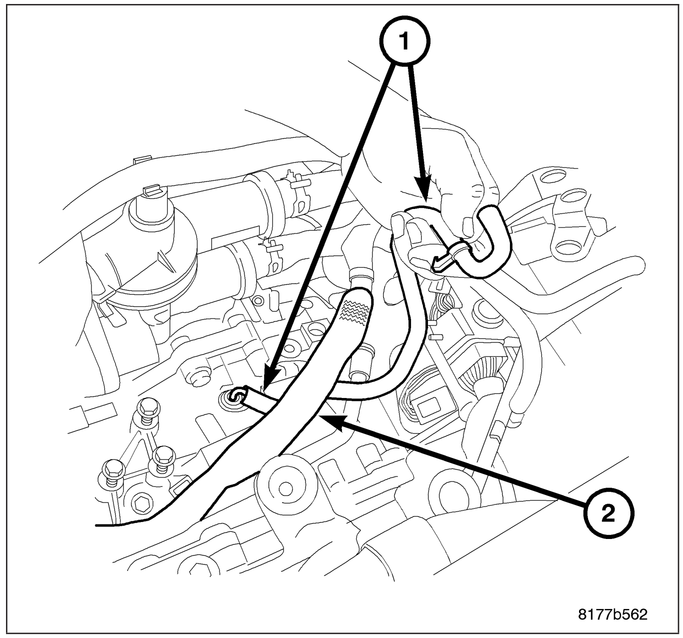
9. Install new torque converter bolts (1) and torque to 88 N·m (65 ft. lbs.).



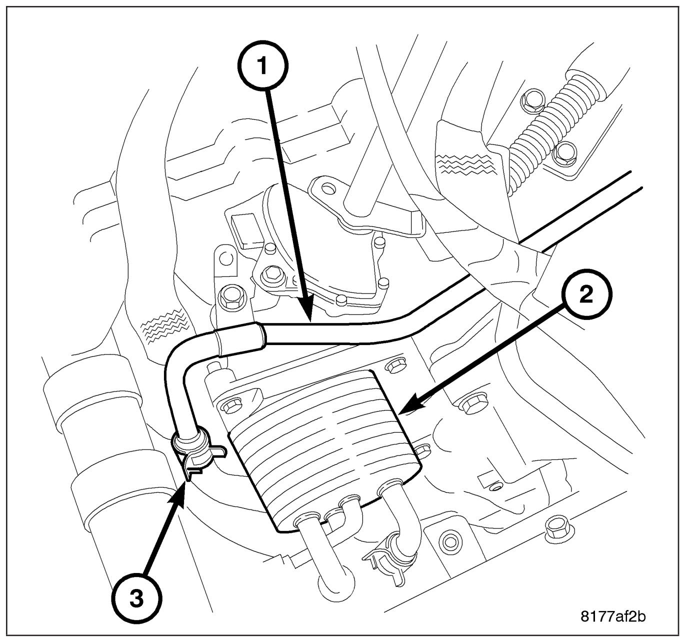
10. Install cover at torque converter (1).
11. Install the PTU if equipped (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).
12. Install the right front lower splash shield.
13. Install the left front lower splash shield.
14. Install left half and right half shafts to the transaxle (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
15. Install both front wheels (Refer to 22 - TIRES/WHEELS - REMOVAL).



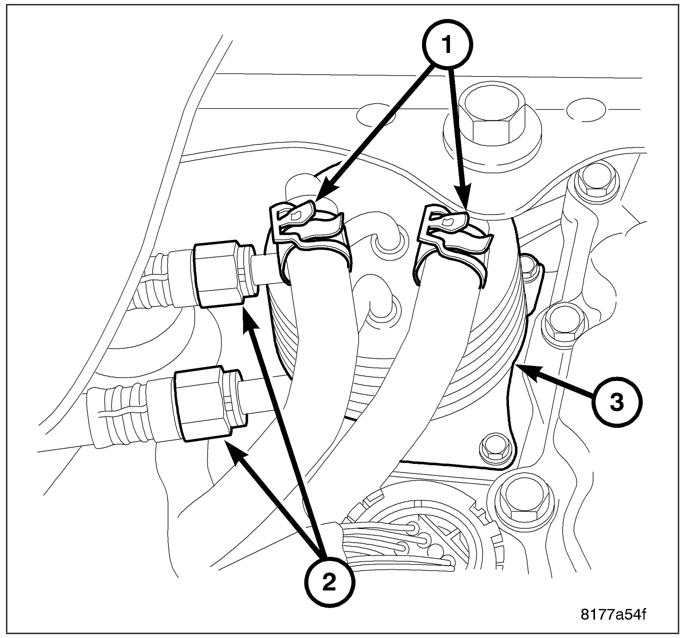
16. Lower hoist.
17. Install upper bell housing bolts (1) and torque to 108 N·m (80 ft. lbs.).



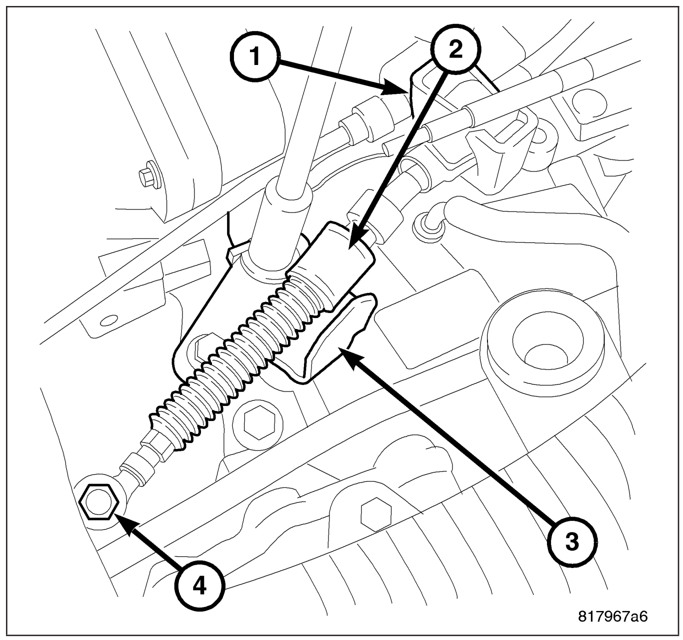
18. Install the upper mount bolts and torque to 75 N·m (55 ft lbs.).
19. Install the upper mount through bolt and torque 75 N·m (55 ft lbs.).



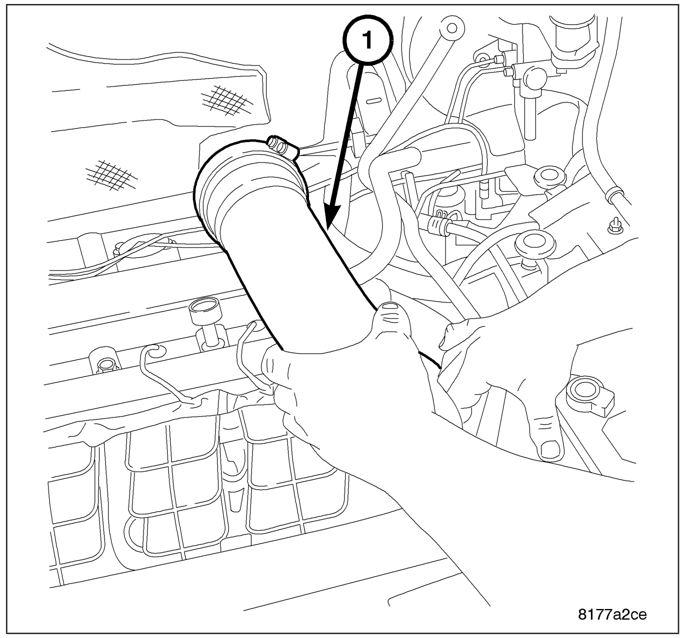
20. Install the throttle body support bracket (1) and torque to 11 N·m (105 in. lbs.).



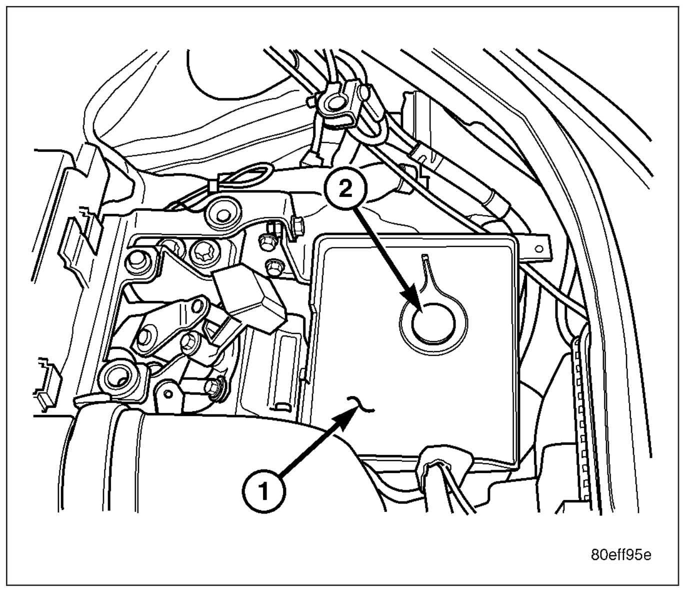
21. Connect the transmission vent tube (1).



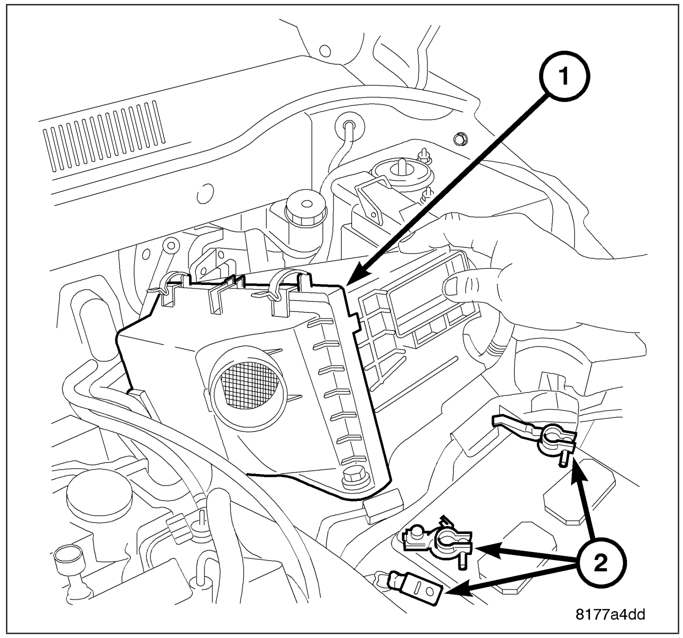
22. Install the heater hose at transmission cooler tube (3).



23. Connect coolant lines at transmission cooler.

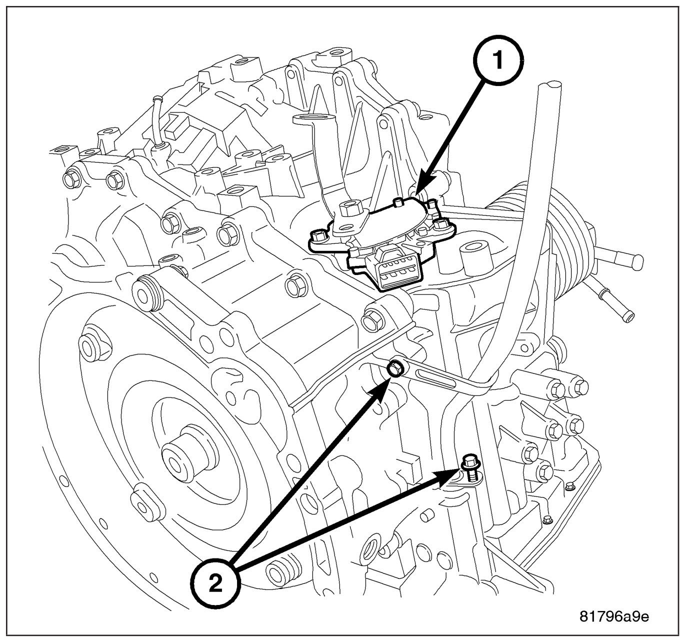


24. Install the shiftier cable (1) and bracket (2) torque to 11 N·m (105 in. lbs.).
25. Install the vacuum supply lines.



26. Install intake air tube (1).
27. Fill engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

28. Install the battery tray (1).
29. Install the battery.



30. Install the air cleaner assembly (1).
31. Connect battery cables (2).

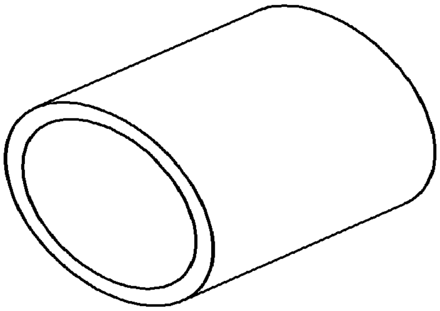
32. Install the transmission fill tube (1) Torque bolt to 9 N·m (79 in. lbs.).
33. Fill the transmission with fluid to the correct level.

CAUTION: Use only MOPAR ® CVTF +4, use of any other type of automatic transmission fluid may cause damage to the CVT.

34. Road test vehicle and inspect for leaks.

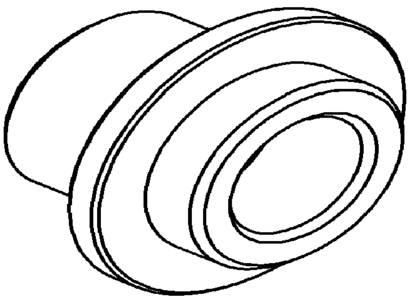
SPECIFICATIONS -

CLEARANCES



DESCRIPTION	SPECIFICATION
Forward clutch	1.2-1.5 mm (0.047-0.059 in.)
Forward Clutch, Total end play	0.25 - 0.55 mm (0.010 - 0.022 in)
Required differential preload	0.17 mm (0.007 in)
Required preload , Reduction gear	0.13-0.19 mm (0.005-0.0075 in)
Reduction Assembly required select shim	Reduction assembly measurement , minus reduction assembly measurement, plus reduction assembly measurement , plus 0.16 mm (0.006 in)

DESCRIPTION	SPECIFICATION
Required clearance, Oil pump drive sprocket	0.10-0.23 mm (0.004-0.009 in.) The select shim is equal to the oil pump drive sprocket measurement one plus the oil pump drive sprocket measurement two minus 0.16 mm (0.0065 in.).
Torque converter installed depth	at least 13 mm



TORQUE SPECIFICATIONS

DESCRIPTION	N-m	Ft. Lbs.	In. Lbs.
bolts, drive belt assembly - to - transaxle case	45	33	-
Bolt, Detente spring to case	7	-	61
Bolts, oil pump - to - transaxle case	19	14	168

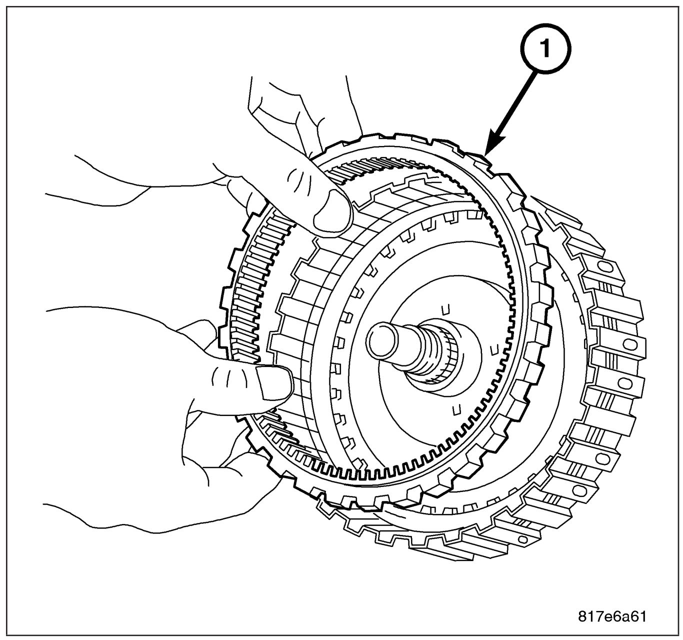
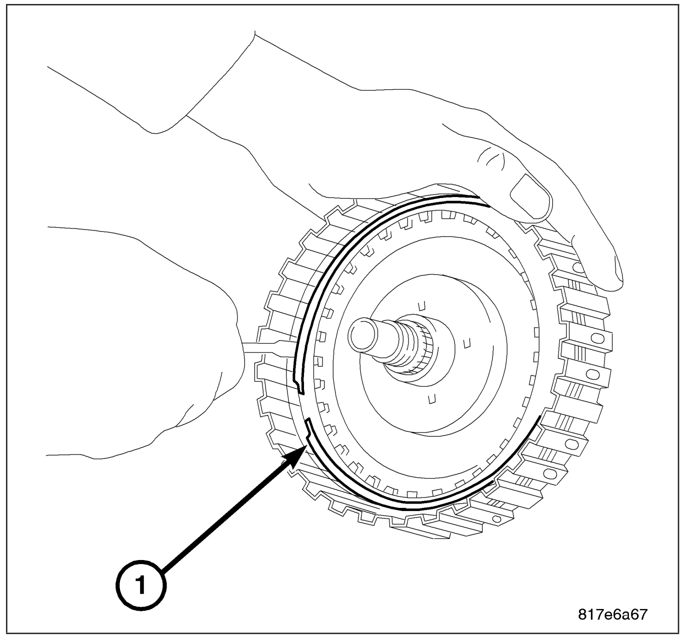
CLUTCH-FORWARD

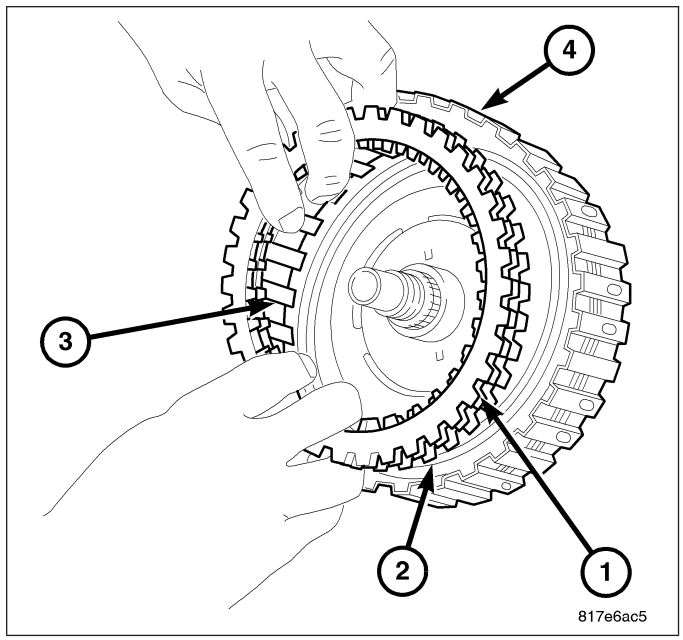
DISASSEMBLY



NOTE: Refer to the exploded views as necessary when performing the following steps.

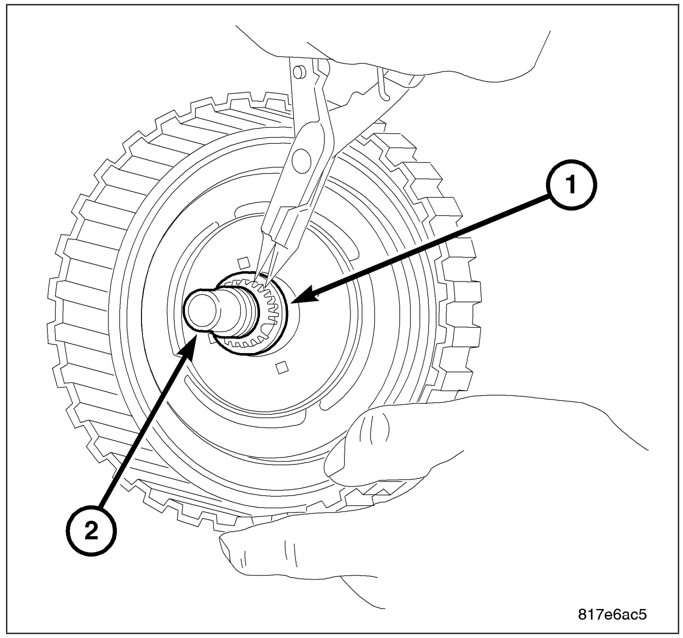


1. Remove the snap ring (1) from the forward clutch drum using a flat head screwdriver.

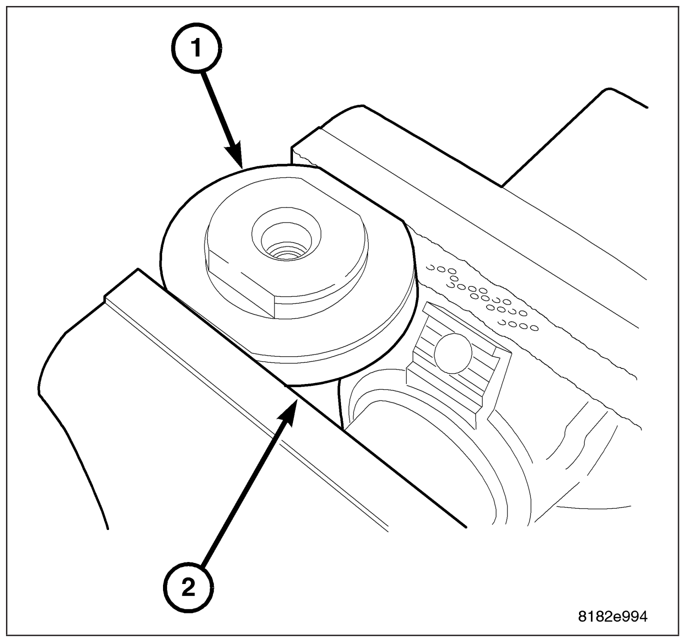


2. Remove the internal gear (1) from the forward clutch drum.

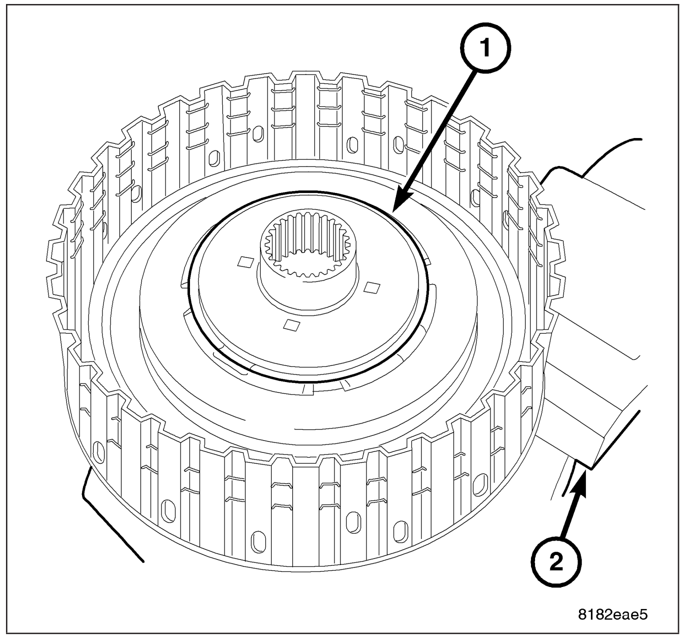
3. Remove the snap rings (1) from the forward clutch drum using a flat head screwdriver.



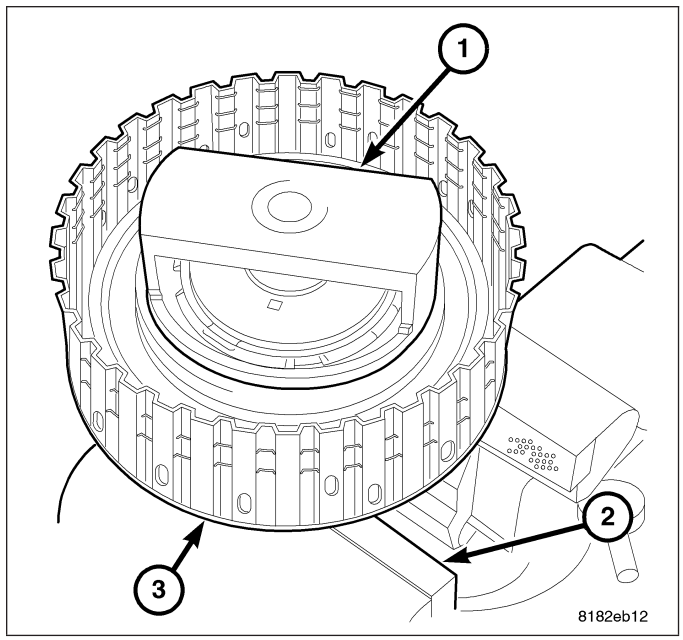
4. Remove the retaining plate (1), the drive and driven plates (3), and the dish plate (2) from the forward clutch drum (4).



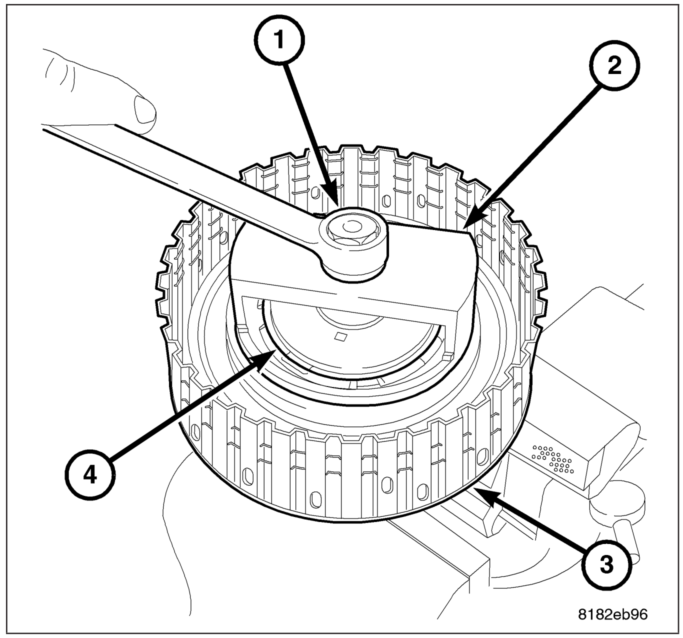
CAUTION: Do not expand the snap ring beyond necessity and do not deform it.



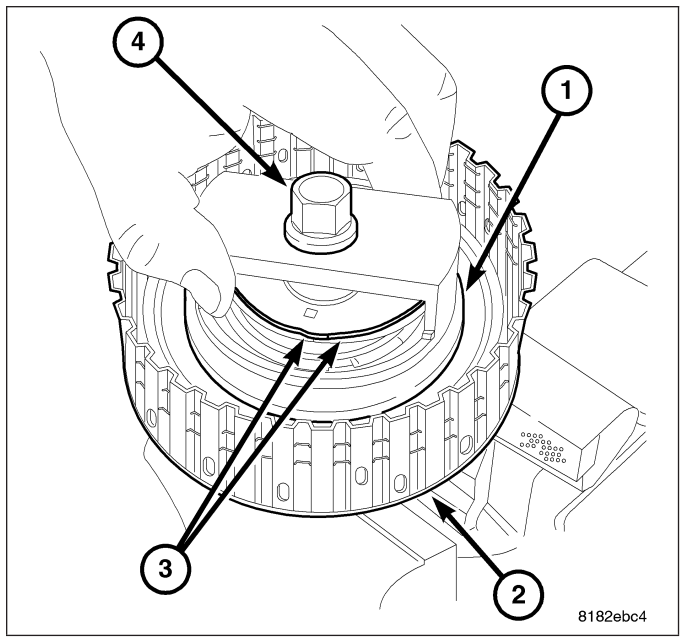
5. Remove the snap ring (1), and remove the input shaft (2) from the forward clutch drum.



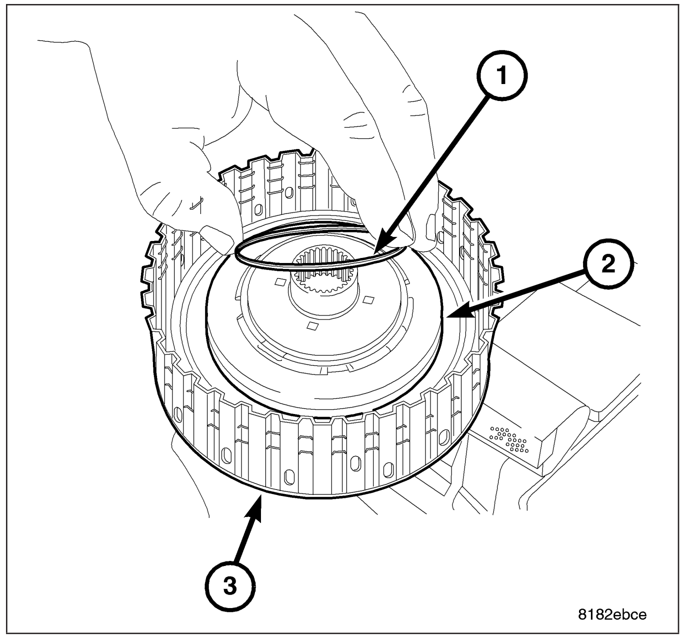
6. Place bottom of Compressor 8900 (1) in Vice (2).



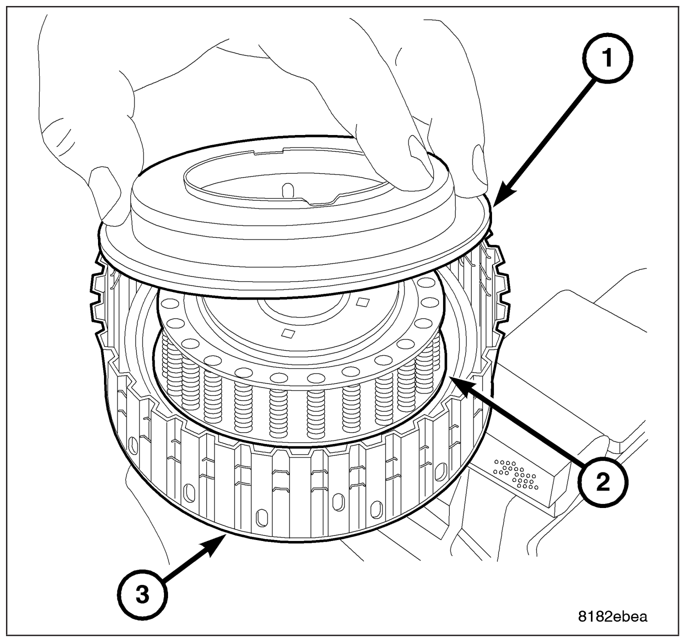
7. Place the drum (1) over Compressor bottom 8900 in Vice (2).



8. Place correct ring (1) that comes with Compressor 8900 in drum (3).

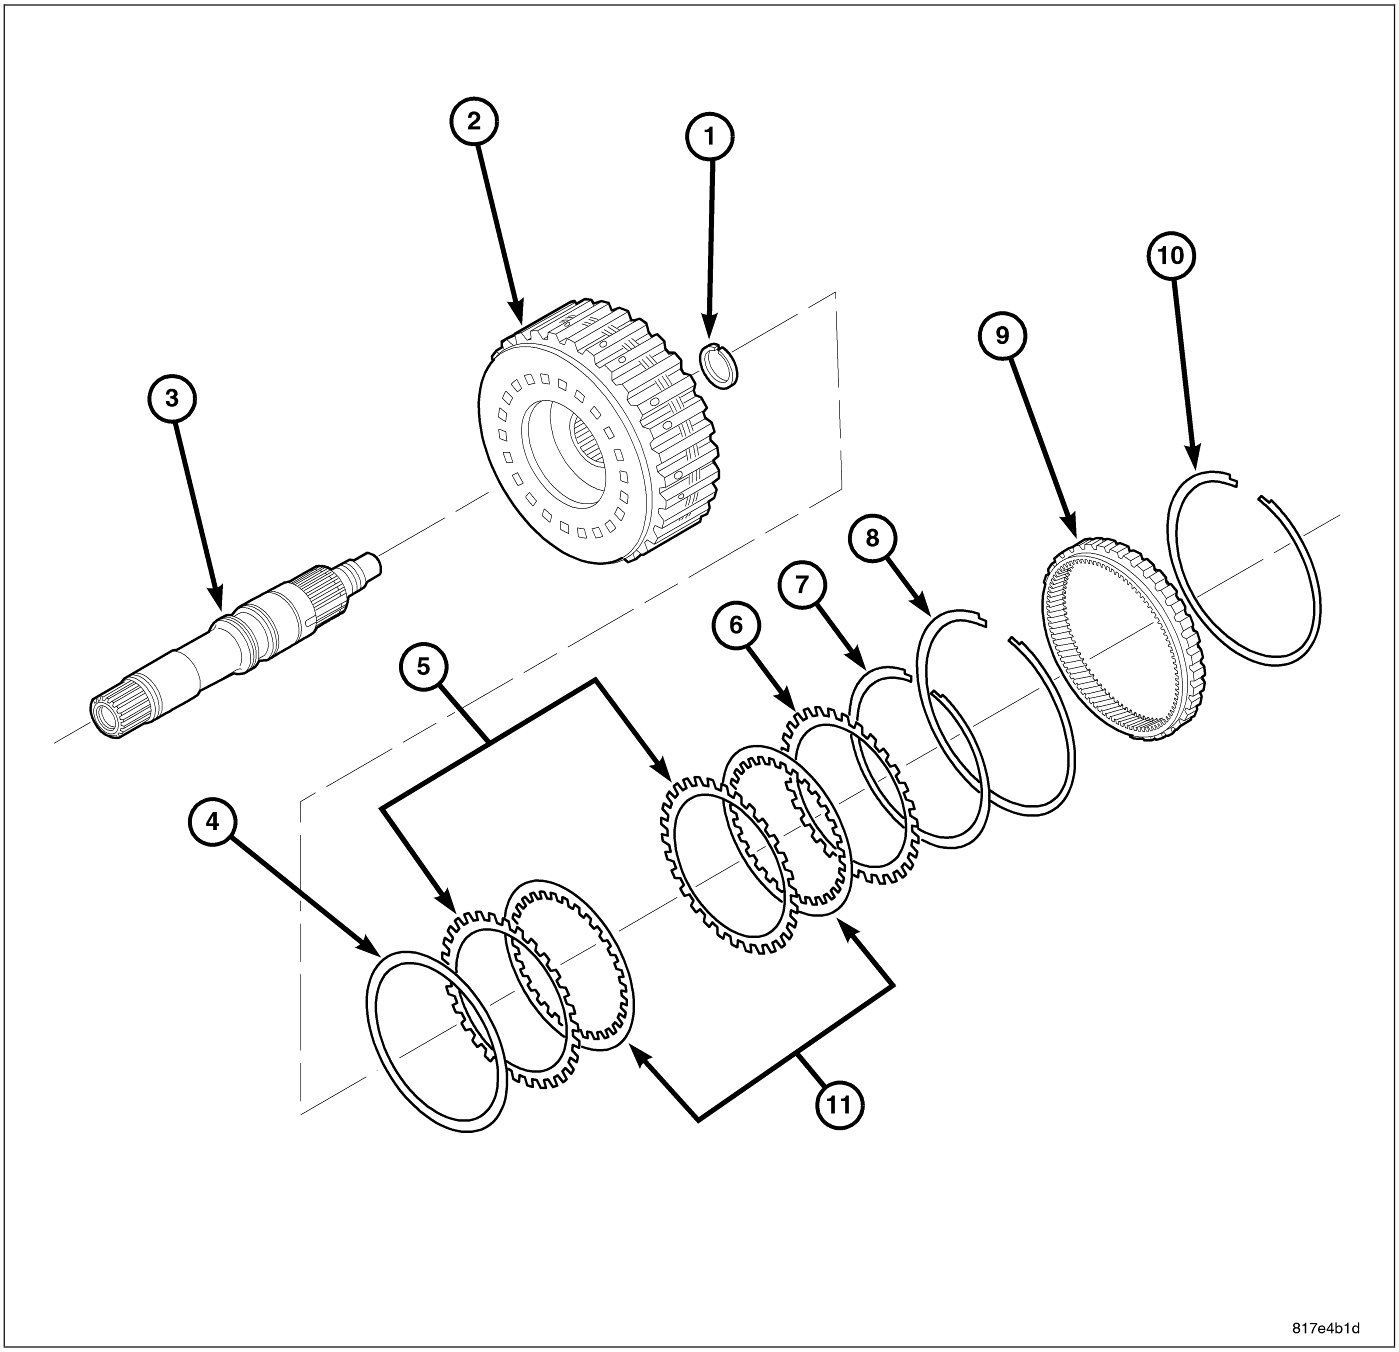


9. Install threaded rod (1) that comes with Compressor 8900 (2) in drum (3).
10. Compress tool until the snap ring (4) can be removed.



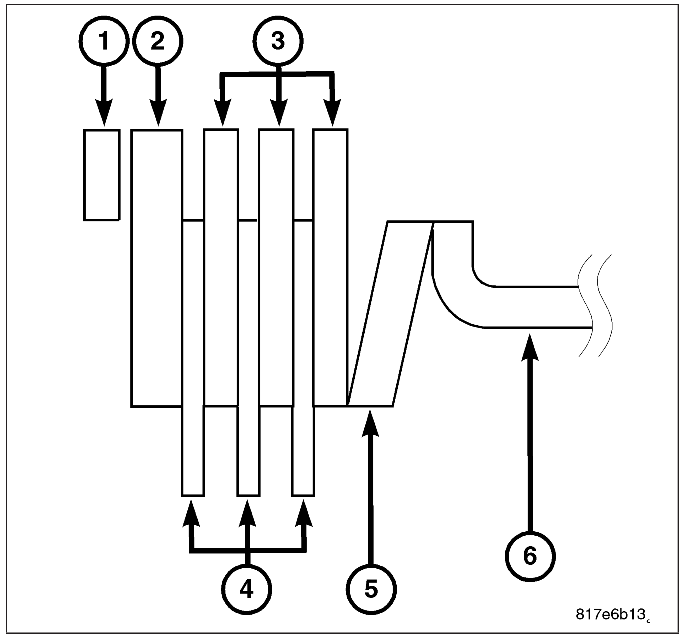
11. Use snap ring pliers or a small screw driver to remove the snap ring (3) from the piston (1).

12. Remove snap ring.



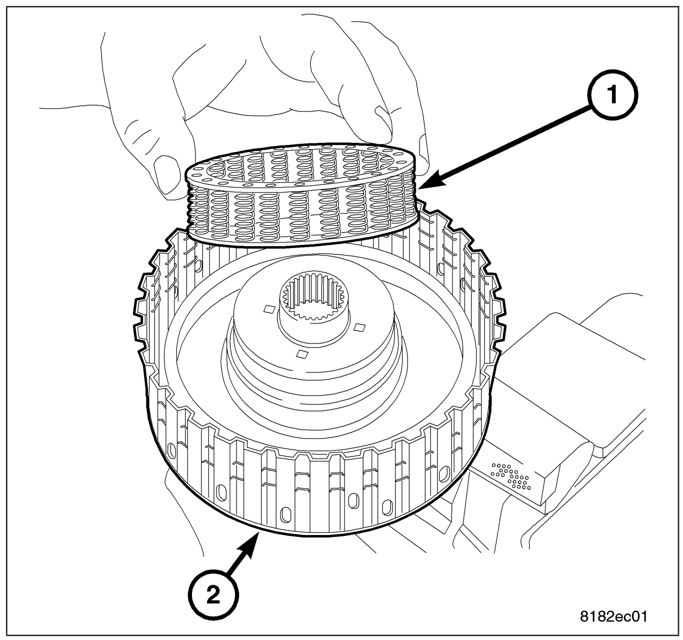
13. Remove the piston (1) from the drum (3).
14. Remove the spring assembly (2) form the drum (3).

INSPECTION

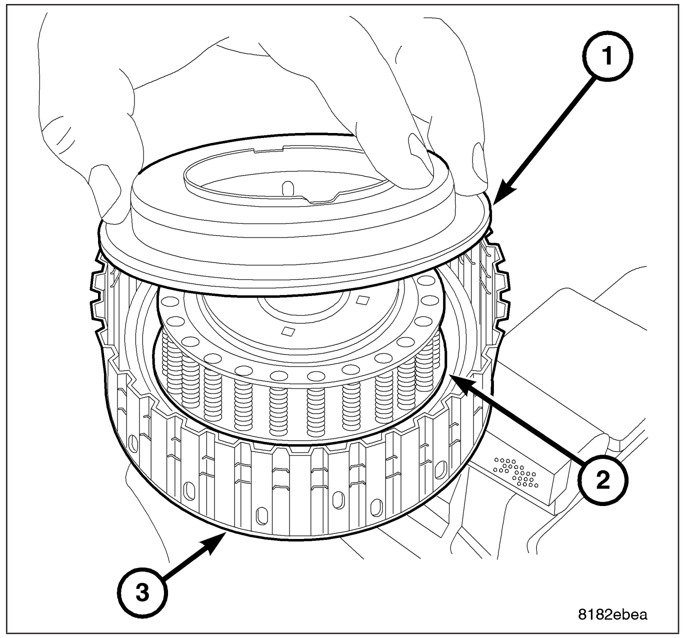


1. Check driven plate, drive plate, retaining plate and forward clutch drum for damage, distortion or burnt surfaces.
2. Check snap ring and dish plate for damage, distortion or permanent fatigue.
3. Check input shaft and internal gear for damage and distortion.

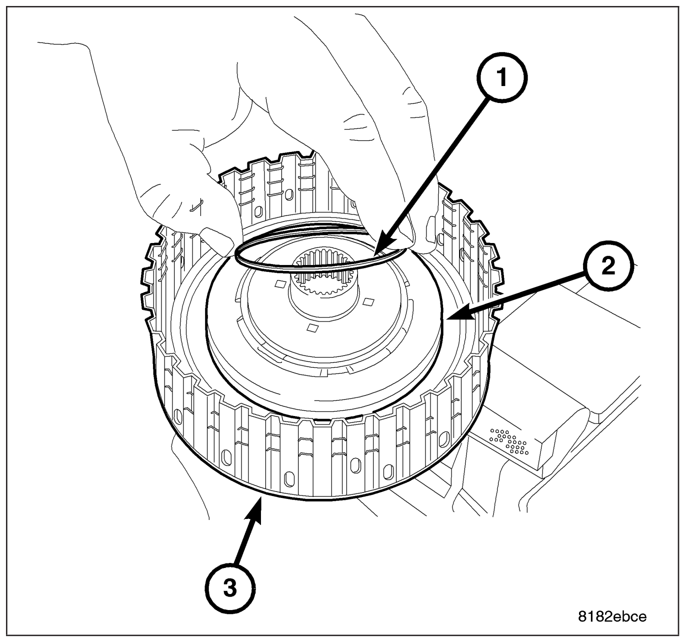
ASSEMBLY



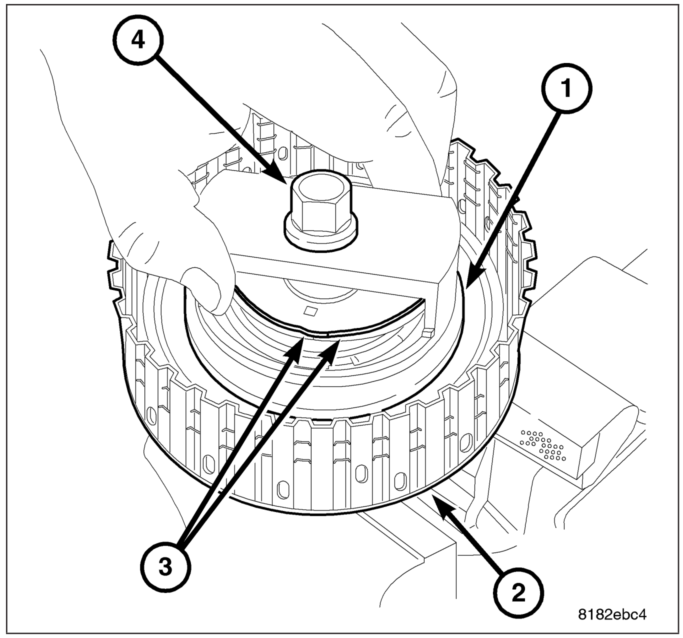
1. Refer to the exploded views as necessary when performing the following steps.



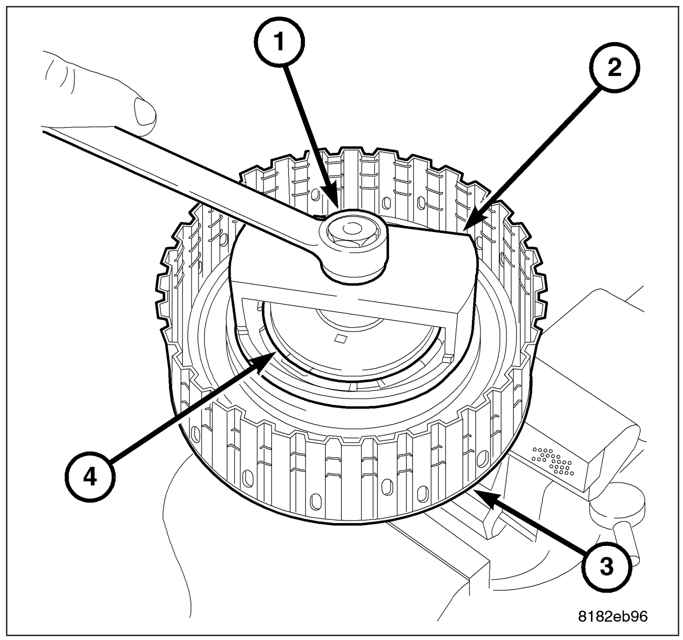
2. Refer to this view as necessary when performing the following steps.



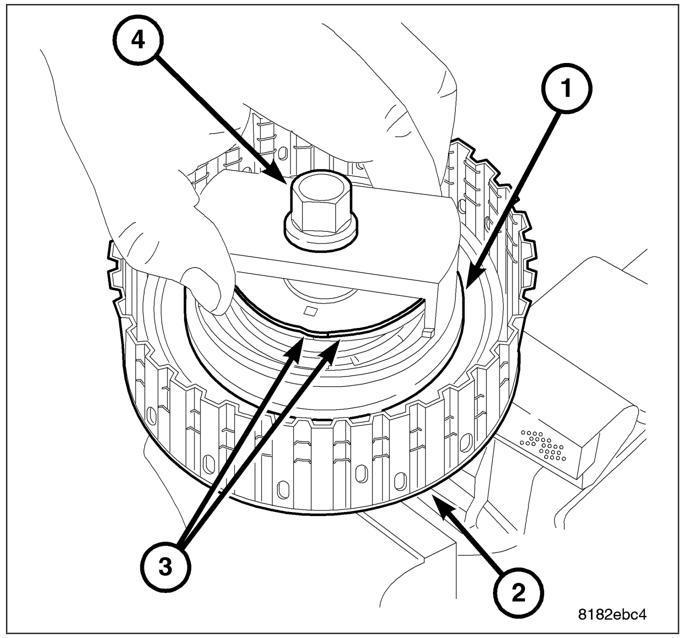
3. Install the spring assembly (1) into the drum (2).



4. Install the piston (1) into the drum (3).

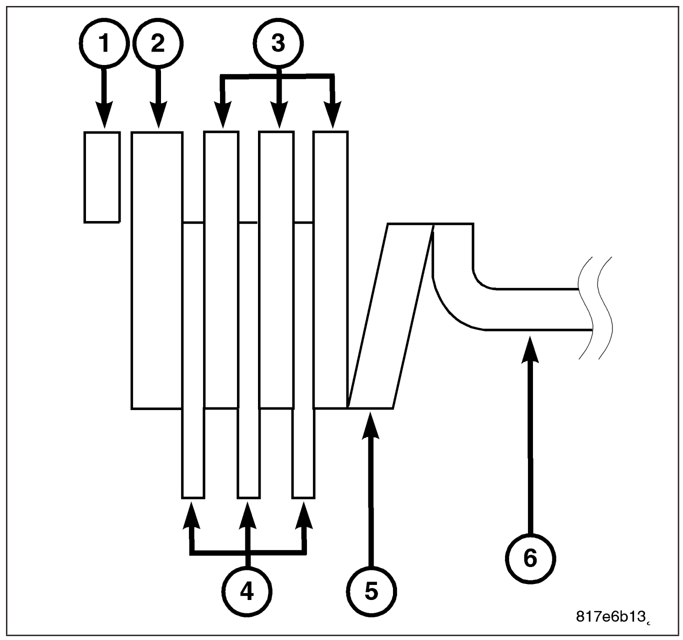


5. Lay the snap ring onto the piston.

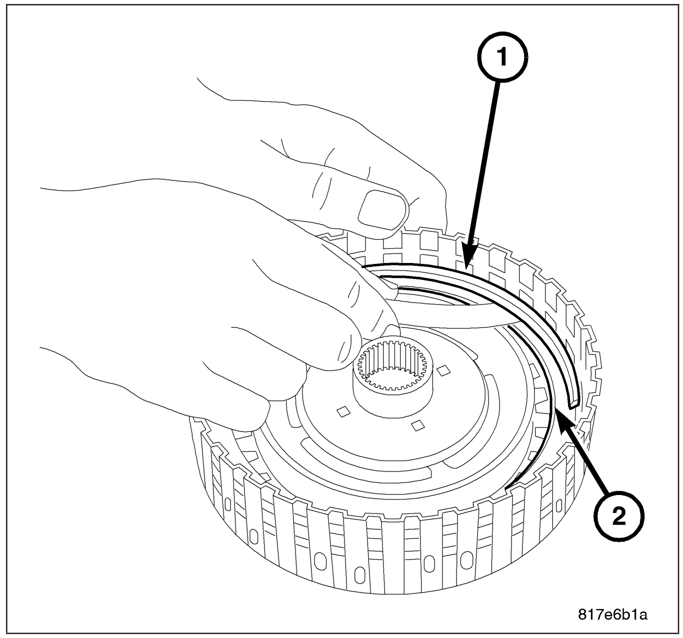


6. Install Compressor 8900.

7. Compress the piston.

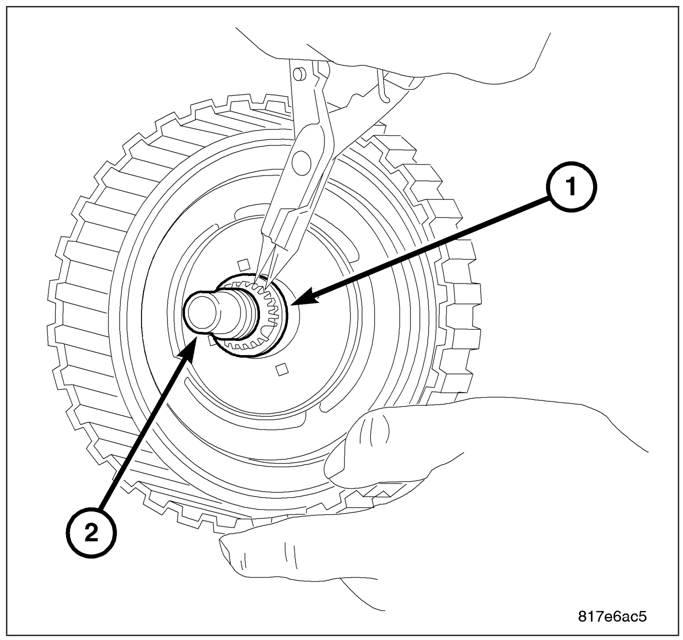


8. Use snap ring pliers or a small screw driver to install the snap ring (3) onto the piston (1).



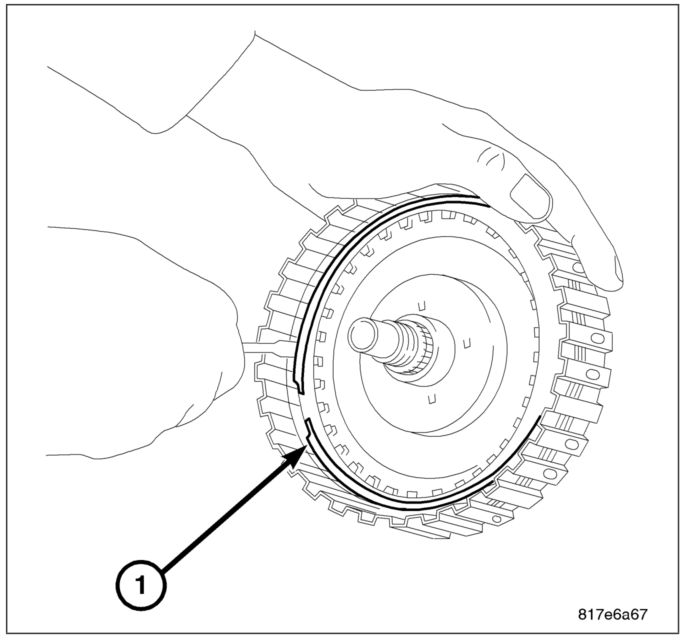
CAUTION: Install so that the installation order of each plate is correct.

9. Install the dish plate (5), the driven plate (3), the drive plate (4), the retaining plate (2) and one piece of the snap ring (1), in the forward clutch piston (6).

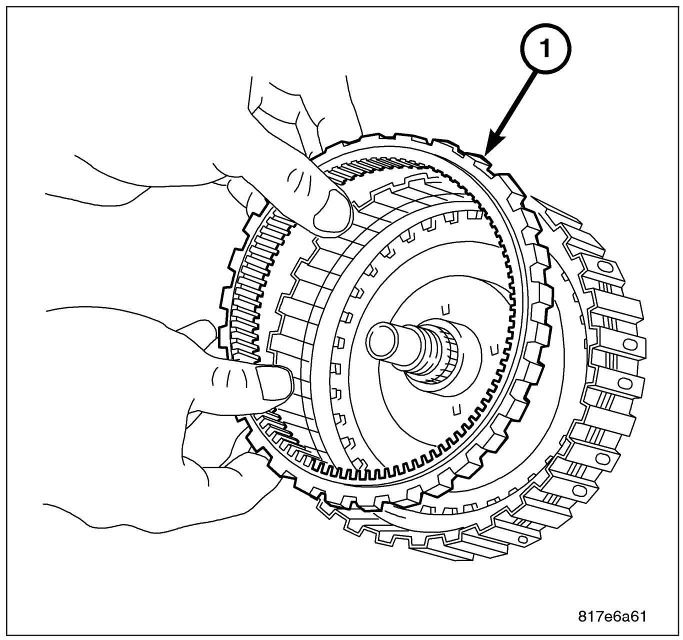


CAUTION: When conducting measurements, measure two or more places and calculate the average value. If clearance is beyond standard value, replace the forward clutch assembly.

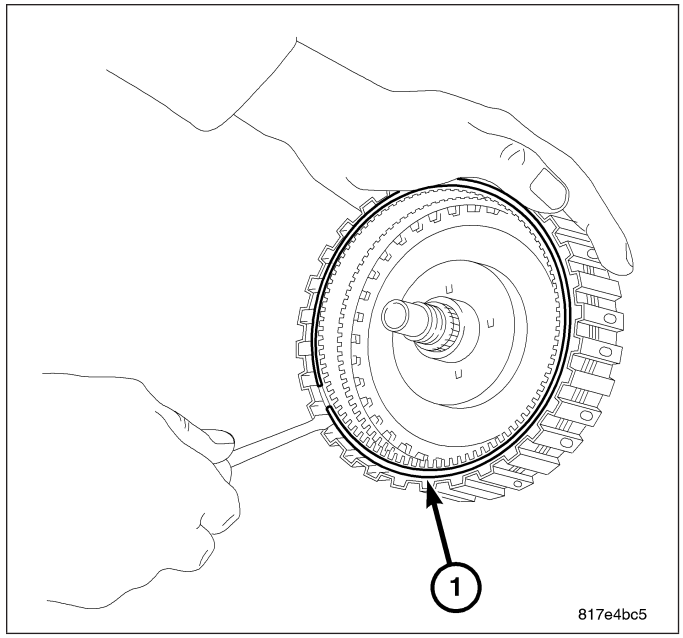
10. Measure the clearance between the snap ring (1) and the retaining plate (2). the correct clutch clearance is 1.2-1.5 mm (0.047-0.059 in.).



CAUTION: Do not expand the snap ring beyond level required to install and do not deform it.



11. Install the input shaft (2) in the forward clutch drum, and install the snap ring (1).



12. Install one piece of the snap ring (1) into the forward clutch drum.

13. Install the internal gear (1) into the forward clutch drum.

14. Install the snap ring (1) in the forward clutch drum.

FLUID

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

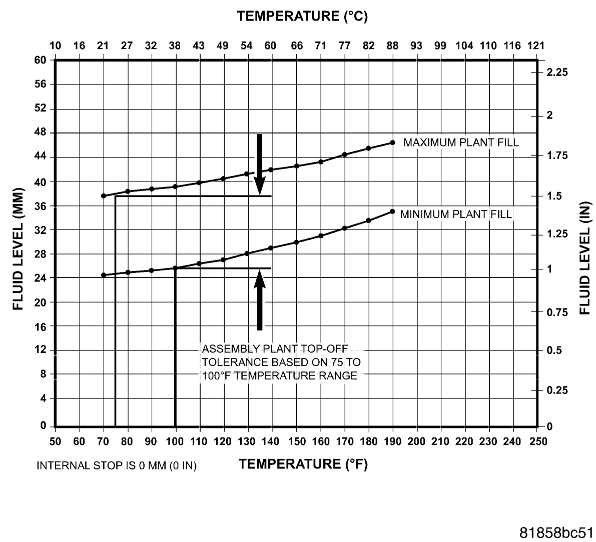
The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE



CHECK OIL LEVEL

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

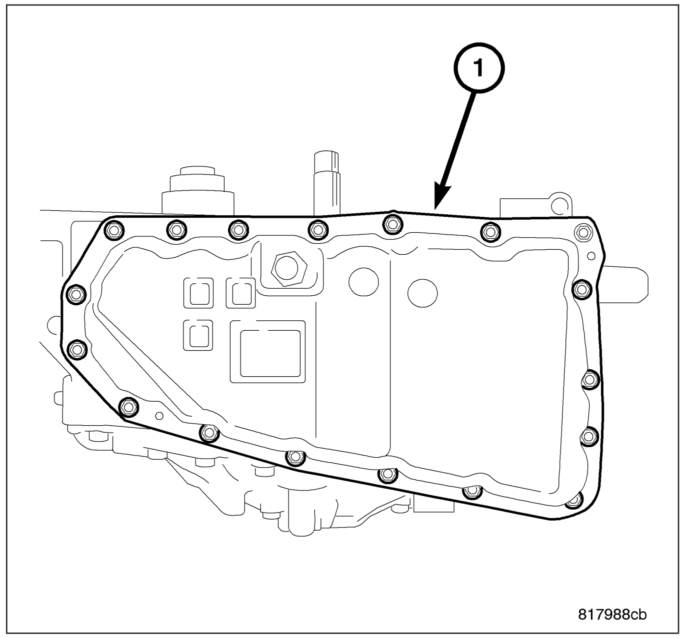
WARNING: There is a risk of accident from vehicle starting off by itself when engine running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position ″P″.
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336 into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick will protrude from the fill tube when installed.

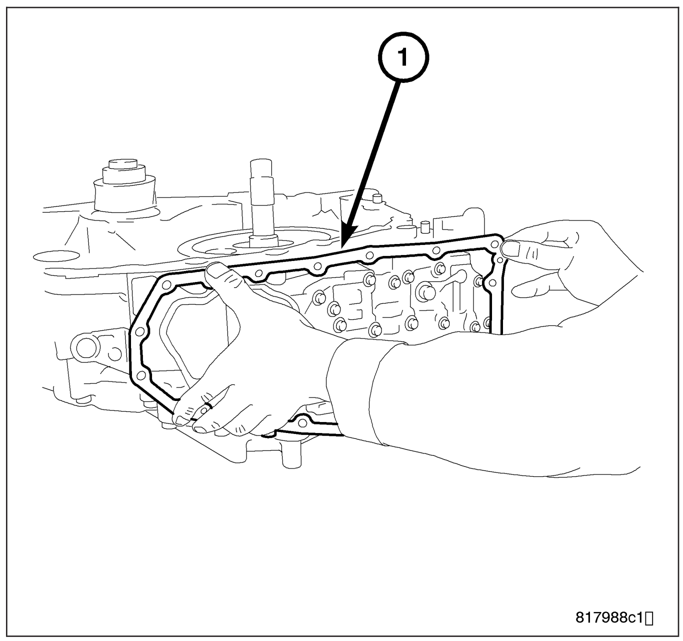
CVT TRANSMISSION FILL GRAPH

6. Check transmission oil temperature using the appropriate scan tool.
7. The transmission Oil Dipstick 9336 has indicator marks every 10 mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.



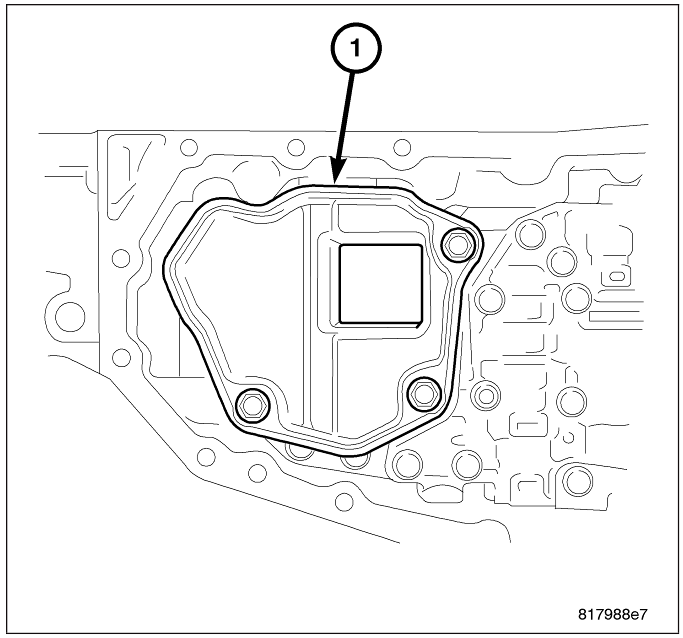
TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:



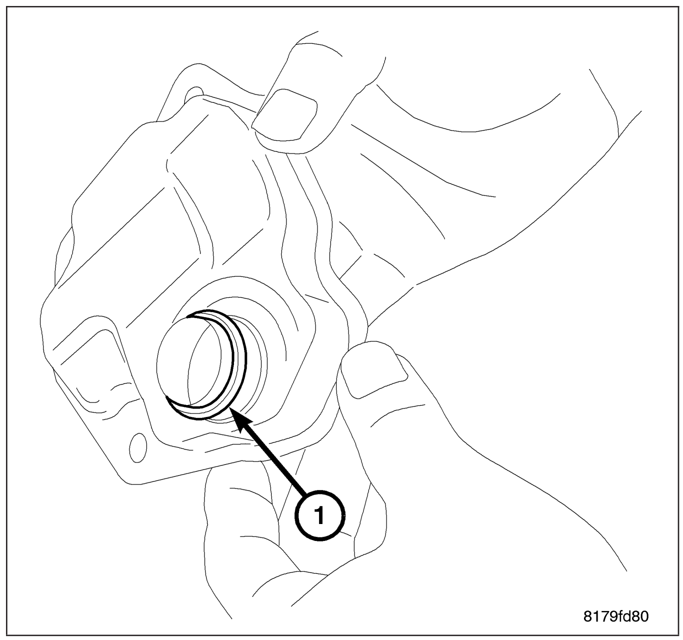
1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.
3. Add following initial quantity of MOPAR® CVT+4, Automatic Transmission Fluid, to the transmission:
   a. If only fluid and filter were changed, add **7.0 L (14.8 pts.)** of transmission fluid to transmission.
   b. If the transmission was completely overhauled or the torque converter was replaced or drained, add **8.1 L (17.1 pts.)** of transmission fluid to transmission.
4. Check the transmission fluid (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/FLUID - STANDARD PROCEDURE) and adjust as required.

FLUID AND STRAINER SERVICE

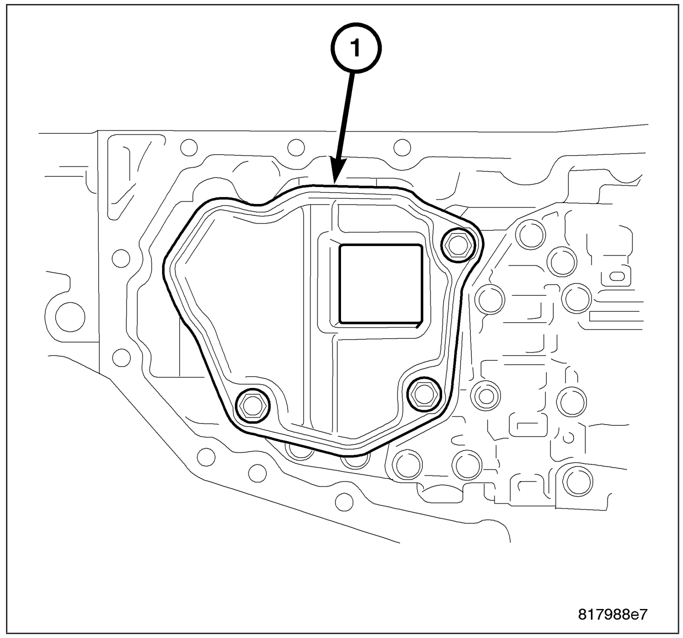


1. Remove the bolts holding the oil pan (1) to the transaxle case.
2. Remove the oil pan from the transaxle case.

3. Remove the oil pan gasket (1) from the transaxle case.

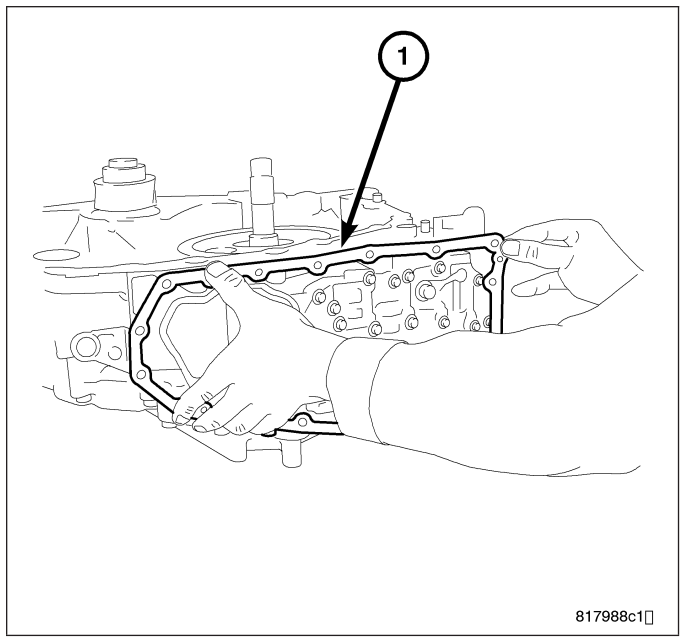


4. Remove the bolts holding the oil strainer (1) to the valve body.
5. Remove the oil strainer.
6. Remove and discard the oil strainer o-ring.

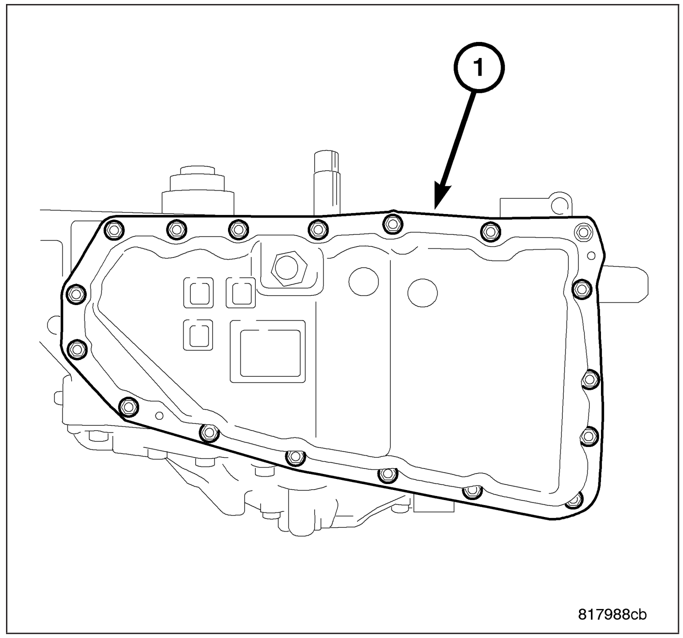


CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

7. Install the new o-ring (1) onto the new oil strainer.



8. Install the new oil strainer (1) onto the control valve assembly. Install and tighten the mounting bolts to 8 N·m (70 in.lbs.).



CAUTION: Do not re-use the oil pan gasket. Remove any moisture, oil, and used gasket material from the surface where the new gasket is to be installed. When installing the oil pan gasket, align the dowel pin with the dowel pin hole in the oil pan gasket.

9. Install the oil pan gasket (1) onto the transaxle case.

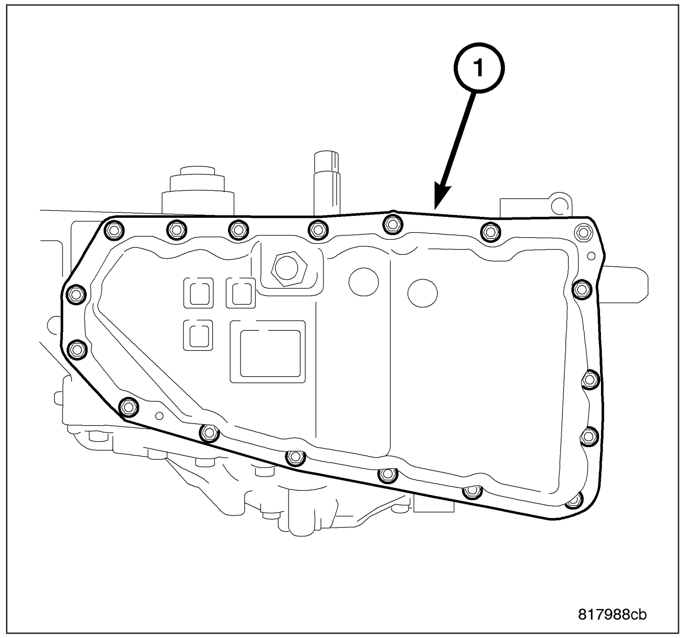
CAUTION: When installing the oil pan, align the dowel pin of the transaxle case with the dowel pin hole of the oil pan.

10. Install the oil pan on the transaxle case (1). Install and tighten the mounting bolts to 8 N·m (70 in.lbs.).

NOTE: Only transmission fluid of the type labeled Mopar® CVTF+4 (Automatic Transmission Fluid) should be used in this transaxle.

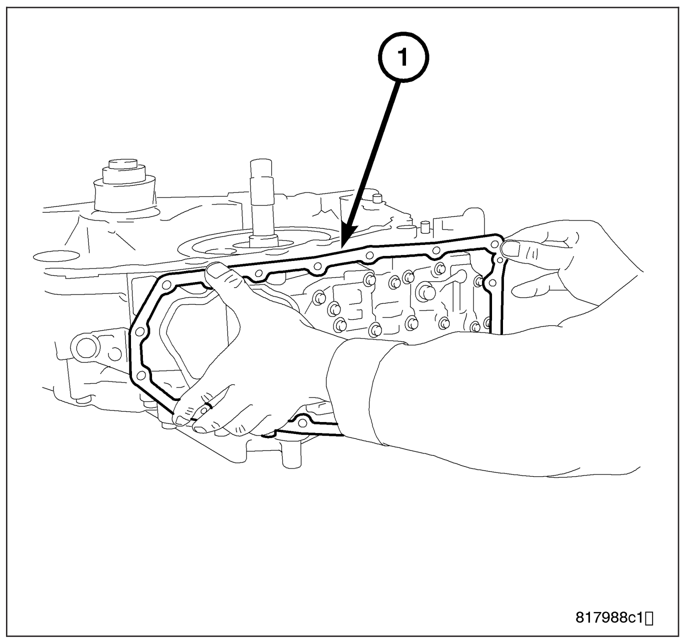
11. Check the oil level (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/FLUID - STANDARD PROCEDURE)

BODY-VALVE



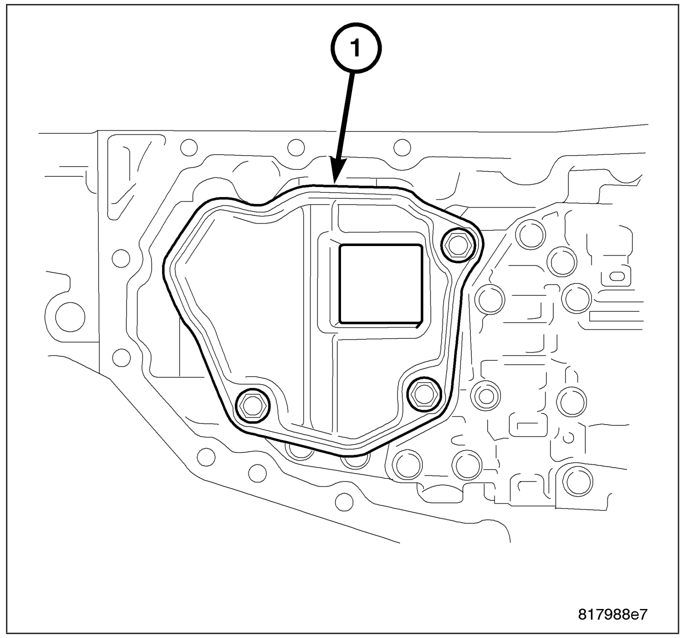
OPERATION

Outline of the Functions of the Main Components

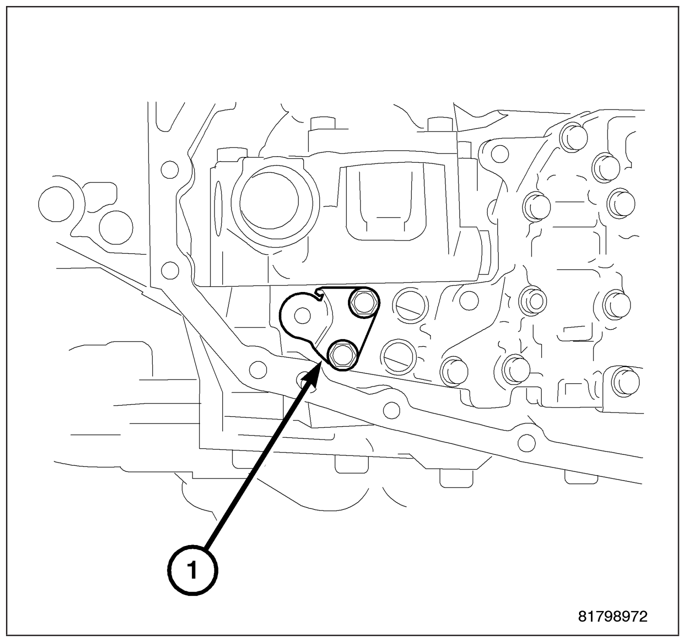


Component	Function
Torque converter regulator valve	Optimizes the supply pressure for the torque converter depending on driving conditions.
Clutch regulator valve	Adjusts the clutch operating pressure depending on operating conditions.
Pressure regulator valve	Optimizes the discharge pressure (line pressure) from the oil pump depending on driving conditions.
Shift control valve	Controls flow-in/out of line pressure to/from the primary pulley depending on the stroke difference between the stepping motor and the primary pulley.
Lock-up/Select switch solenoid valve	Switches use of the lock-up solenoid control pressure between applying/releasing lock-up and engaging/ releasing the forward/reverse clutch (the forward clutch and the reverse brake).
Select switch valve	Switches use of the lock-up solenoid control pressure between applying/releasing lock-up and engaging/ releasing the forward/reverse clutch (the forward clutch and the reverse brake).
Line pressure solenoid valve	Controls the line pressure control valve.
Lock-up solenoid valve	Controls the lock-up control valve.
Lock-up/Select switch solenoid valve	Controls the select switching valve.
Stepping motor	Controls the pulley ratio.
Secondary valve	Reduces the line pressure and adjusts the secondary pressure.
Select control valve	Engages when making a selection. Adjusts the forward clutch pressure and the reverse brake pressure.
Lock-up control valve	Adjusts engaging/releasing pressure for the torque converter.
Secondary pressure solenoid valve	Controls flow-in/out of line pressure to/from the secondary pulley depending on driving conditions.

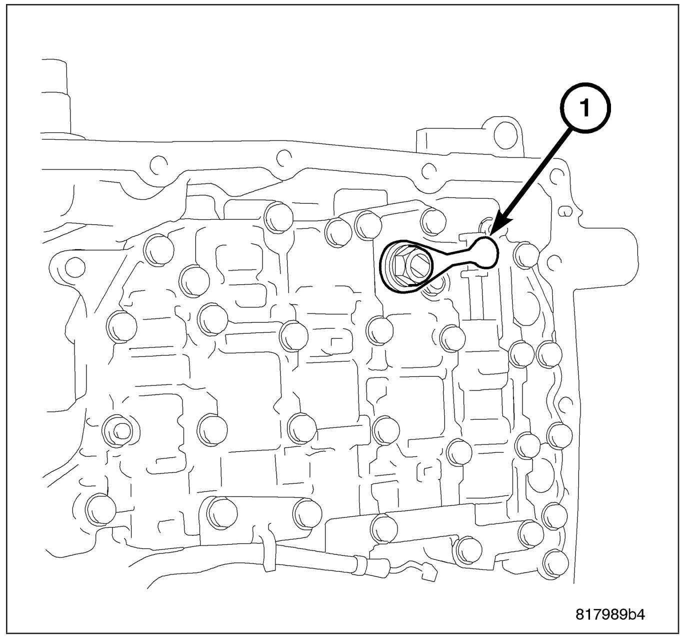
REMOVAL



1. Remove the bolts holding the oil pan (1) to the transaxle case.
2. Remove the oil pan from the transaxle case.

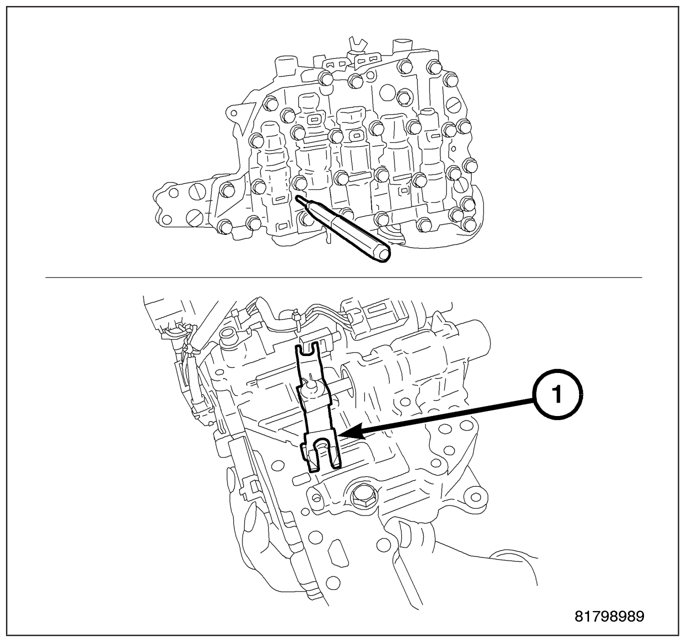


3. Remove the oil pan gasket (1) from the transaxle case.

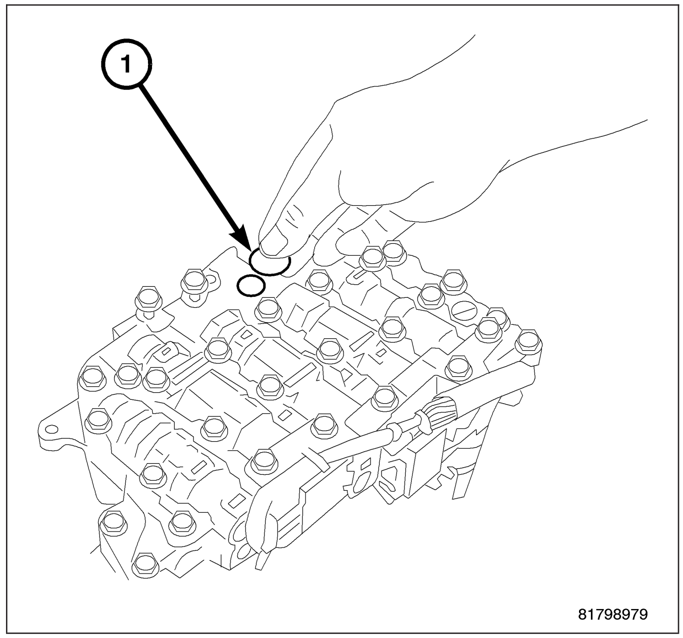


4. Remove the bolts holding the oil strainer (1) to the valve body.
5. Remove the oil strainer.
6. Remove and discard the oil strainer o-ring.

7. Remove the bolts holding the bracket (1) to the valve body assembly.
8. Remove the bracket from the valve body assembly.

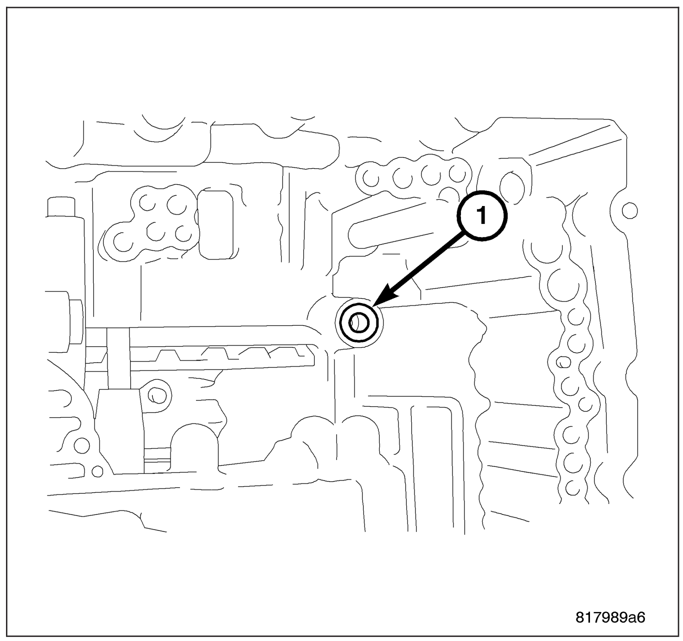


9. Remove the nut holding the manual lever (1) to the manual shaft.
10. Remove the manual lever from the manual shaft.



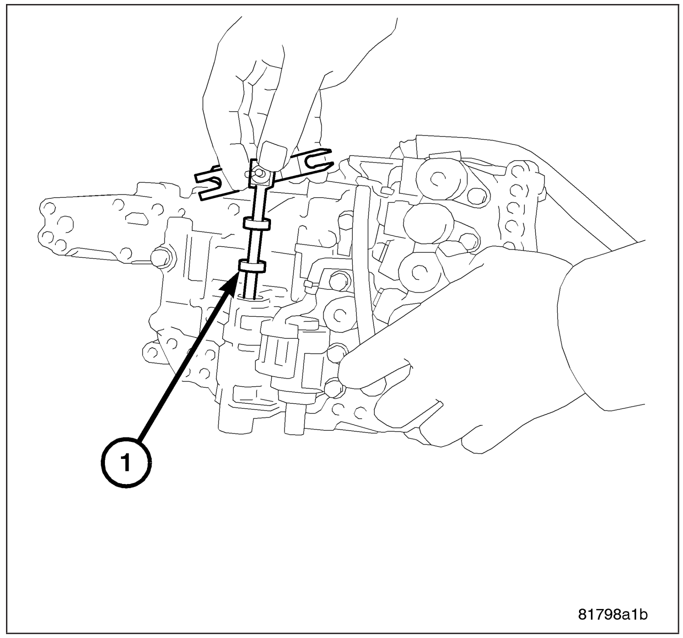
CAUTION: Tilt the valve body assembly away from the transaxle case on the manual shaft side to ease removal. Pay attention to completely remove the terminal body from the transaxle case.

11. Remove the valve body assembly from the transaxle case as follows:
    a. Insert a 75 mm (3 in.) long 3 mm (0.118 in.) rod or wire into the linkage stopper hole of the valve body assembly to fix the pulley ratio linkage (1).
    b. Remove the bolts holding the valve body assembly to the transaxle case.
    c. Remove the valve body assembly from the transaxle case.

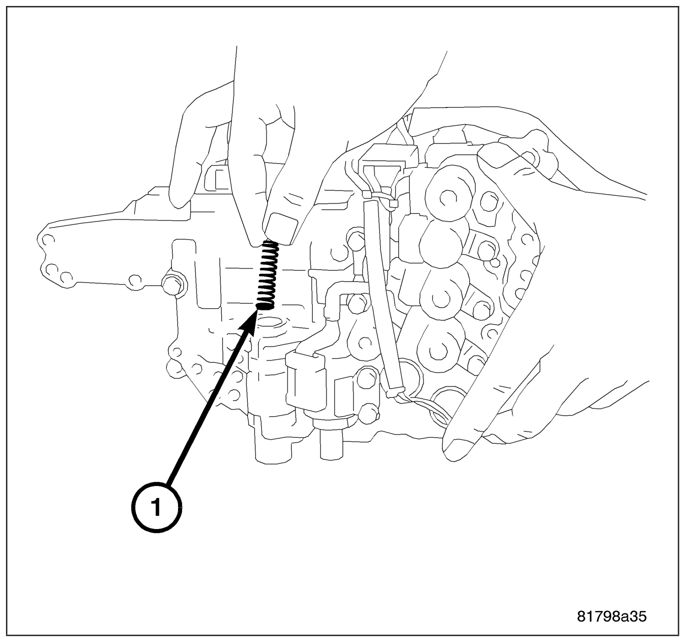


DISASSEMBLY

1. Remove and discard the bushing (1) from the valve body.

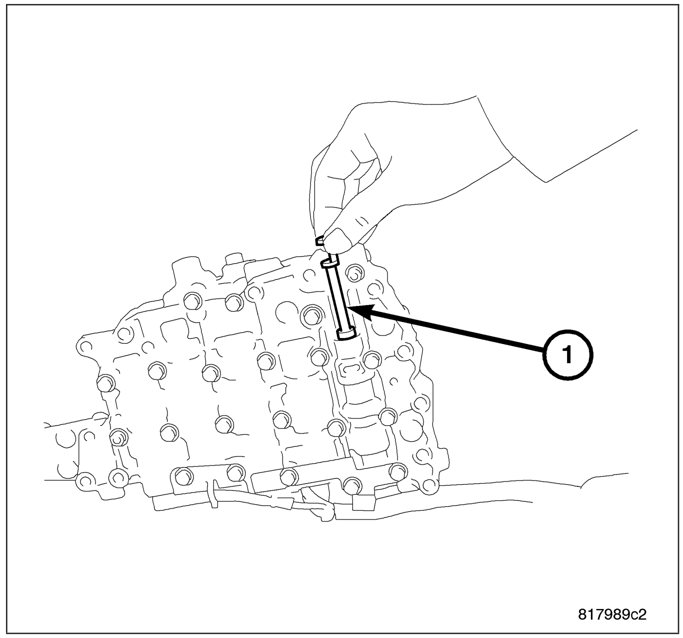


2. Remove and discard the lip seal (1) from the trans-axle case.

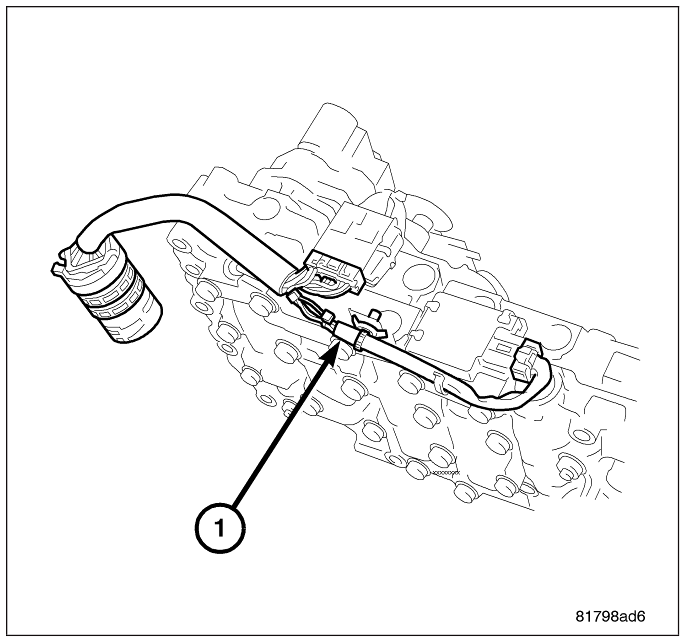


CAUTION: Do not drop the pulley ratio linkage.

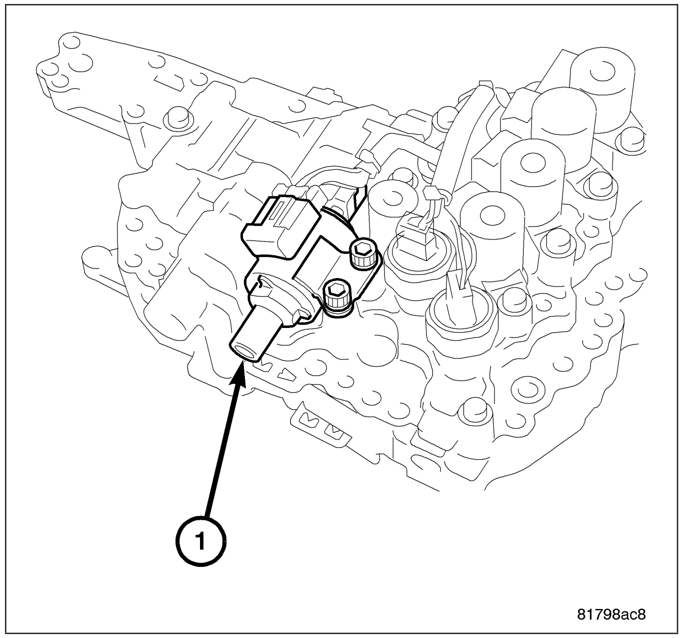
3. Remove the pulley ratio linkage (1) from the valve body.



4. Remove the return spring (1) from the valve body.

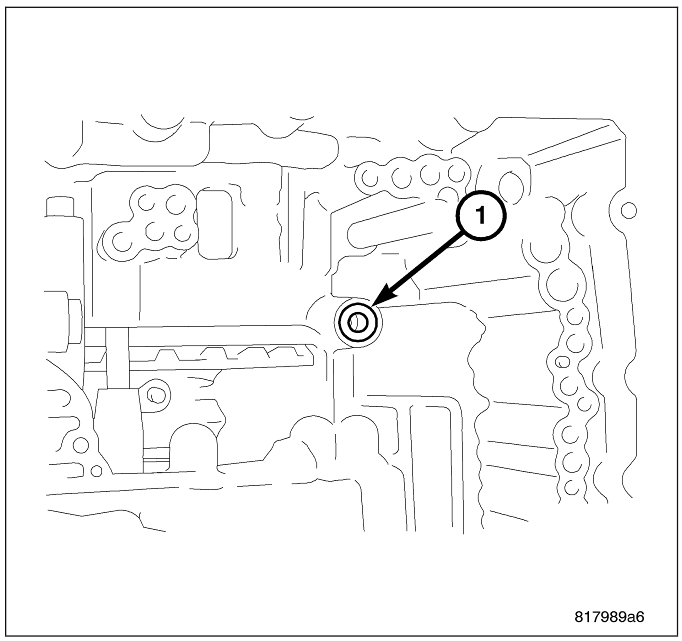


CAUTION: Do not drop the manual valve.

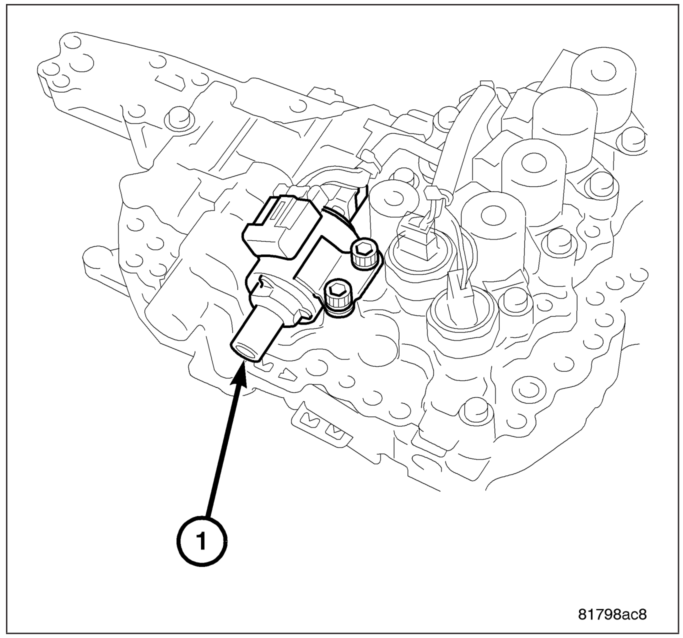


5. Remove the manual valve (1) from the valve body.

6. Remove the valve body harness (1) from the valve body.

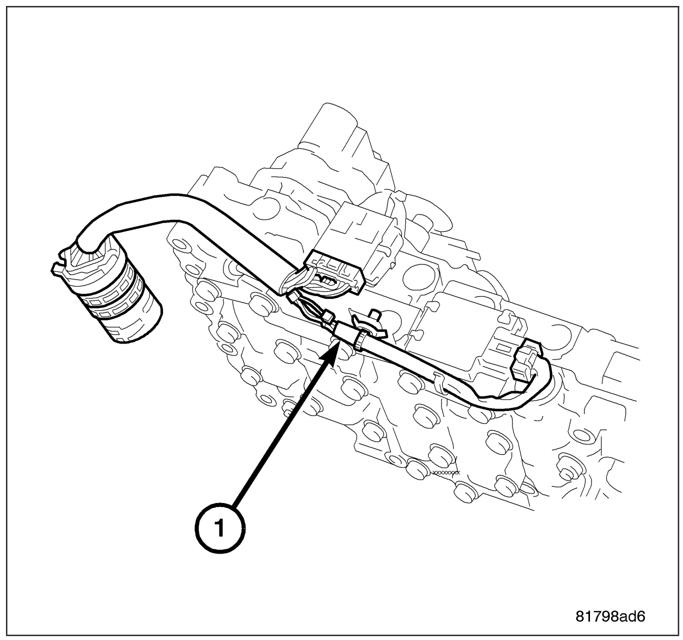


7. Remove the stepping motor (1) from the valve body.



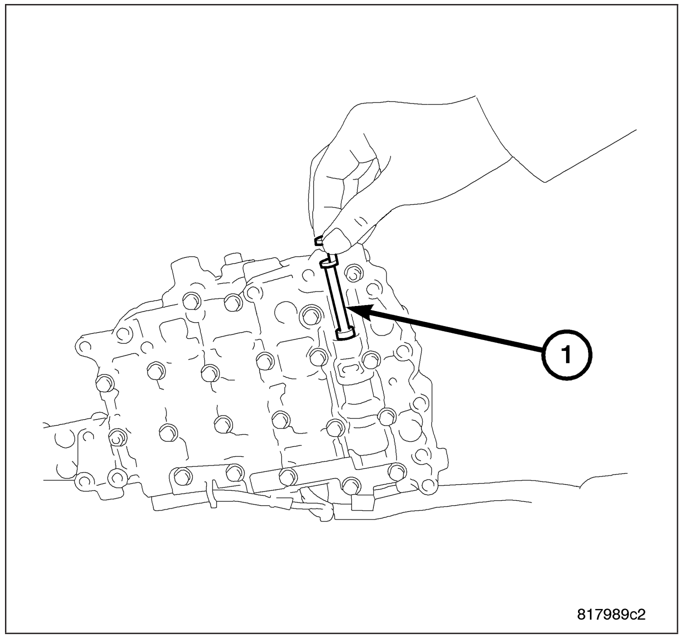
ASSEMBLY

CAUTION: Do not re-use the lip seal. Apply CVT fluid when installing the lip seal.

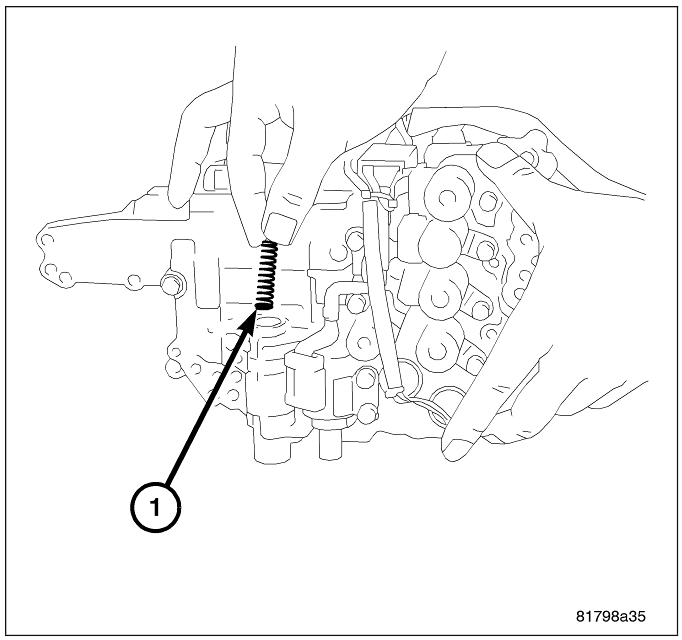


1. Install the new lip seal (1) into the transaxle case.

2. Install the stepping motor (1) onto the control valve body. Install and Torque the mounting bolts to 8 N·m (70 in.lbs.).

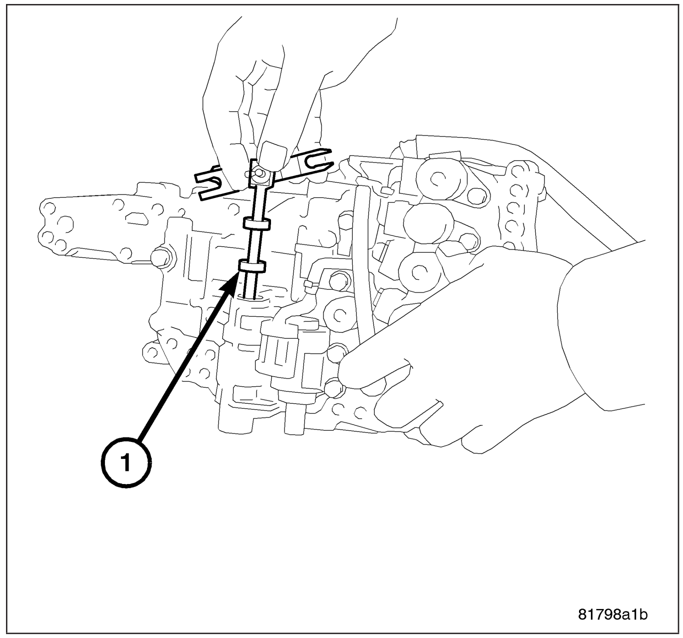


3. Install the valve body harness (1) onto the control valve body.

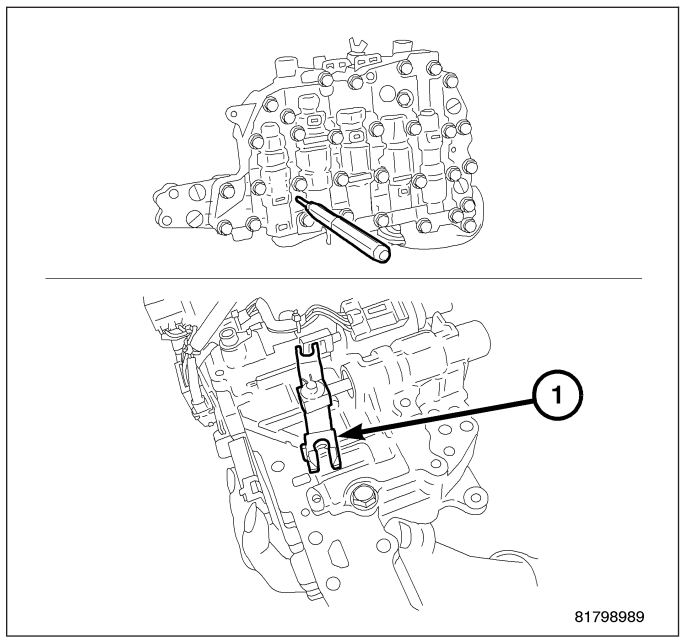


CAUTION: Ensure the manual valve is free of dirt, lint or other debris. Apply CVT fluid when installing the manual valve.

4. Install the manual valve (1) into the control valve body.

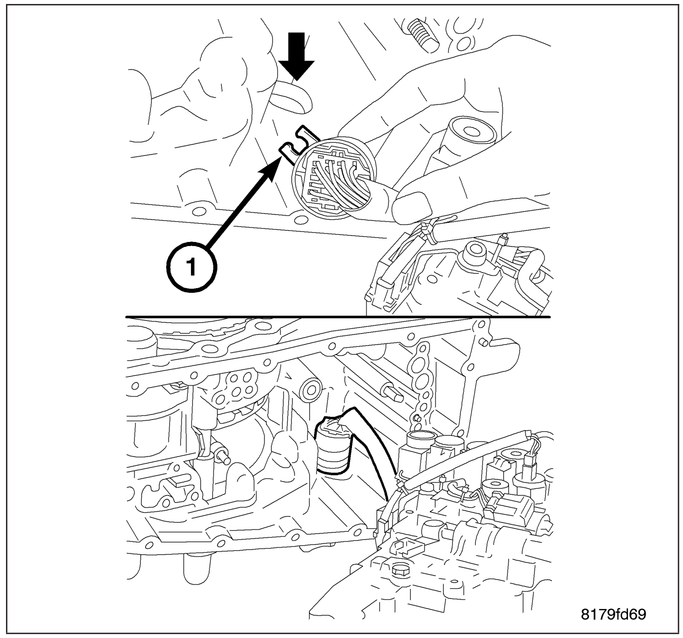


5. Install the return spring (1) into the control valve body.

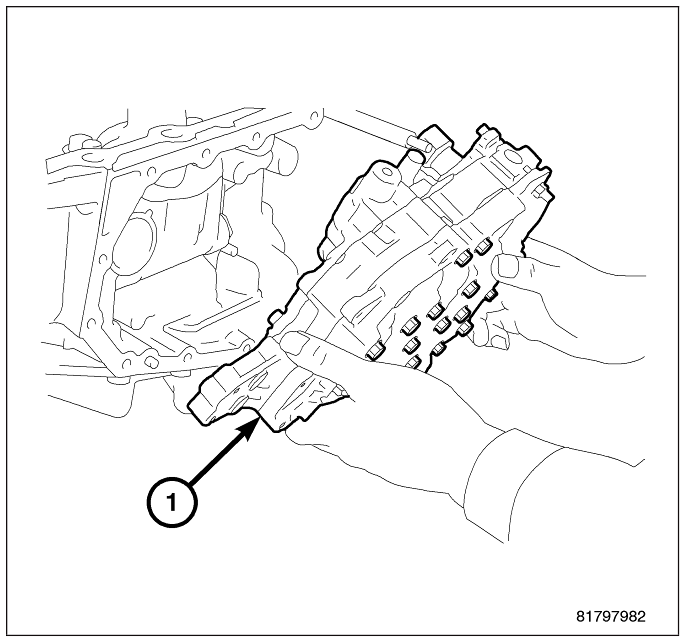


CAUTION: Apply CVT fluid when installing the pulley ratio linkage.

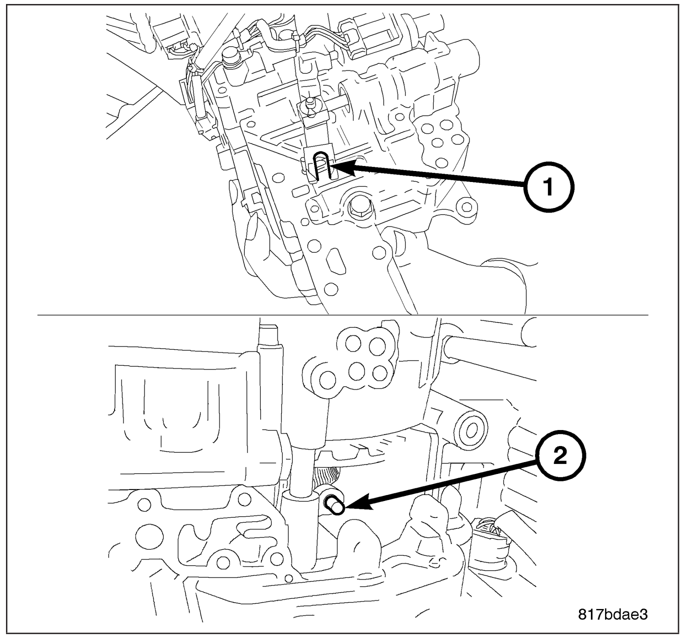
6. Hook the pawl of the pulley ratio linkage (1) onto the stepping motor and install it on the control valve.



INSTALLATION

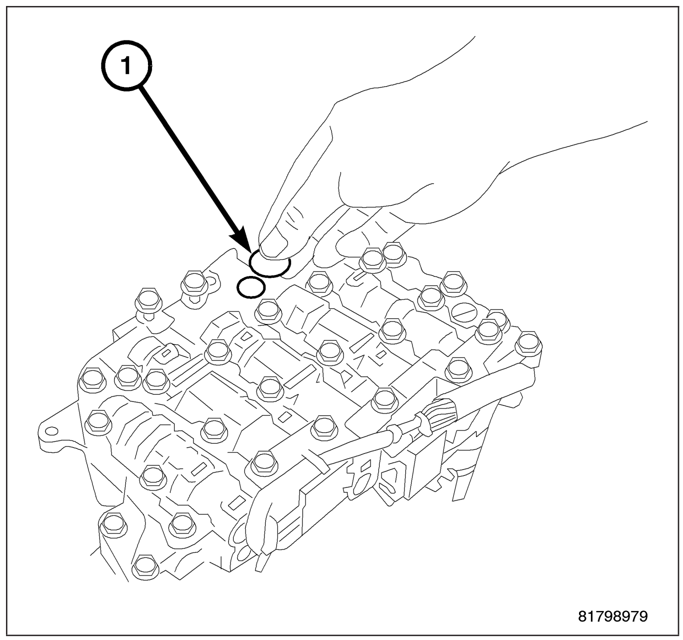


1. To install the control valve body assembly on to the transaxle case, insert a 75 mm (3 in.) long 3 mm (0.118 in.) rod or wire into the linkage stopper hole of the control valve assembly to set the pulley ratio linkage (1) in position.

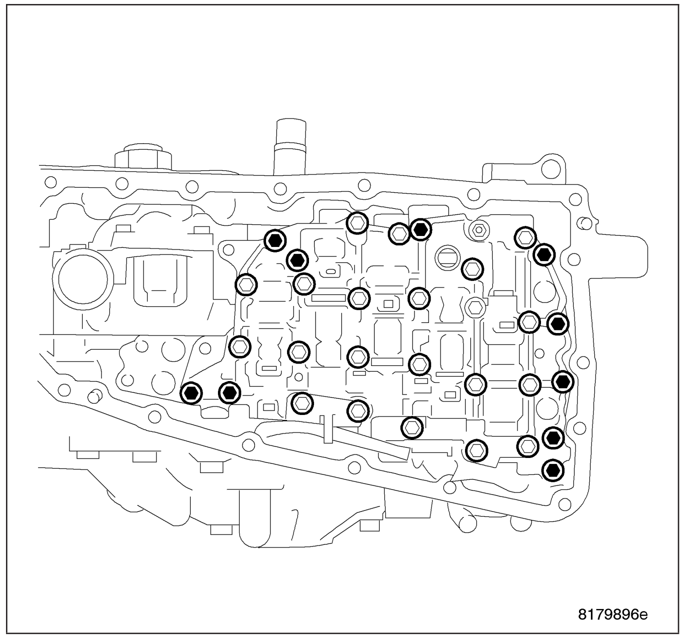


2. Position the locating tab (1) of the terminal body as shown and install the terminal body into the transaxle case.

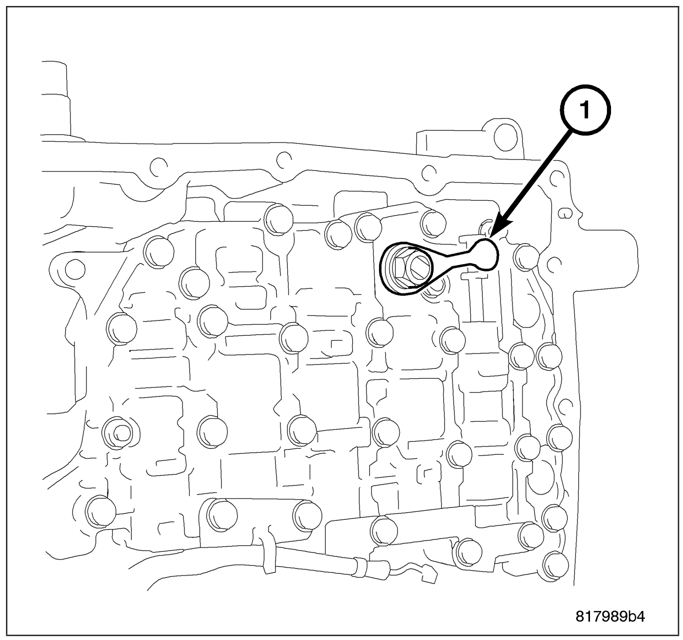
3. Install the control valve assembly (1) up from the bottom side and install it into the transaxle case.



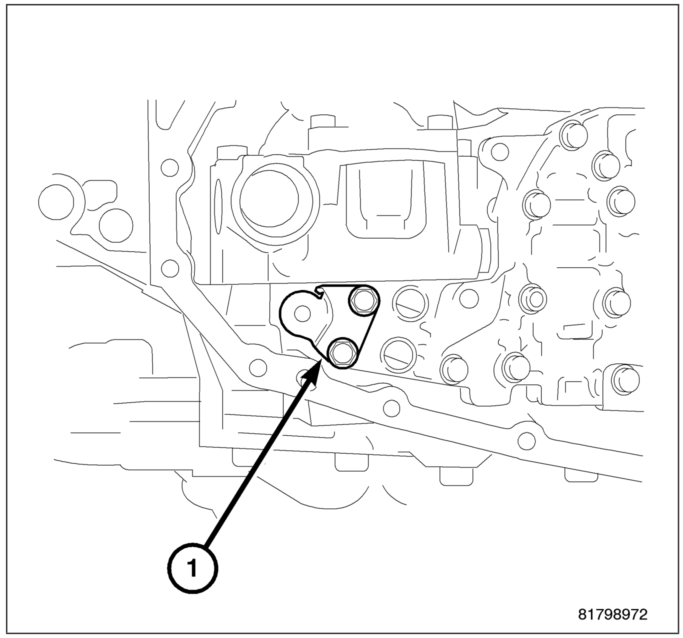
4. Align the notch (1) of the pulley ratio linkage with the sheave position sensor (2).



CAUTION: Apply CVT fluid when installing the bushing.

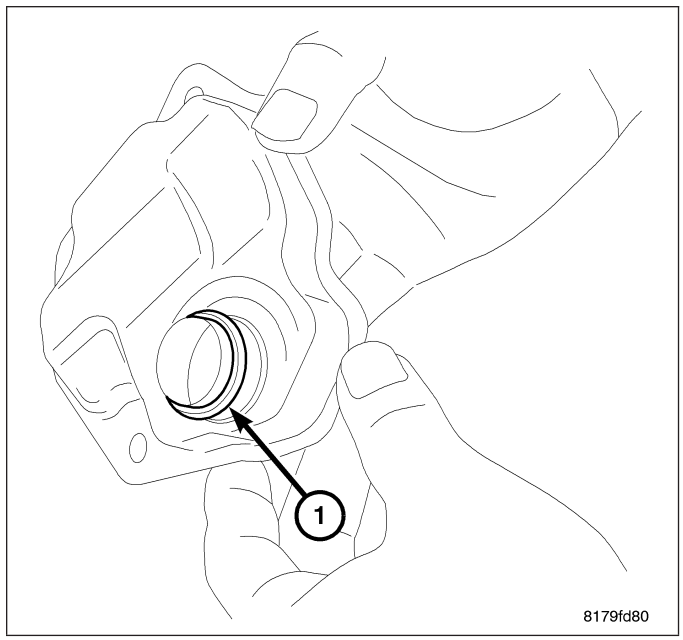


5. Install the bushing (1) into the control valve assembly.

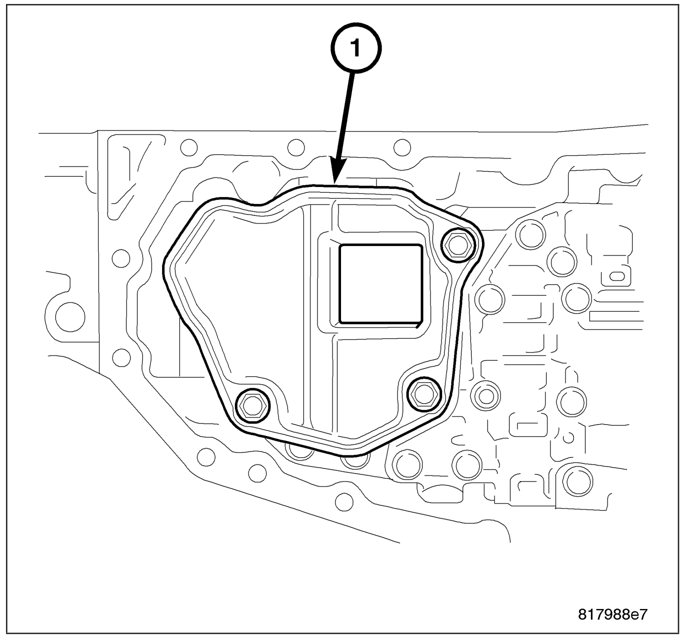


6. Torque the mounting bolts of the control valve body assembly to 8 N·m (70 in.lbs).

7. Install the manual lever (1) onto the manual shaft. Install and torque the mounting nut to 22 N·m (16 in. lbs.).

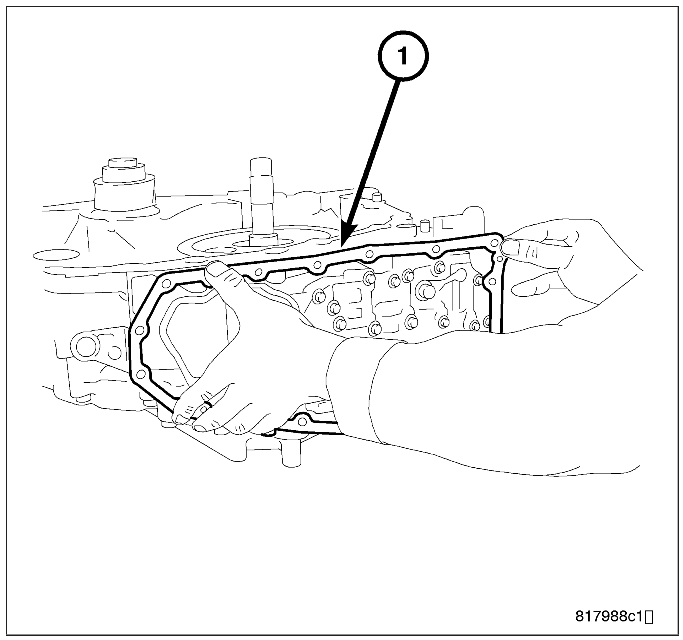


8. Install the bracket (1) onto the control valve assembly. Install and tighten the mounting bolts to 8 N·m (70 in. lbs.).

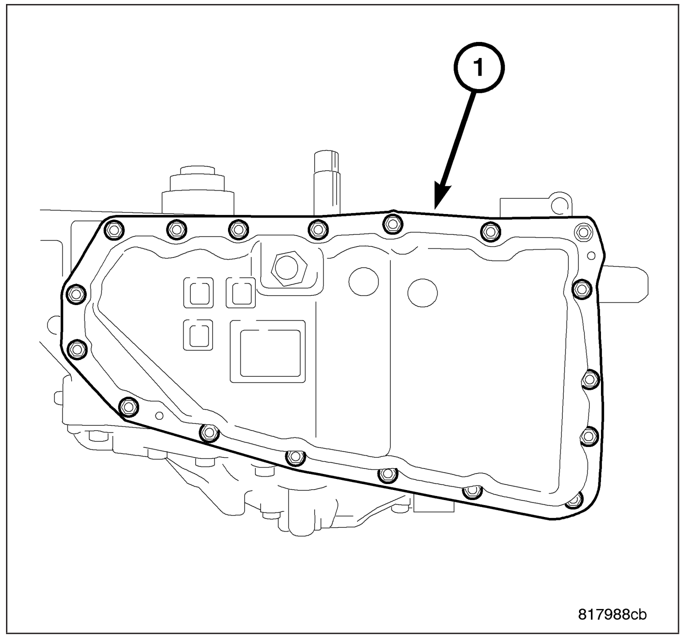


CAUTION: Do not re-use the o-ring. Apply CVT fluid when installing the o-ring.

9. Install the new o-ring (1) onto the new oil strainer.

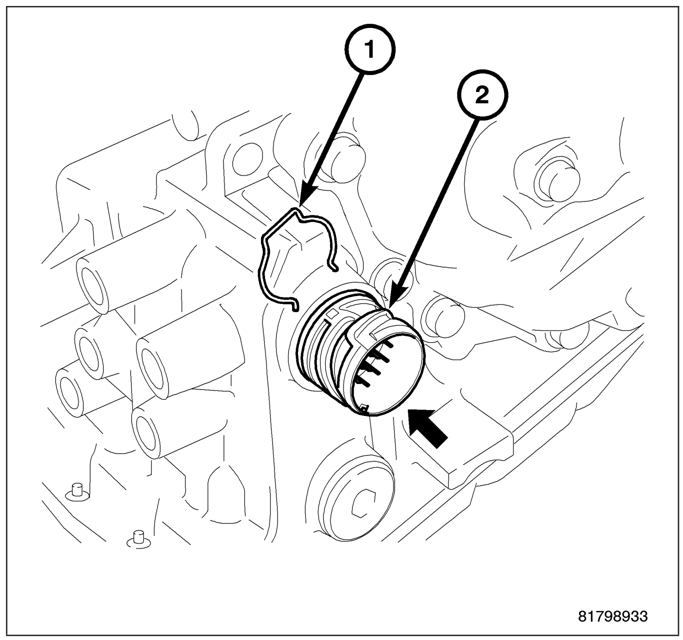


10. Install the new oil strainer (1) onto the control valve assembly. Install and torque the mounting bolts to 8 N·m (70 in. lbs.).



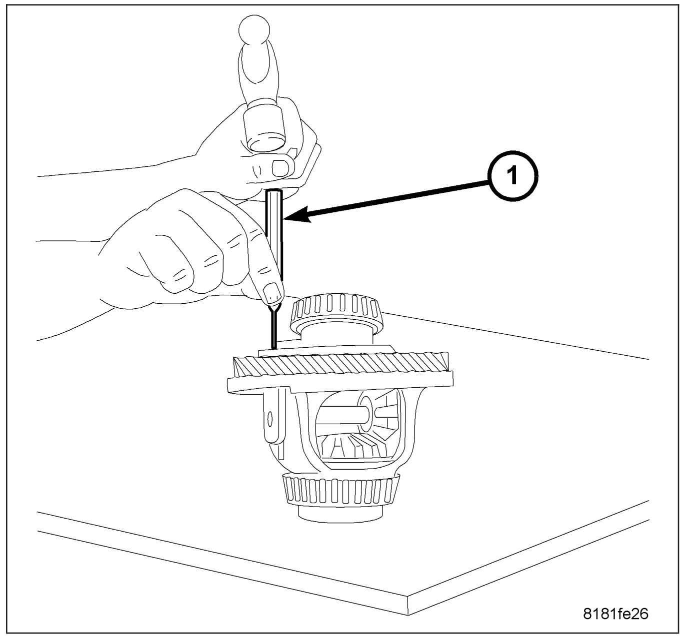
CAUTION: Do not re-use the oil pan gasket. Remove any moisture, oil, and used gasket material from the surface where the new gasket is to be installed. When installing the oil pan gasket, align the dowel pin with the dowel pin hole in the oil pan gasket.

11. Install the oil pan gasket (1) onto the transaxle case.

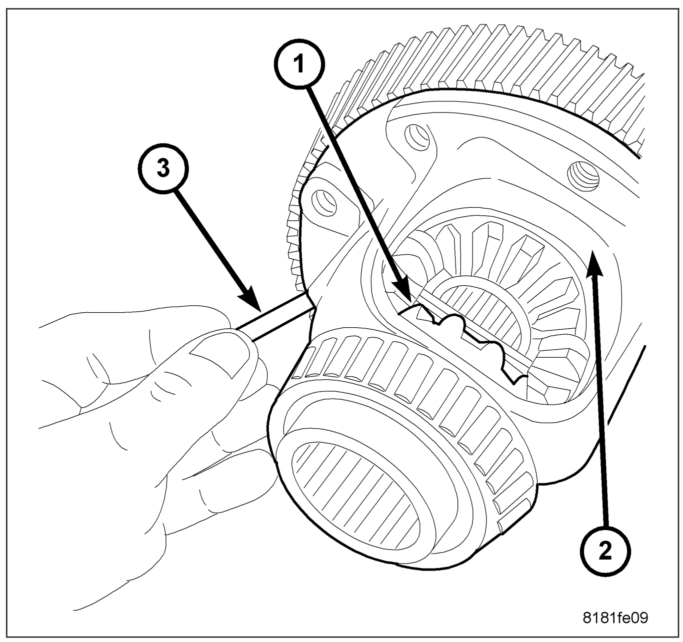


CAUTION: When installing the oil pan, align the dowel pin of the transaxle case with the dowel pin hole of the oil pan.

12. Install the oil pan on the transaxle case (1). Install and torque the mounting bolts to 8 N·m (70 in. lbs.).

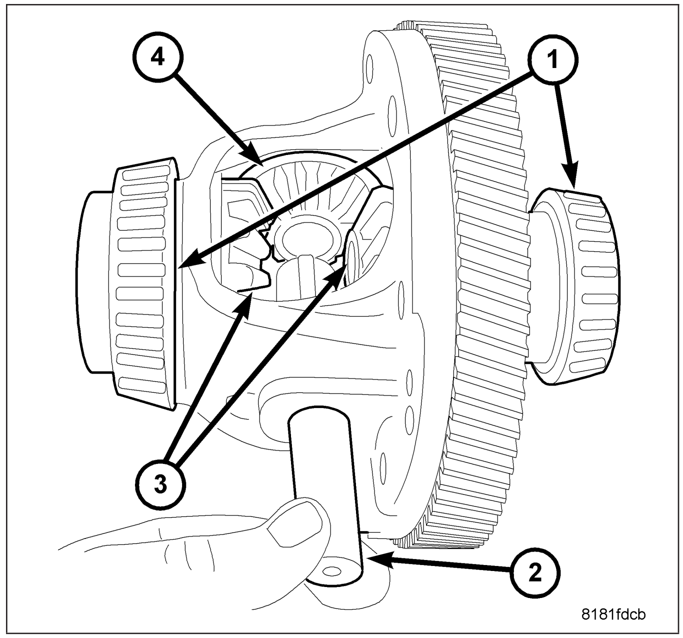


13. Install the snap ring (1) onto the terminal body.
14. Fill transmission with the required fluid. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/FLUID - STANDARD PROCEDURE)

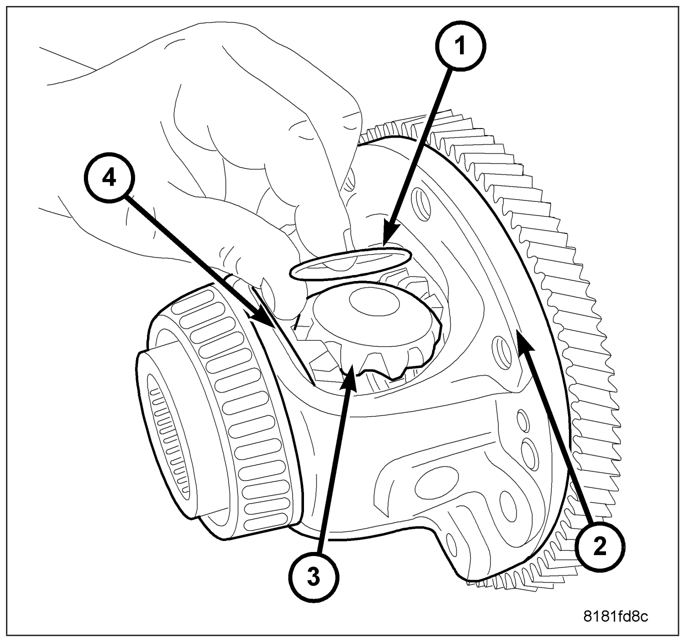


DRIVE-FINAL

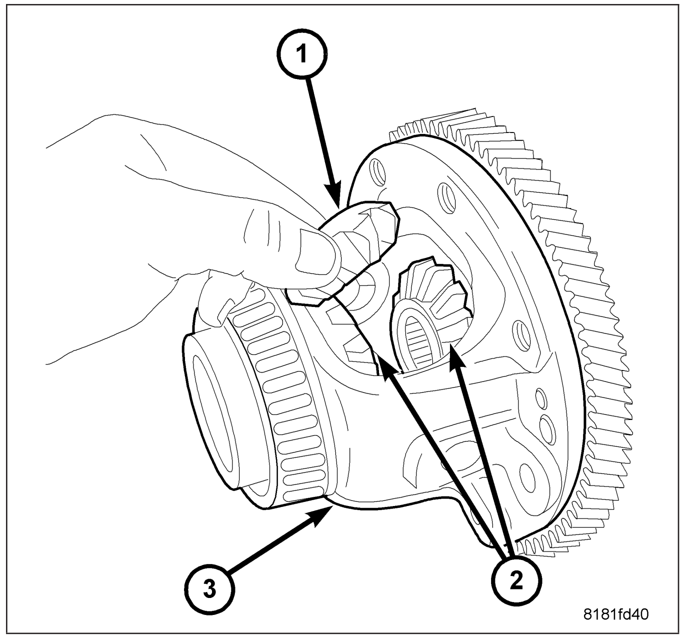
DISASSEMBLY



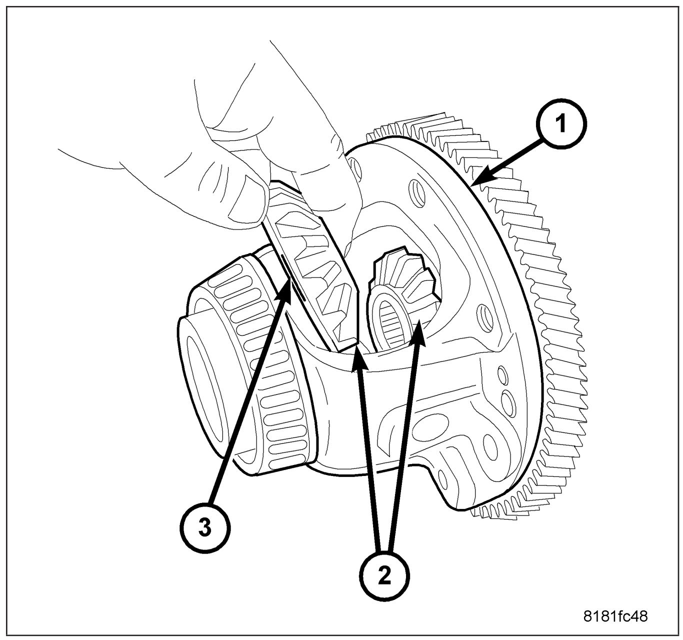
1. Remove the roll pin using a pin punch (1).



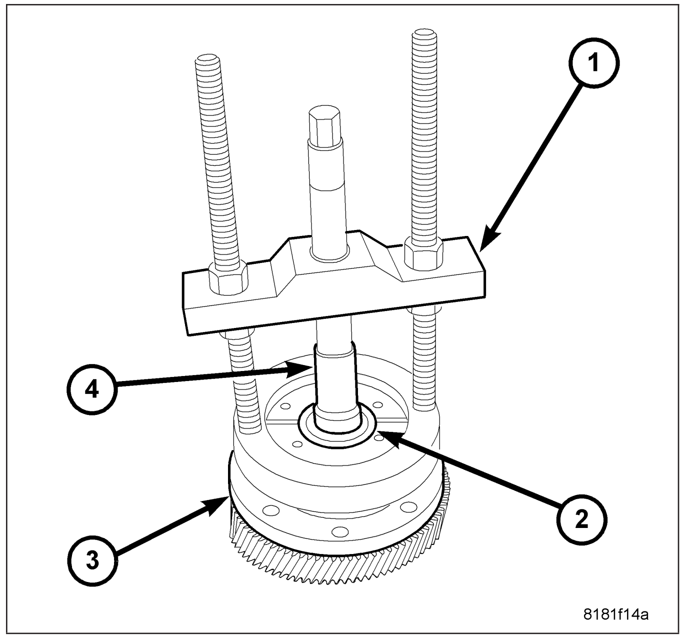
2. Discard the old roll pin (3).



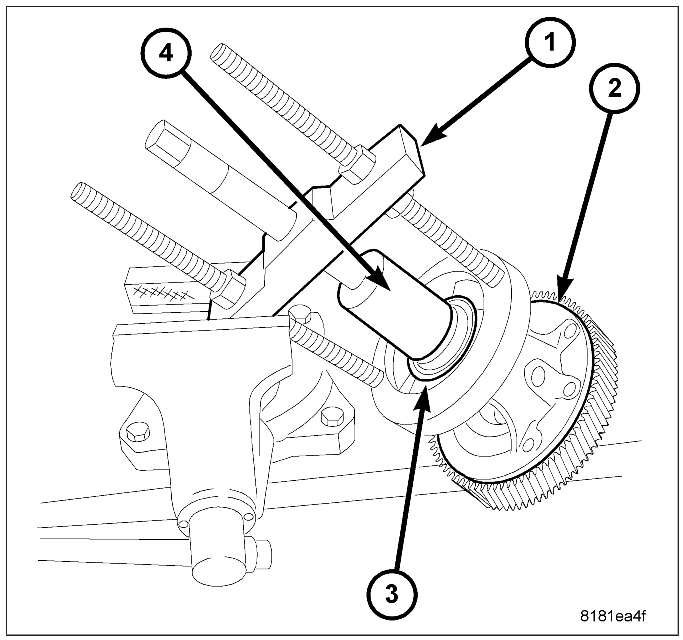
3. Remove the pinion shaft (2) and inspect for excessive ware.



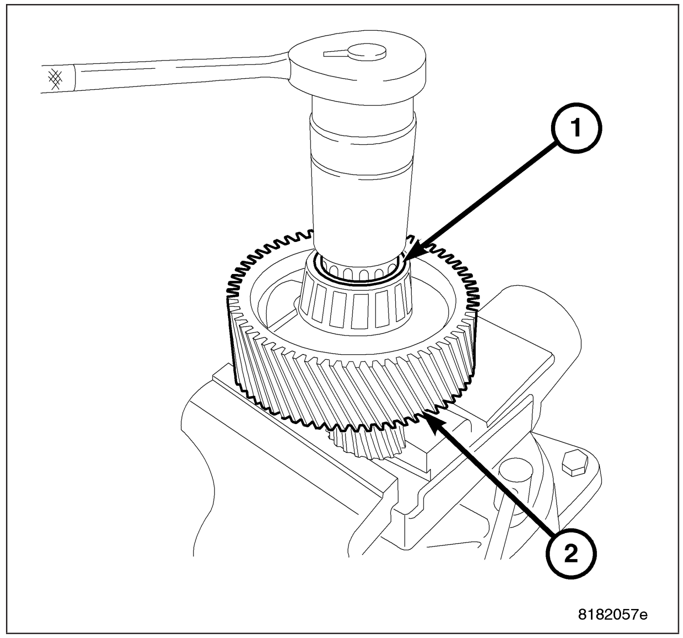
4. Roll the pinion gears (3)and shims (1) out of the carrier (2).
5. Remove the pinion gear shims (1) and mark for installation.



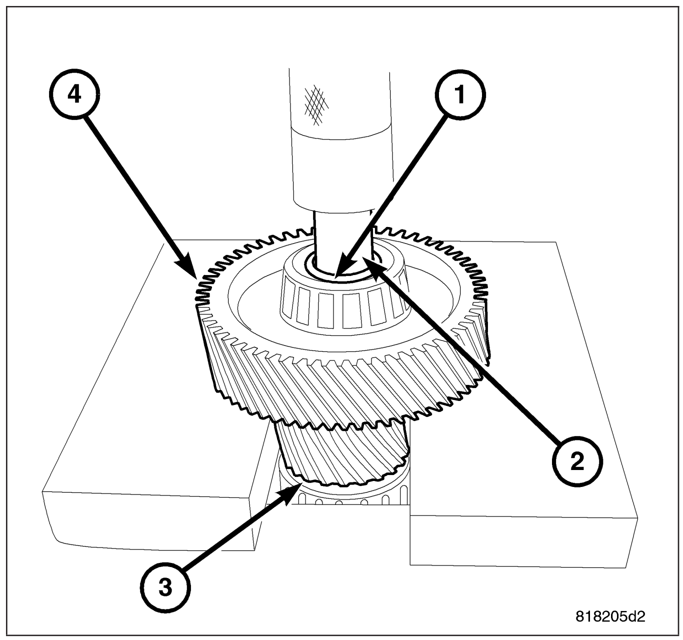
6. Remove the pinion gears (1) from the carrier (3).



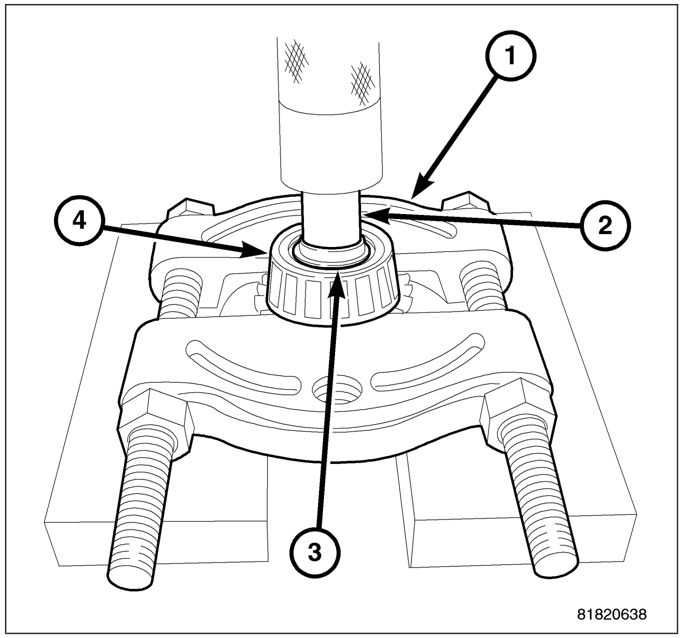
7. Remove the side gears (2) and shims (3) from the carrier.



8. If the vehicle is a two wheel drive remove the carrier bearings using Puller C-293 PA, six Inserts C-293-40 and Press Insert C-4996.



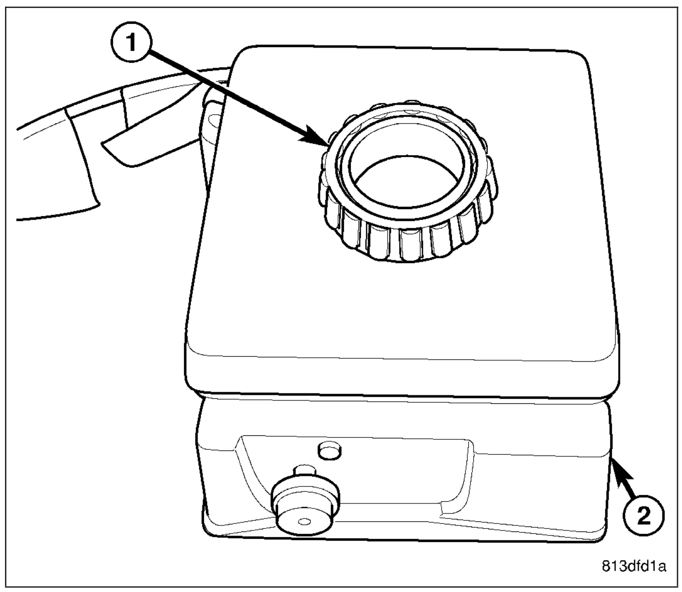
9. If all wheel drive use Puller C-293 PA, six 9613 inserts and Press insert 8888 to remove the carrier bearings.



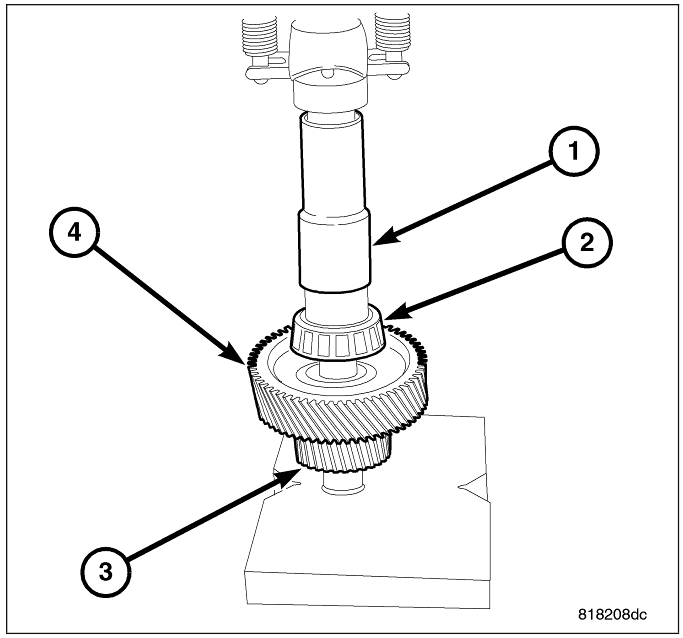
10. Remove the nut (1) on the reduction gear (2).

11. Press the shaft of the small gear (1) using Button 8923 (2), a Press and Blocks to remove from large gear (4).

12. Remove the small side reduction gear bearing (4) using Splitter 1126 (1), Button 8923 (2) and a Press.

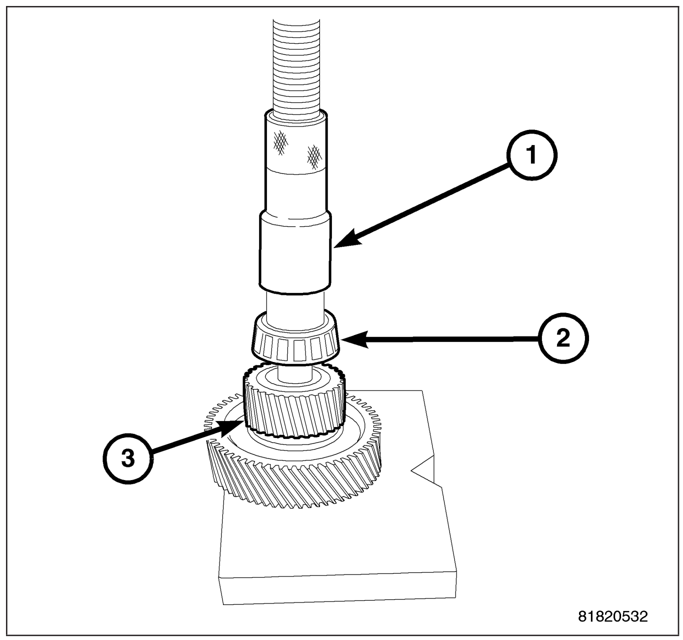


ASSEMBLY

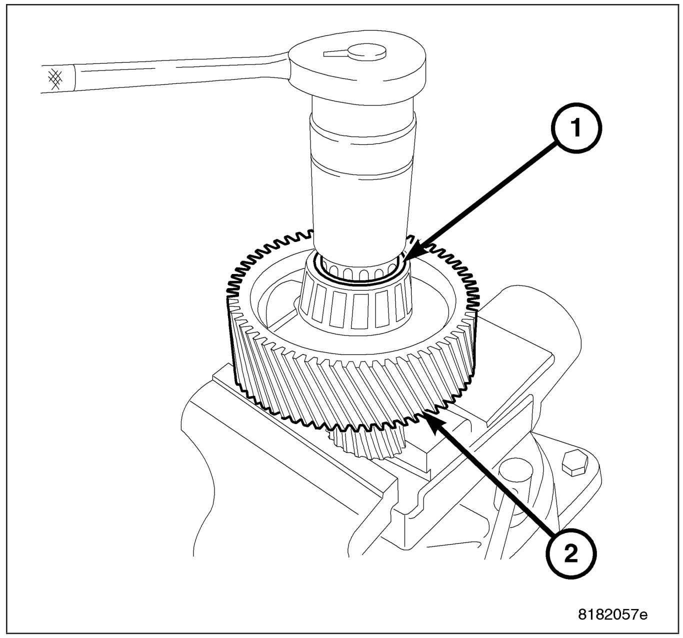


WARNING: Use welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

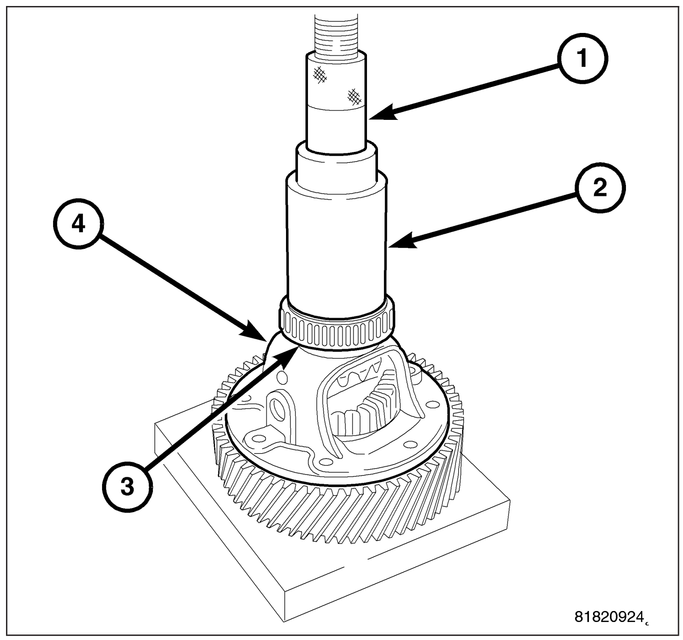
CAUTION: A bearing heater is used to assembly some components. Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 177 Celsius (212 deg Min. - 350 deg Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.



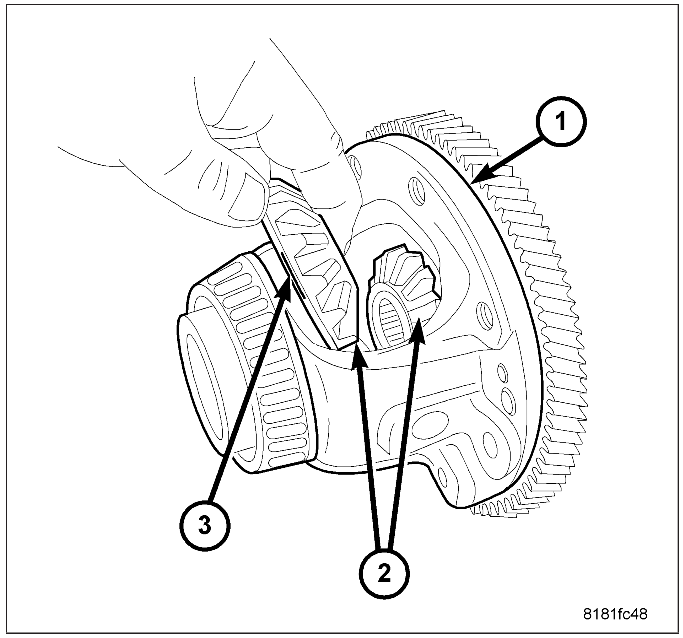
1. A bearing heater may be used in place of a installer.



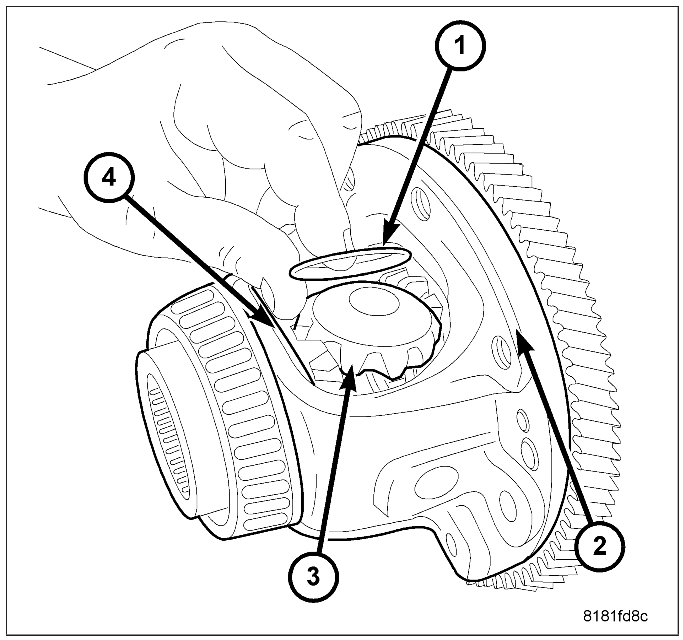
2. Install small gear and shaft (3)onto large gear (4).
3. Using installer L-4507 (1) or a bearing heater install the bearing (2) onto the shaft.



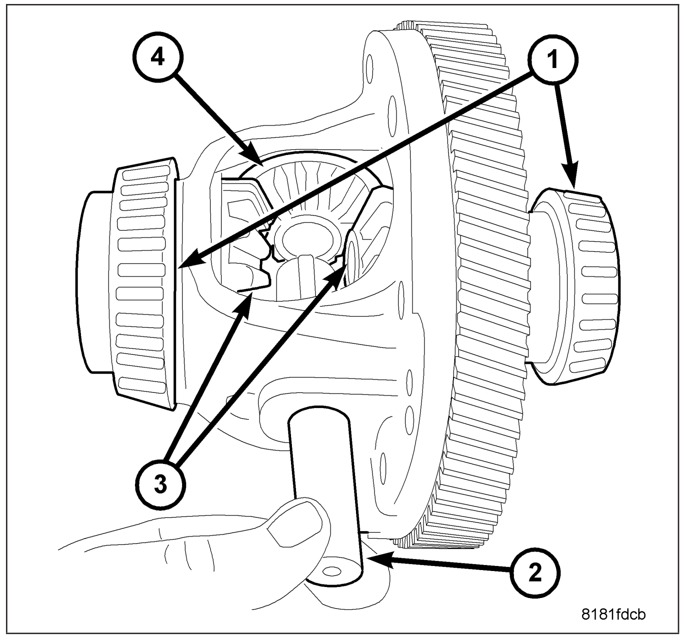
4. Using installer L-4507 (1) or a bearing heater install the small gear side bearing onto the shaft.



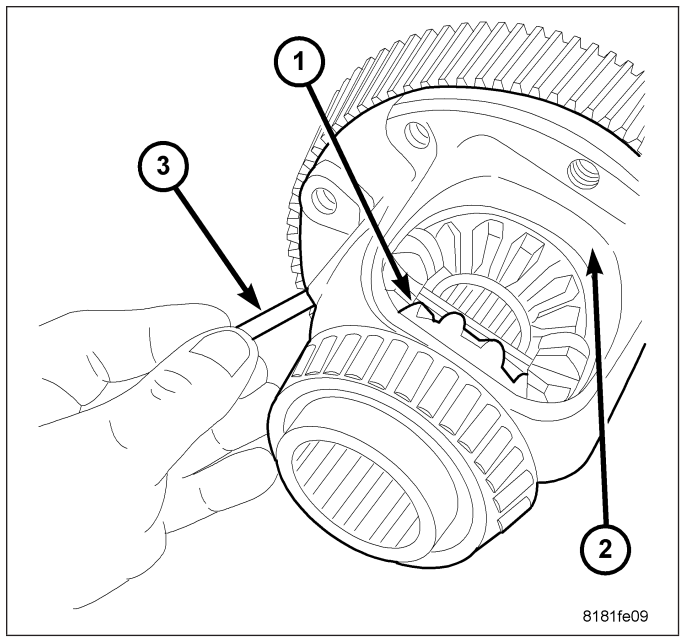
5. Install the new reduction gear nut and torque to 250 N·m (184 ft. lbs.)



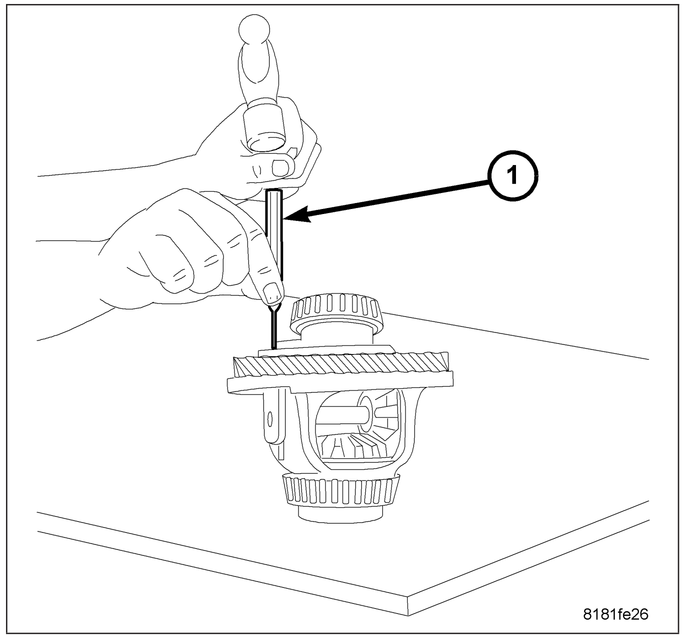
6. For two wheel vehicles use Installer C-3716 A and Handle C-4171 or a bearing heater to install the bearings onto the carrier (both sides). Use installer 9333-2 or a bearing heater on the big bearing and Installer C-3716 A and Handle C-4171 on the small bearing for four wheel drive vehicles.



7. Install the side gears (2) and shims (3) onto the carrier.

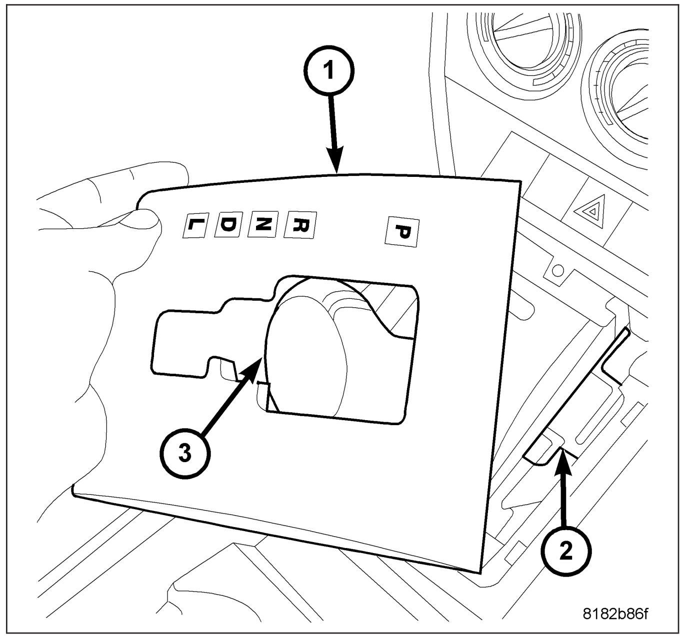


8. Place the pinion gears (3) onto the side gears with the correct shims (1).
9. Roll into place.

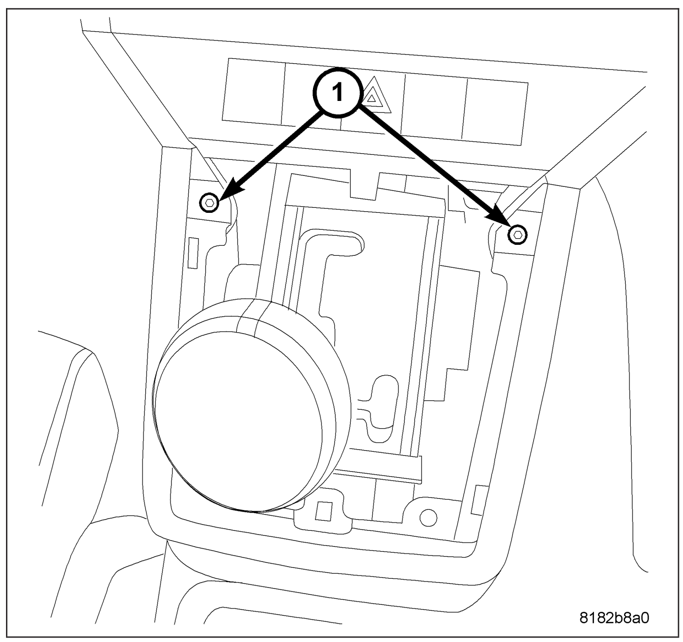


10. Install the pinion shaft (2).

11. Use a new roll pin (3).

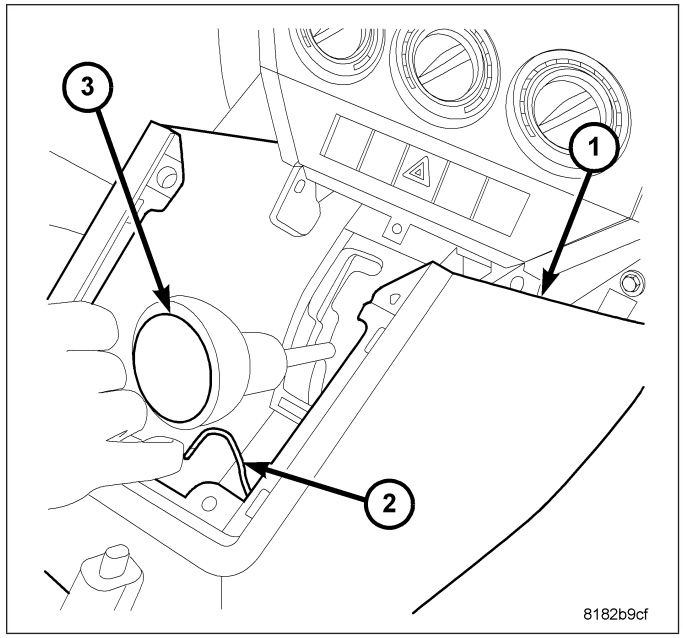


12. Install the roll pin (3) a pin punch (1).

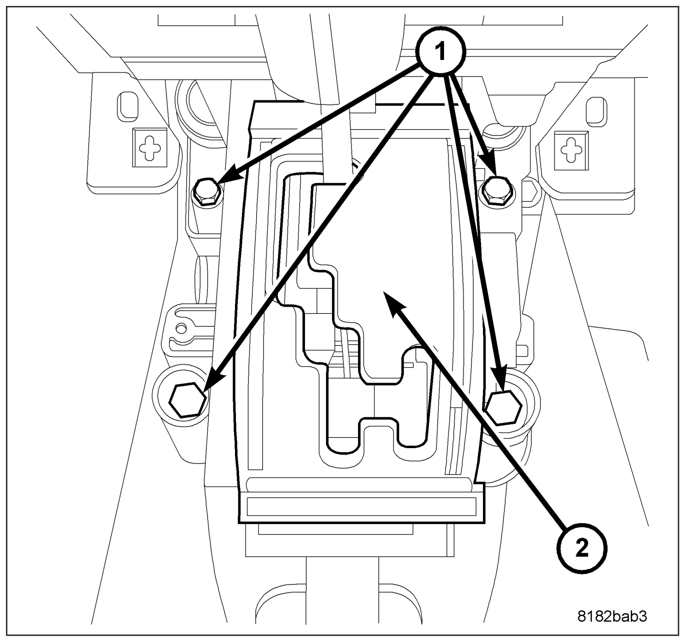


MECHANISM-SHIFT

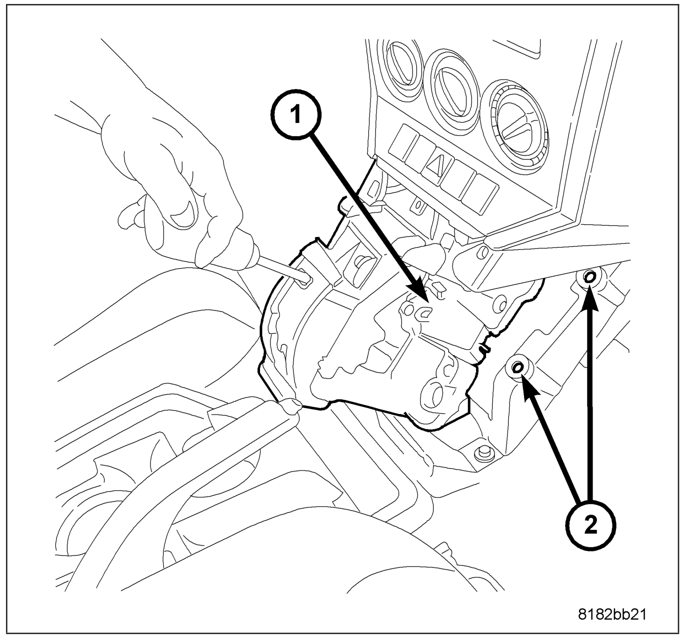
REMOVAL



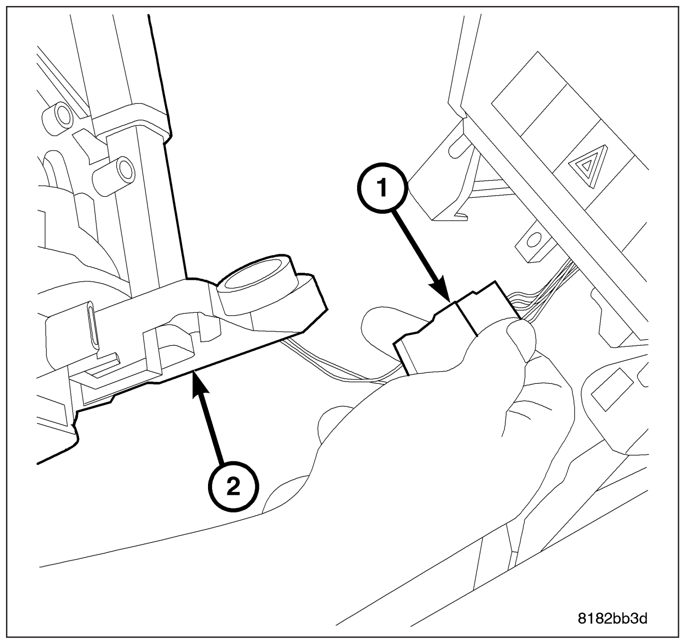
1. Remove the shifter bezel (1).



2. Remove the screws (1) at the counsel.

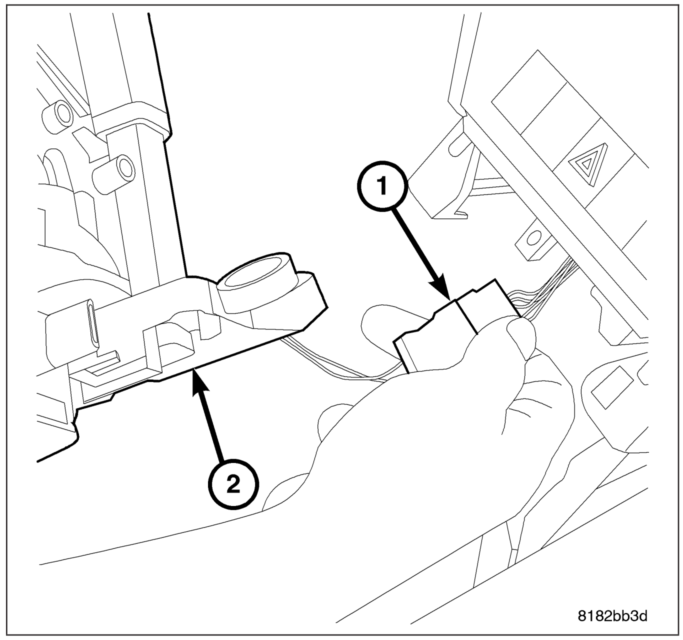


3. Pull the counsel (1) back and remove electrical connector (2) (if equipped).
4. Remove the counsel (1).

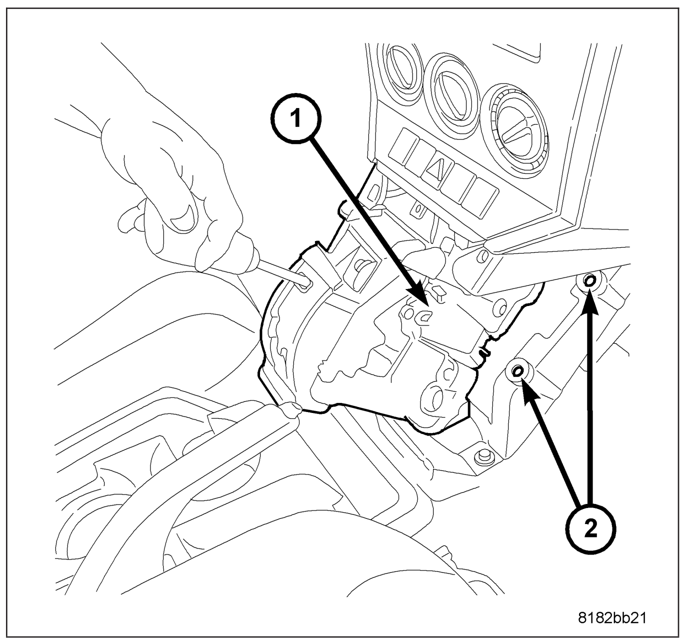


5. Remove the bolts (1) at the shifter.
6. Separate the shift cable from the shifter.

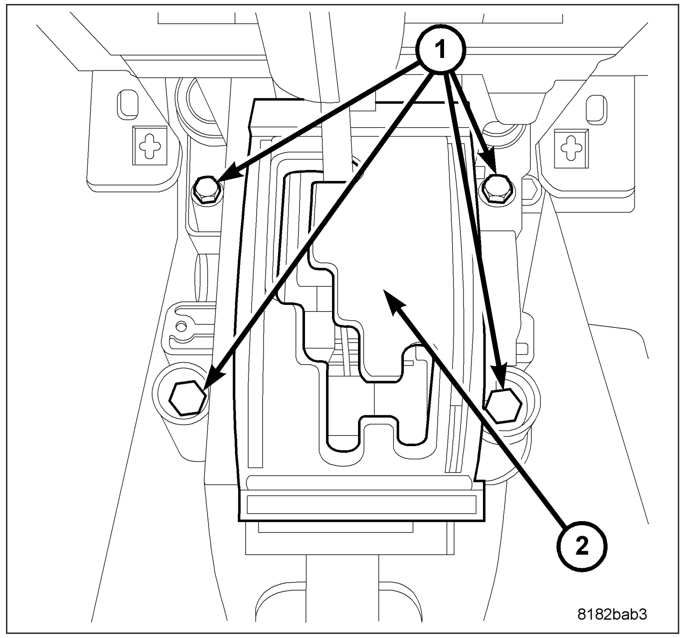
7. Lift the shifter enough to gain access to electrical connector.



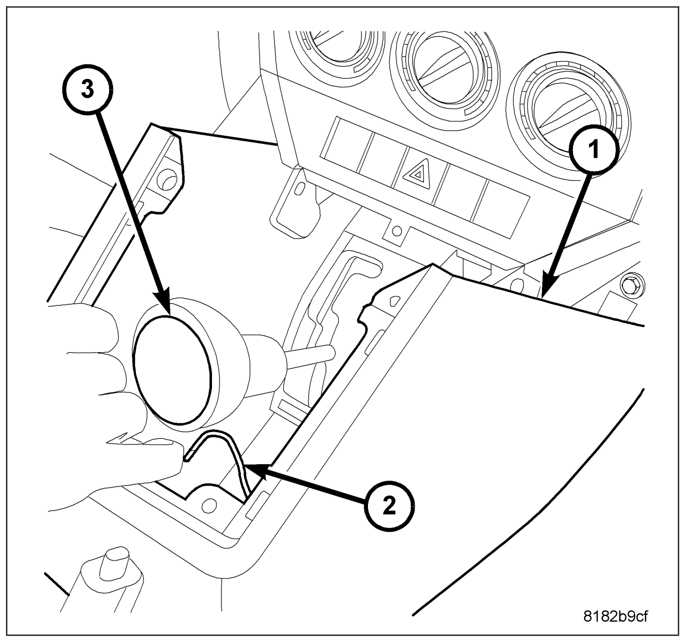
8. Unplug the electrical connector at the shifter.
9. Remove the shifter.



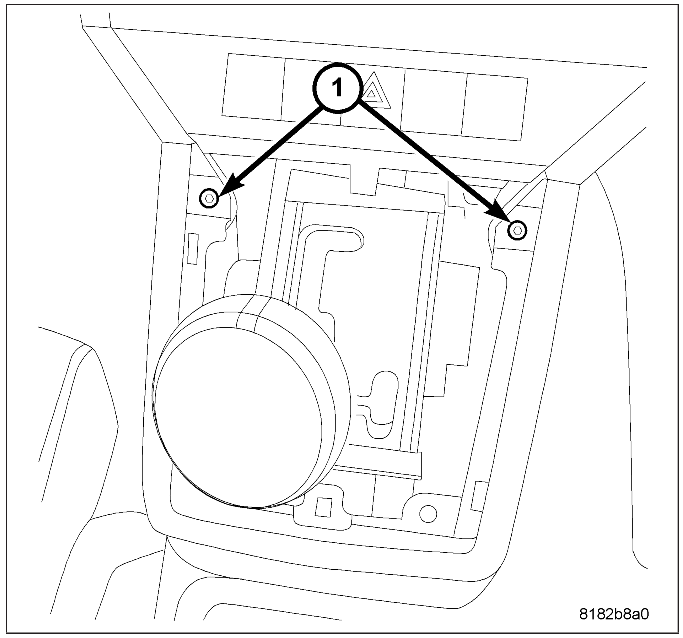
INSTALLATION



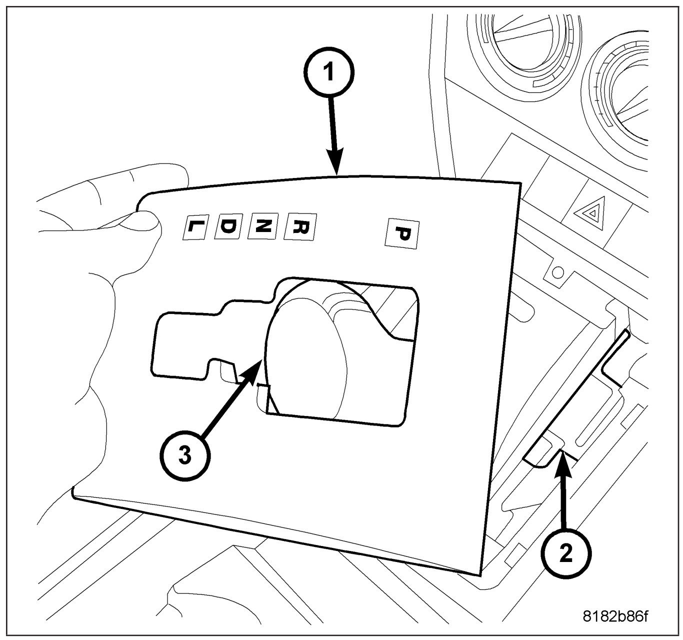
1. Plug the electrical connector in at the shifter.



2. Install the shifter in place.
3. Clip the shift cable to the shifter.

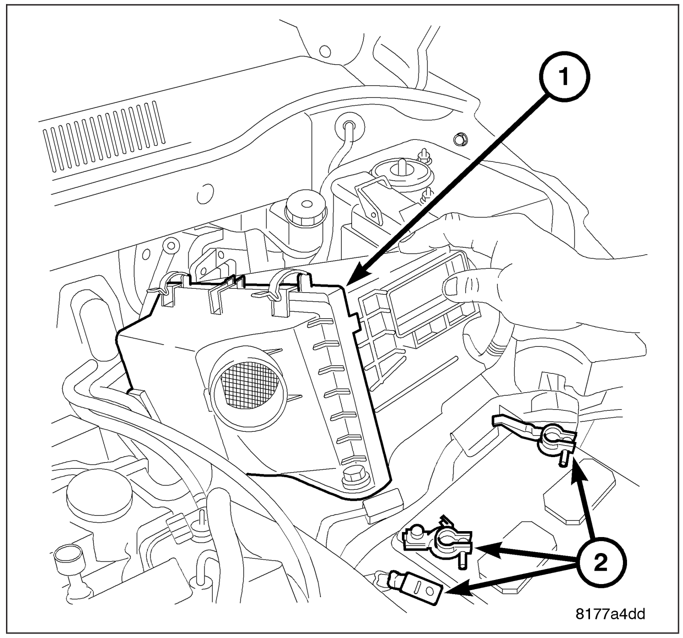


4. Install the shifter bolts and torque to 70 N·m (52 ft. lbs.).

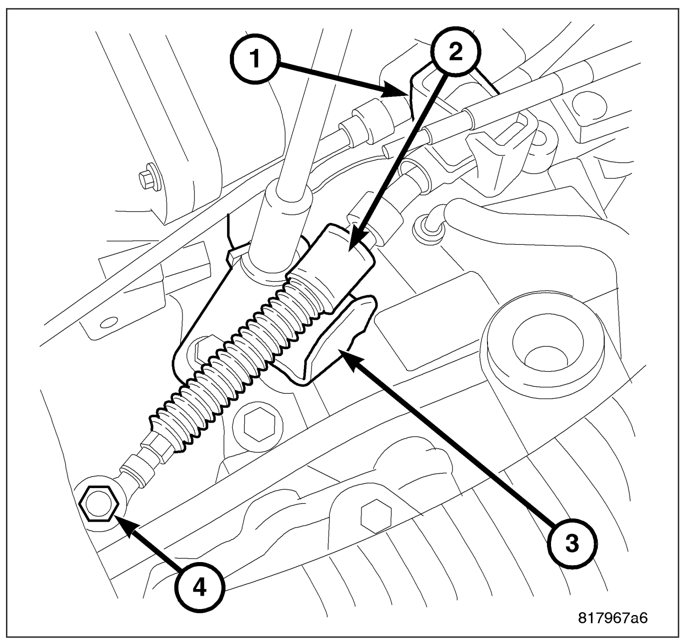


5. Install the counsel (1).
6. Connect the electrical connector (2) (if equipped).

7. Install the screws (1) at the counsel.

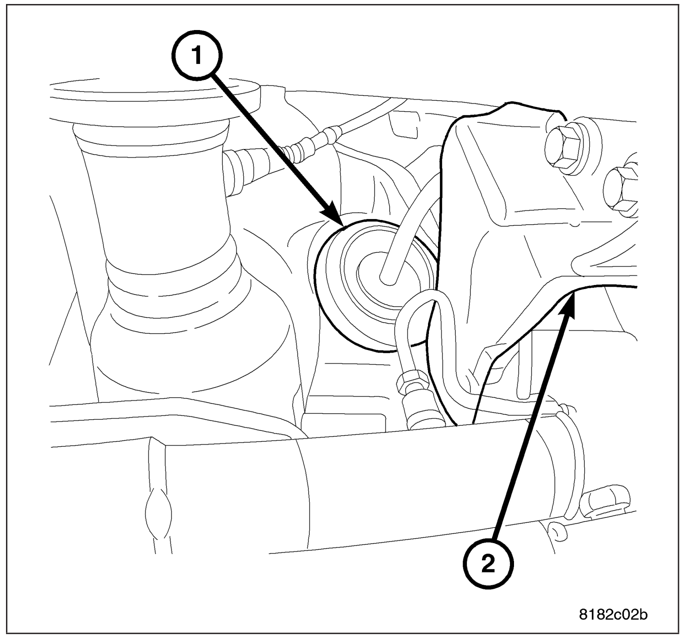


8. Install the shifter bezel (1).

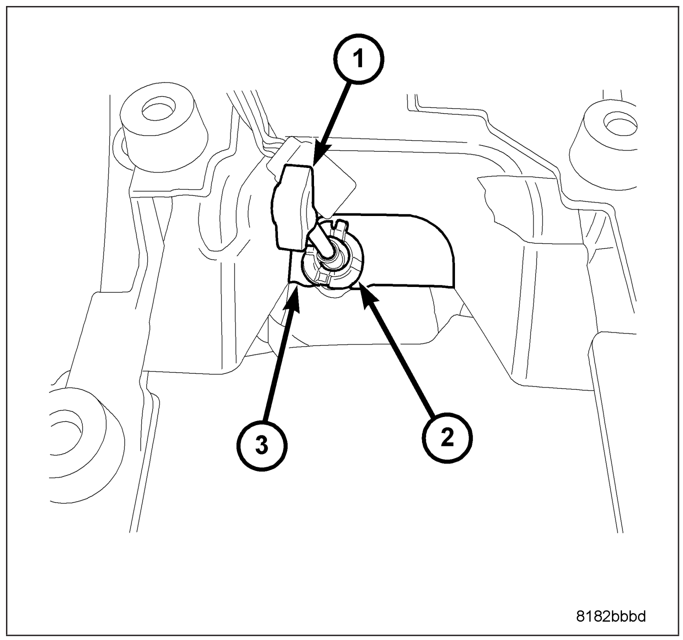


CABLE-GEAR SHIFT

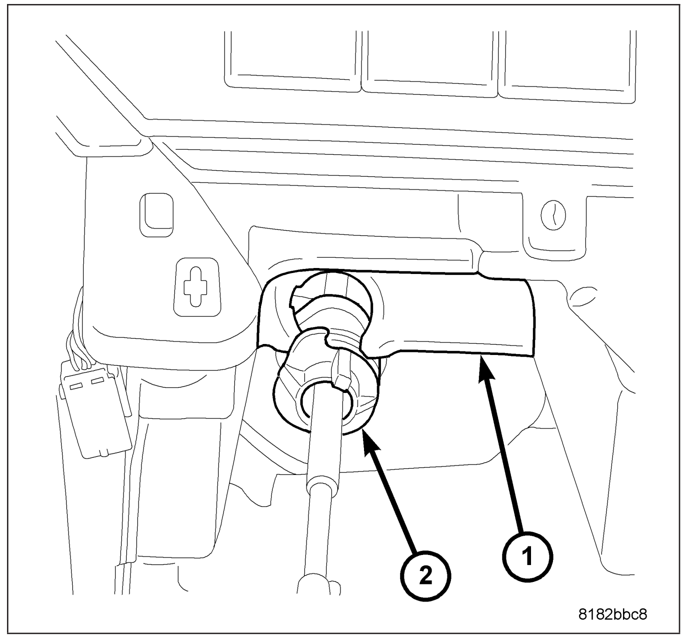
REMOVAL



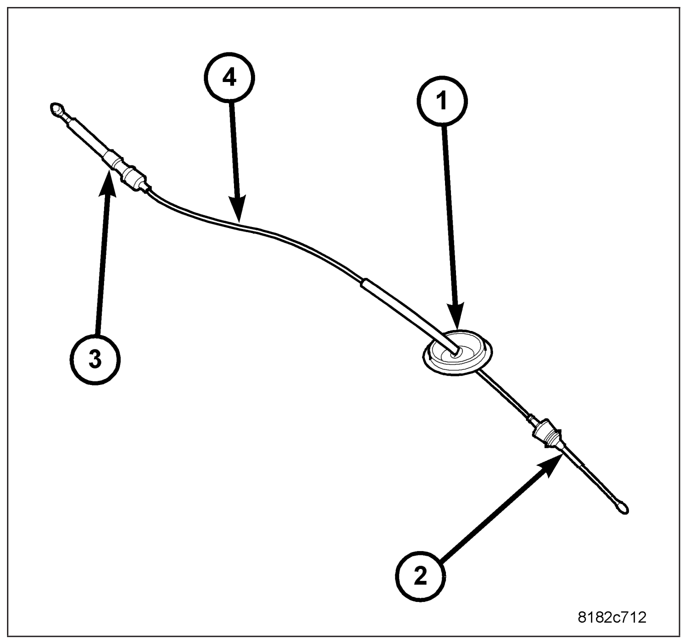
1. Remove the air box (1).
2. Disconnect the Negative battery cable (2).



3. Remove shifter cable (2)at transmission bracket (3).
4. Remove the nut (3) on the shifter cable to shift lever.

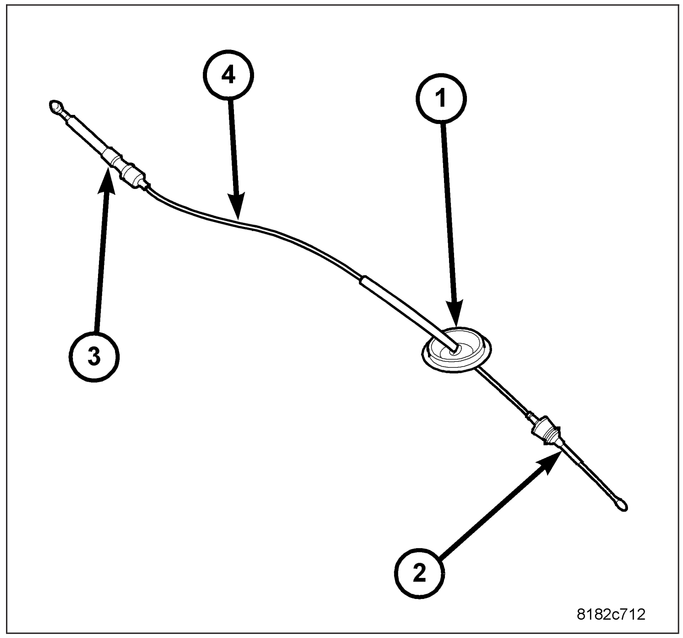


5. Remove the grommet (1) at the bulkhead.
6. Remove the shifter (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/SHIFT MECHANISM - REMOVAL).

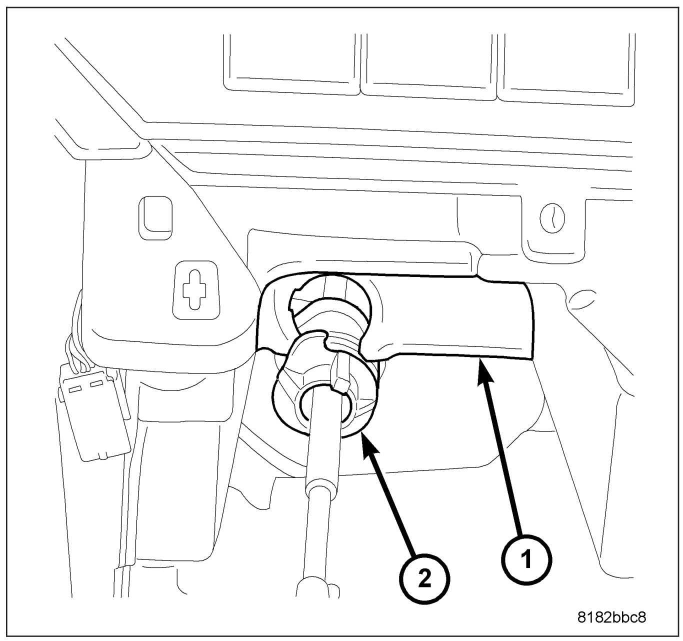


7. Squeeze clip (2) at cable (1).

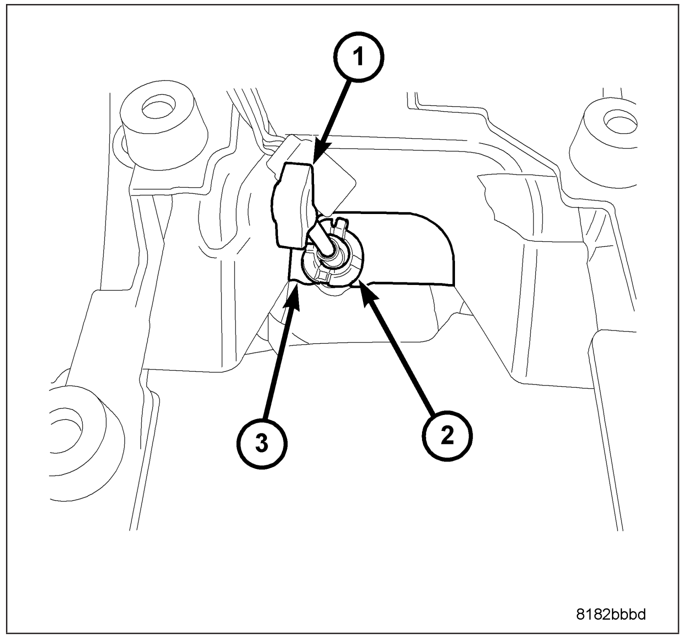
8. Pull cable from bracket (2) at bulkhead (1).



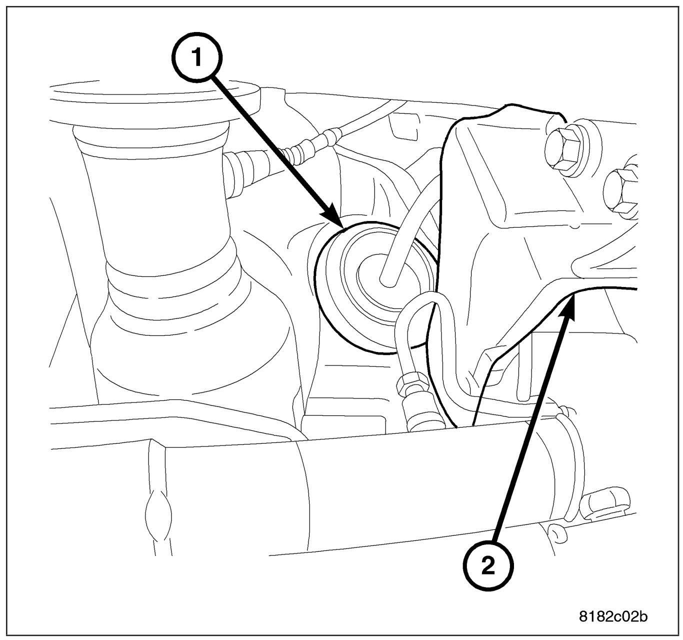
9. Pull the cable (1,2) through the bulkhead into the engine compartment.



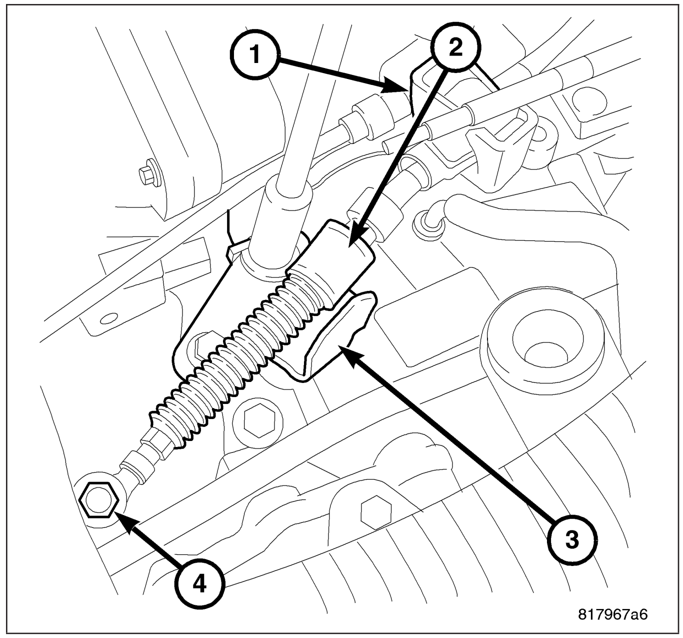
INSTALLATION



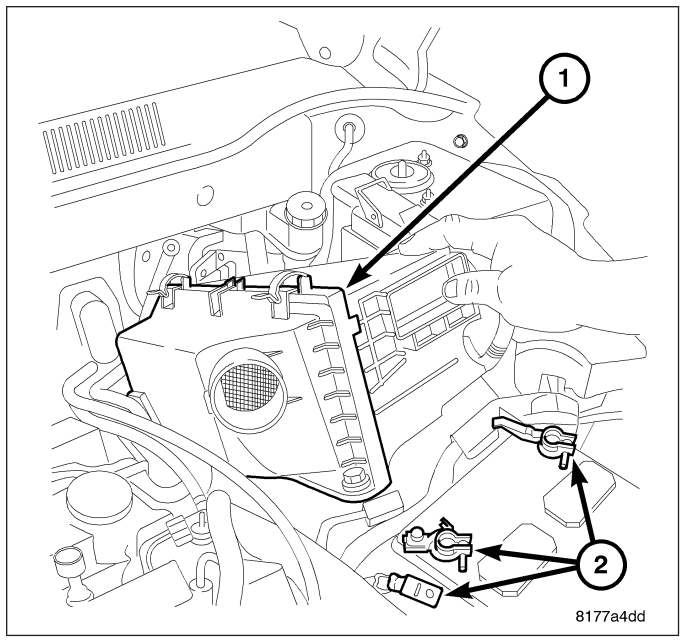
1. Install the shifter cable (1,2) through the bulkhead and into the passenger compartment.



2. Install the cable into the bracket (2) at bulkhead (1).

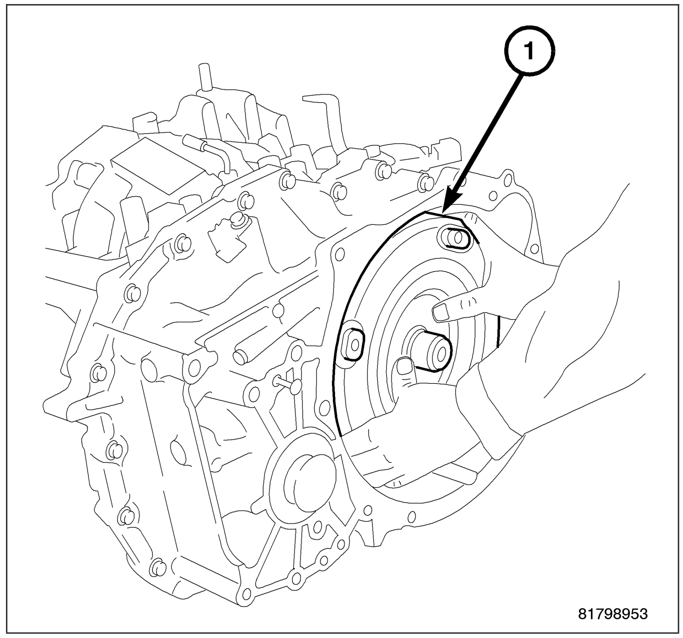


3. Insure the cable clips into place.
4. Install the shifter (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT/SHIFT MECHANISM - INSTALLATION).



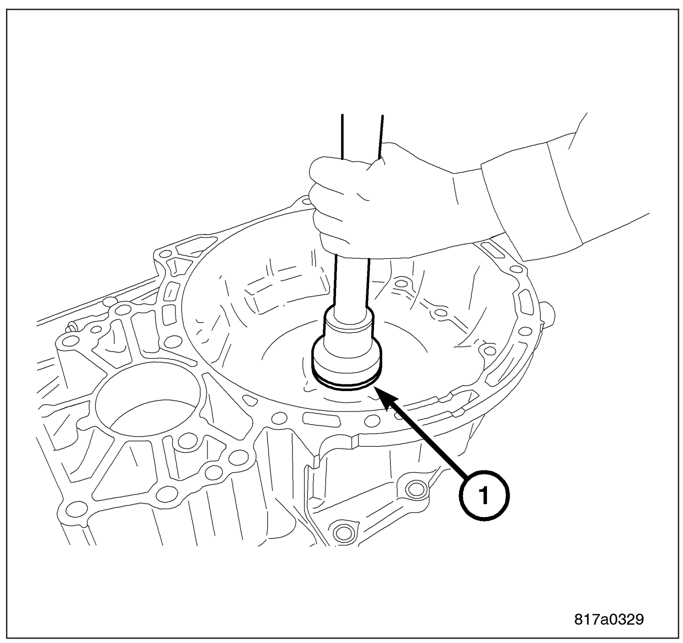
5. Install the shifter cable grommet (1) at the bulkhead.

6. Clip the cable (2) into the bracket (1) install the nut (4) over the shifter cable at the transmission shift lever.



7. Connect the Negative battery cable (2).
8. Install the air box (1)

SEAL-TORQUE CONVERTER

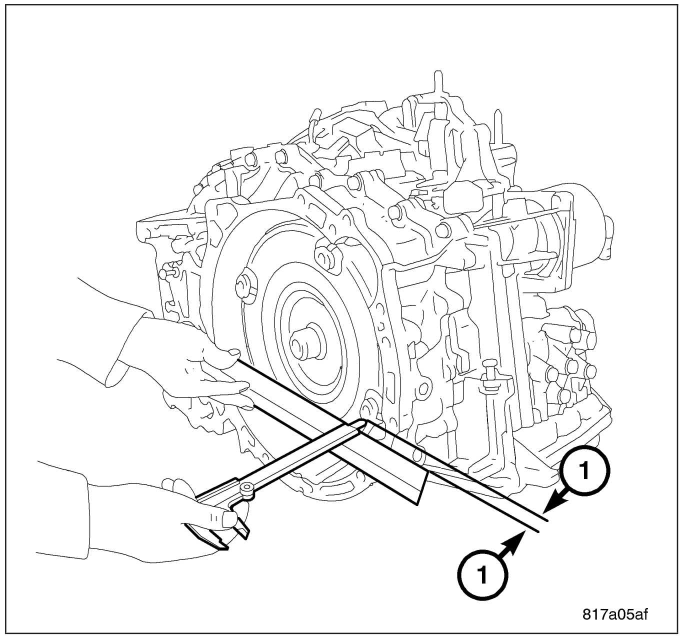


REMOVAL

1. Remove transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - REMOVAL).
2. Remove torque converter.
3. Remove torque converter seal using Slide Hammer C-3752 and oil Seal Remover 9667.

INSTALLATION

1. Install torque converter seal using oil seal Installer 9858.

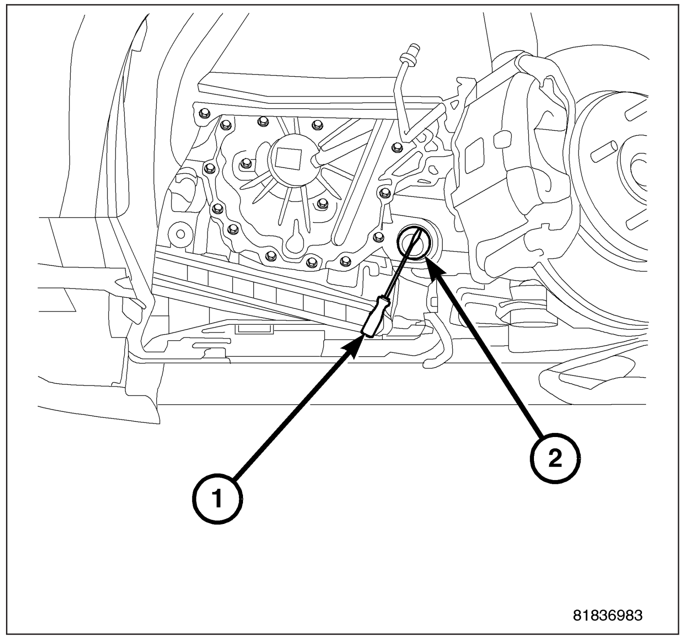


NOTE: Gauge Bar 6311 can be used for doing the following measurement

NOTE: When conducting measurements, measure two or more places and calculate the average value.

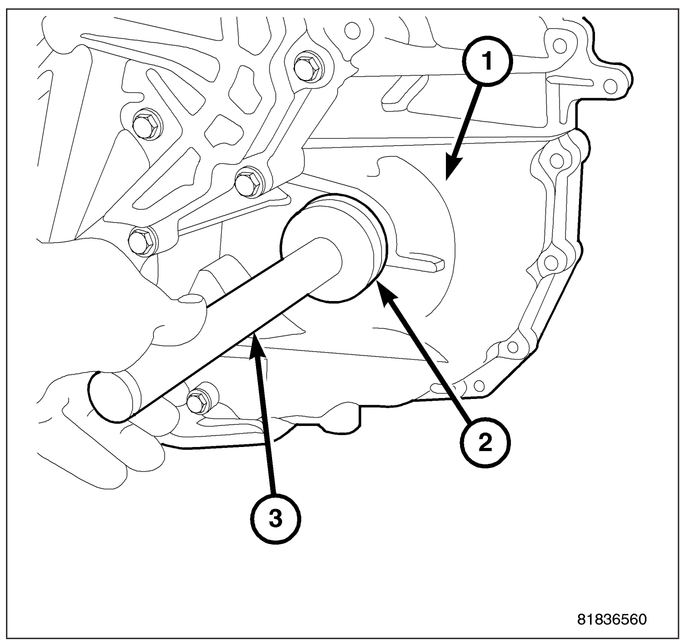
2. Install the torque converter on the transaxle and measure the dimension (1) to see if it is at least 13 mm. If the measurement is less than 13 mm, the torque converter is not fully installed.

NOTE: Use the designated brand of CVT fluid. Use of other brands of CVT fluid other than the designated brand will deteriorate the driveability and the durability of the CVT, and will cause damage to the CVT.



3. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - CVT - INSTALLATION).

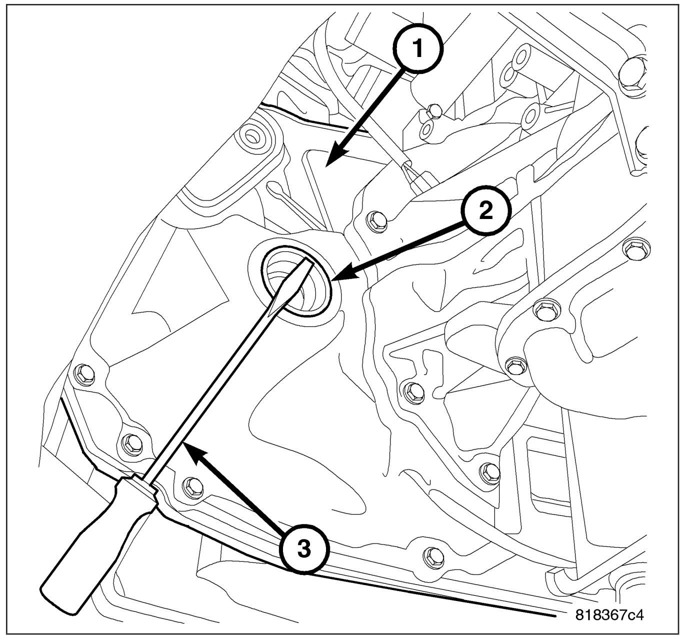
SEAL-HALFSHAFT LEFT SIDE



REMOVAL

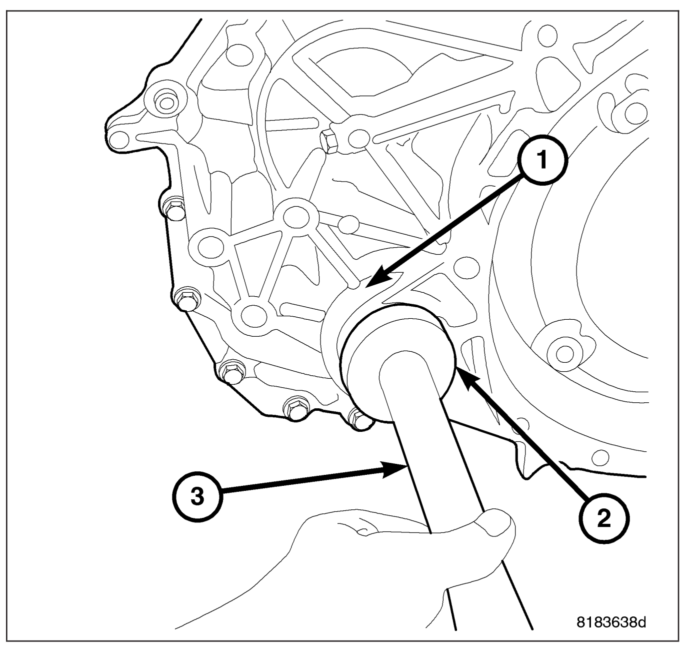
1. Remove halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
2. Remove left side differential oil seal.

INSTALLATION



1. Install the left side differential oil seal using Installer 9871 (2) and Handle C-4171 (3).
2. Install halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
3. Road test vehicle and inspect for leaks.

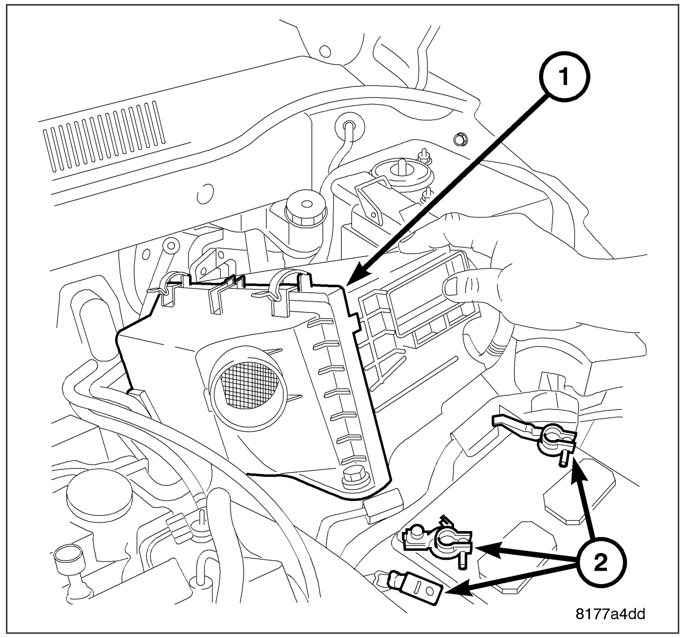
SEAL-HALFSHAFT RIGHT SIDE



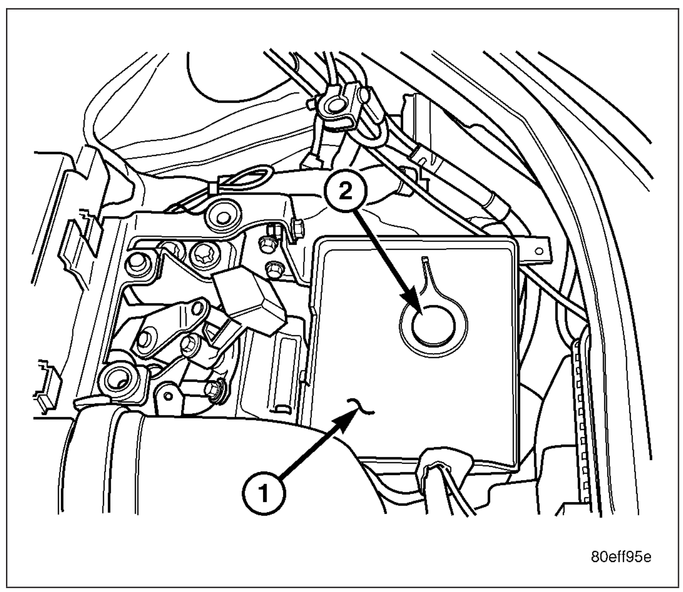
REMOVAL

1. Remove halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL).
2. If all wheel drive remove the PTU (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).
3. Remove the seal (2) form the transaxle using a screwdriver (3).

INSTALLATION

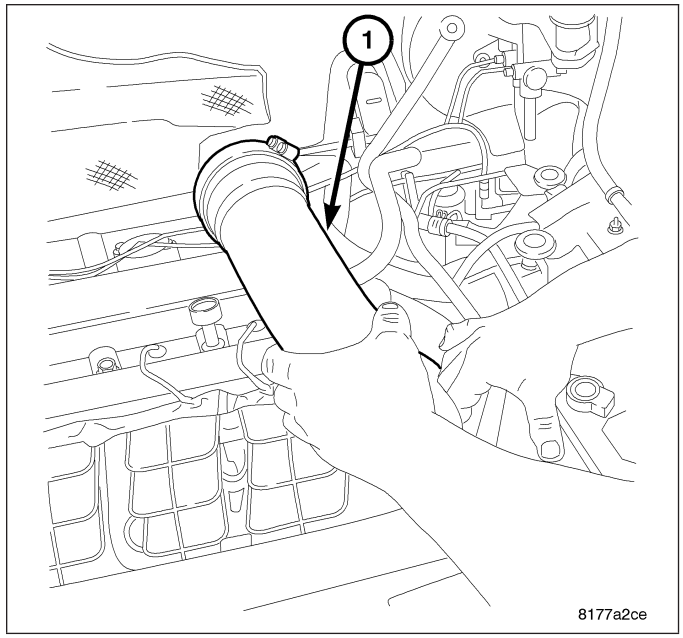


1. Install the seal using Installer 9877(2) and Handle C-4171 (3).
2. If all wheel drive install the PTU (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - INSTALLATION).
3. Install Halfshaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
4. Road test vehicle and inspect for leaks.

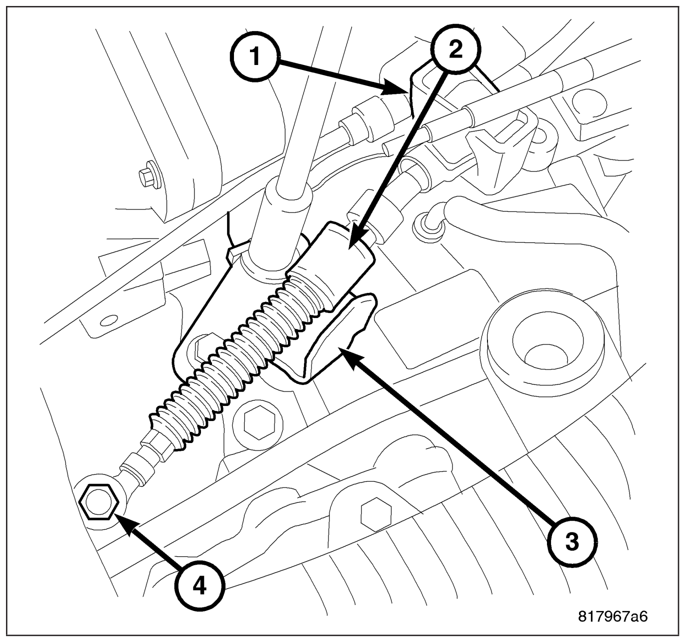


TRANSMISSION RANGE SENSOR

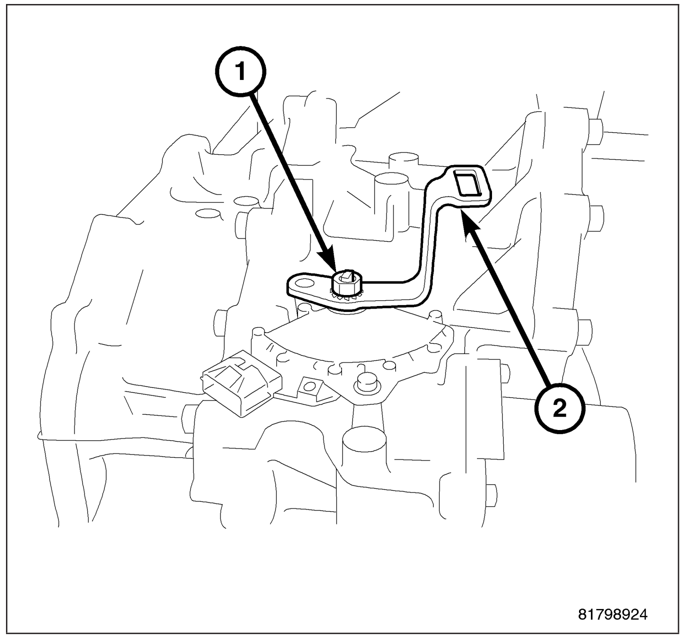
REMOVAL



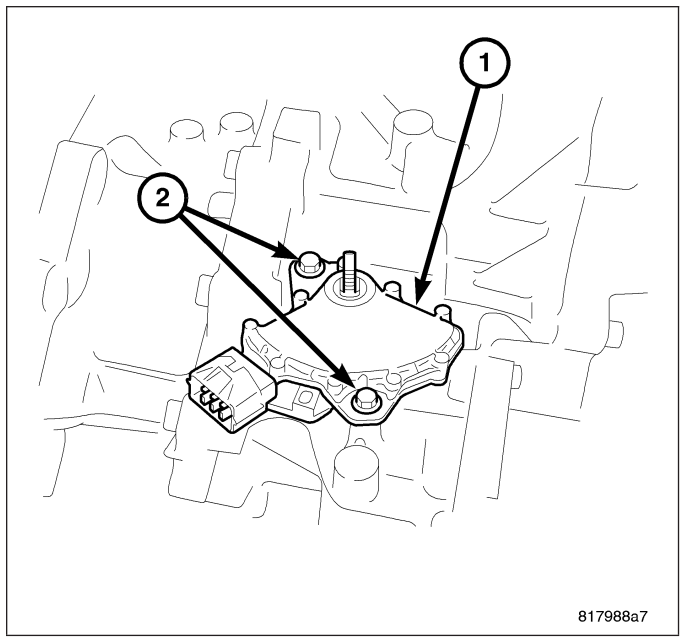
1. Disconnect battery cables (2).
2. Remove air cleaner assembly (1).



3. Remove battery.
4. Remove battery tray (1).

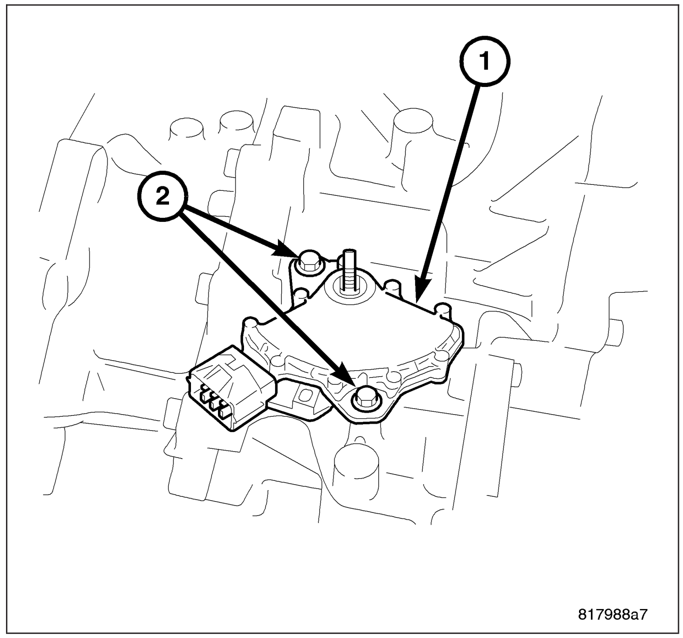


5. Remove inlet air tube (1).

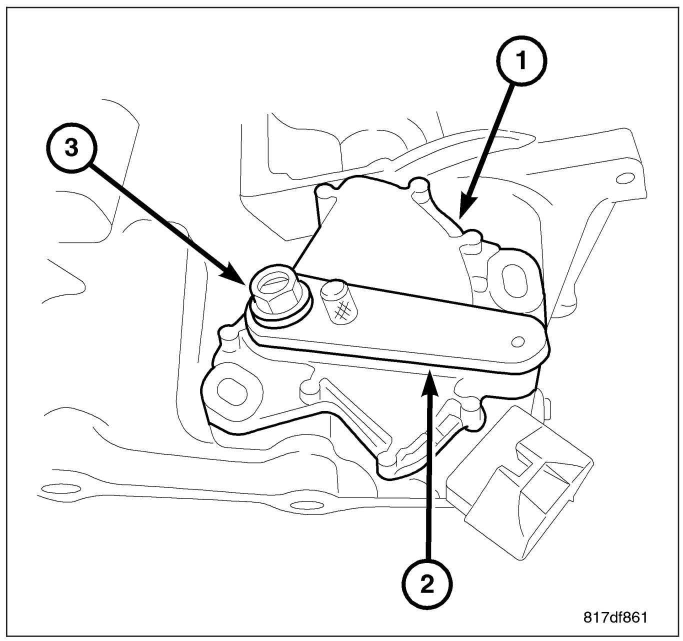


6. Remove the shiftier cable (2).

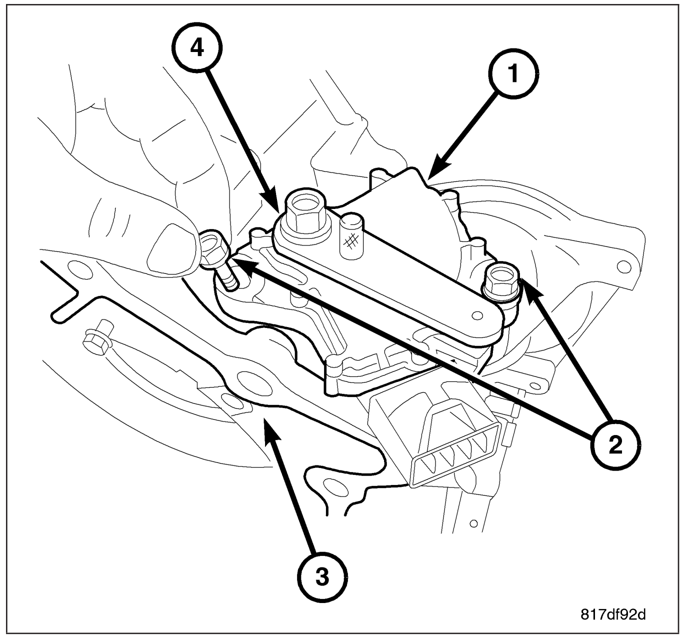
7. Remove nut (1) at shift lever.
8. Remove shift lever (2).



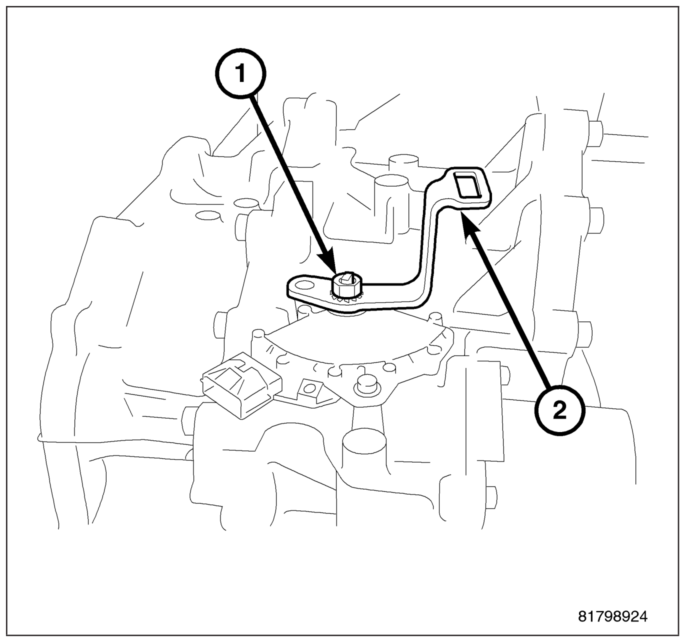
9. Remove bolts (2) at TRS.
10. Remove TRS (1).



INSTALLATION



1. Install TRS into position (1).



2. Put the manual shaft in the N position (3).
3. Install Alignment Tool 9876 (2) and adjust the position of the TRS (1).

4. Install and Torque the mounting bolts of the TRS to 6 N·m (49 in.lbs.).

5. Remove Alignment Tool 9876 and Install the shift lever (2) onto the manual shaft (1).
6. Install and Torque the mounting nut to 17 N·m (150 in.lbs.).

TIRES/WHEELS - ELECTRICAL DIAGNOSIS

TABLE OF CONTENTS

TIRE PRESSURE MONITORING - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

C0077- LOW TIRE PRESSURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

Possible Causes
INTERMITTENT PERFORMANCE DTC
INCORRECT TIRE PRESSURE
TIRE PRESSURE SENSOR
WCM (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

NOTE:
If the following conditions are present:
– Low Tire Pressure DTC (C0077) (Active)
– Spare Tire is not equipped with a Tire Pressure Sensor
– Spare Tire is currently on the vehicle
Repair the tire and place it back on the vehicle.
Test drive the vehicle.
If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. LOW TIRE PRESSURE

Correct all tire pressure to the recommended specifications and wait 2 minutes.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

3. TIRE PRESSURE SENSOR

NOTE: Before continuing, ensure the tire is free from any leaks or damage that would cause a low tire pressure condition. If a problem is found, repair as necessary and retest.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

No >> Test Complete.

4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Repair as necessary.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

No >> Test complete.

C1501–TIRE PRESSURE SENSOR 1 INTERNAL

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 MPH (24 km/h). (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum peroid of 10 minuntes. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE:
If the following conditions are present:
– Tire Pressure Sensor Internal DTC (Active)
– Spare Tire is not equipped with a Tire Pressure Sensor
– Spare Tire is currently on the vehicle
Repair the tire and place it back on the vehicle.
Test drive the vehicle.
If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE SENSOR

NOTE:
When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.
1. Set all tire pressures to the recommended specifications and recheck for fault/alert.
2. Turn the ignition on.
3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.
4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified. Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

C1502–TIRE PRESSURE SENSOR 2 INTERNAL

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 MPH (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minunites. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE:
If the following conditions are present:
– Tire Pressure Sensor Internal DTC (Active)
– Spare Tire is not equipped with a Tire Pressure Sensor
– Spare Tire is currently on the vehicle
Repair the tire and place it back on the vehicle.
Test drive the vehicle.
If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE SENSOR

NOTE:
When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.
1. Set all tire pressures to the recommended specifications and recheck for fault/alert.
2. Turn the ignition on.
3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.
4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified. Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

C1503–TIRE PRESSURE SENSOR 3 INTERNAL

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 MPH (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minunites. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE:
If the following conditions are present:
– Tire Pressure Sensor Internal DTC (Active)
– Spare Tire is not equipped with a Tire Pressure Sensor
– Spare Tire is currently on the vehicle
Repair the tire and place it back on the vehicle.
Test drive the vehicle.
If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE SENSOR

NOTE:
When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.
1. Set all tire pressures to the recommended specifications and recheck for fault/alert.
2. Turn the ignition on.
3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.
4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified. Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

4. INTERMITTENT TIRE PRESSURE SENSOR DTC

The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

C1504–TIRE PRESSURE SENSOR 4 INTERNAL

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The tire pressure sensor actively monitors the air pressure and air temperature inside the tire, the sensor internal battery status, and the radial acceleration of the wheel. Each sensor has a unique ID code. The sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Wireless Control Module (SKREEM).

- **When Monitored:**
  With vehicle speed greater than 15 m.p.h. (24 km/h).
- **Set Condition:**
  The WCM (SKREEM) will monitor the signals from the four active road tire sensors. A loss of signal error is detected when eight consecutive blocks of data are not received or cannot be accurately decoded within a maximum period of 10 minunites. An internal sensor hardware error condition will be set when an error in the accelerometer, pressure sensor, or temperature sensor is detected.

Possible Causes
INTERMITTENT TIRE PRESSURE SENSOR INTERNAL DTC
TIRE PRESSURE SENSOR
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE:
If the following conditions are present:
– Tire Pressure Sensor Internal DTC (Active)
– Spare Tire is not equipped with a Tire Pressure Sensor
– Spare Tire is currently on the vehicle
Repair the tire and place it back on the vehicle.
Test drive the vehicle.
If the DTC(s) reset continue with the diagnostic procedure.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE SENSOR

NOTE:
When working with vehicles equipped with the base tire pressure monitoring system the correct tire that set the fault must be identified. Following the below procedure will help in identifying the correct tire.
1. Set all tire pressures to the recommended specifications and recheck for fault/alert.
2. Turn the ignition on.
3. Starting with the left front wheel, deflate the tire to 20 PSI and wait 2 minutes. The fault will set once the pressure has reached 20 PSI within the 2 minute time frame.
4. If the TPM fault was detected and not associated to this Sensor/Transmitter, repeat the process until the faulty Sensor/Transmitter has been identified. Once a fault/alert has set, it will establish the location of the tire pressure sensor/transmitter. Repeat steps until the applicable Tire Pressure Sensor/Transmitter has been located.

Turn the ignition off.

Replace the Tire Pressure Sensor in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 m.p.h.
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

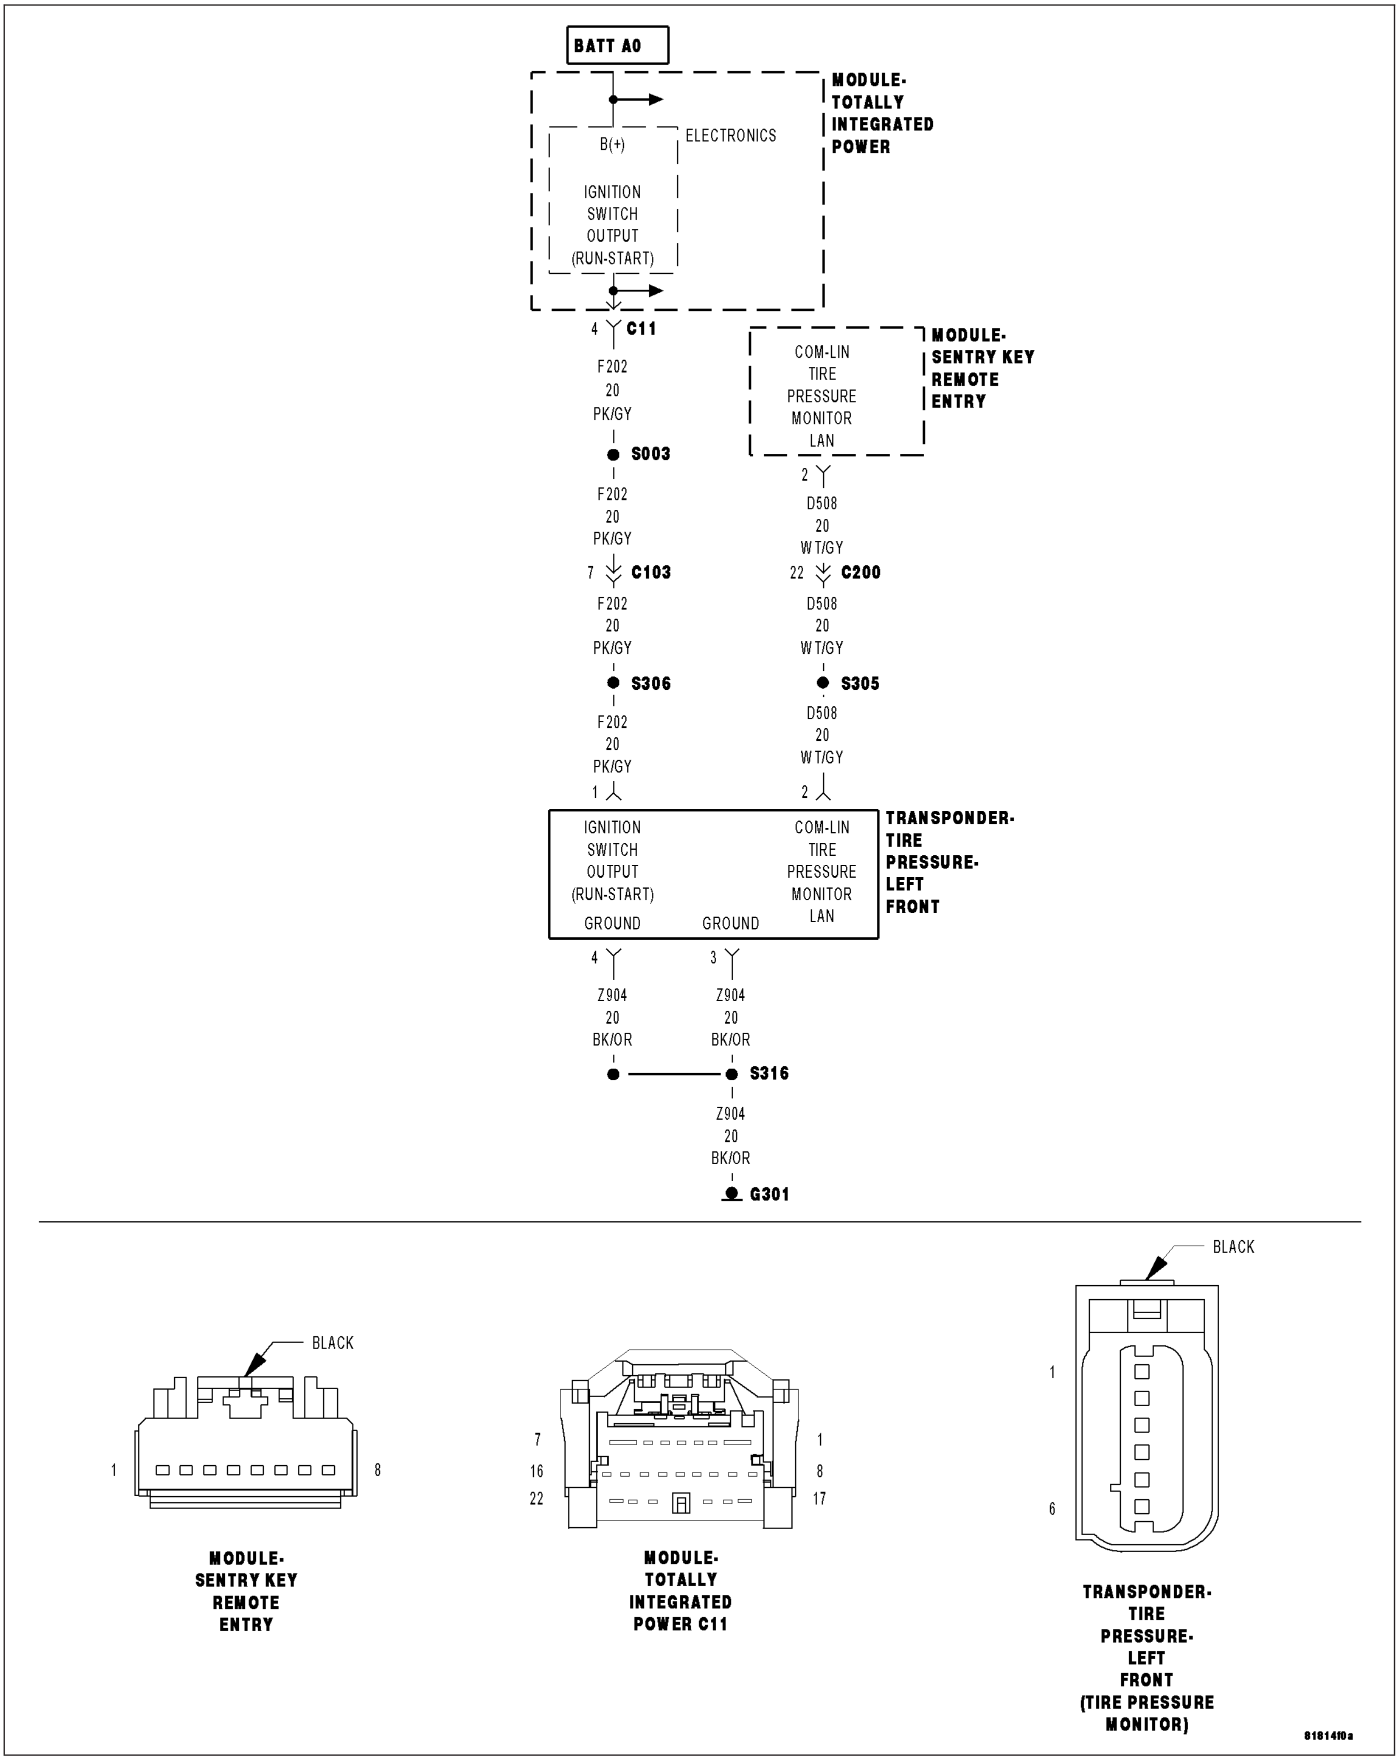
3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

4. INTERMITTENT TIRE PRESSURE SENSOR DTC



The conditions necessary to set this DTC are not present at this time.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the beginning of this test and perform the diagnostic procedure as necessary.

No >> Test complete.

C1506–LEFT FRONT TIRE PRESSURE TRIGGER MODULE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (TPM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (TPM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (TPM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: If the incorrect Placard Values were programmed into the WCM/TPM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (TPM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (TPM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (TPM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. WIRELESS CONTROL MODULE (TPM)

View repair.

Repair

Replace the Wireless Control Module (TPM) in accordance with the Service Information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

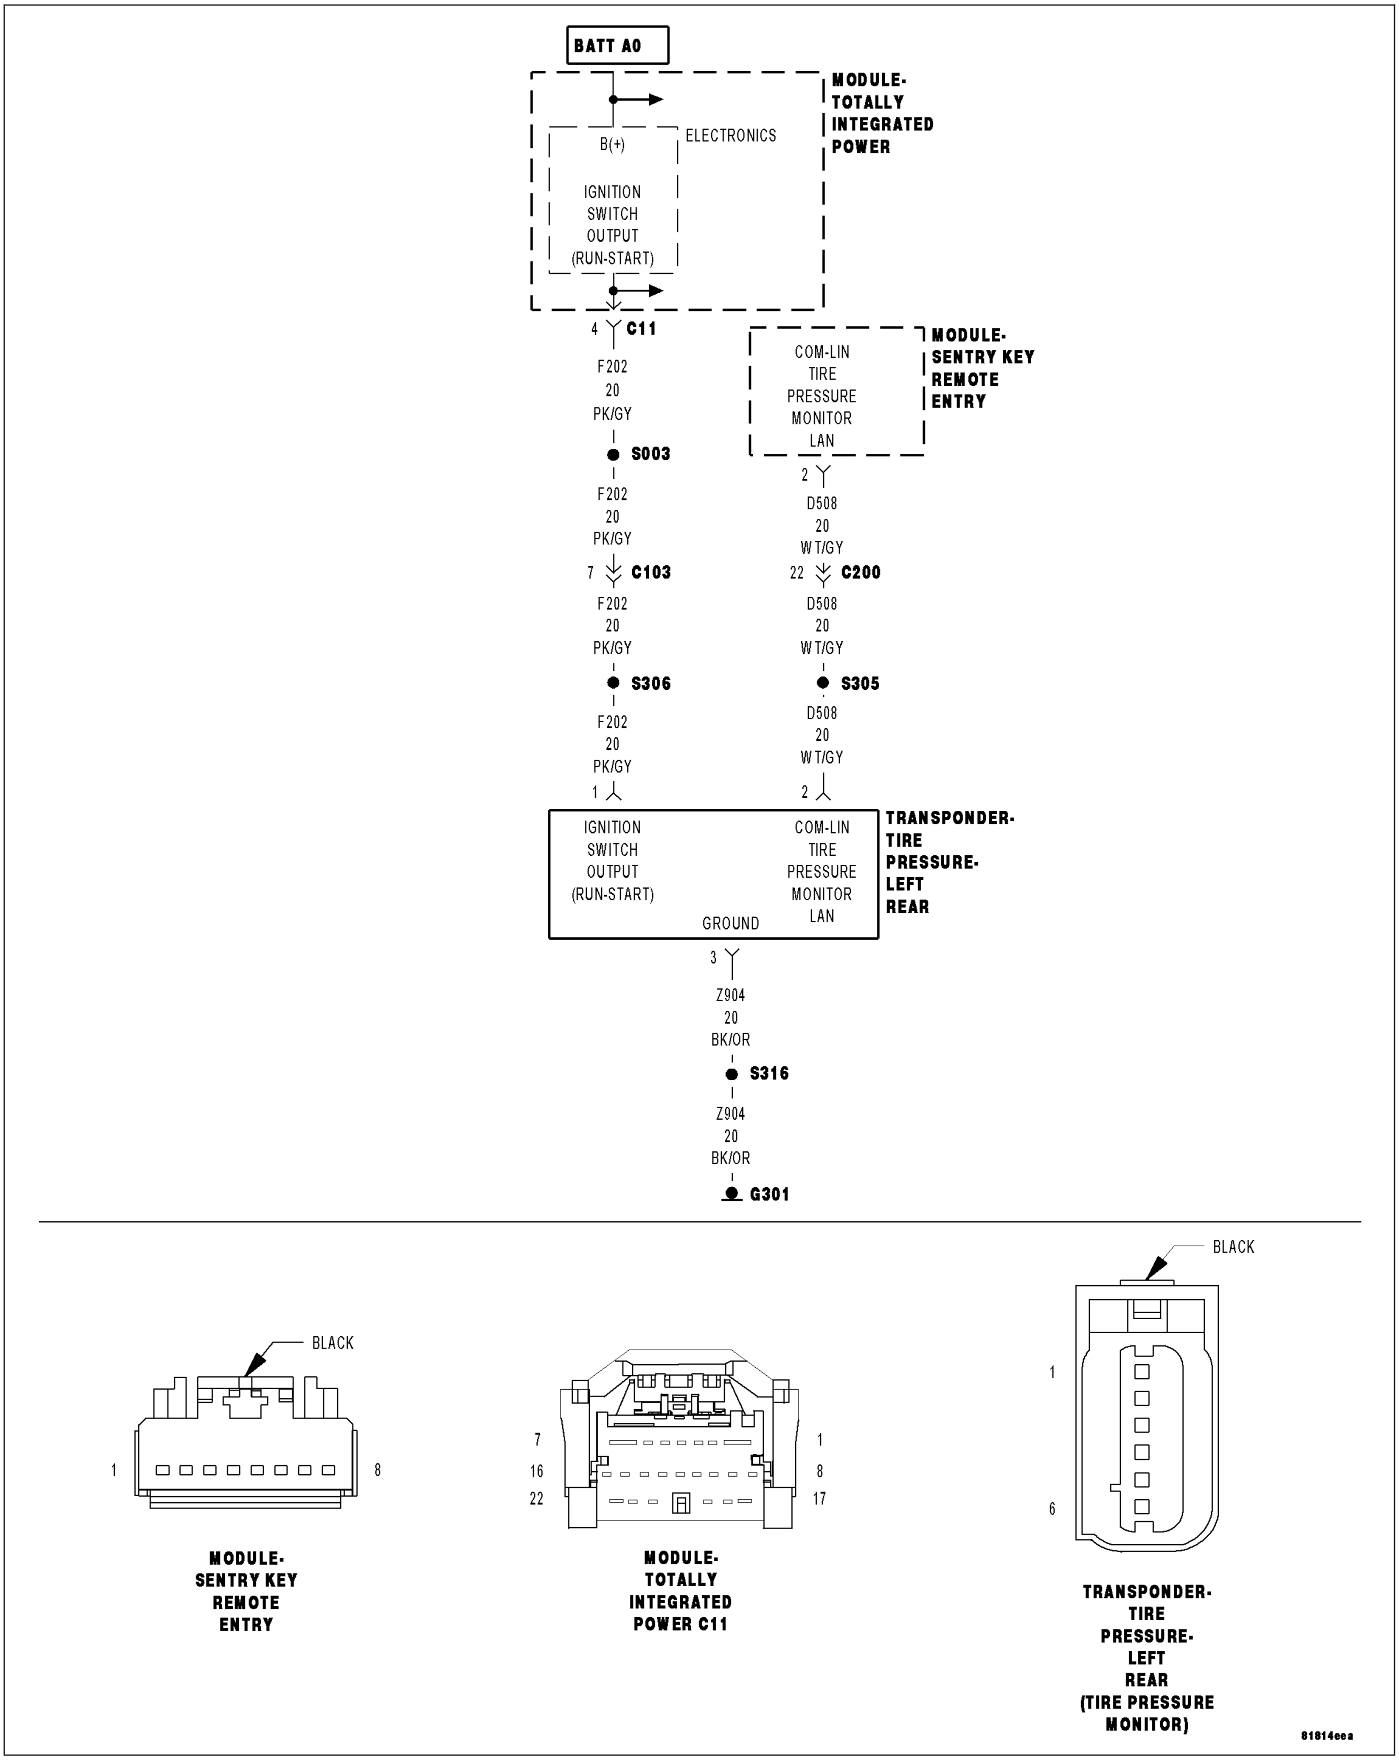
The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (TPM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).



With the scan tool, select View DTCs in the Wireless Control Module (TPM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C1508–LEFT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a LR transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

3. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

4. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

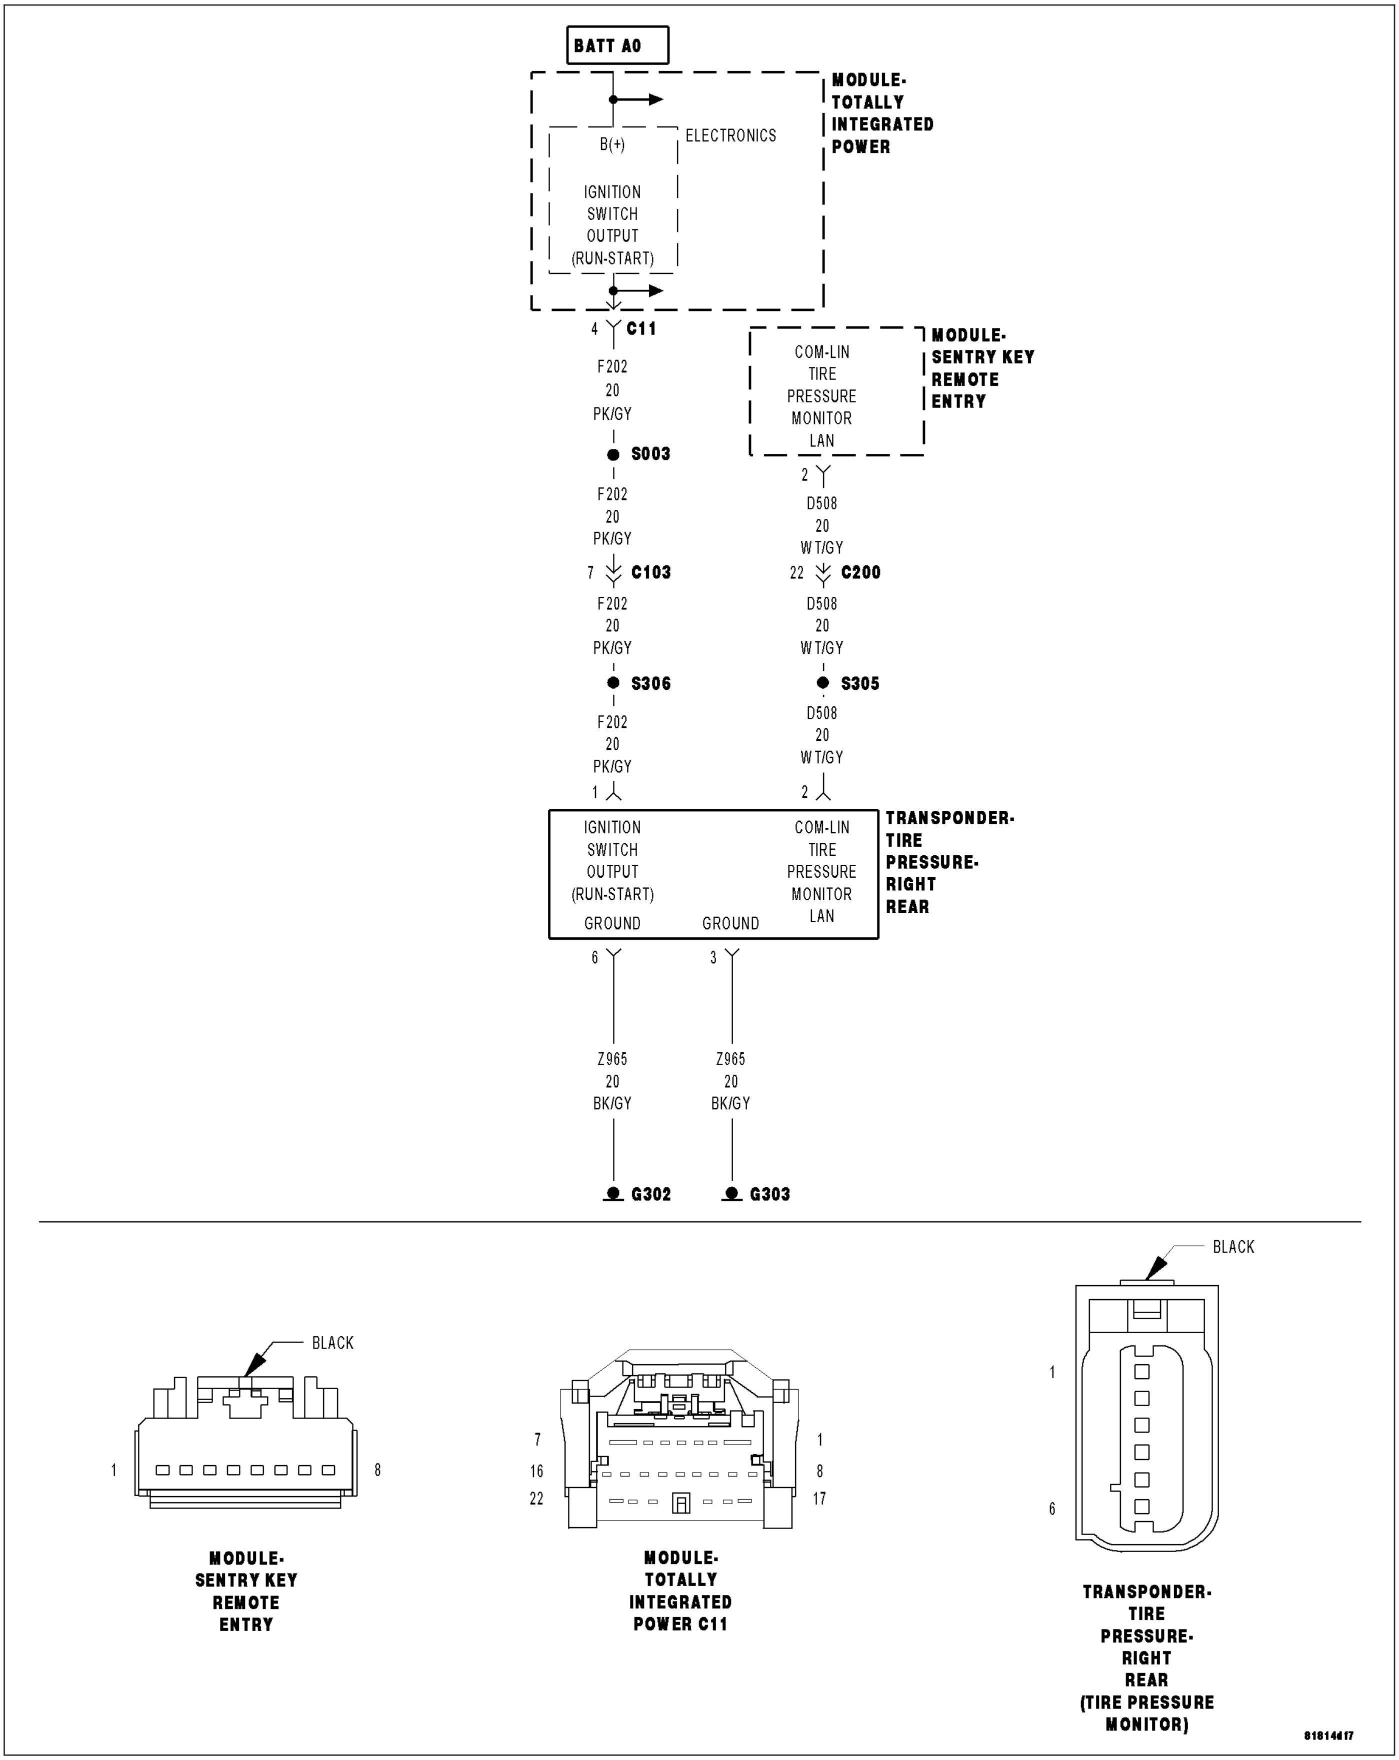
The conditions necessary to set this DTC are not present at this time.

Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).



With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C1509–RIGHT REAR TIRE PRESSURE TRIGGER MODULE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM (SKREEM) will monitor the messages from each Tire Pressure Trigger Module over the LIN bus. If any of the messages are not received, or are received other than as expected, a DTC will set. When the condition is corrected, or is no longer detected, as acknowledged via a LIN bus message, the WCM will reset the appropriate trigger module fault status.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

Turn the ignition on.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

Yes >> Go to 2

No >> Go to 4

2. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 3

No >> Test Complete.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. WIRELESS CONTROL MODULE (SKREEM)

The conditions necessary to set this DTC are not present at this time.
Using the wiring schematic as a guide, inspect the wiring and connectors relative to this circuit.
Refer to any Technical Service Bulletins that may apply to this condition.
With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).
Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).
With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C150A–LEFT FRONT TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

Turn the ignition on.

NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

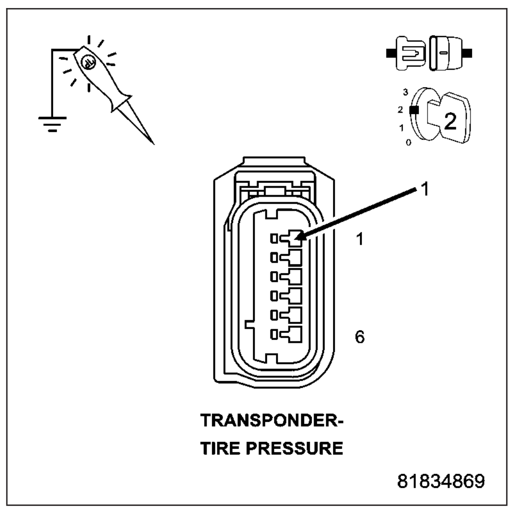
Yes >> Go to 2

No >> Go to 6

2. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

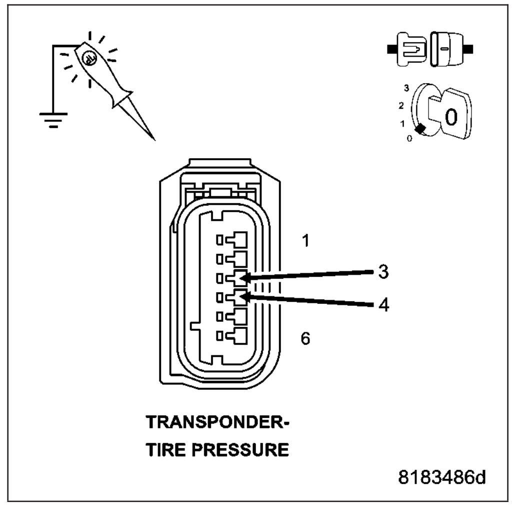
Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F202) Fused Ignition Switch Output (Run) circuit.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 3

No >> Repair the (F202) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. (Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z904) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z904) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 5

No >> Test Complete.

5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

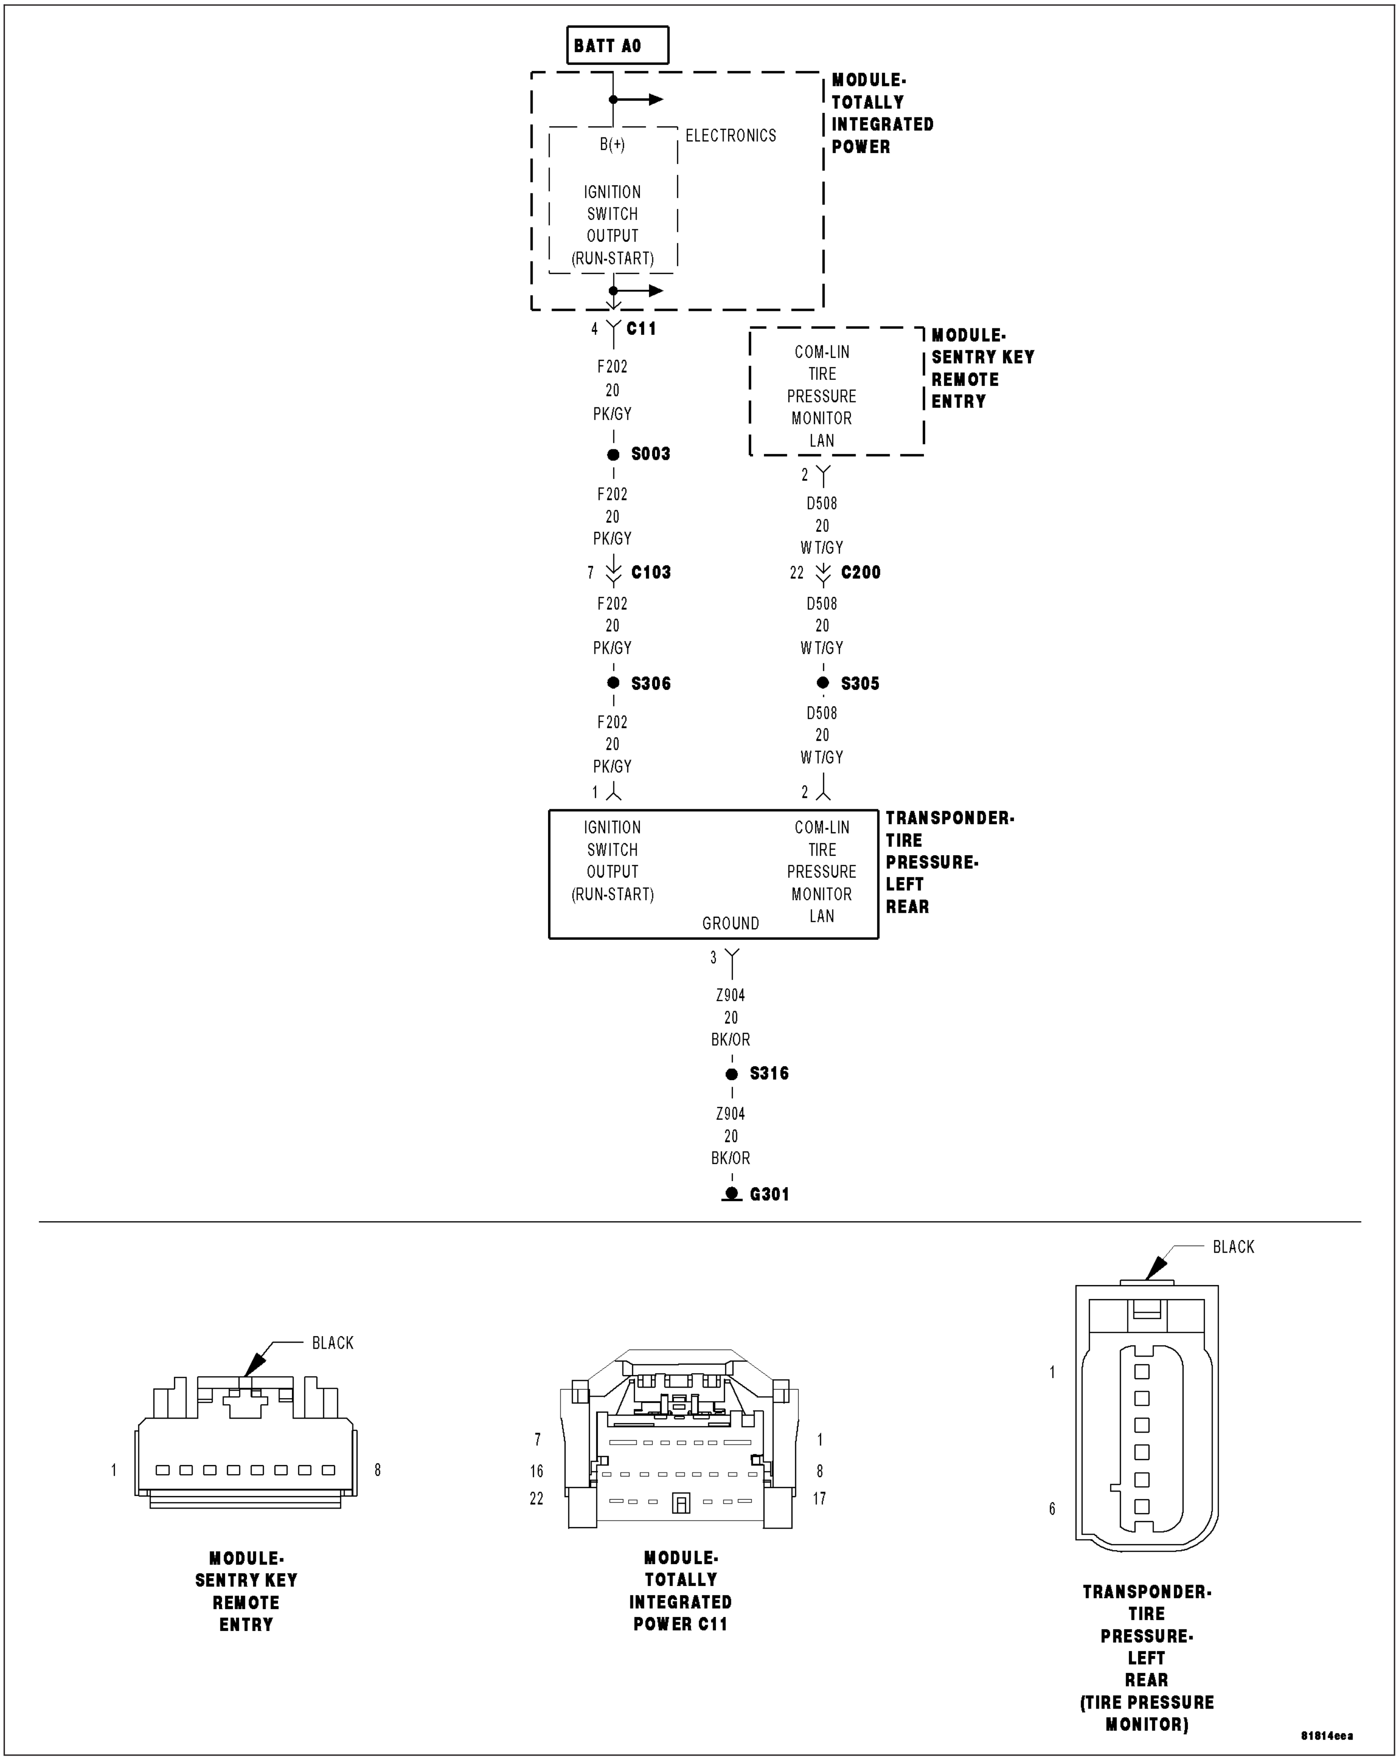
6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).



With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C150C–LEFT REAR TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

Turn the ignition on.

NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?

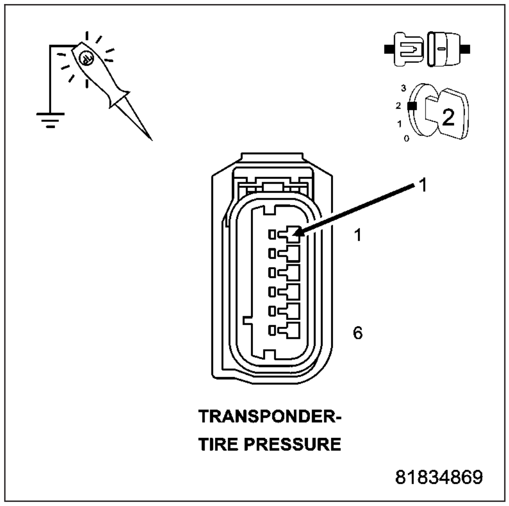
Yes >> Go to 2

No >> Go to 6

2. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F202) Fused Ignition Switch Output (Run) circuit.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

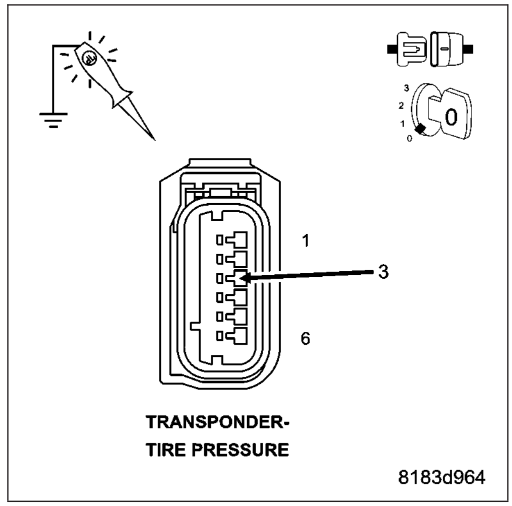
Yes >> Go to 3

No >> Repair the (F202) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. (Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z904) Ground circuit(s).



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z904) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 5

No >> Test Complete.

5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

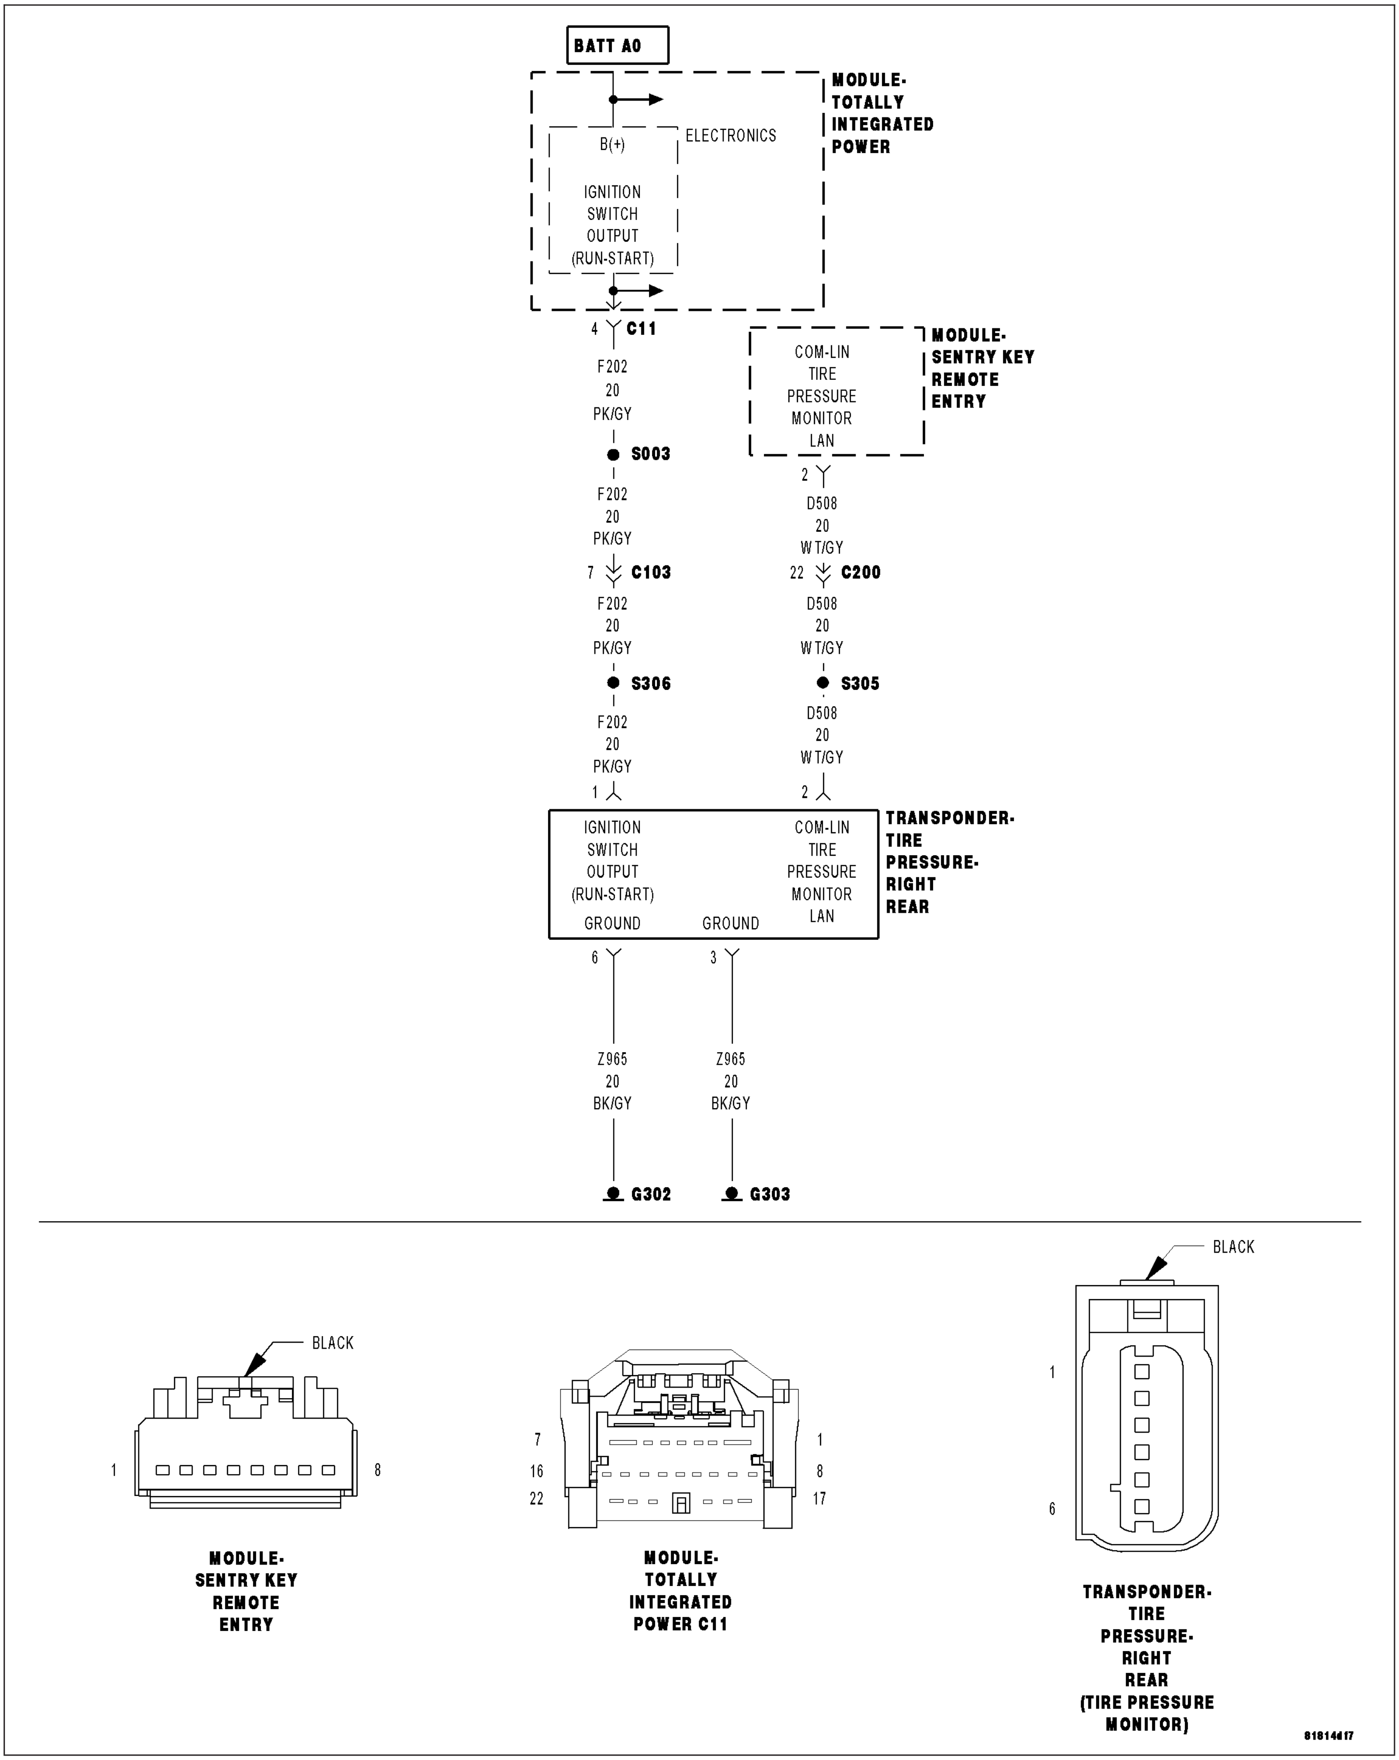
6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).



With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C150D–RIGHT REAR TIRE PRESSURE TRIGGER MODULE VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Tire Pressure Trigger Module is used to automatically learn the location of each wheel sensor on the vehicle. The module is controlled and activated in sequence by the Wireless Control Module (SKREEM) over a LIN bus. When activated, the module will generate a 125 KHz signal of sufficient field strength to trigger the tire pressure sensor and force a RF transmission from the sensor.

- **When Monitored:**
  Continuously.
- **Set Condition:**
  The WCM receives a message from the Tire Pressure Trigger Module indicating that an over voltage condition has been detected.

Possible Causes
INTERMITTENT TIRE PRESSURE TRIGGER MODULE PERFORMANCE DTC
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
TIRE PRESSURE TRIGGER MODULE
WIRELESS CONTROL MODULE (SKREEM)

Diagnostic Test

1. DTC STATUS IS ACTIVE

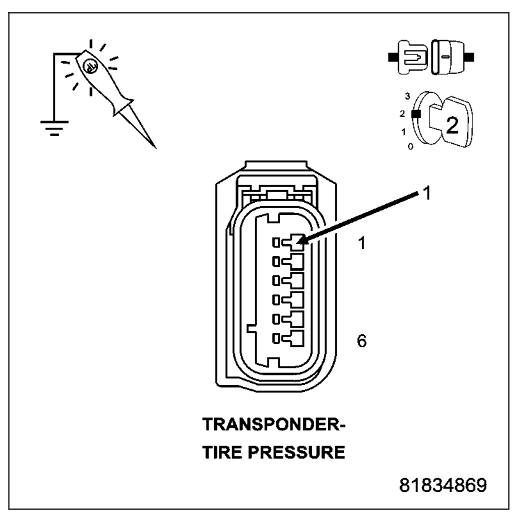
NOTE: If the incorrect Placard Values were programmed into the WCM/SKREEM, a DTC could be set. Before continuing with any TPM diagnostic test, using the scan tool, check that the correct Placard Values have been programmed in to the module.

Turn the ignition on.

NOTE: If a system or battery voltage high DTC is set in the Wireless Control Module (SKREEM) or in the PCM, repair the voltage DTC before continuing with this test.

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Is the DTC status Active at this time?



Yes >> Go to 2

No >> Go to 6

2. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F202) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

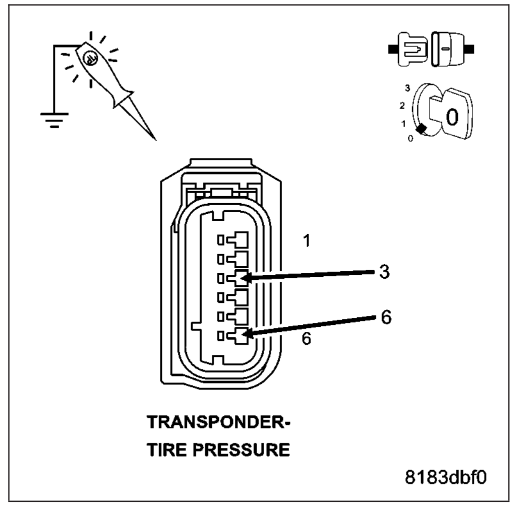
Yes >> Go to 3

No >> Repair the (F202) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. (Z965) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z965) Ground circuit(s).



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z965) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. TIRE PRESSURE TRIGGER MODULE

Turn the ignition off.

Replace the appropriate Tire Pressure Trigger Module in accordance with the Service Information.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Go to 5

No >> Test Complete.

5. WIRELESS CONTROL MODULE (SKREEM)

View repair.

Repair

Replace the Wireless Control Module (SKREEM) in accordance with the Service Information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

6. INTERMITTENT TIRE PRESSURE TRIGGER MODULE DTC

The conditions necessary to set this DTC are not present at this time.

Refer to any Technical Service Bulletins that may apply to this condition.

With the scan tool, clear DTCs in the Wireless Control Module (SKREEM).

Test Drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 15 MPH (24 km/h).

With the scan tool, select View DTCs in the Wireless Control Module (SKREEM).

Does the DTC reset or is the status Active for this DTC?

Yes >> Return to the first step of this test and perform the diagnostic procedure.

No >> Test complete.

C151D-TIRE PRESSURE SENSOR LOCATION UNDERETEMIND

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The vehicle sensor locate process occurs after the vehicle sits at zero speed for more than 19 min. The tire pressure monitor system will determin the sensor positios while driving at speeds above 15 MPH (24 Km/h). This process can take up to 10 min to determin sensor positions.

- **When Monitored:**
  During vehicle sensor locate process.
- **Set Condition:**
  Must fail vehicle sensor locate process 3 times in a row.

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
TPM SENSOR
WCM

Diagnostic Test

1. OTHER DTC'S SET

Repair all other DTC's first.

Is this DTC still active after all other DTC's repaired?

Yes >> Go To 2

No >> Test Complete.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

2. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
Turn the ignition on.

With the scan tool, read and record WCM DTCs.

With the scan tool, erase WCM DTCs.

Cycle the ignition switch.

With the scan tool, read WCM DTCs.

Does this DTC reset?

Yes >> Go To 3

No >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).
Perform BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

Is the resistance below 5 Ohms?

Yes >> Go To 4

No >> Repair or replace the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

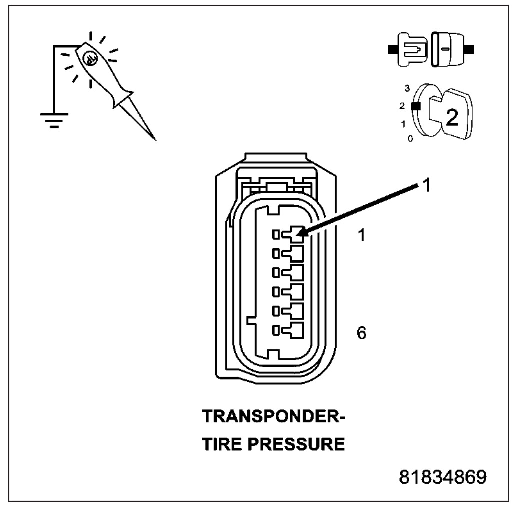
Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Using a 12–volt test light connect to ground, check the Fused Ignition Switch Output (Run) circuit.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

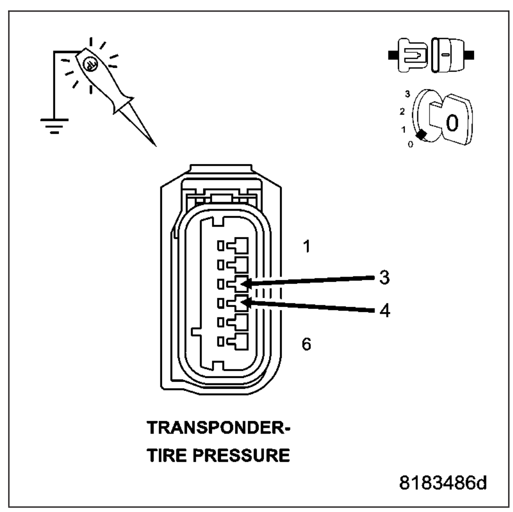
Yes >> Go to 5

No >> Repair the Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

5. GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12-volt test light connect to battery voltage, probe each of the Ground circuit(s).

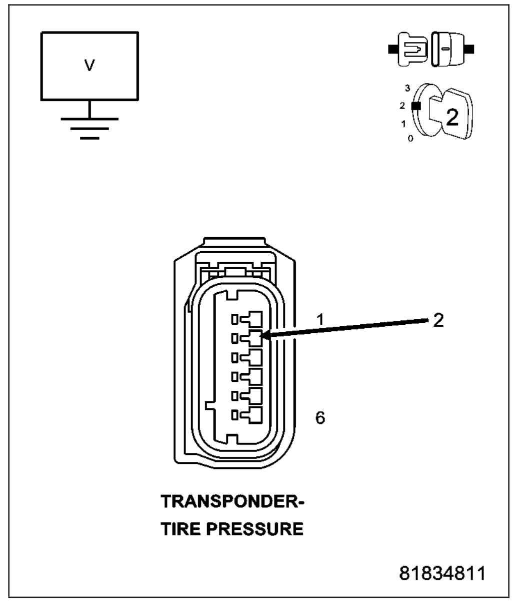


NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 6

No >> Repair the Ground circuit(s) for an open circuit or high resistance.



Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

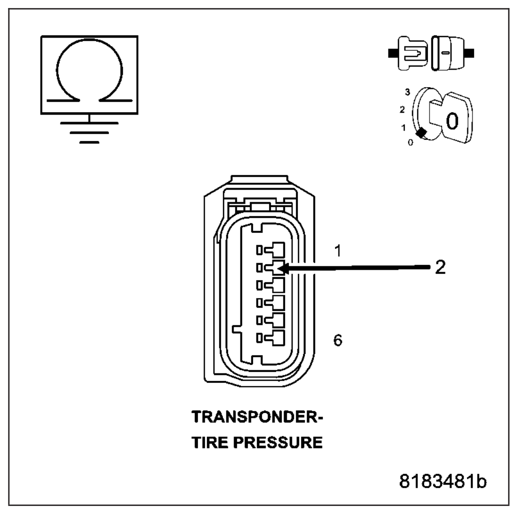
6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.



No >> Go to 7

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

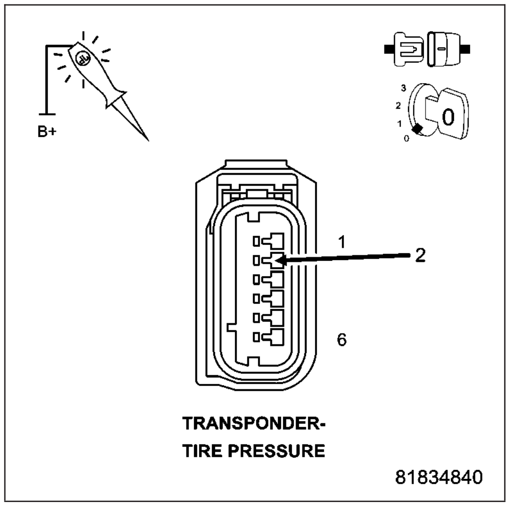
7. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.



Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Go to 8

8. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the TPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes >> Go to 9

No >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

9. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes >> Go To 10

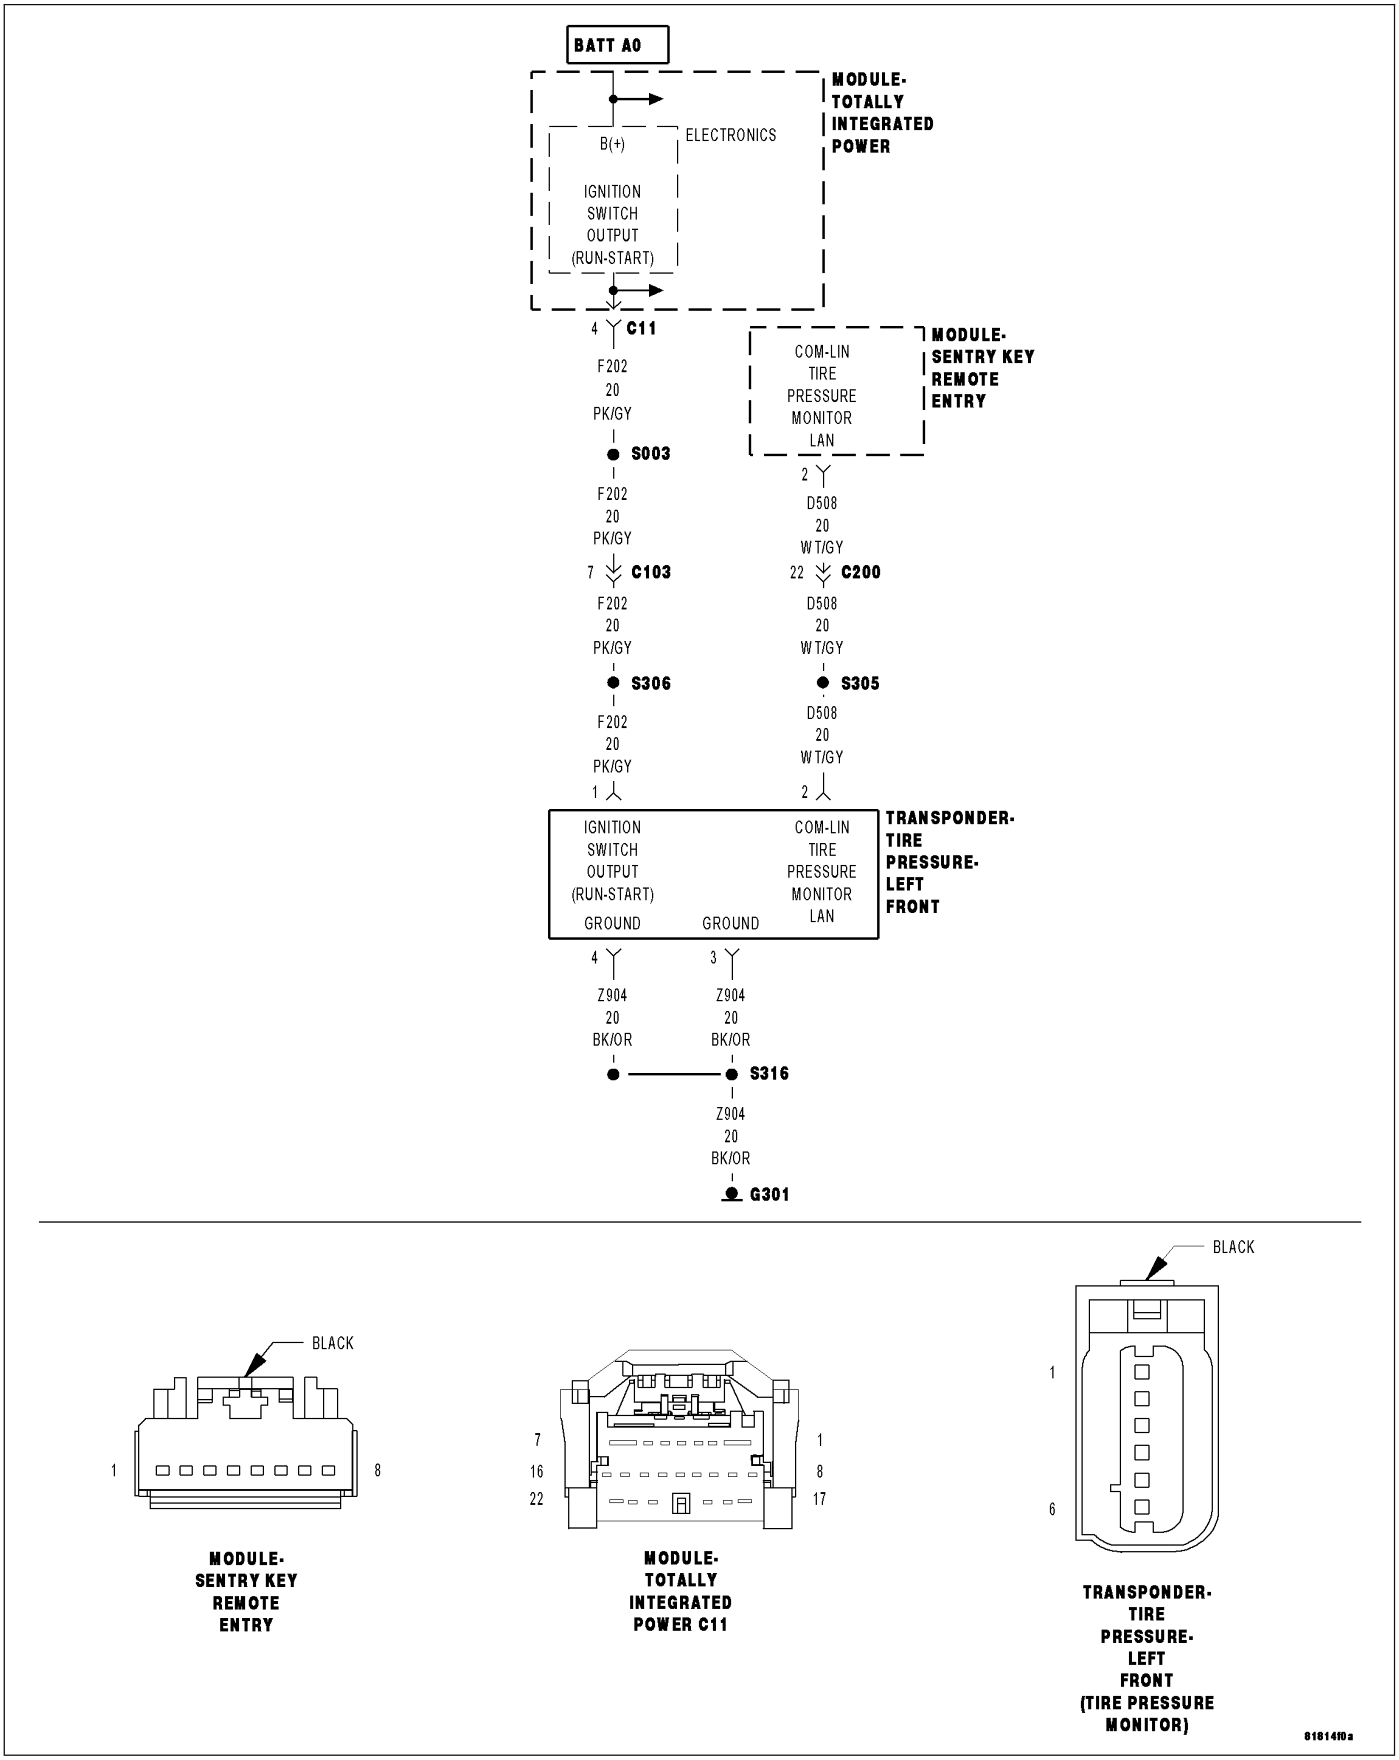
No >> Repair the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

10. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the WCM?



Yes >> Replace/update the WCM in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Replace the Tire pressure trigger Module in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

U1114–LOST COMMUNICATION WITH LEFT FRONT TIRE PRESSURE TRIGGER MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the WCM fails to receive bus messages from the Tire pressure trigger module for two consecutive counts of trigger module not responding to a communication check.

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record WCM DTCs.

With the scan tool, erase WCM DTCs.

Cycle the ignition switch.

With the scan tool, read WCM DTCs.

Does this DTC reset?

Yes >> Go To 3

No >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

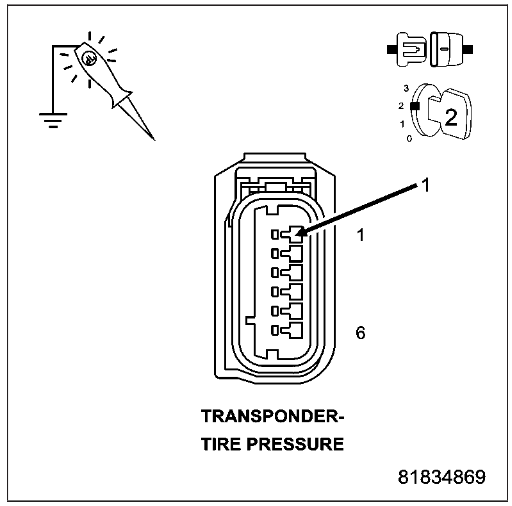
Is the resistance below 5 Ohms?

Yes >> Go To 4

No >> Repair or replace the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE



Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

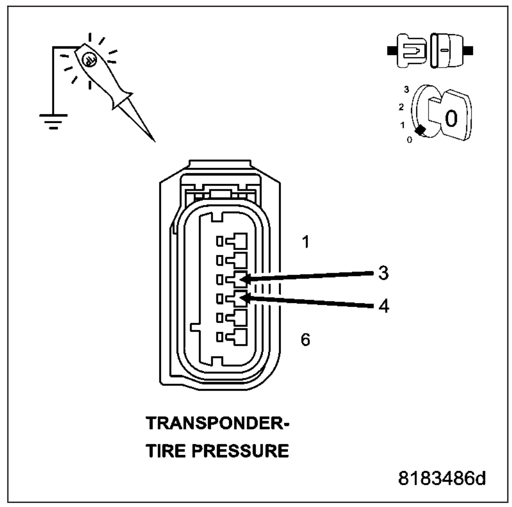
Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F924) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 5

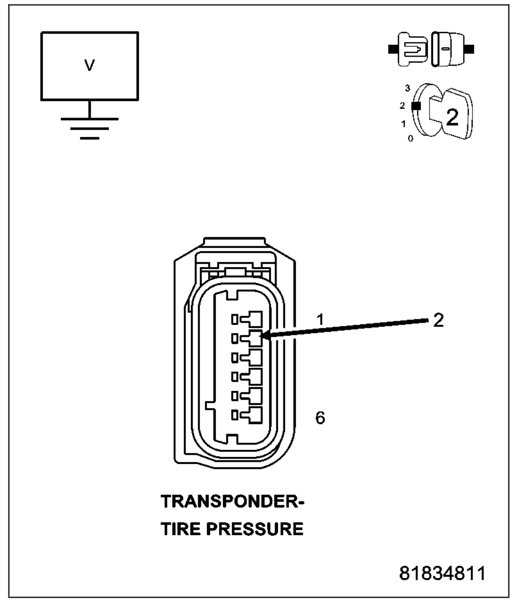
No >> Repair the (F924) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

4. (Z924) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12-volt test light connect to battery voltage, probe each of the (Z924) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Go to 6

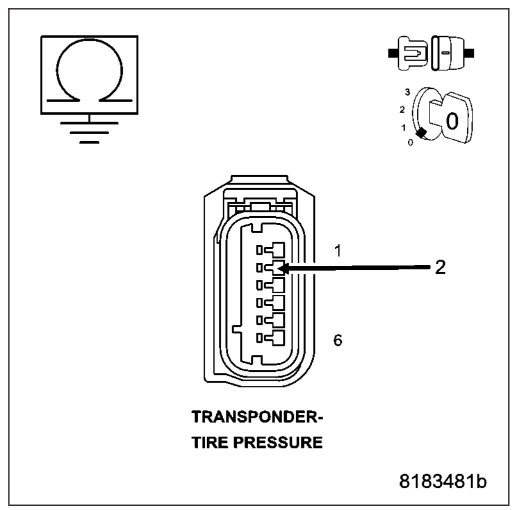
No >> Repair the (Z924) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.



Is there any voltage present?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

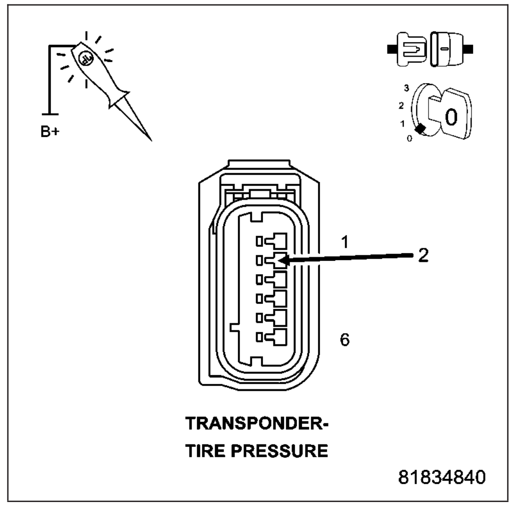
No >> Go to 7

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.



Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Go to 8

7. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the TPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes >> Go to 9

No >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

8. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes >> Go To 10

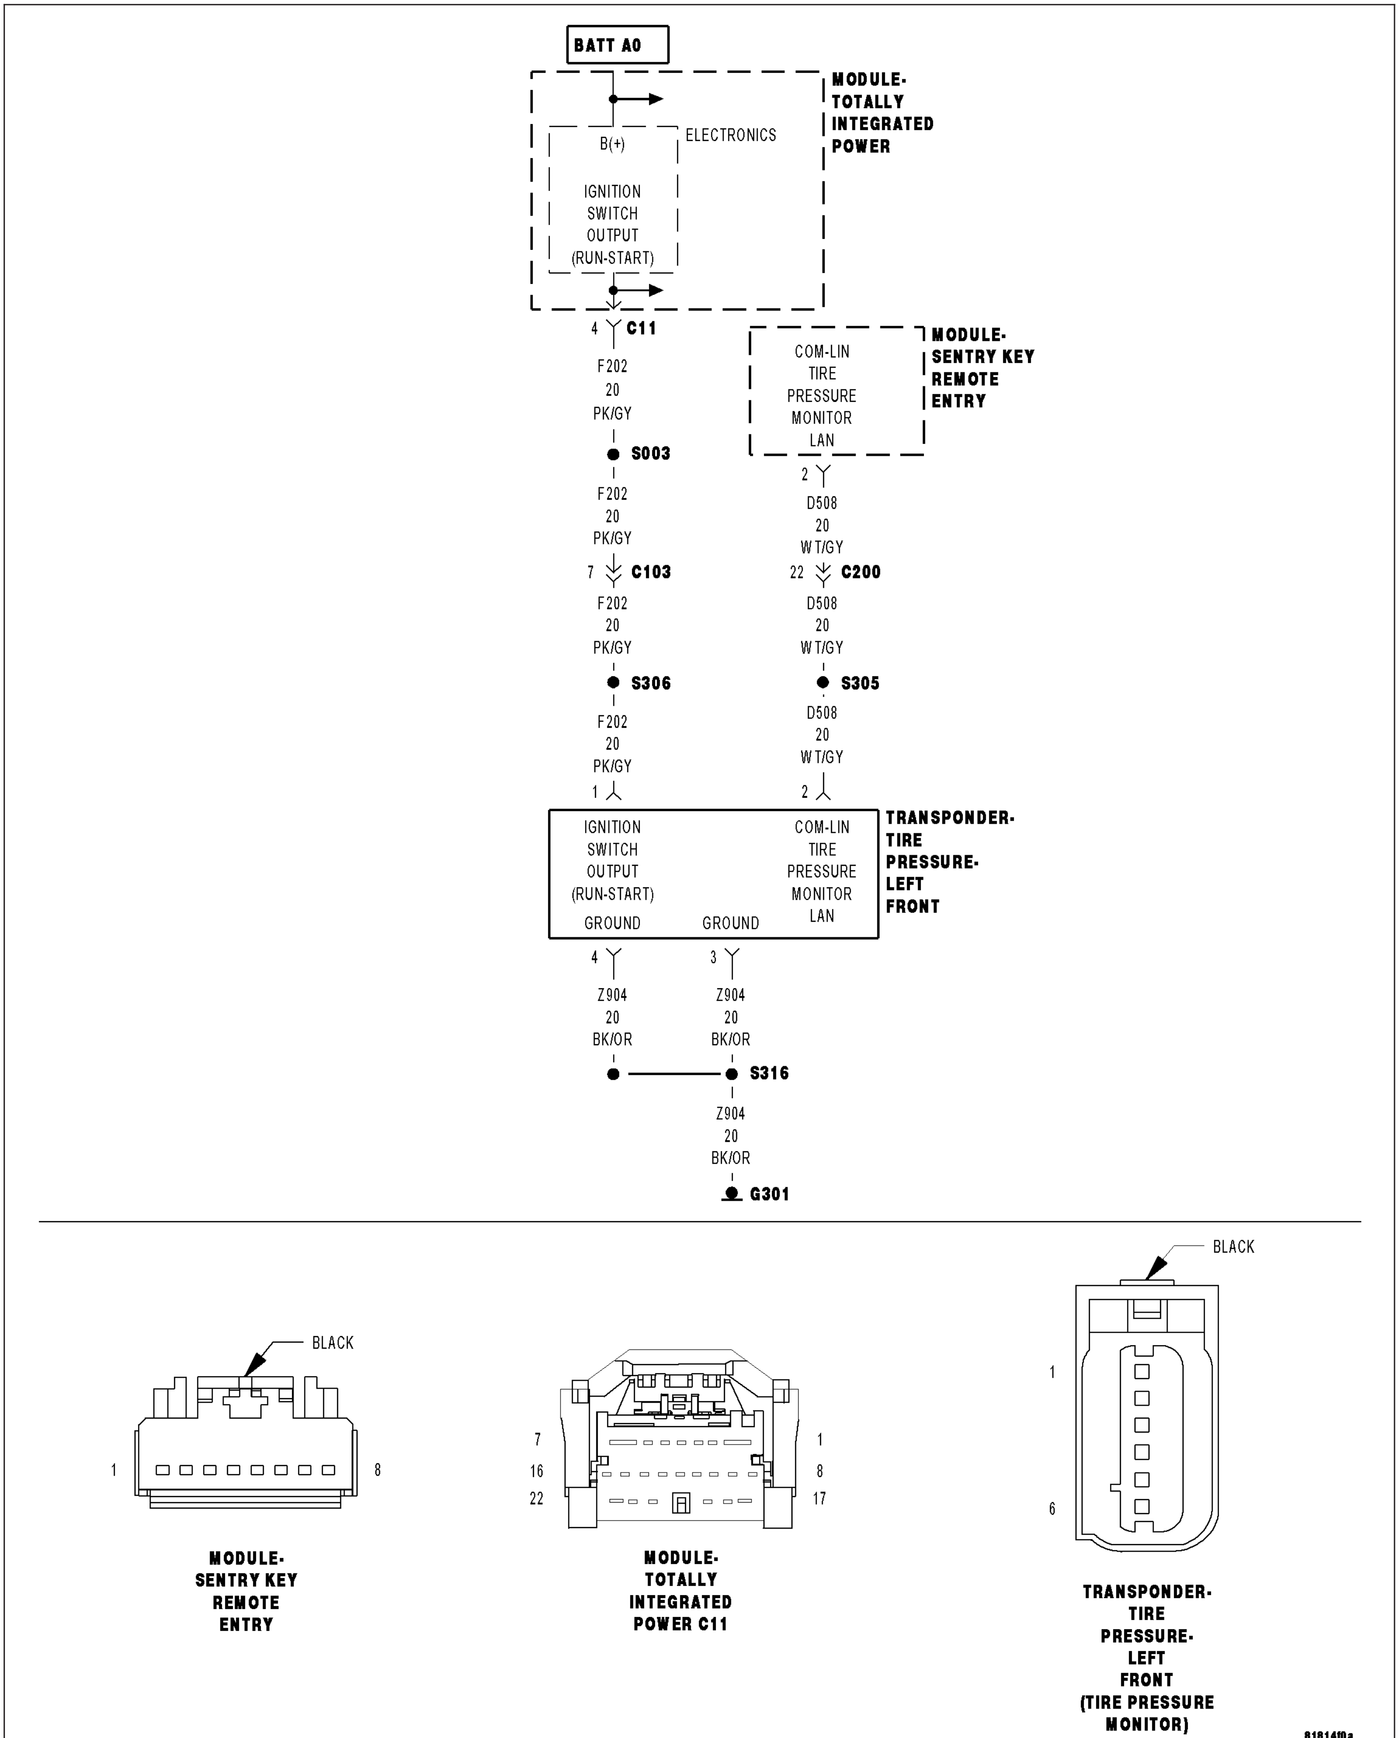
No >> Repair the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

9. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the WCM?



Yes >> Replace/update the WCM in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Replace the Tire pressure trigger Module in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

U1116–LOST COMMUNICATION WITH LEFT REAR TIRE PRESSURE TRIGGER MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the WCM fails to receive bus messages from the Tire pressure trigger module for two consecutive counts of trigger module not responding to a communication check.

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
Turn the ignition on.

With the scan tool, read and record WCM DTCs.

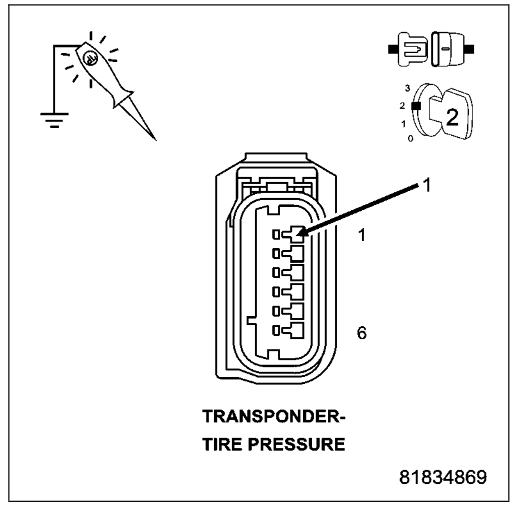
With the scan tool, erase WCM DTCs.

Cycle the ignition switch.

With the scan tool, read WCM DTCs.

Does this DTC reset?

Yes >> Go To 2



No >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

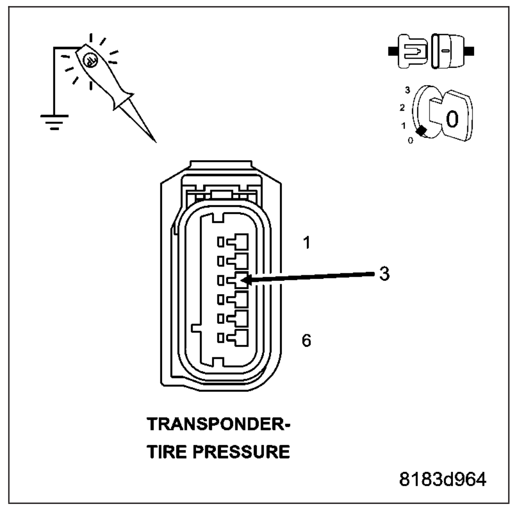
2. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F202) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 3

No >> Repair the (F202) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/ WHEELS - DIAGNOSIS AND TESTING)

3. (Z904) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z904) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

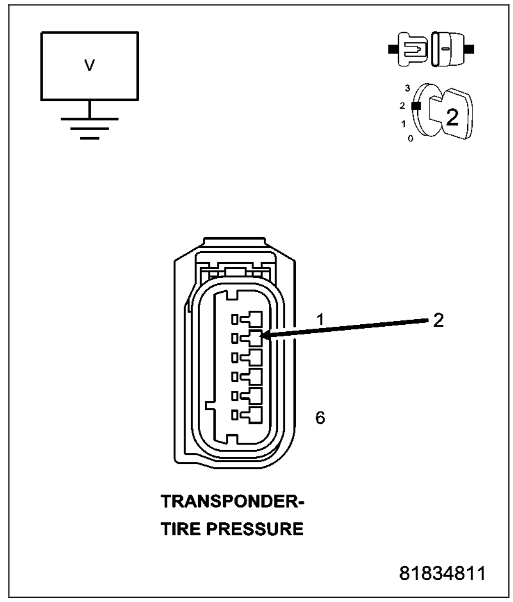
Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z904) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/ WHEELS - DIAGNOSIS AND TESTING)

4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE



Turn the ignition off.

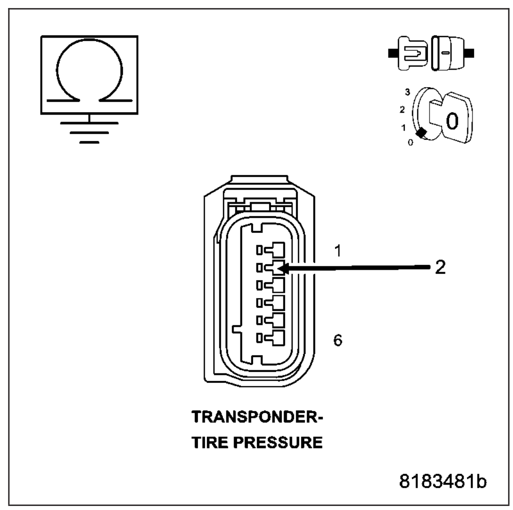
Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.

Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?



Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

No >> Go to 5

5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

No >> Go to 6

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes >> Go to 7

No >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

7. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

Is the resistance below 5 Ohms?

Yes >> Go To 8

No >> Repair or replace the open circuit.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

8. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

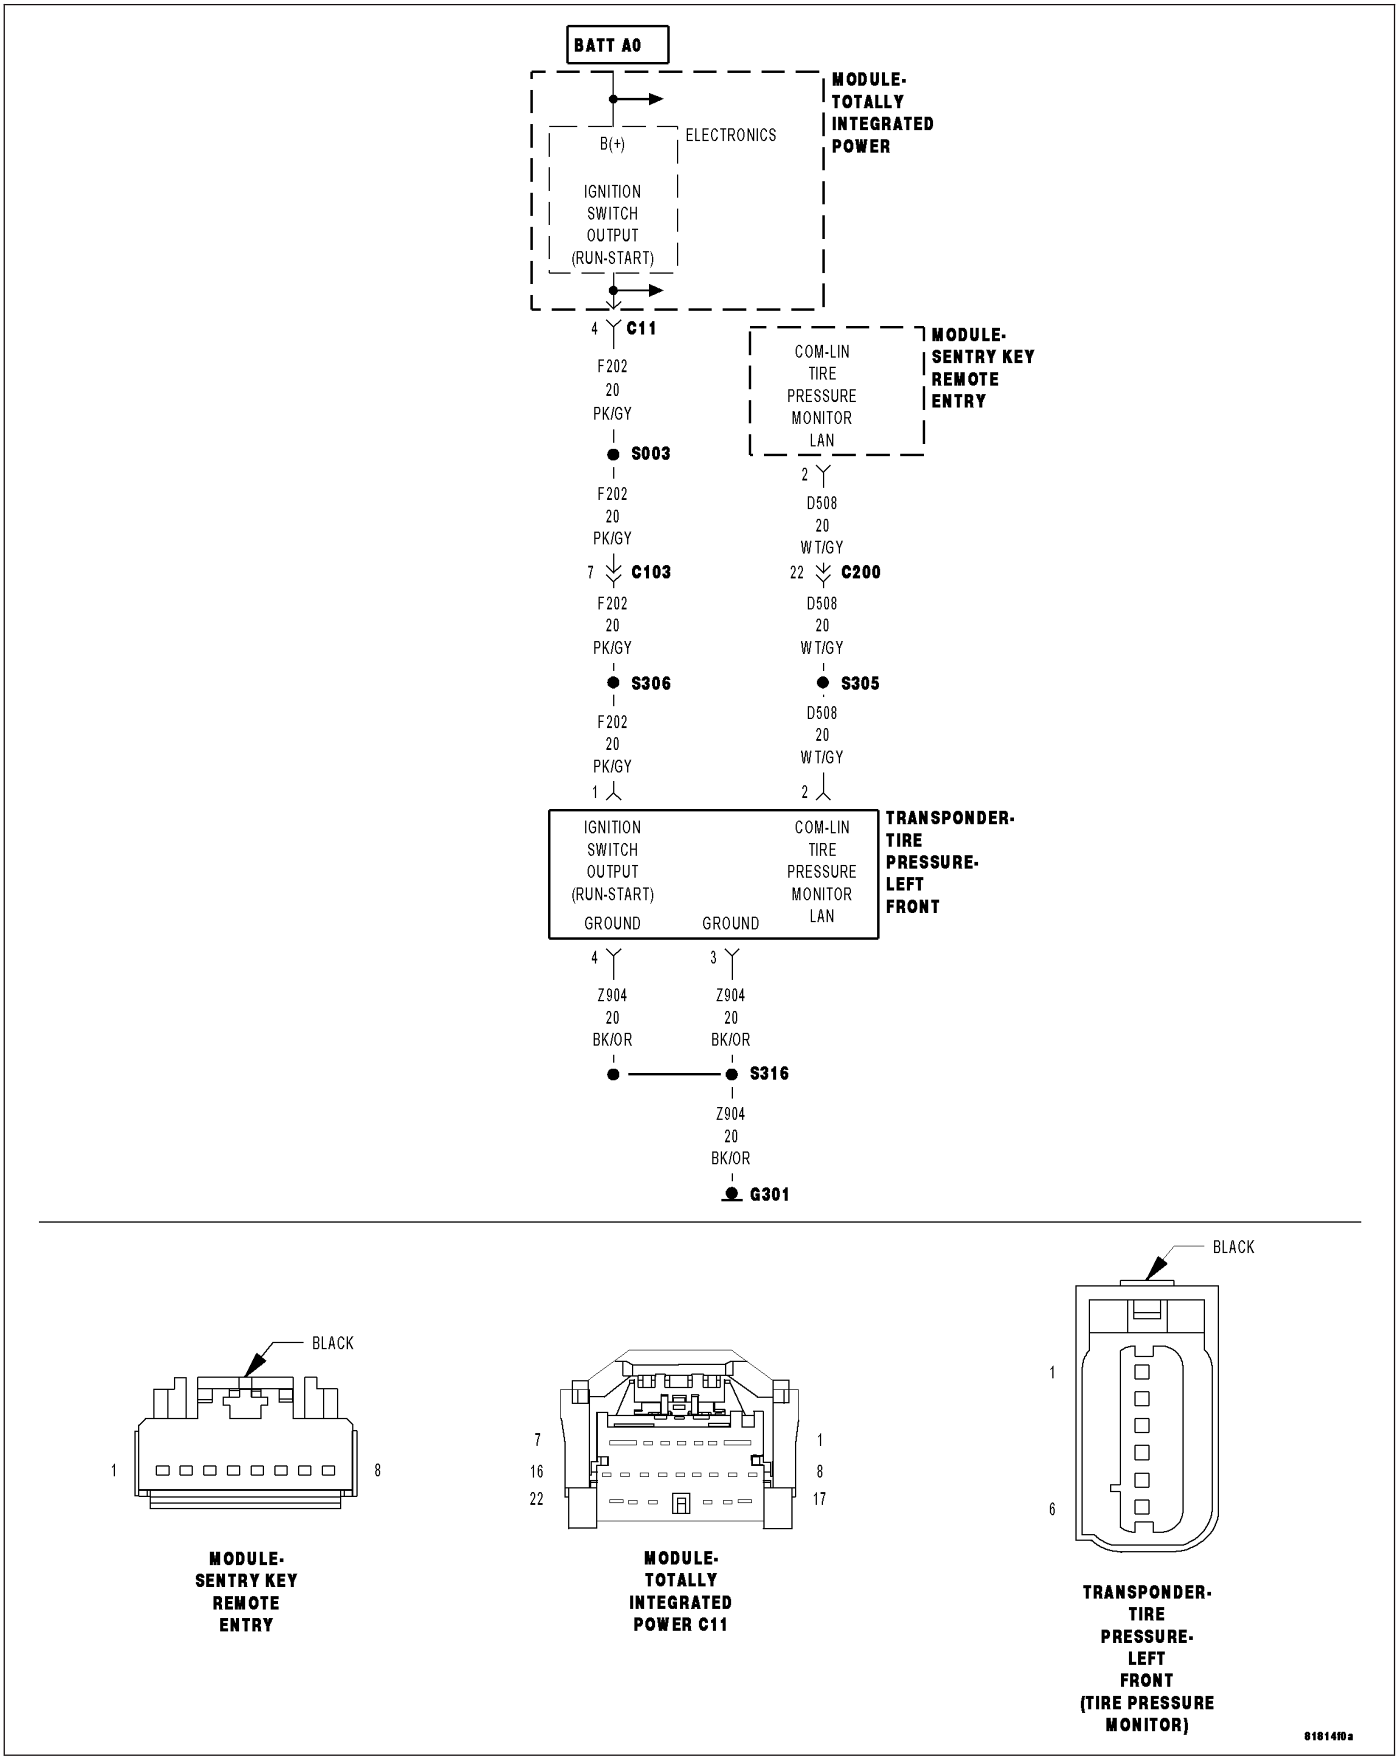
With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes >> Go To 9

No >> Repair the open circuit.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

9. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs



With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the WCM?

Yes >> Replace/update the WCM in accordance with the service information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Replace the Tire pressure trigger Module in accordance with the service information.
Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

U1117–LOST COMMUNICATION WITH RIGHT REAR TIRE PRESSURE TRIGGER MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
- **Set Condition:**
  If the WCM fails to receive bus messages from the Tire pressure trigger module for two consecutive counts of trigger module not responding to a communication check.

Possible Causes
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND
(D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
(D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN
TIRE PRESSURE TRIGGER MODULE POWER AND GROUND
WCM

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

Turn the ignition on.

With the scan tool, read and record WCM DTCs.

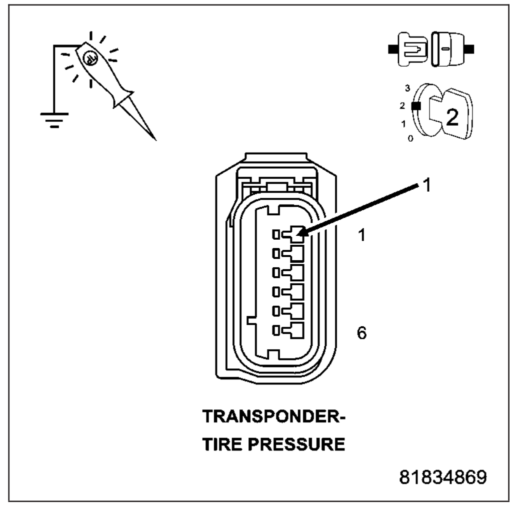
With the scan tool, erase WCM DTCs.

Cycle the ignition switch.

With the scan tool, read WCM DTCs.

Does this DTC reset?

Yes >> Go To 2



No >> Perform the Stored Lost Communication test procedure. Refer to the table of contents in this section. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

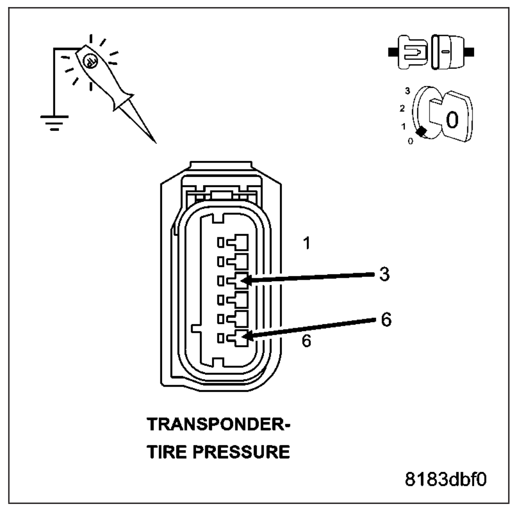
2. (F202) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12–volt test light connect to ground, check the (F202) Fused Ignition Switch Output (Run) circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 3

No >> Repair the (F202) Fused Ignition Switch Output (Run) circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

3. (Z965) GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE

Using a 12–volt test light connect to 12 volts, check each of the (Z965) Ground circuit(s).

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z965) Ground circuit(s) for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

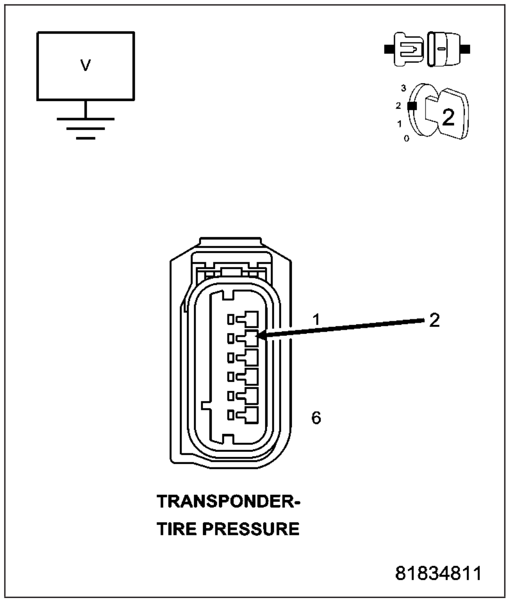
4. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Tire Pressure Transponder harness connector.

Disconnect the Sentry Key Remote Entry Module harness connector.

Turn the ignition on.



Measure the voltage of the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is there any voltage present?

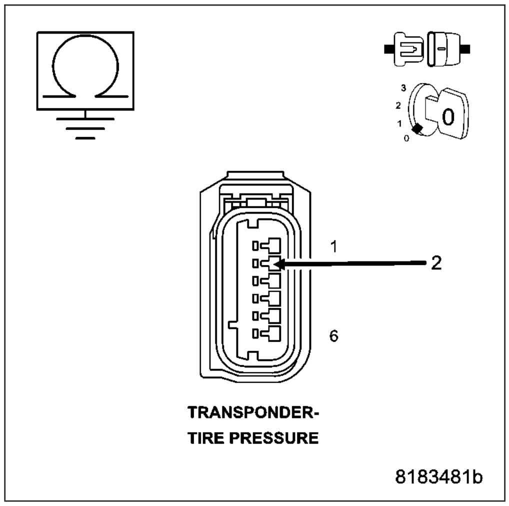
Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to voltage.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Go to 5

5. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT SHORT TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (D508) COM - LIN Tire Pressure Monitor LAN circuit.

Is the resistance below 5.0 ohms?

Yes >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for a short to ground.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Go to 6

6. (D508) COM - LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN OR HIGH RESISTANCE

Use a jumper wire with one end connected to ground and the other to the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the Front Left Pressure Tire Transponder harness connector.

Using a 12-Volt test light connected to battery voltage, probe the (D508) COM - LIN Tire Pressure Monitor LAN circuit in the SKREEM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate bright?

Yes >> Go to 7

No >> Repair the (D508) COM - LIN Tire Pressure Monitor LAN circuit for an open circuit or high resistance.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

7. (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT OPEN

Turn the ignition off.

Disconnect the Tire Pressure Trigger Module.

Disconnect the WCM.

With an ohmmeter measure the resistance of the (D508) COM-LIN TIRE PRESSURE MONITOR LAN CIRCUIT.

Is the resistance below 5 Ohms?

Yes >> Go To 8

No >> Repair or replace the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

8. POWER AND GROUND CIRCUIT OPEN

Turn the ignition on.

With a voltmeter measure the voltage between the power and ground circuit at the Trigger Module.

Is the voltage at least the same as battery voltage?

Yes >> Go To 9

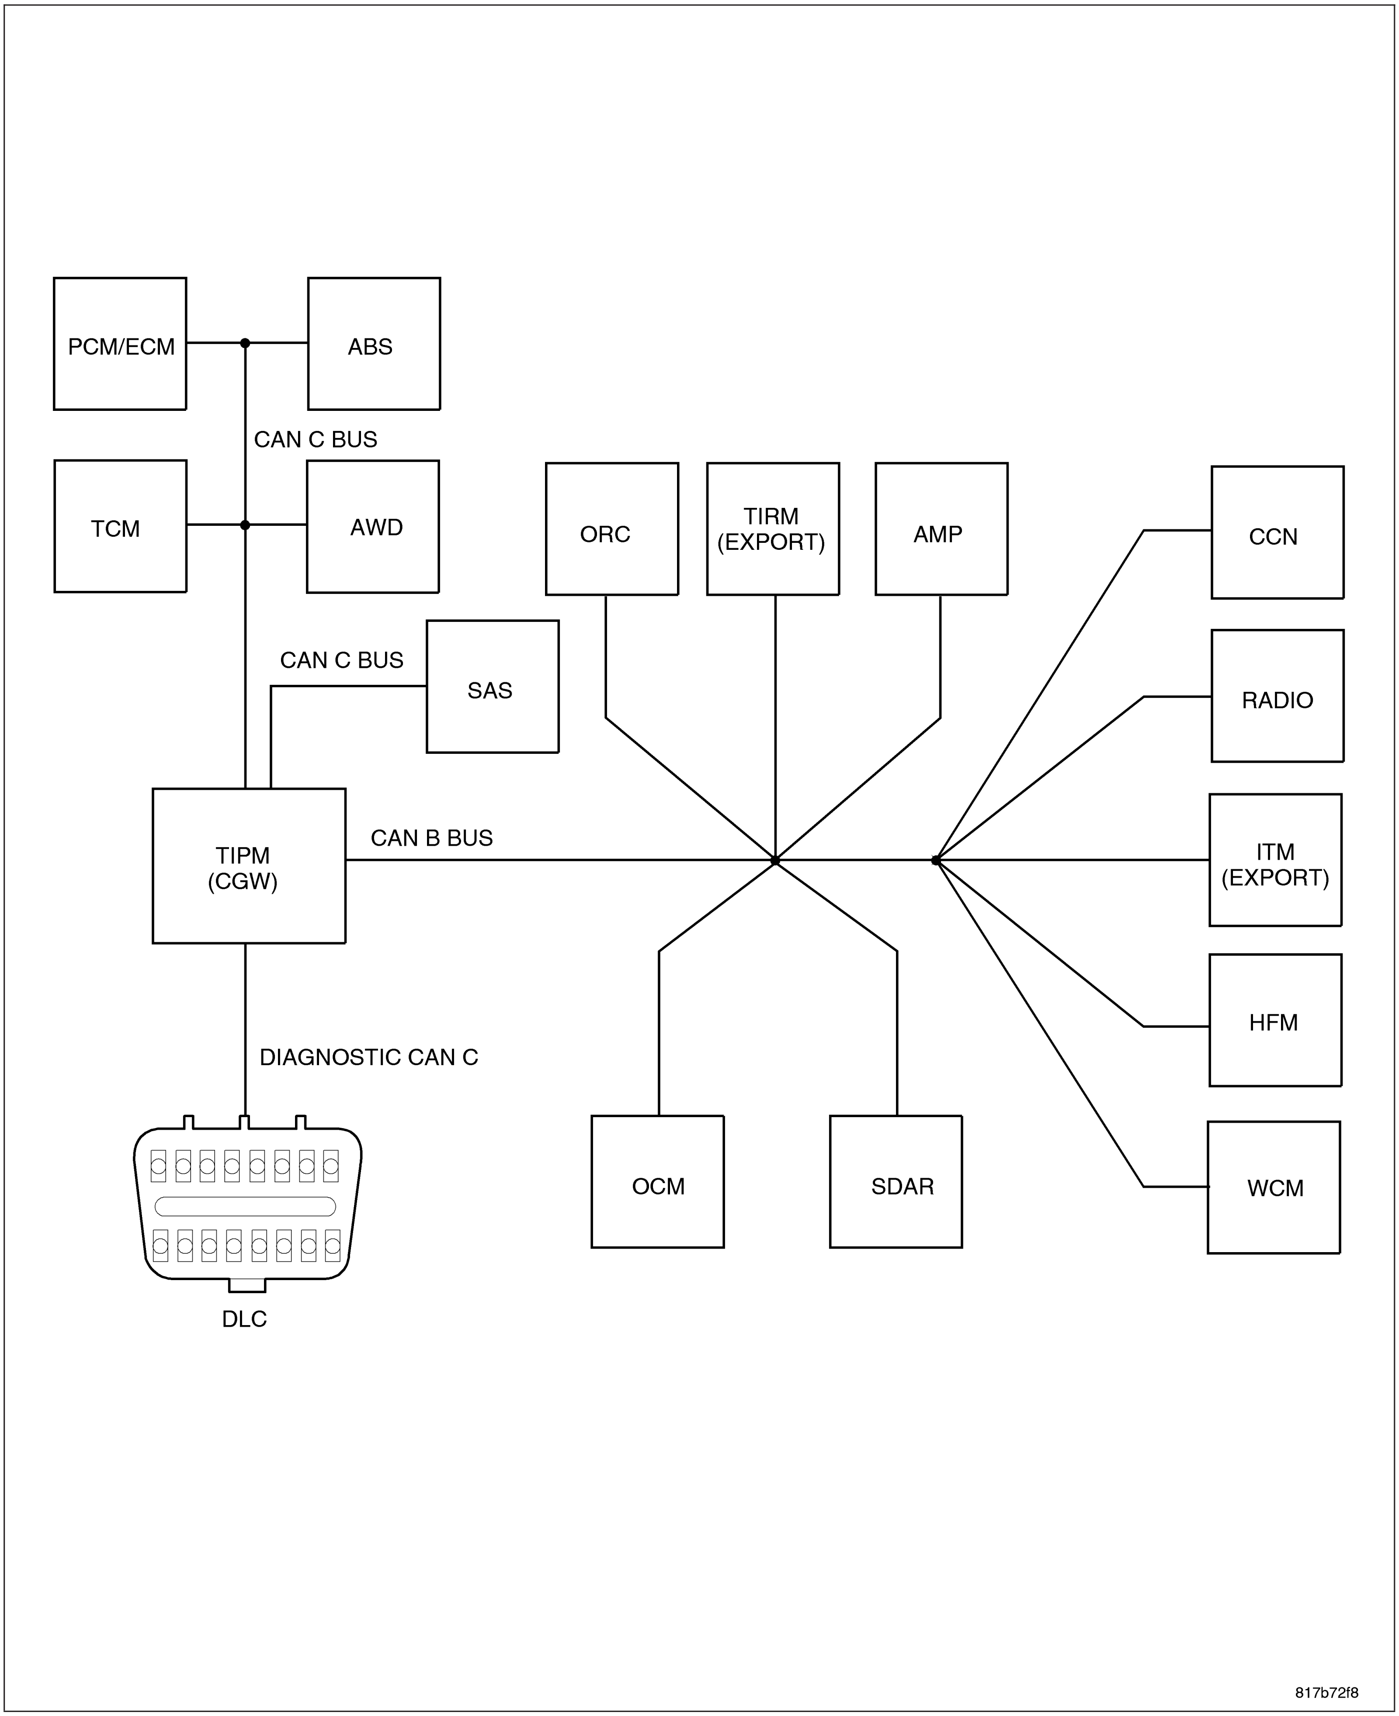
No >> Repair the open circuit.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

9. CHECK FOR ADDITIONAL TRIGGER MODULE COMMUNICATION RELATED DTCs

With the scan tool, select Network View and select Advanced.

Is there more than one module with active DTCs “Logged Against” the WCM?



Yes >> Replace/update the WCM in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

No >> Replace the Tire pressure trigger Module in accordance with the service information.

Perform TPM VERIFICATION TEST. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - STANDARD PROCEDURE)

*STORED LOST COMMUNICATION DTC'S

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
  Battery voltage between 10 and 16 volts.
  IOD fuse installed.
  TIPM is configured correctly.
- **Set Condition:**
  Bus messages not received for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TIPM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
IOD FUSE WAS REMOVED DURING SHIPPING
CHECK FOR RELATED TSB'S

Diagnostic Test

1. VERIFY DTC IS STORED

NOTE: Stored faults may indicate a customer perceived intermittent condition.

NOTE: Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.
With the scan tool, read stored DTC's.

Is this DTC stored?

Yes >> Go To 2

No >> Diagnose the active DTC. Refer to the Table of Contents for a list of the symptoms.

2. CHECK THE ENVIRONMENTAL DATA

With the scan tool, read the loss of communication environmental data.

Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are their any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, TIPM configuration DTC's present with matching environmental data?

Yes >> These DTC's may have been the result of other service procedures performed. Clear DTC's.

No >> Go To 3

3. VERIFY INTERMITTENT LOST COMMUNICATION DTC – WIRING CONCERNS

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and one or more lost communication DTC's stored in the offending module?

Yes >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

No >> Go To 4

4. VERIFY INTERMITTENT LOST COMMUNICATION DTC – OFFENDING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there more than one ECU with stored DTC's "Logged Against" the module and NO lost communication DTC's stored in the offending module?

Yes >> Check for TSB related to this offending module.

No >> Go To 5

5. VERIFY INTERMITTENT LOST COMMUNICATION DTC – REPORTING MODULE

Turn the ignition on.

With the scan tool, select Network View and select Advanced.

Is there ONLY ONE ECU with stored DTC's "Logged Against" the module?

Yes >> Check for TSB related to the module that set this DTC.

No >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

STANDARD PROCEDURE

TPM VERIFICATION

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. TPM

Was the WCM/SKREEM replaced during the test procedure?

Yes >> Go to 2

No >> Go to 3

2. WCM/SKREEM

NOTE: When entering the PIN, care should be taken because the SKREEM will only allow three consecutive attempts to enter the correct PIN. If three consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain in the Run position for one hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

1. Reconnect the previously removed and/or disconnected components and connectors.
2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKREEM. This number can be obtained from the vehicle invoice or from the DaimlerChrysler Customer Center (Phone 1-800-992-1997).
3. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
4. If the WCM/SKREEM was replaced, all the customer's keys must be programmed to the new module. Use the scan tool and the Program Key procedure
5. With the scan tool, erase all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
6. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
7. With the scan tool, read WCM/SKREEM DTC(s).

Are there any DTC(s) present?

Yes >> Repair not complete, refer to the appropriate symptom.

No >> Repair is complete.

3. TIRE PRESSURE SENSOR/TIRE PRESSURE TRANSPONDER REPLACE

1. Reconnect the previously removed and/or disconnected components and connectors.
2. Drive the vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC(s) automatically.
3. With the scan tool, read TPM DTC(s).

Are there any DTC(s) present?

Yes >> Repair not complete, refer to the appropriate symptom.

No >> Repair is complete.

TIRES/WHEELS - SERVICE INFORMATION

TABLE OF CONTENTS

TIRES/WHEELS - SERVICE INFORMATION

DIAGNOSIS AND TESTING

TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and force variation can cause vehicles to exhibit steering wheel vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise the vehicle on a suitable hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as correct wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

Road test vehicle on a smooth road for a least five miles to warm tires (remove any flat spots). Lightly place hands on steering wheel at the 10:00 and 2:00 positions while slowly sweeping up and down from 90 to 110 km/h (55 to 70 mph) where legal speed limits allow.

Observe the steering wheel for:

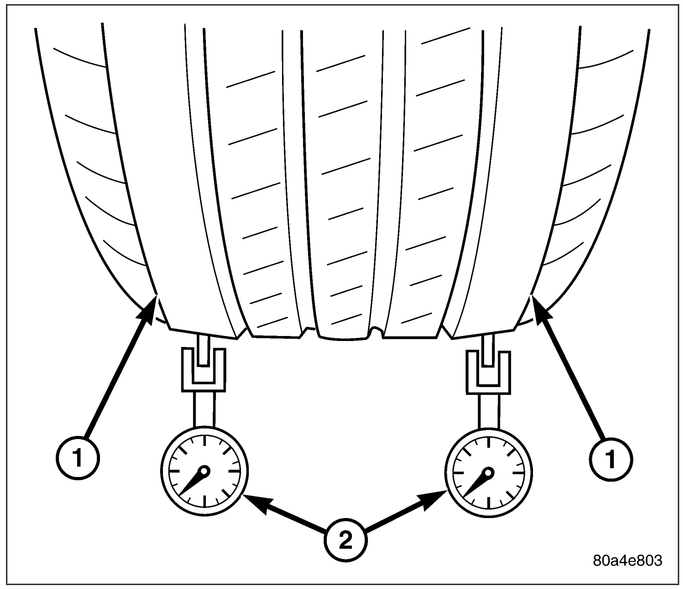
- Visual Nibble (oscillation: clockwise/counterclockwise, usually due to tire imbalance)
- Visual Buzziness (high frequency, rapid vibration up and down)

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at speed; if vibration occurs or is enhanced, vibration is likely due to causes other than tire and wheel assemblies.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to causes other than tire and wheel assemblies.

For brake vibrations, (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTOR - DIAGNOSIS AND TESTING).

For powertrain vibrations, (Refer to 3 - DIFFERENTIAL & DRIVELINE - DIAGNOSIS AND TESTING).

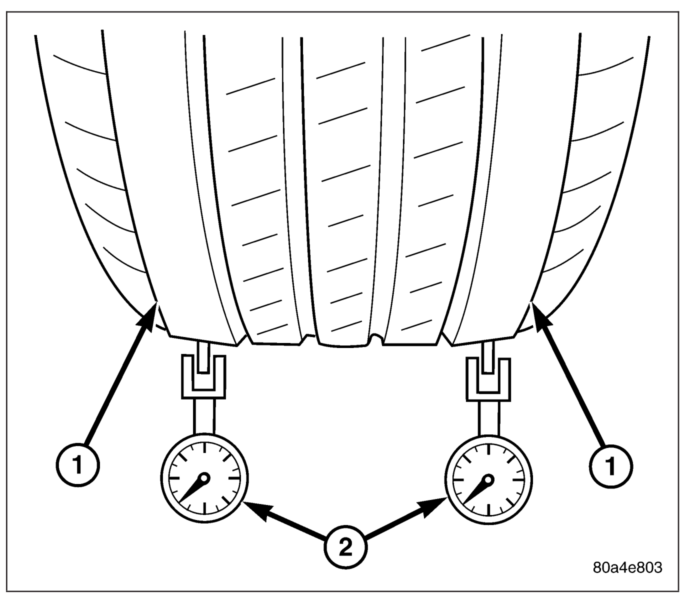


For tire and wheel assembly vibrations, continue with this diagnosis and testing procedure.

TIRE AND WHEEL BALANCE

1. Balance the tire and wheel assemblies as necessary following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)
2. Road test the vehicle for at least 5 miles, following the format described in Road Test.
3. If the vibration persists, continue with this diagnosis and testing procedure.

TIRE AND WHEEL RUNOUT/MATCH MOUNTING



1. **System Radial Runout.** This on-the-vehicle system check will measure the radial runout including the hub, wheel and tire.
   a. Raise vehicle so tires clear floor. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
   b. Apply masking tape around the circumference of the tire in the locations to be measured (1). Do not overlap the tape.
   c. Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (2) and rotate the tire and wheel. System radial runout should not exceed 0.76 mm (0.030 inch) with no tread “dips” or “steps.” Tread “dips” and “steps” can be identified by spikes of the dial indicator gauge.

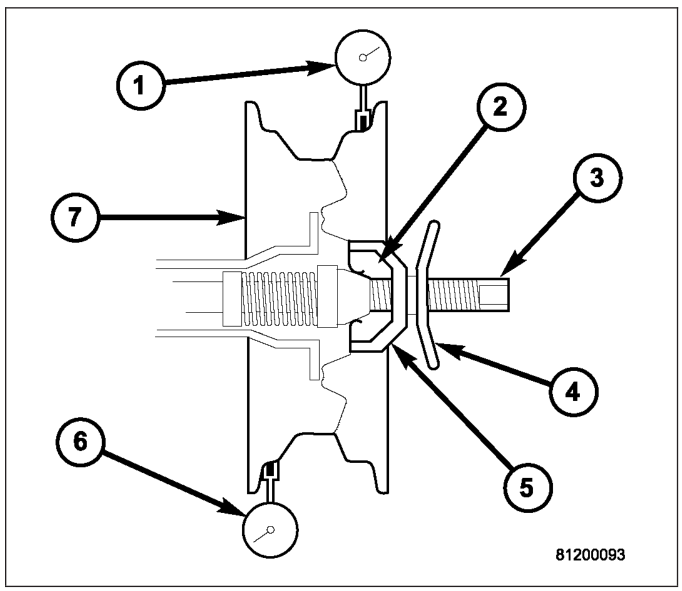
- Tread ″dips″; Rapid decrease then increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.
- Tread ″steps″; Rapid decrease or increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.

   d. If system runout is excessive, re-index the tire and wheel assembly on the hub. Remove assembly from vehicle and install it back on the hub two studs over from original mounting position. If re-indexing the tire and wheel assembly corrects or reduces system runout, check hub runout and repair as necessary (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).
   e. If system runout is still excessive, continue with this diagnosis and testing procedure.

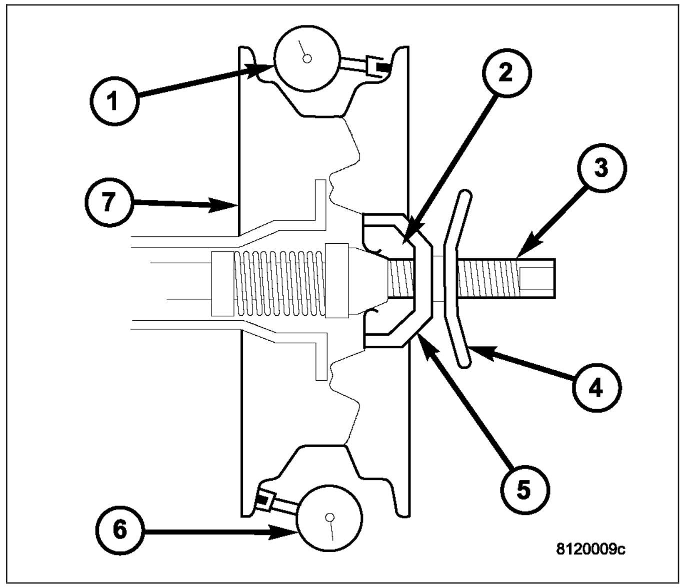
2. **Tire and Wheel Assembly Radial Runout.** This radial runout check is performed with the tire and wheel assembly off the vehicle.
   a. Remove tire and wheel assembly from vehicle and install it on a suitable wheel balancer.
   b. Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) and rotate the tire and wheel. Radial runout should not exceed 0.76 mm (0.030 inch) with no tread “dips” or “steps.” Tread “dips” and “steps” can be identified by spikes of the dial indicator gauge.

c. If runout exceeds limits, mark the original location of the tire on the wheel at the valve stem (1)(4). Also, mark the tire and wheel to indicate the original high spot (2) of the assembly and record the runout measurement.

d. If runout exceeds limits, the tire will need to be dismounted from the wheel to verify wheel vs. tire contribution. Refer to Wheel Runout below.



3. **Lateral Runout.** Lateral runout for the vehicle system as well as the tire and wheel assembly should be less than 0.76 mm (0.030 inch). The same procedure and theory described for radial runout can also be applied to identify and reduce lateral runout.
4. **Wheel Runout.** This runout check is performed as follows:

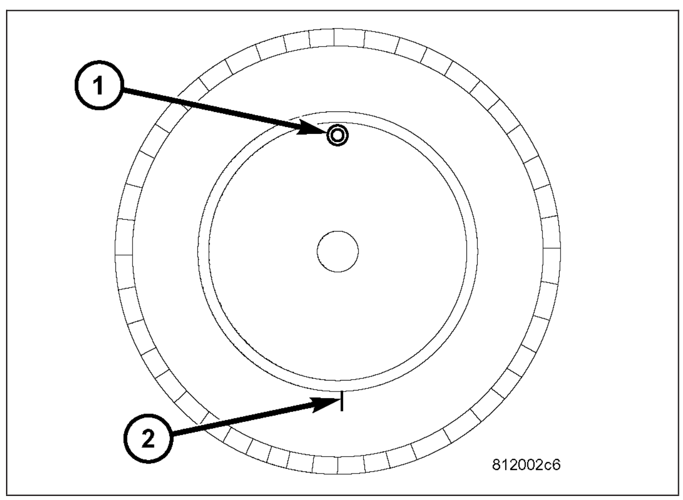


a. Dismount the tire from the wheel.

b. Mount the wheel back on the wheel balancer.

c. Measure radial runout of the wheel at the tire bead seat (1, 6). Runout should not exceed the specification limit listed in the following table. Replace the wheel if it exceeds the limit.

d. Measure lateral runout of the wheel at the tire bead seat (1, 6). Runout should not exceed the specification limit listed in the following table. Replace the wheel if it exceeds the limit.

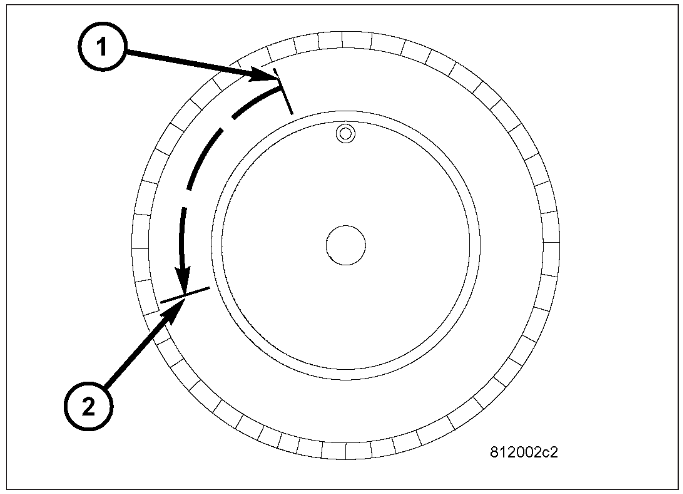


WHEEL RUNOUT LIMITS

WHEEL TYPE	RADIAL RUNOUT	LATERAL RUNOUT
Aluminum Wheel	0.50 mm (0.020 inch)	0.50 mm (0.020 inch)
Steel Wheel	0.62 mm (0.024 inch)	0.80 mm (0.031 inch)

5. **Match Mounting.** If the wheel runout is within specifications, tire and wheel assembly runout can be improved by re-indexing (match mounting) the tire to the wheel as described below.

a. Remount the tire on the rim 180 degrees from its original location. Ensure the tire bead is properly seated.



b. Re-measure the total runout. Mark the tire at the high spot and record the measurement.

If runout is still excessive, perform the following:

- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the tire, replace the tire.
- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the wheel, the wheel may be out of specification. Refer to Wheel Runout above.

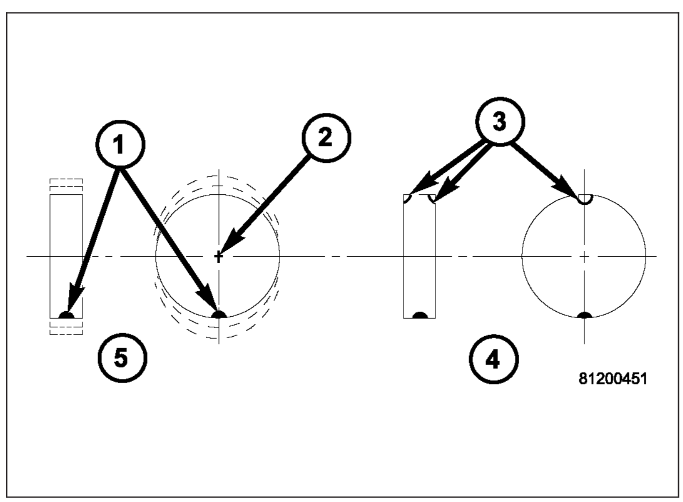
- If the new high spot is NOT within 102 mm (4.0 inch) of either high spot, draw an arrow on the tread from new high spot toward the original (2). Break down the tire and remount it 90 degrees on rim in that direction, then re-measure runout. This will normally reduce the runout to an acceptable amount.

6. Once back together, road test the vehicle for at least 5 miles, following the format described in Road Test. If vibration persists, and all components tested are within specification, the tires may have an excessive radial force condition. Radial force variation can be checked using a wheel balancer capable of measuring radial force variation, such as the Hunter GSP 9700 Vibration Control System (Wheel Balancer) or equivalent. If this equipment is not available, consult with the tire manufacturer.

STANDARD PROCEDURE

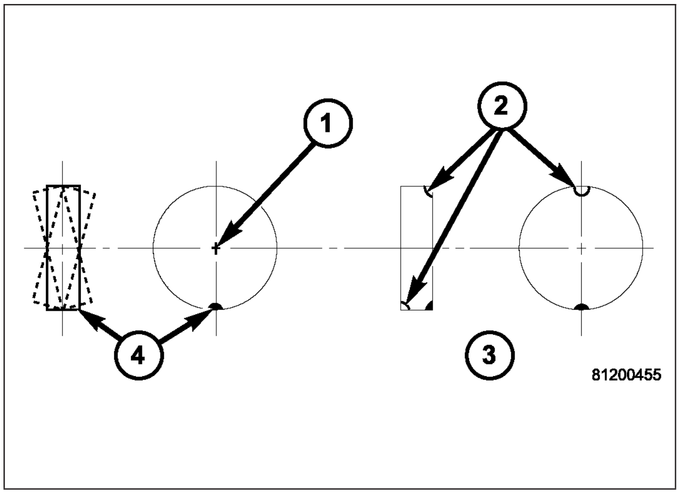
TIRE AND WHEEL BALANCE

NOTE: Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.



Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

NOTE: If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.



It is recommended that a two-plane dynamic balancer be used when a tire and wheel assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (¼) ounce.

For static balancing, find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

The aluminum wheels on this vehicle use a different wheel weight than do the steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the Balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (⅛) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

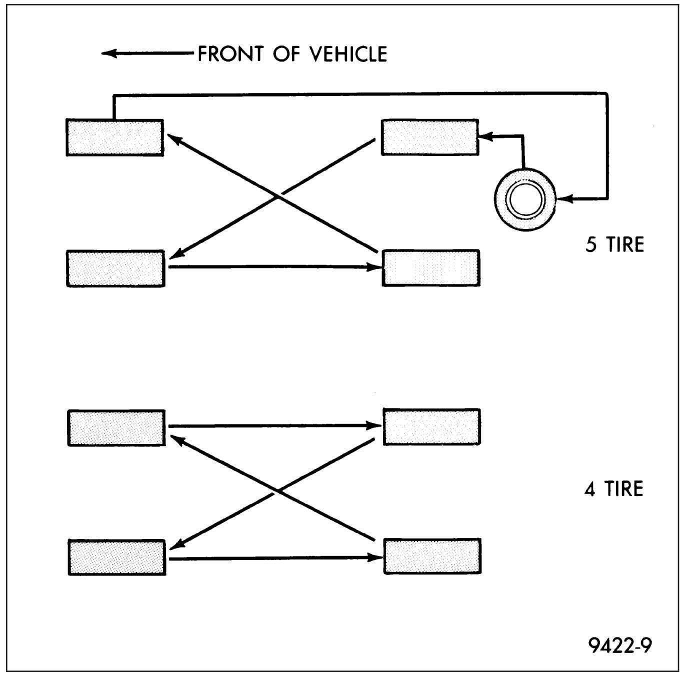
TIRE AND WHEEL MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel and tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the wheel is identified with a label on the outside of the rim and a dot or line in the drop well area of the rim (inside where the tire mounts). If the outside label has been removed, the tire will have to be removed to locate the dot or line on the inside of the rim. The tire can then be match mounted to the tire.

Information on match mounting the tire to the wheel can be found in Tire and Wheel Runout/Match Mounting, items (2) through (5), within Diagnosis And Testing - Tire And Wheel Vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

TIRE AND WHEEL ROTATION

NOTE: Refer to the Owner's Manual for rotation schedules.



NON-DIRECTIONAL TREAD PATTERN TIRES

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

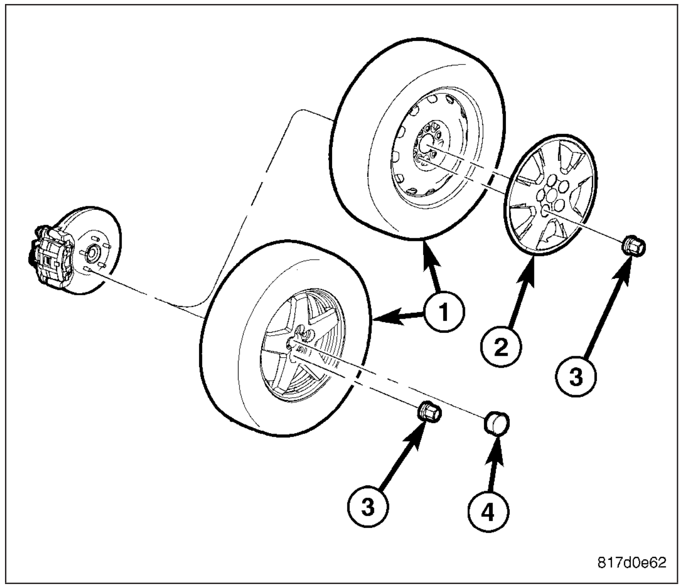
- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in this graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

NOTE: Only the 4 tire rotation method may be used if the vehicle is equipped with a compact or temporary spare tire.

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles may be fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.



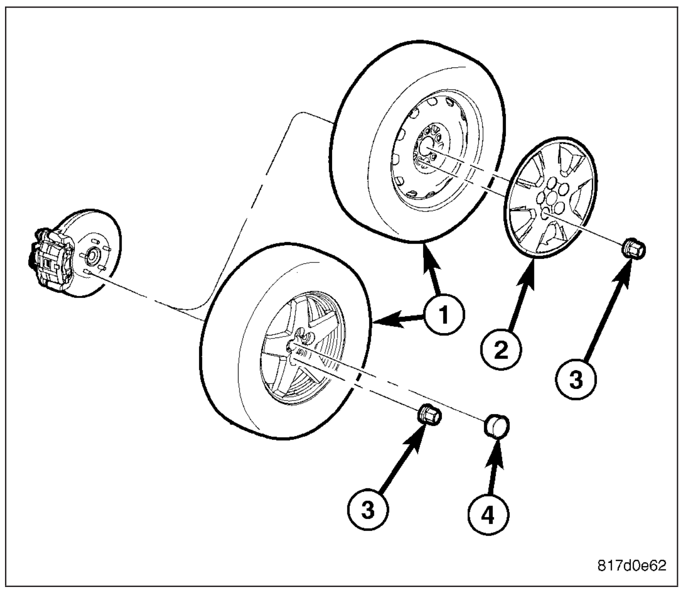
When being installed, extra care is needed to ensure that this direction of rotation is maintained.

REMOVAL

TIRE AND WHEEL ASSEMBLY - ALUMINUM WHEEL

1. Raise and support the vehicle so that tire and wheel assembly clears ground level. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. If the vehicle is equipped with wheel center caps that cover the wheel nuts, remove the cap with an appropriate removal tool utilizing the notch formed into the wheel near valve stem. Use care not to damage the wheel coating.

3. Remove five wheel mounting (lug) nuts (3) from studs.
4. Remove tire and wheel assembly (1) from hub.



TIRE AND WHEEL ASSEMBLY - STEEL WHEEL

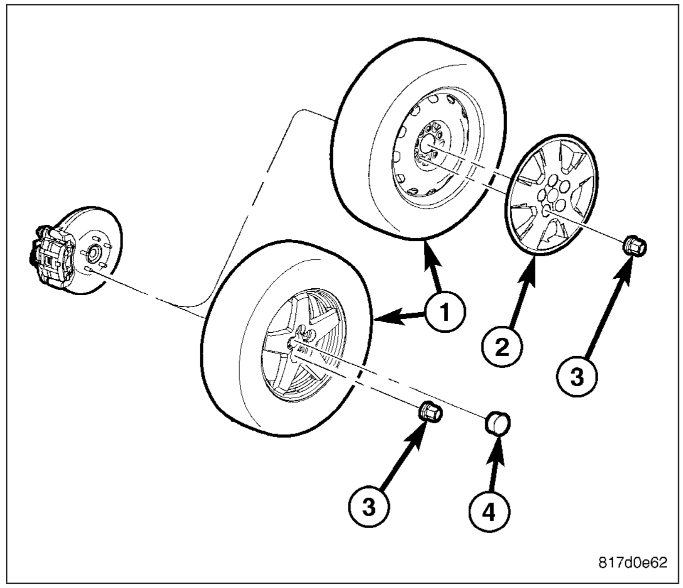
1. Raise and support the vehicle so that tire and wheel assembly clears ground level. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When removing the bolt-on wheel cover, do not attempt to pry the wheel cover off the wheel. It is held on by the wheel mounting nuts.

2. Remove the five wheel mounting (lug) nuts (3) from the wheel studs. While removing the nuts, hold the wheel cover (2) in place so it doesn't fall off when the last nut is removed.
3. Remove the wheel cover (2) using care not to let the tire and wheel assembly (1) fall off the vehicle.
4. Remove the tire and wheel assembly (1) from the hub.

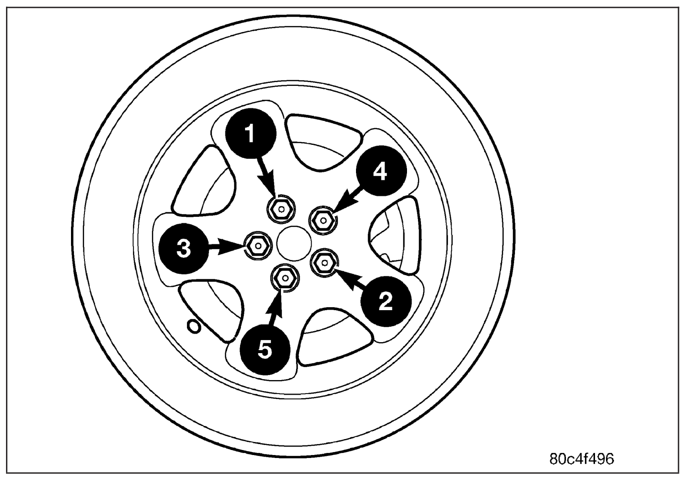
INSTALLATION

TIRE AND WHEEL ASSEMBLY - ALUMINUM WHEEL



WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting (lug) nuts.



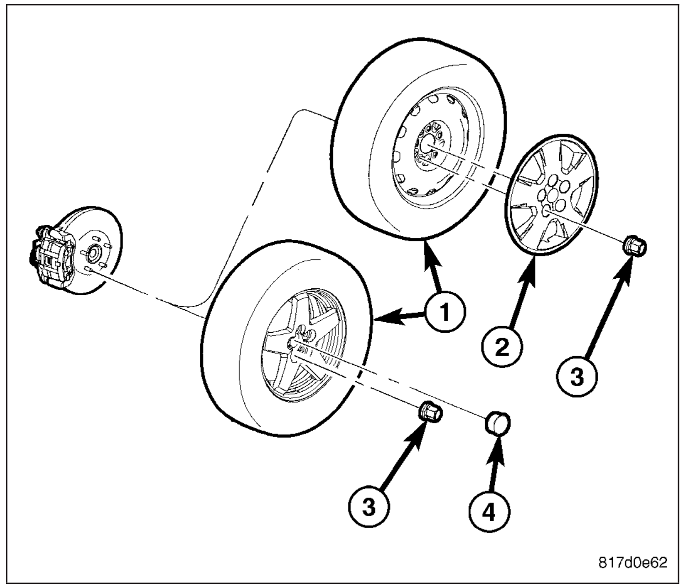
1. Clean wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between the wheel and vehicle.
2. Position the tire and wheel assembly (1) on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

NOTE: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.

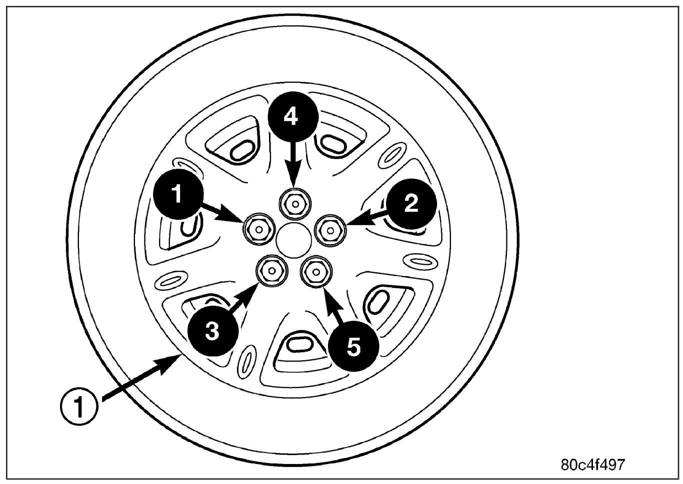
3. Install and lightly snug all five wheel mounting (lug) nuts (3) **Do not tighten at this time**.

4. If applicable, install the wheel center cap.
5. Lower the vehicle.
6. Progressively tighten all wheel mounting nuts in the proper sequence shown. Tighten nuts to a final torque of 135 N·m (100 ft. lbs.).

TIRE AND WHEEL ASSEMBLY - STEEL WHEEL



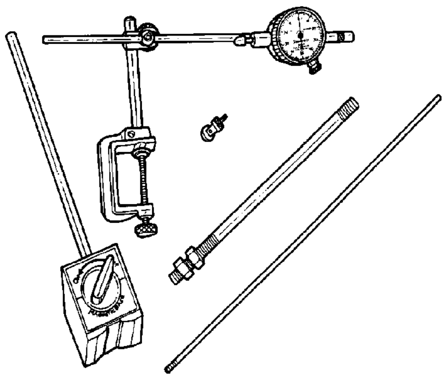
WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.



NOTE: Never use oil or grease on studs or wheel mounting (lug) nuts.

1. Clean the wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between the wheel and vehicle.
2. Position the tire and wheel assembly (1) on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.
3. Align the valve notch in the wheel cover with the valve stem on the wheel and install the wheel cover over the studs.

NOTE: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.



4. Install and lightly snug all five wheel mounting (lug) nuts (3) **Do not tighten at this time**.
5. Lower the vehicle.
6. Progressively tighten all wheel mounting (lug) nuts in the proper sequence shown. Tighten the nuts to a final torque of 135 N·m (100 ft. lbs.).

Press, Ball Joint C-4150A

TIRE PRESSURE MONITORING - SERVICE INFORMATION

DESCRIPTION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is not monitored. A premium system specifying how many tires are low and where they are located is used on this vehicle.

TPM alerts the driver when tire pressure falls below predetermined thresholds. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - OPERATION)

The TPM systems are controlled by the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM).

There is a sensor (transmitter) in each of the vehicle's four road wheels that operates on a 315 MHz radio frequency. Export vehicle sensors operate on a 433 MHz radio frequency.

Premium TPM transponders are located in three of the four wheel wells of the vehicle are used to provide the WCM with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, left rear and right rear wheel wells.

An indicator lamp located in the instrument cluster and messages in the Electronic Vehicle Information Center (EVIC) are used to communicate system information.

For further information, refer to the Owners Manual or the appropriate diagnostic information.

OPERATION

The Tire Pressure Monitoring (TPM) system uses radio and sensor technology to monitor tire air pressure levels. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM). These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). The Tire Pressure Monitoring system remains active even if no tire pressure related message is displayed.

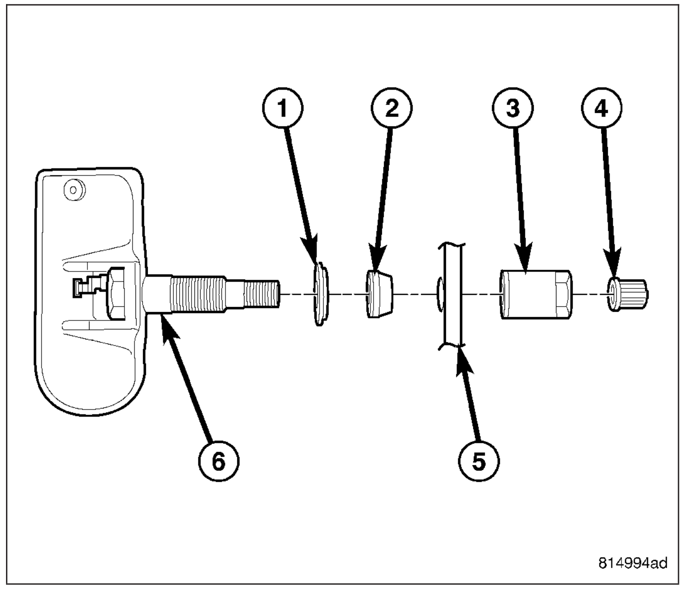
The sensors lay dormant (Park Mode), then wake and start transmitting (Drive Mode) when the vehicle first reaches speeds over 15 mph (24 km/h). Once the wheels stop rotating for a period of approximately 20 minutes, the sensors shut down until again awaken. Although not transmitting as when in Drive Mode, while in Park Mode, the sensors still transmit approximately once every 13 hours to let the receiver know air pressure status at that time. Sensors will also transmit when a pressure change of one psi (seven kPa) or more is detected during that period. For more information on sensors, (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/SENSOR - OPERATION).

Premium TPM transponders located in three of the four wheel wells of the vehicle are used to provide the WCM with the location of the tire pressure sensors on the vehicle. The transponders are located in the left front, left rear and right rear wheel wells. A fourth transponder is not necessary in the remaining wheel well due to the process-of-elimination theory. Once the system knows the location of the first three sensors it assumes the location of the fourth tire pressure sensor is in the right front tire. For more information, (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING/TRANSPONDER - OPERATION).

If the system detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see following table), the TPM system will continuously illuminate an indicator lamp. Also, a message will be displayed in the instrument cluster. The text message will indicate which tire is low and the display will show all current tire pressures, the low tire will be flashing with its pressure value. This message will be displayed for the rest of the ignition cycle, or until the Low Tire pressure condition has been corrected. A chime will sound upon initial detection. Once pressure in the suspect tire raises above the Low Pressure (lamp) OFF Threshold, the lamp will go out and the system returns to normal within approximately two minutes time. If a message center button is pressed, the message is replaced by the new message requested; however, if the Low Tire condition has not been corrected, the Low Tire pressure message will again be displayed.

If a system fault is detected, the indicator lamp will flash on/off for 60 seconds, once every 10 minutes.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.NOTE:
To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver's B-Pillar, then apply the placard pressure to the following table.



TPM THRESHOLD PRESSURES

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	26

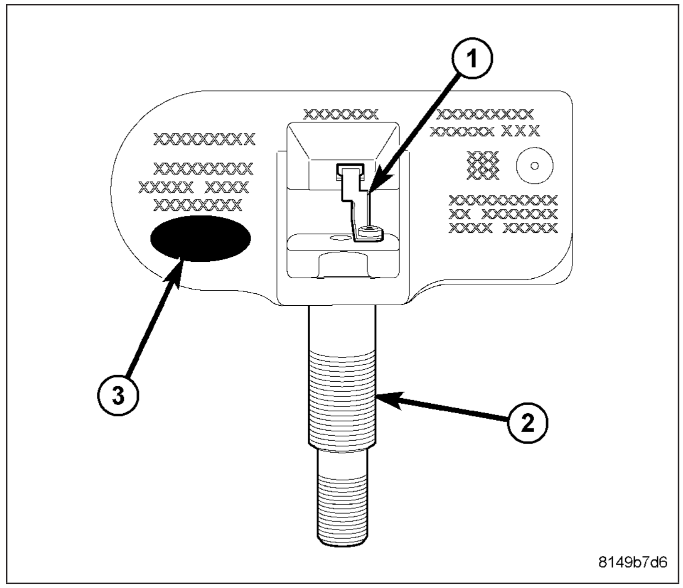
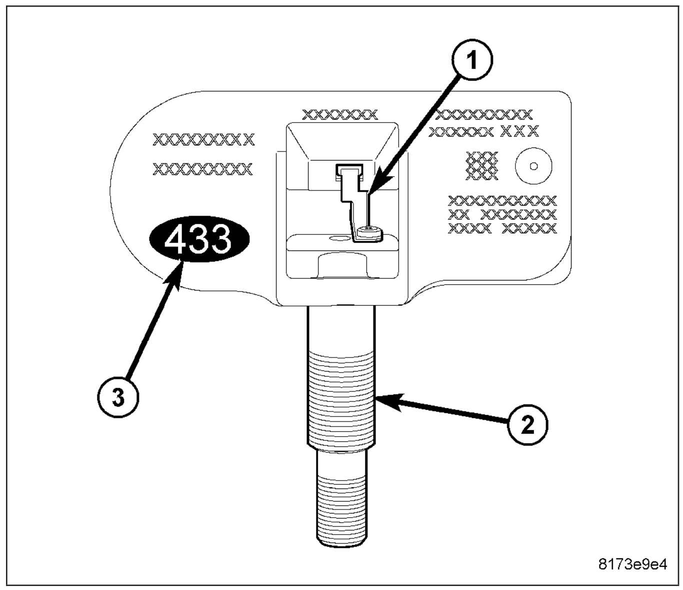
SENSOR - TPM

DESCRIPTION



On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel (5) in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

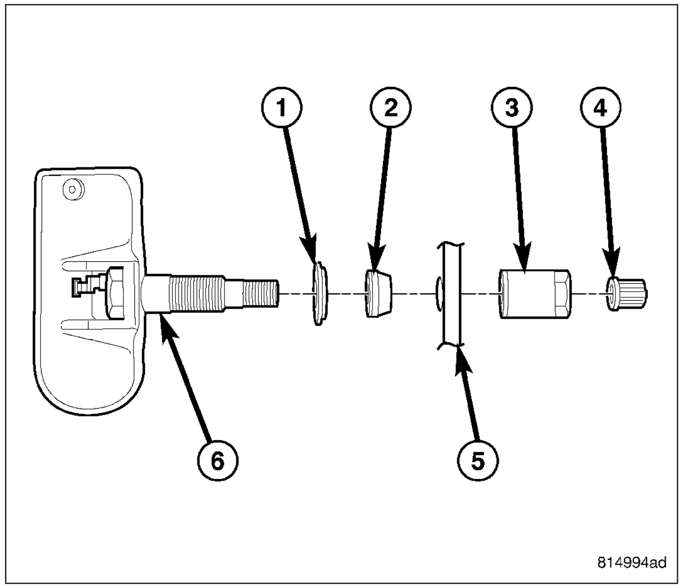


The TPM system operates on a 315 MHz radio frequency. The 315 MHz sensors can be easily identified by a white outline oval (black center) insignia (3) on the sensor body.

The Export TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors can be easily identified by either a solid white oval insignia (3) on the body or...

... a solid white oval insignia (3) with 433 printed in the center. The sensors are identical except for the oval insignia.

CAUTION: Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used.



NOTE: Sensors may be identified by valve stem cap color. From the factory, 315 MHz sensors have a gray valve stem cap while 433 MHz sensors have a black valve stem cap. Otherwise, once mounted inside a tire and wheel assembly you are not able to visually tell the difference between a 315 MHz and 433 MHz sensor. The tire must be dismounted allowing visual inspection of the sensor body.

The TPM sensors are designed for original style factory wheels. **Do not attempt to install a tire pressure sensor in an aftermarket wheel. If aftermarket wheels are installed and do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.**

The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core
- Valve Stem Nut (with pressed-in washer) (3)

NOTE: Any time a sensor is installed on a wheel, a new Sensor-To-Wheel Seal (2) and Metal Washer (1) must be installed to ensure proper sealing.

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

The battery operated tire pressure sensors lay dormant (Park Mode), then wake and start transmitting (Drive Mode) when the vehicle first reaches speeds over 15 mph (24 km/h). Once the wheels stop rotating for a period of approximately 20 minutes, the sensors shut down until again awaken. Although not transmitting as when in Drive Mode, while in Park Mode, the sensors still transmit approximately once every 13 hours to let the receiver know air pressure status at that time. Sensors will also transmit when a pressure change of one psi (seven kPa) or more is detected during that period.

Using an RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM), can monitor the state of each of the sensors in the four rotating road wheels. Once a sensor has been replaced and the vehicle has remained stationary for more than 19 minutes, the WCM automatically learns and stores the sensor's ID while driving. This learning process can take up to 10 minutes while driving at speeds above 15 mph (24 km/h). **There is no formal retraining procedure necessary.**

For additional information, refer to appropriate diagnostic information.

CAUTION

CAUTION: The use of tire sealants is strictly prohibited for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants can clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: Any time a sensor is to be installed in a wheel, a new seal and washer must be installed on the stem to ensure air tight sealing.

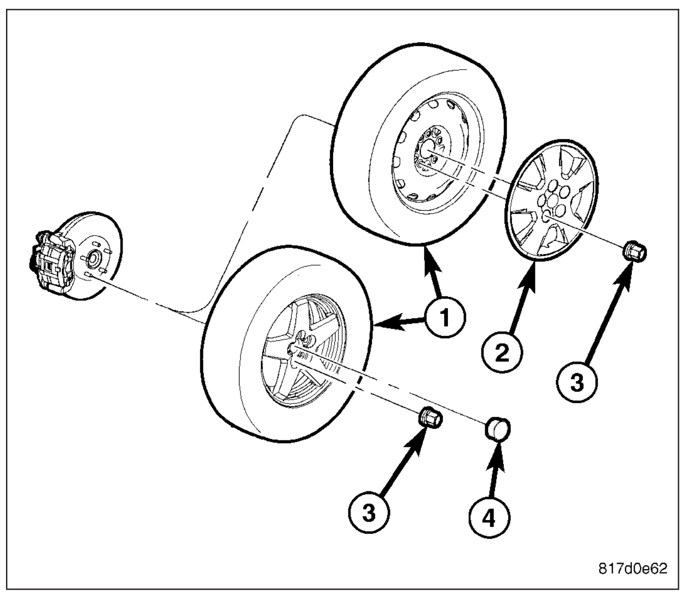
NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DIAGNOSIS AND TESTING

TIRE PRESSURE SENSOR

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

When diagnosing a tire pressure issue, always check air pressure in the tires first with a known accurate air gauge. Adjust air pressure as necessary to that listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver's side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

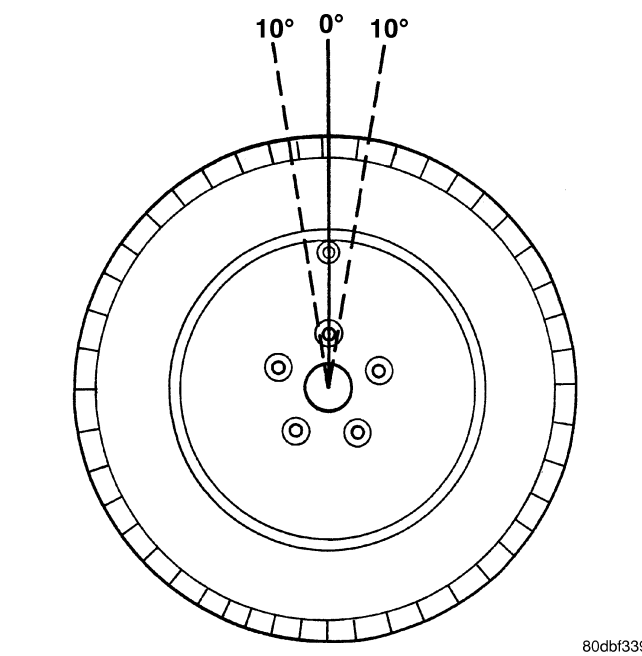


Check the tire pressure indicator lamp in the instrument cluster. If the lamp is illuminating continuously, proceed as listed below. If the indicator lamp is flashing on/off for 60 seconds, once every 10 minutes, there is a system fault detected. Refer to the appropriate diagnostic information.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original valve stem cap is securely installed to keep moisture out of the sensor.

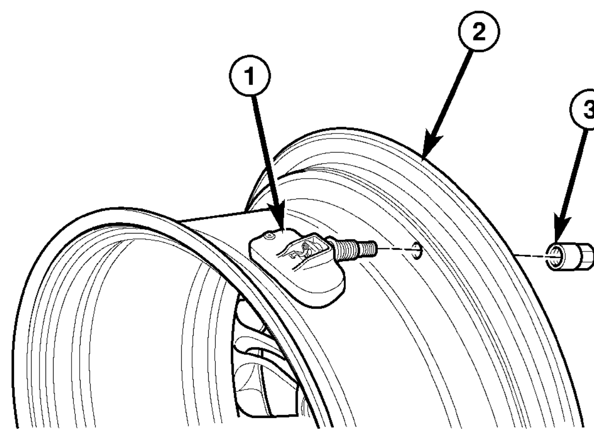
If the gauge-read pressure in the tires does not indicate a tire pressure issue, refer to the appropriate diagnostic information.

REMOVAL



1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1). (Refer to 22 - TIRES/WHEELS - REMOVAL)

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Retain this valve stem cap for reuse. Do not substitute a regular valve stem cap in its place.

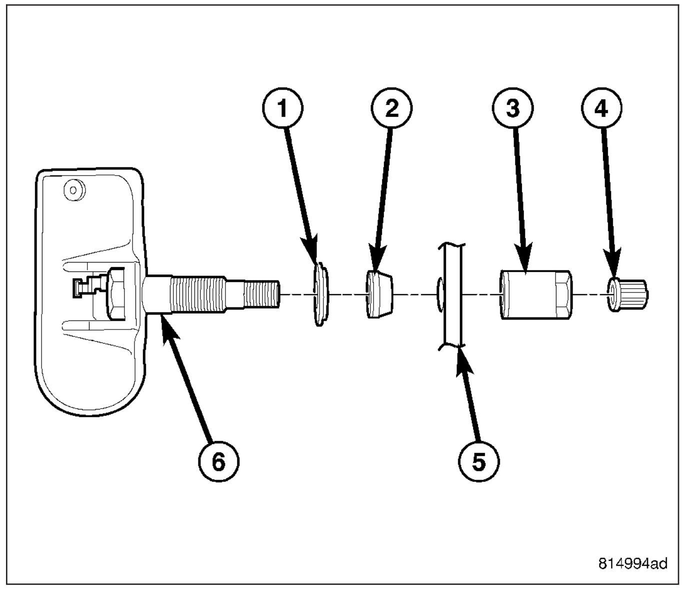


CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

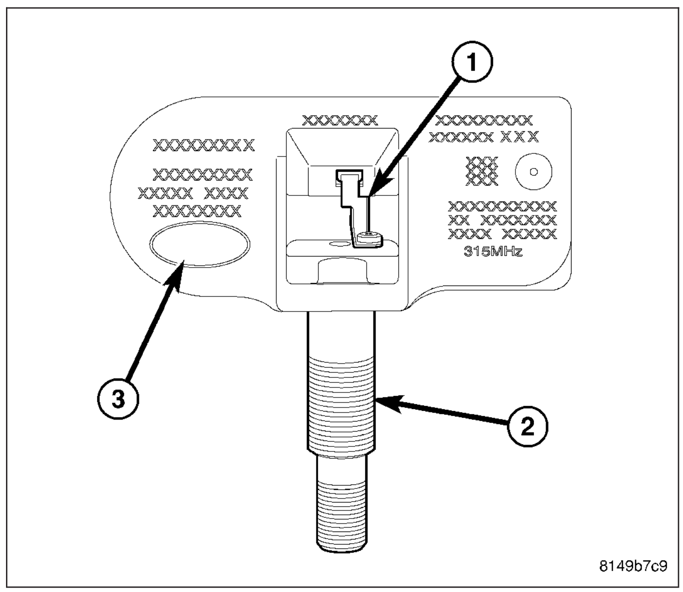
3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
   a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor. That includes both front and rear beads of the tire.
   b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool at the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both the upper and lower tire beads.

80dbf339

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem to keep valve stem from pushing rearward, damaging antenna strap.
5. Remove sensor (1) from wheel (2).

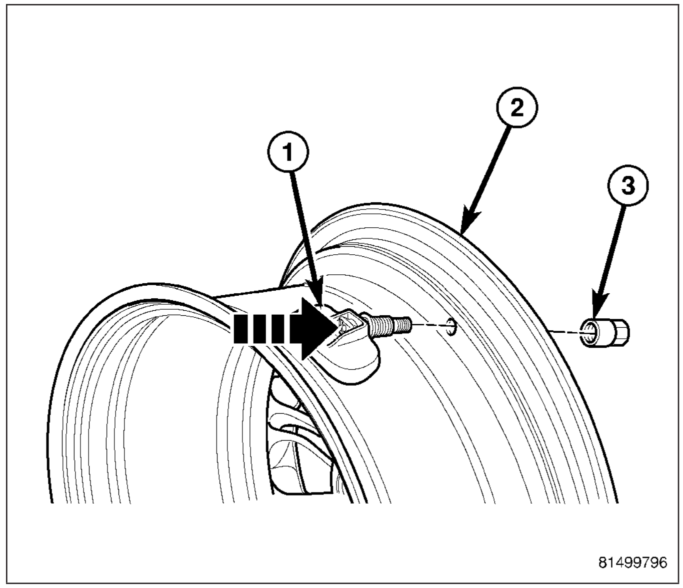


814a12bd



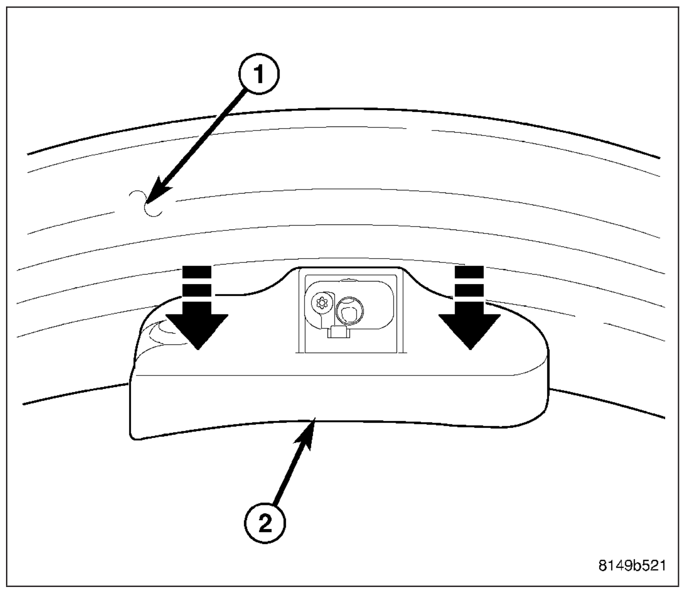
INSTALLATION

NOTE: Before reinstalling an existing tire pressure sensor, replace seal (2) and metal washer (1) at base of sensor valve stem (6) to ensure proper sealing.



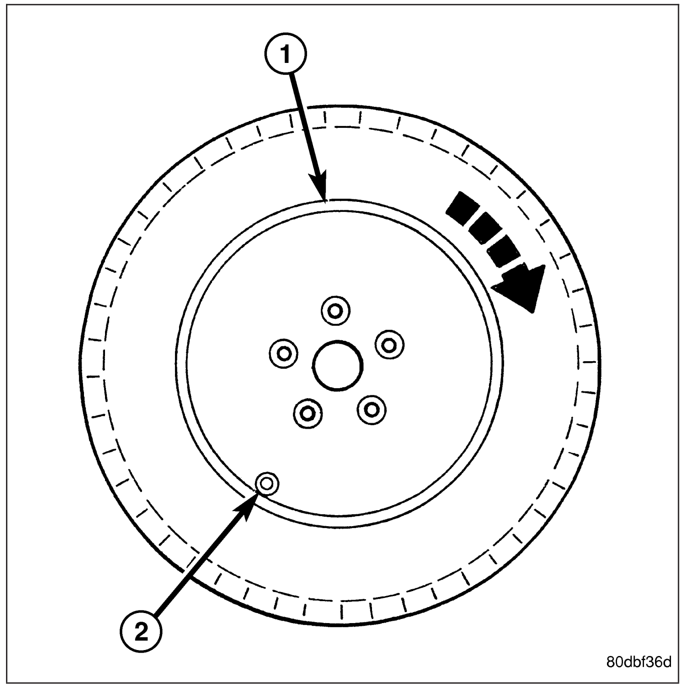
1. Wipe area clean around sensor/valve stem mounting hole in wheel (5). Make sure surface of wheel is not damaged.

CAUTION: To avoid damaging sensor antenna strap (1), hold pressure against rear of metal valve stem (2) while sensor is inserted through wheel mounting hole and nut is installed.



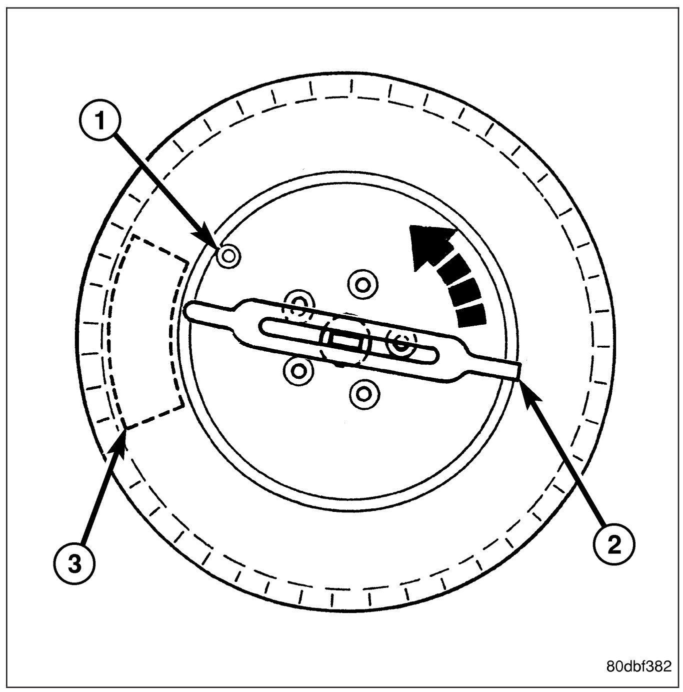
2. Insert sensor (1) through wheel (2) as shown keeping pressure against rear of metal valve stem (See Arrow). Potted side of sensor is to be positioned toward wheel. Do not attempt to mount sensor otherwise, damage may occur.
3. Install sensor nut (with pressed-in washer) (3) by hand.

NOTE: Before tightening sensor nut, push downward on sensor housing (2) in an attempt to make it flush with interior contour of wheel (1).



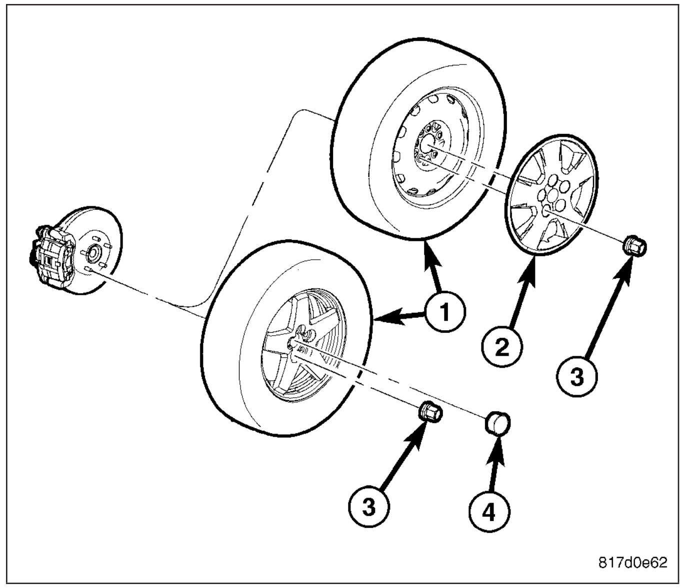
4. While holding sensor in position, tighten sensor nut to 6.5 N·m (58 in. lbs.).

CAUTION: Over-torquing the sensor nut by as little as 12 N·m (106 in. lbs.) may result in sensor separation from the valve stem. Under this condition, the sensor may still function. However, the condition should be corrected immediately.



5. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 210° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the upper and lower tire beads.



b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the upper and lower tire beads.

6. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (applied to driver's side B-pillar). Make sure **original style and color** valve stem cap is securely installed to keep moisture out of sensor.
7. Install tire and wheel assembly (1) on vehicle (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 135 N·m (100 ft. lbs.).
8. Lower vehicle.

NOTE: Once a sensor has been replaced and the vehicle has remained stationary (0 mph (0 km/h)) for more than 19 minutes, the WCM automatically learns and stores the sensor's ID while driving.

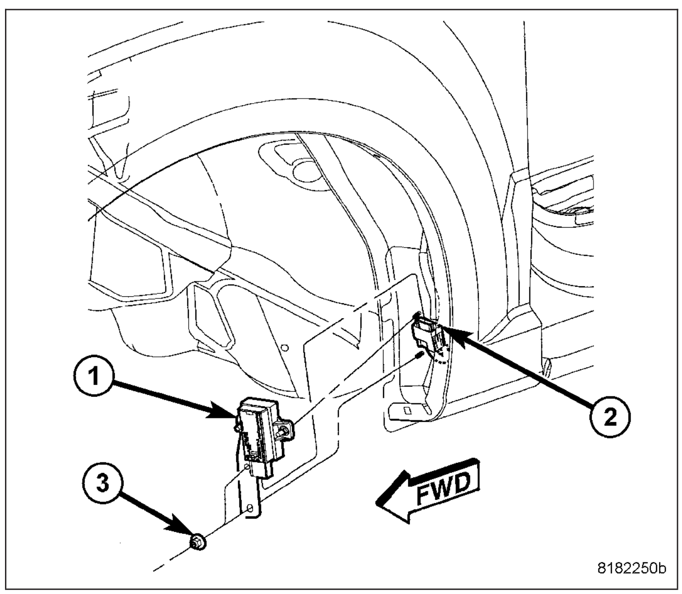
9. Drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time the system will learn the new sensor ID code and will clear any DTC's automatically (refer to above note).

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TRANSPONDER - TPM

DESCRIPTION

Vehicles equipped with the premium TPM system use transponders, sometimes referred to as trigger modules, to provide the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM), with the location of the tire pressure sensors on the vehicle. A transponder is located in three of the four wheel wells on the vehicle The transponders are located in the left front, left rear and right rear wheel wells behind the wheelhouse splash shields. Only three transponders are necessary to locate the four rotating sensors because the WCM can determine the location of the fourth by using the process-of-elimination theory. Once the system knows the location of the first three sensors, it assumes the location of the fourth tire pressure sensor is in the right front tire.

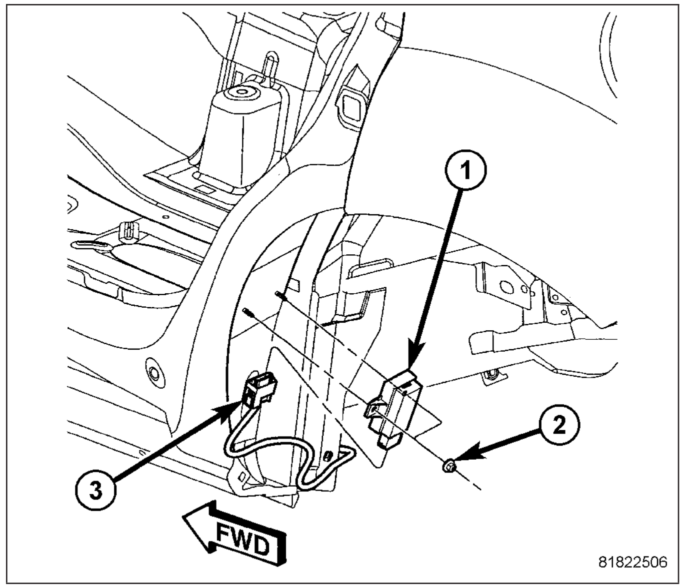


OPERATION

On vehicles equipped with the premium TPM system, the Wireless Control Module (WCM), commonly referred to as the Sentry Key Remote Entry Module (SKREEM), uses transponders (trigger modules) located in three of the four wheel wells on the vehicle to provide it with the location of the tire pressure sensors on the vehicle. Like the base system, the WCM receives RF signals from all four rotating wheel speed sensors. When the WCM needs to know which sensor is located at a particular location on the vehicle, it directs the transponder at that location to send out a low frequency signal to excite the nearby sensor. The WCM then receives that excited signal and knows where that sensor is located. This auto-locating process only happens in the first 10 minutes of any WCM cycle while traveling at speeds above 20 mph (32 km/h) (Each WCM cycle ends when the vehicle has been shut off for a time period of approximately 15 minutes or longer). Once the WCM has performed this to the three locations that have transponders (left front, left rear and right rear wheel wells), it uses the process-of-elimination theory to know that the fourth sensor ID signal is coming from the right front tire sensor.

REMOVAL

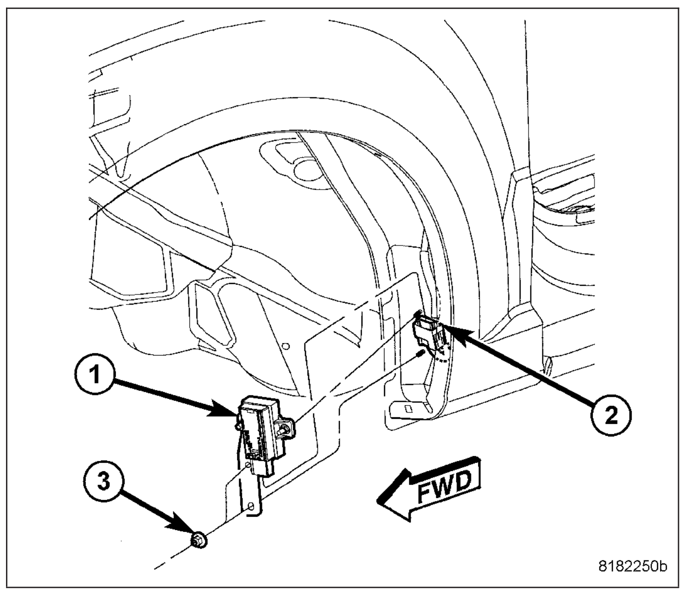
FRONT



1. Remove the wheelhouse splash shield at the transponder requiring service. (Refer to 23 - BODY/EXTERIOR/F WHEELHOUSE SPLASH SHIELD - REMOVAL)
2. Disconnect the wiring harness connector (2) at the transponder (1).
3. Remove the mounting nuts (3), then remove the transponder (1).

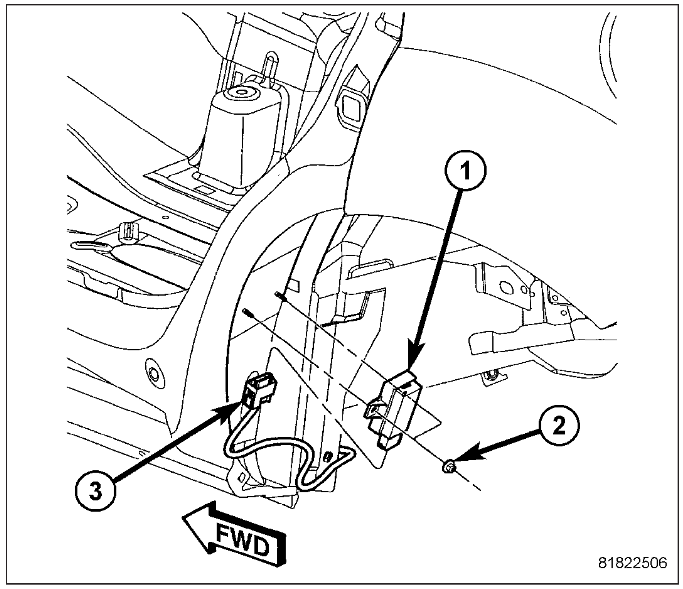
REAR

1. Remove the wheelhouse splash shield at the transponder requiring service. (Refer to 23 - BODY/EXTERIOR/ REAR WHEELHOUSE SPLASH SHIELD - REMOVAL)



2. Disconnect the wiring harness connector (3) at the transponder (1).
3. Remove the mounting nuts (2), then remove the transponder (1).

INSTALLATION



FRONT

1. Position the transponder (1) and install the mounting nuts (3).
2. Connect the wiring harness connector (2) to the transponder (1).
3. Install the wheelhouse splash shield and all components removed to access it. (Refer to 23 - BODY/EXTERIOR/F WHEELHOUSE SPLASH SHIELD - INSTALLATION)
4. Perform the TPM Diagnostic Verification Test. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - DIAGNOSIS AND TESTING)

REAR

1. Position the transponder (1) and install the mounting nuts (2).
2. Connect the wiring harness connector (3) to the transponder (1).
3. Install the wheelhouse splash shield and all components removed to access it. (Refer to 23 - BODY/EXTERIOR/REAR WHEELHOUSE SPLASH SHIELD - INSTALLATION)
4. Perform the TPM Diagnostic Verification Test. (Refer to 22 - TIRES/WHEELS/TIRE PRESSURE MONITORING - DIAGNOSIS AND TESTING)

TIRES

DESCRIPTION

TIRE

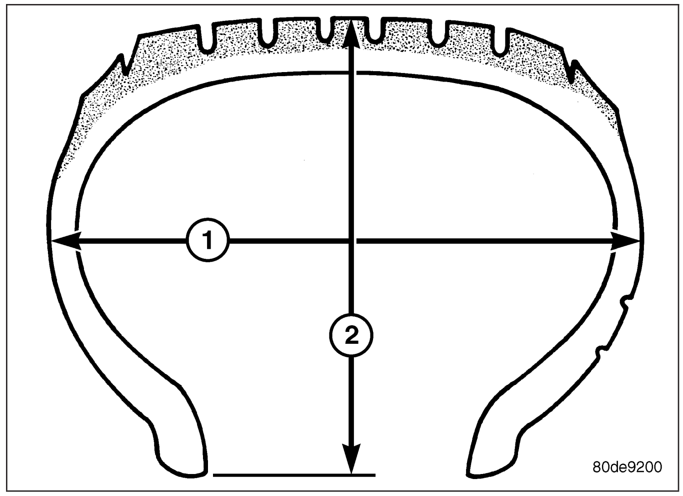
Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION



Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. For example purposes, the tire size P225/60 R 16 97 T is used in the chart. An All Season type tire will also have either M + S, M & S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall. The absence of an "XL" or "LL" marking infers a standard load tire.

TIRE IDENTIFICATION

P	TIRE TYPE (Not present on all tires)	P - Passenger T - Temporary C - Commercial LT - Light Truck
225	SECTIONAL WIDTH	SHOWN IN MILLIMETERS
60	ASPECT RATIO	SECTIONAL HEIGHT ÷ SECTIONAL WIDTH *
R	CONSTRUCTION TYPE	R - RADIAL B - BIAS BELTED D - DIAGONAL (BIAS)
16	WHEEL DIAMETER	SHOWN IN INCHES
97	LOAD INDEX	**
T	SPEED RATING	**

*** NOTE: Height (2) ÷ Width (1) = Aspect Ratio.**

**** NOTE: Consult the tire manufacturer regarding any questions on tire specifications or capabilities.**

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

REPLACEMENT TIRES

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

WARNING: In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

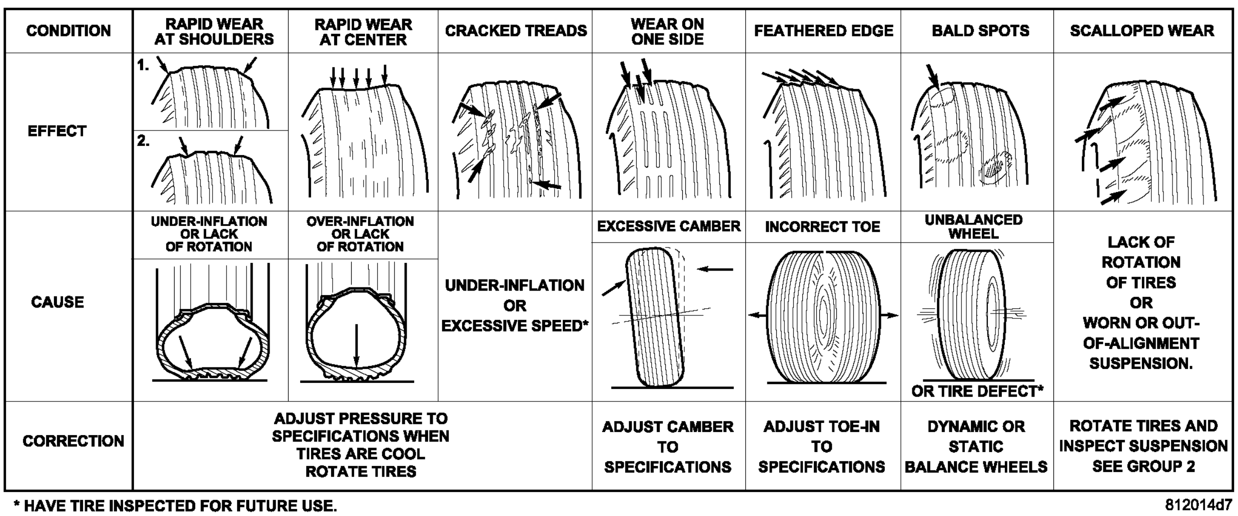
The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire is standard equipment on this vehicle. A full-size spare is available on some models.

The compact spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact spare tire. Refer to the Owner’s Manual for complete details.

DIAGNOSIS AND TESTING



TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING). For irregular tire wear issues, (Refer to 22 - TIRES/WHEELS/TIRES - DIAGNOSIS AND TESTING).

TIRE/VEHICLE LEAD

(Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING)

TIRE WEAR PATTERNS

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT	1. 2.						
CAUSE	UNDER-INFLATION OR LACK OF ROTATION	OVER-INFLATION OR LACK OF ROTATION	UNDER-INFLATION OR EXCESSIVE SPEED*	EXCESSIVE CAMBER	INCORRECT TOE	UNBALANCED WHEEL OR TIRE DEFECT*	LACK OF ROTATION OF TIRES OR WORN OR OUT-OF-ALIGNMENT SUSPENSION.

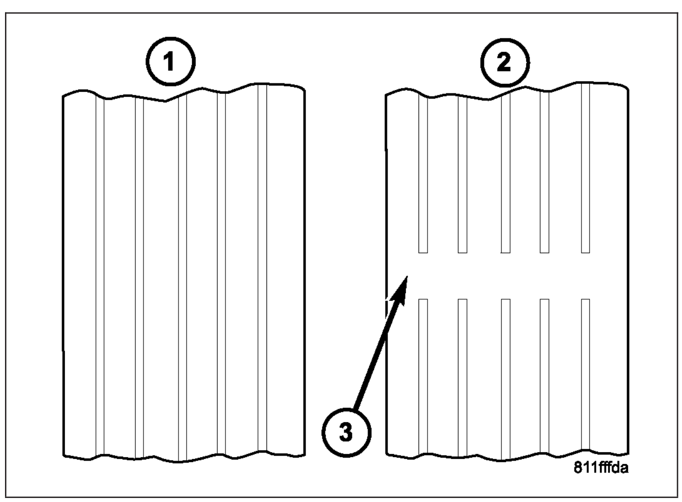
* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.



Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

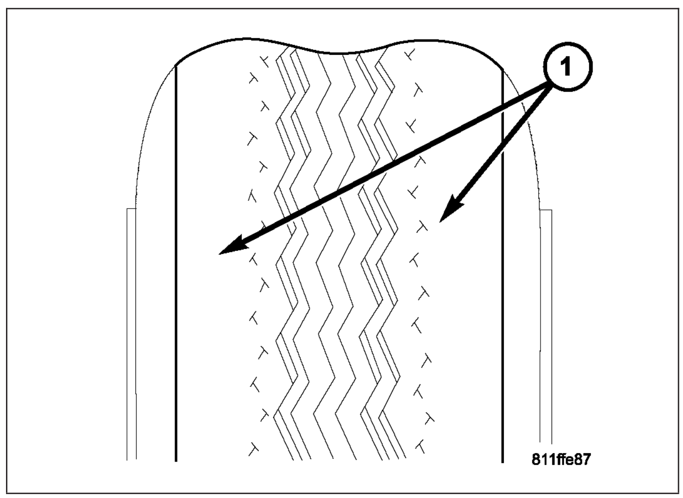
Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

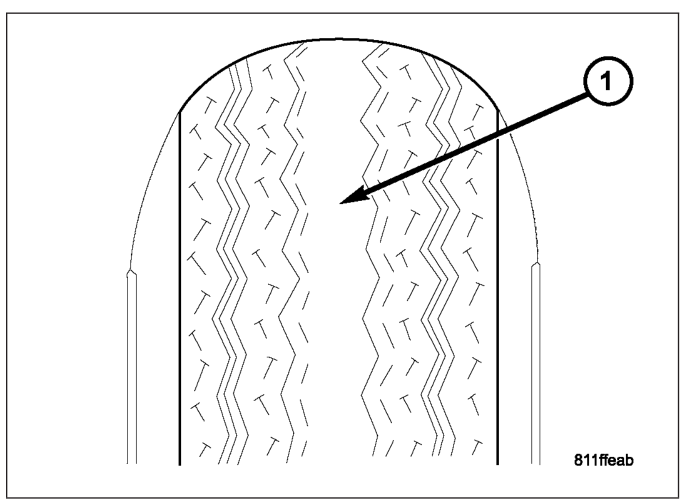
The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening (B-pillar) or rear shutface of driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.



Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

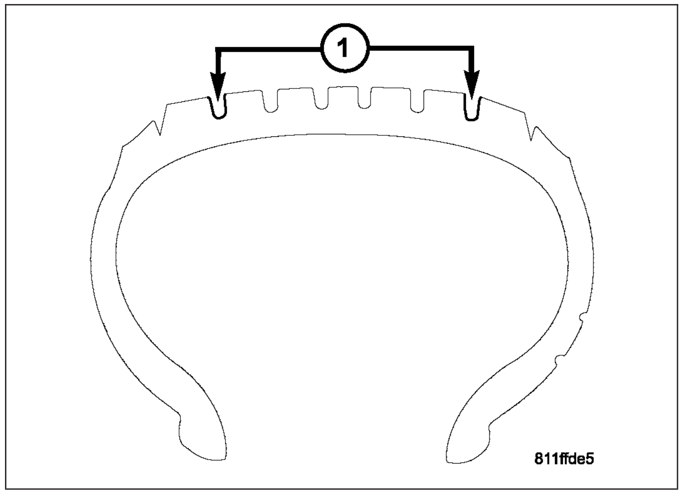


- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).



TIRE PRESSURE FOR HIGH SPEED OPERATION

Refer to the vehicle's Owners Manual Package.

TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

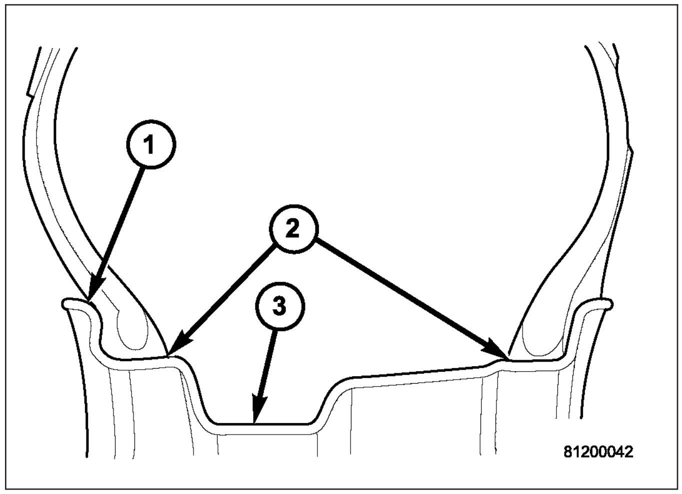
Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the five wheel nuts to a torque of 135 N·m (100 ft. lbs.).

CLEANING

TIRE CLEANING

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.



CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

WHEELS

DESCRIPTION

WHEEL

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.

WARNING: Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

CLEANING

WHEEL AND WHEEL TRIM CARE

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the “DO NOT USE” items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

SPECIFICATIONS

WHEEL

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Wheel Mounting (Lug) Nut Hex Size	19 mm

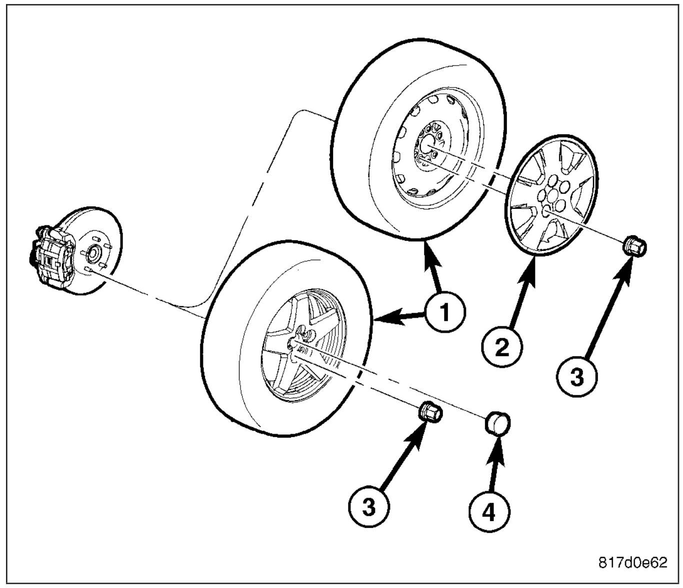
TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
TPM Sensor Nut	6.5	—	58
TPM Transponder Mounting Nut	3	—	26
Wheel Mounting (Lug) Nut	135	100	—



WHEEL COVER

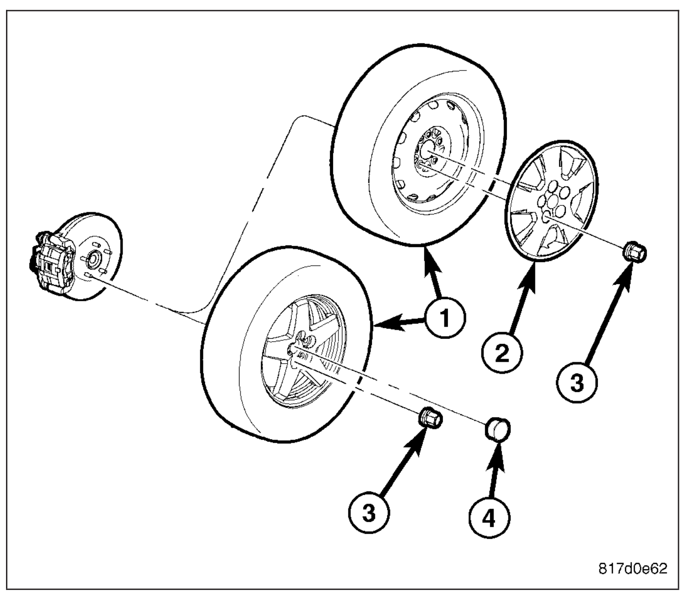
REMOVAL

1. Raise and support the vehicle so that tire and wheel assembly clears ground level. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

CAUTION: When removing the bolt-on wheel cover, do not attempt to pry the wheel cover off the wheel. It is held on by the wheel mounting nuts.

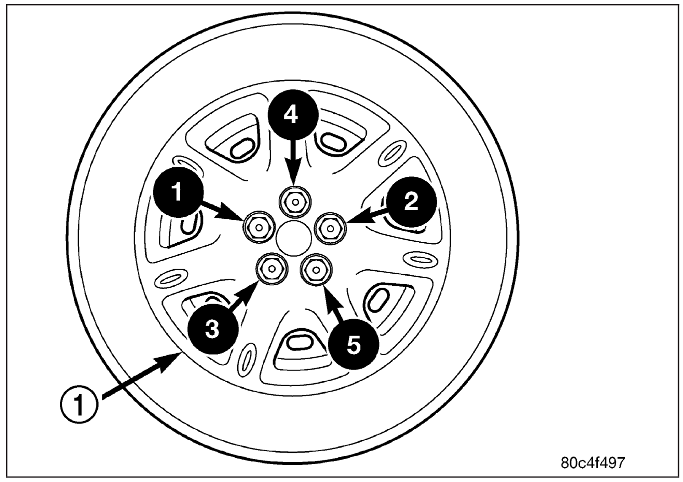
2. Remove the five wheel mounting (lug) nuts (3) from the wheel studs. While removing the nuts, hold the wheel cover (2) in place so it doesn't fall off when the last nut is removed.
3. Remove the wheel cover (2) using care not to let the tire and wheel assembly (1) fall off the vehicle.

INSTALLATION



WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting (lug) nuts.



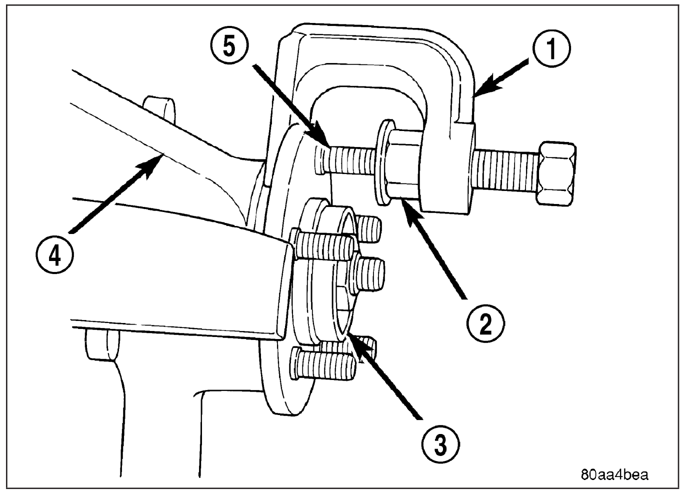
1. With the tire and wheel assembly (1) positioned on the wheel studs without the wheel mounting (lug) nuts installed, align the valve notch in the wheel cover with the valve stem on the wheel and install the wheel cover over the studs.

NOTE: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.

2. Install and lightly snug all five wheel mounting (lug) nuts (3) **Do not tighten at this time**.
3. Lower the vehicle.

4. Progressively tighten all wheel mounting (lug) nuts in the proper sequence shown. Tighten the nuts to a final torque of 135 N·m (100 ft. lbs.).

STUDS-WHEEL MOUNTING FRONT

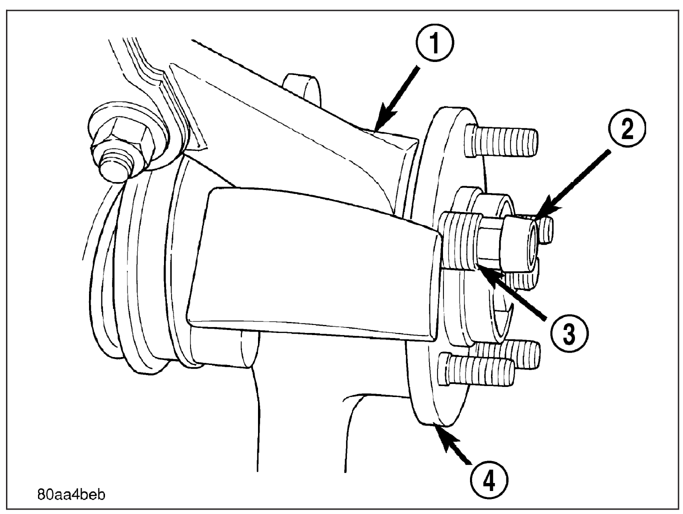


REMOVAL

NOTE: Use the following procedure to remove one of five studs on one wheel hub.

1. Access and remove front brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

CAUTION: Do not hammer wheel mounting studs out of the hub. Damage to the wheel bearing will occur, leading to premature bearing failure.



2. If possible, install a standard wheel mounting nut (2) on the wheel mounting stud (5) being removed far enough so the threads on the stud are even with end of lug nut.
3. Rotate the hub so the stud requiring removal is aligned with the notch cast into the front of the steering knuckle (4).
4. Install Remover (1), Special Tool C-4150A, on the hub flange and wheel stud.
5. Tighten the Remover, pushing the wheel mounting stud out the rear of the hub flange. When the shoulder of the stud is past the flange, remove the Remover from the hub.
6. Remove the nut from the stud, then remove the stud from the flange.

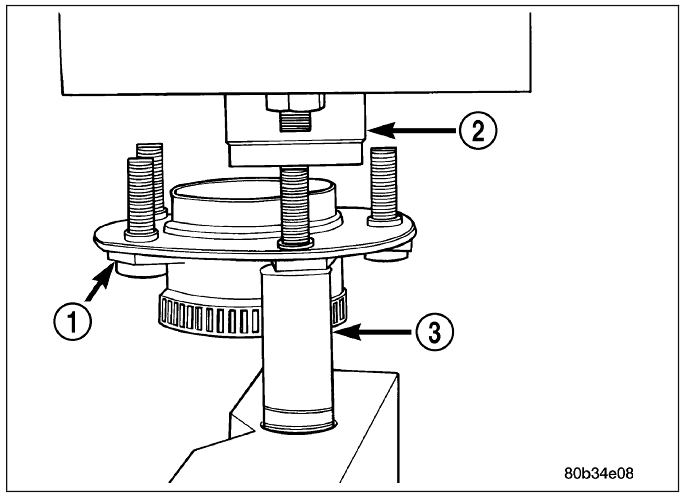
INSTALLATION

NOTE: Use the following procedure to install one of five studs on one wheel hub.

1. Install the NEW wheel mounting stud in the flange of hub from the rear.
2. Install several washers (3) and a standard wheel mounting (lug) nut (2) on the stud. Install the mounting nut so that the flat side of the nut is against the washers to eliminate any binding.
3. Tighten the wheel mounting nut (2). This will pull the wheel mounting stud into the hub flange. When the head of the stud is fully seated against the rear of the hub flange, remove the wheel mounting nut and washers.

4. Install the brake rotor and all components previously removed to access it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)

STUDS-WHEEL MOUNTING REAR

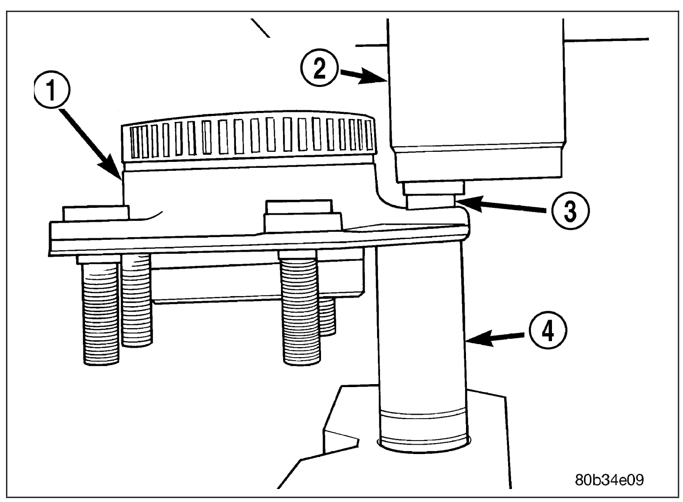


REMOVAL

CAUTION: DO NOT hammer studs out of the hub flange. If a stud is removed by hammering it out of the bearing flange, damage to the hub and bearing assembly will occur leading to premature bearing failure.

1. Remove the hub and bearing from the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)

CAUTION: Take care to keep hub and bearing assembly from falling during stud removal. Damage to the hub and bearing could result.



2. Position the hub and bearing assembly (1) under a hydraulic press ram (2), supported by a 21 mm deep-well impact socket (3) under the stud to be replaced.
3. Press the stud out of the hub flange and into the socket well.
4. Remove the hub and bearing assembly (1) from the press.
5. Remove the stud from the socket (3).

INSTALLATION

CAUTION: DO NOT hammer studs into the hub flange. If a stud is installed in such a manner, damage to the hub and bearing assembly may occur leading to premature bearing failure.

1. Install the wheel stud (3) into mounting hole from the rear of the hub and bearing assembly.
2. Position the hub and bearing assembly (1) face down with the stud pointing down into the well of the 21 mm impact socket (3). The hydraulic press ram (2) must line up with the stud (3).
3. Press the stud (3) into the hub flange until it bottoms.
4. Remove the hub and bearing assembly (1) from the press.

5. Install the hub and bearing on the vehicle. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)

BODY

TABLE OF CONTENTS

BODY

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE AN OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.
DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.
Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.
Always have a fire extinguisher ready for use when welding.
Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.
Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.
Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.
Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

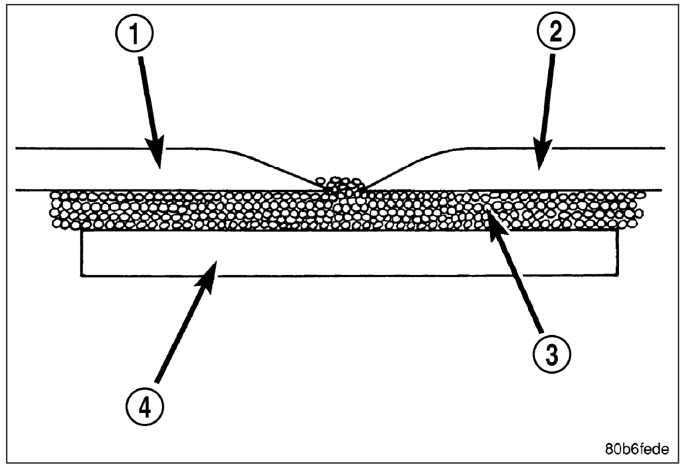
Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

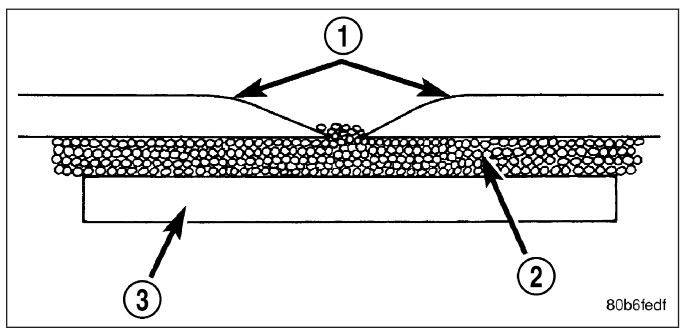


NOTE:
- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

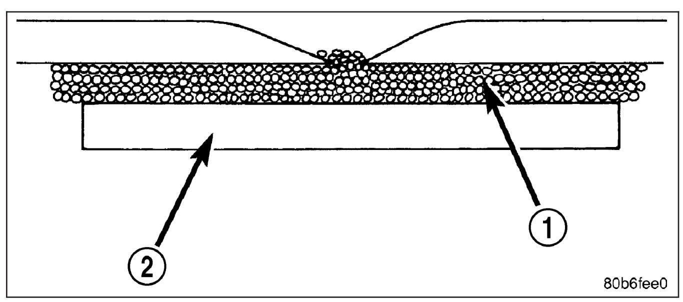
RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	″A″ PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPTHALATE/EEBC ALLOY	BEXLOY, ″M″, PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/ POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/ PROPROPYLENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/ PROPROPYLENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	—
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLON, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS



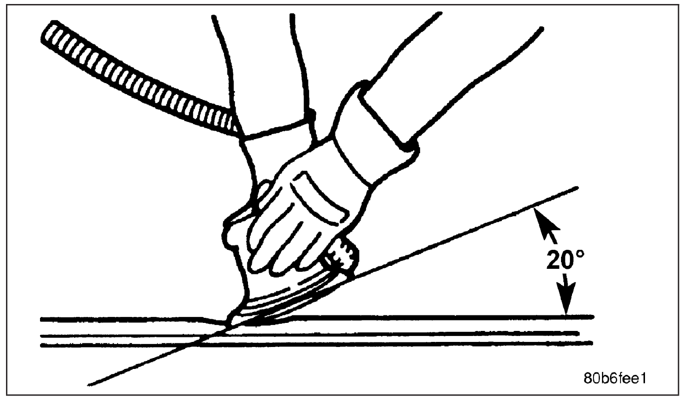
PANEL SECTIONING



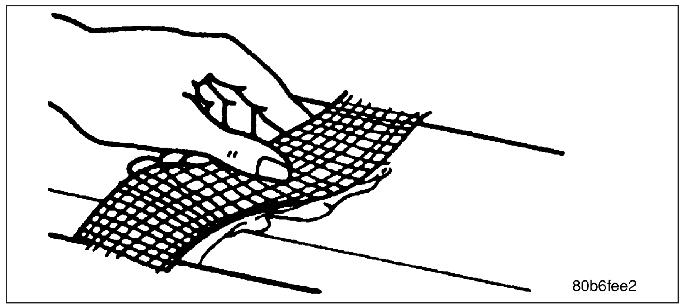
If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 °angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

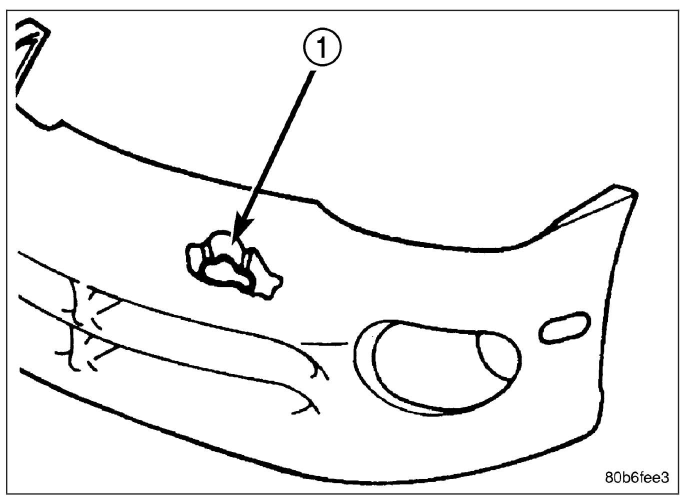


Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.



Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first “V’d” out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 ° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

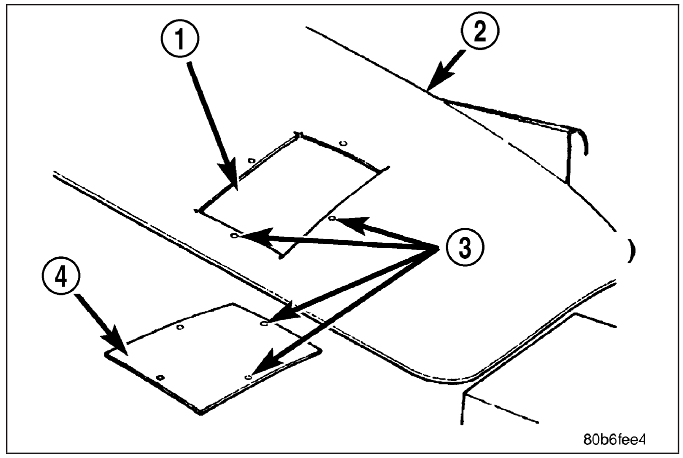


- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

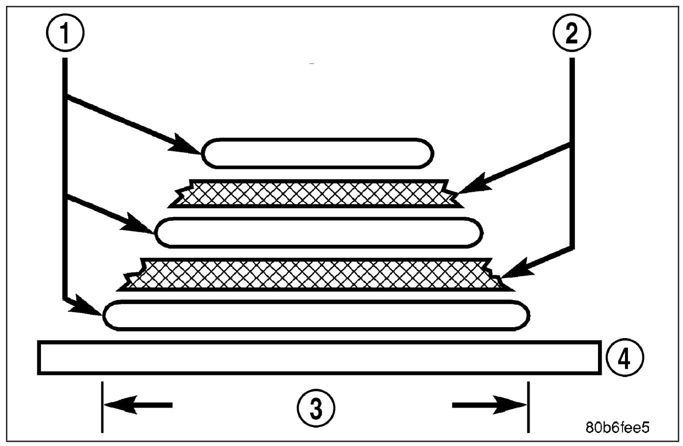
Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.



PANEL SURFACE PREPARATION

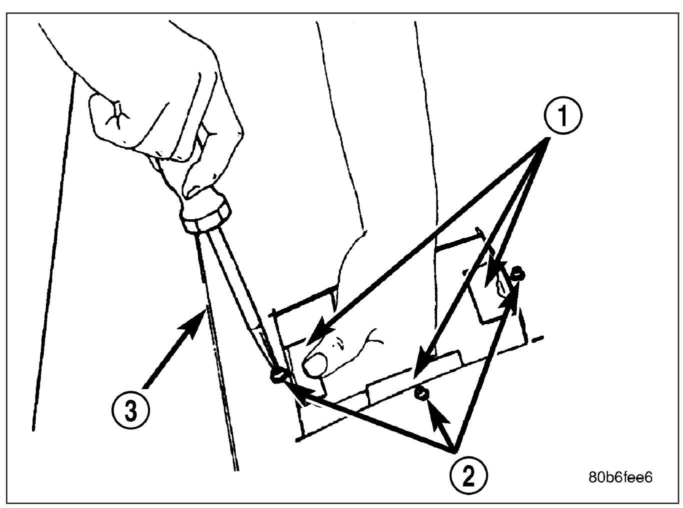
If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.



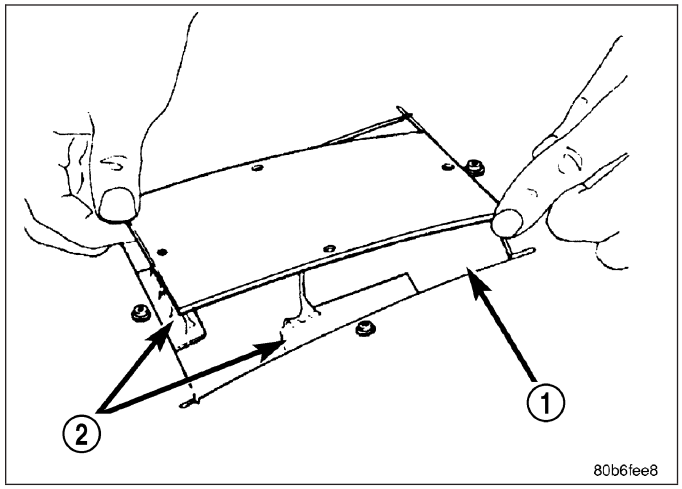
PATCHING PANELS

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

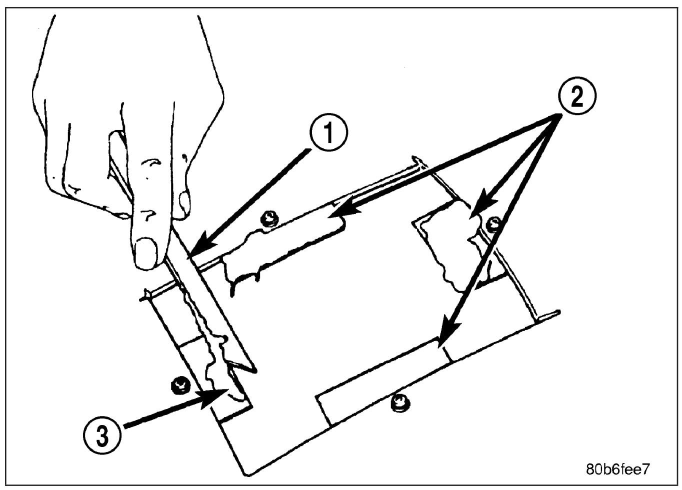


A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

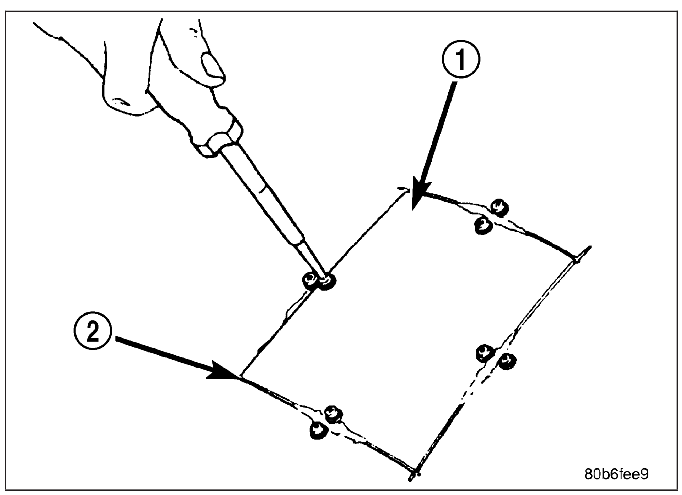


1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

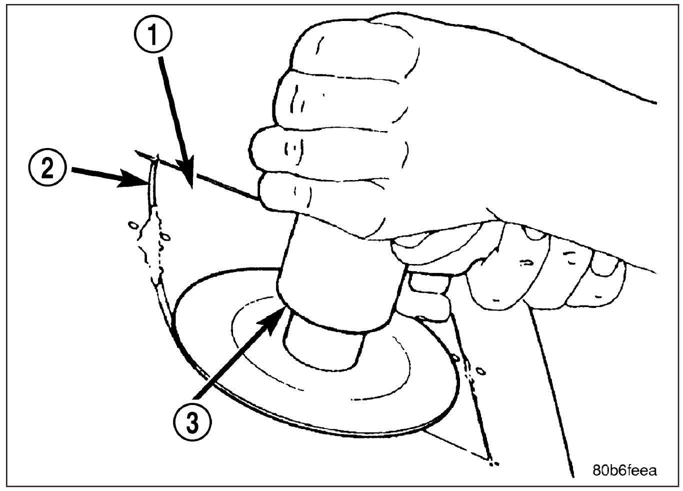
PANEL PATCH INSTALLATION



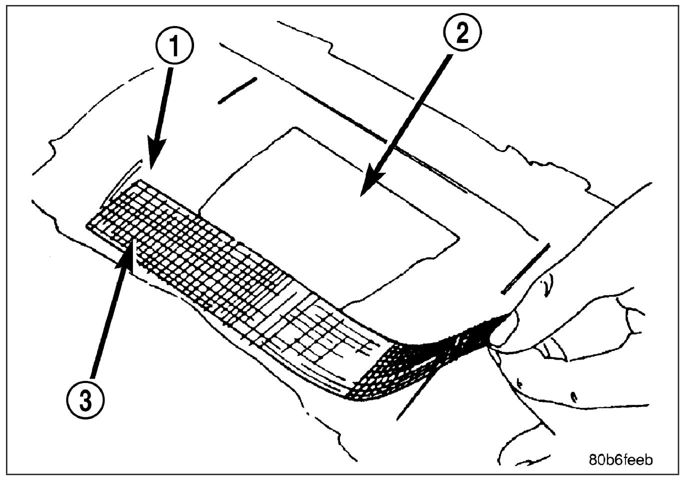
1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.



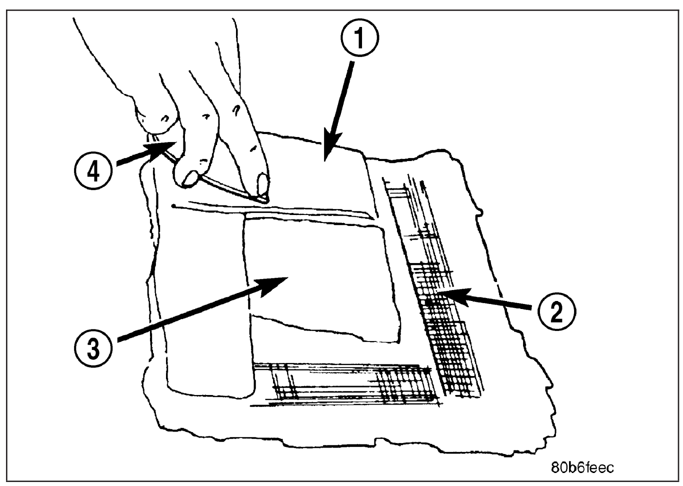
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.
12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.



14. Apply a coat of adhesive to the exposed ends of the support squares.



15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.



17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

STANDARD PROCEDURE - HEAT STAKING

1. Remove trim panel.

2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
   a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
   b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

SPECIFICATIONS

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

ENGINE OIL

- Door Hinges – Hinge Pin and Pivot Contact Areas
- Hood Hinges – Pivot Points
- Liftgate Hinges

MOPAR® SPRAY WHITE LUBE OR EQUIVALENT

- Door Check Straps
- Liftgate Latches
- Liftgate Prop Pivots

- Ash Receiver
- Fuel Filler Door Remote Control Latch Mechanism
- Parking Brake Mechanism
- Sliding Seat Tracks
- Liftgate Latch

MOPAR® Multipurpose GREASE OR EQUIVALENT

- All Other Hood Mechanisms

MOPAR® LOCK CYLINDER LUBRICANT OR EQUIVALENT

- Door Lock Cylinders
- Liftgate Lock Cylinder

SPECIAL TOOLS

BODY

STICK, TRIM C 4755

REMOVER, MOLDINGS C-4829-A

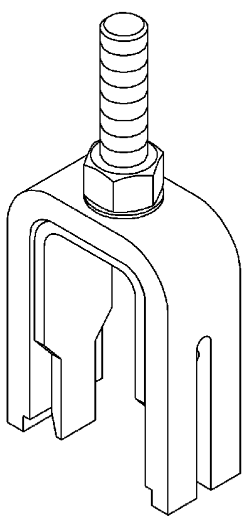

Fig. 1 STRAIN GAUGE HOLDER 9689

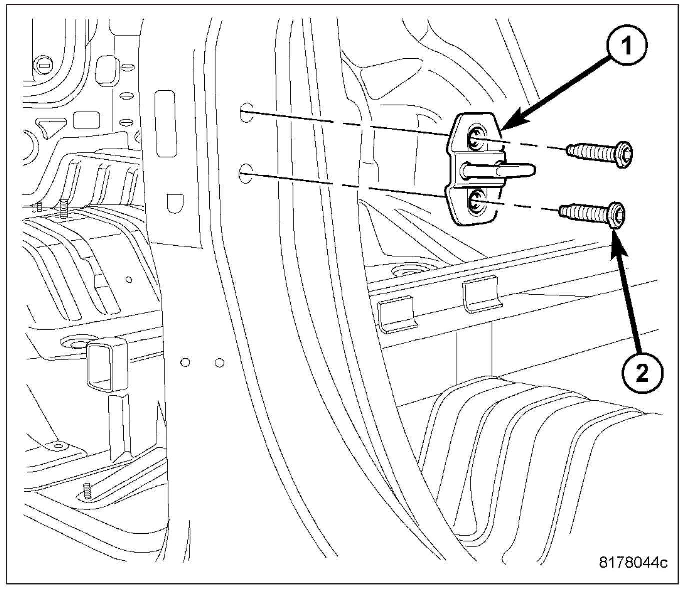
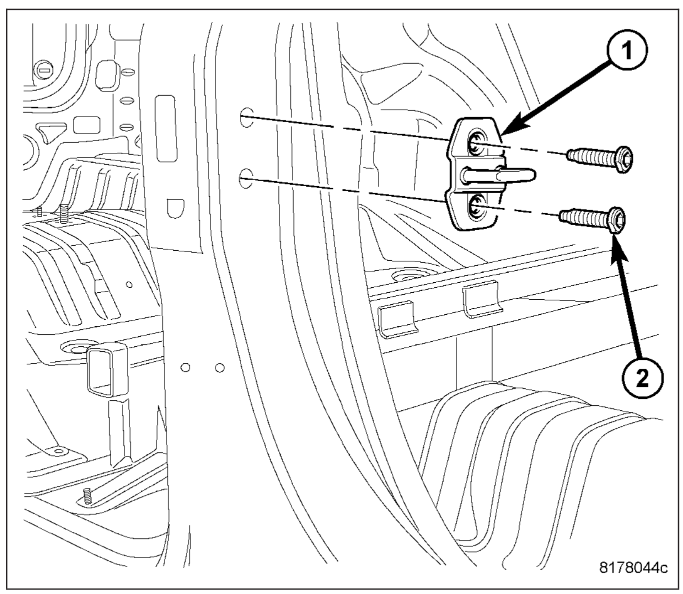


DOOR - FRONT

TABLE OF CONTENTS

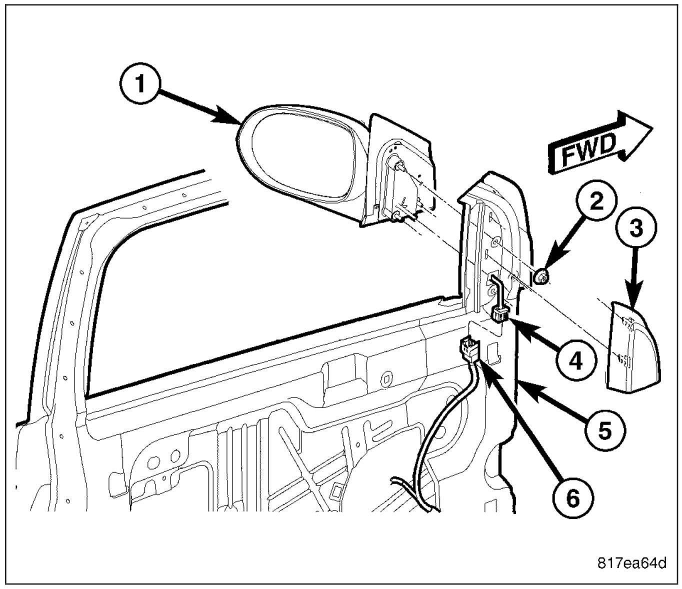
FRONT DOOR LATCH STRIKER



REMOVAL

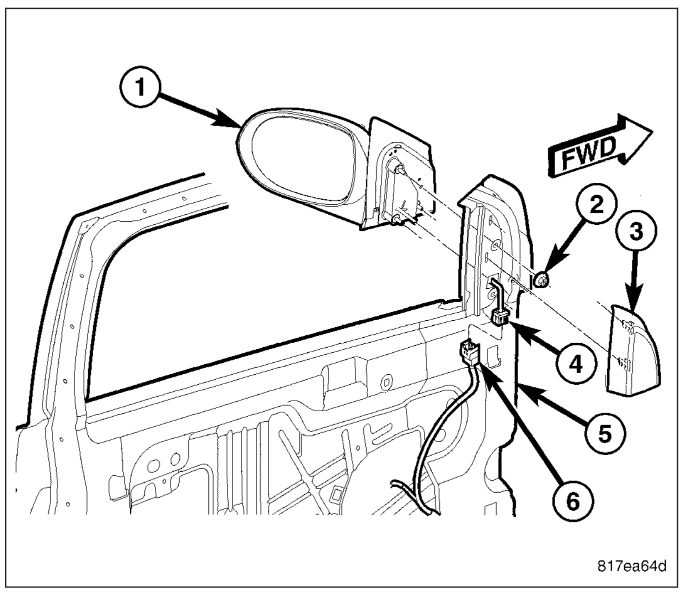
1. Remove fasteners (2) from door jamb.
2. Remove door striker (1) from vehicle.

INSTALLATION



1. Install striker (1) onto door jamb.
2. Install fasteners (2) into striker.
3. Tighten fasteners to 26 N·m (19 ft. lbs.)

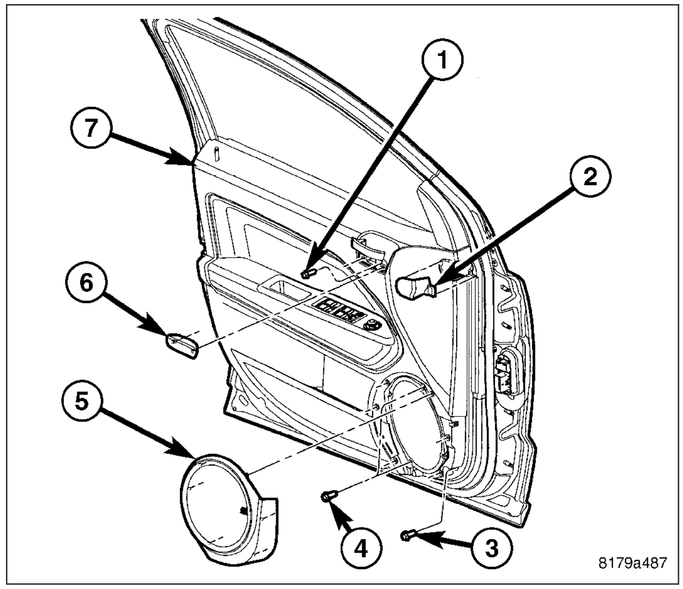
DOOR- OUTSIDE MIRROR



REMOVAL

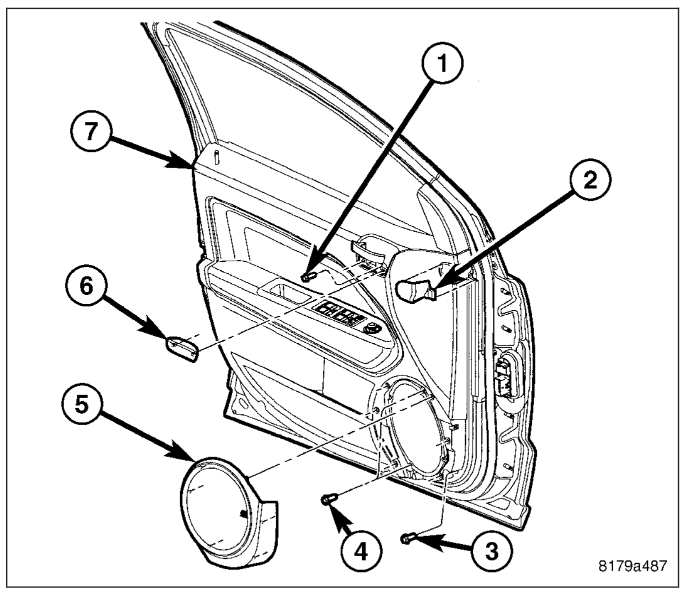
1. Using trim stick C-4755, pry up mirror flag cover (3).
2. Disconnect wire connector (4) from wire harness (6).
3. Remove nuts (2).
4. Remove mirror (1) from door (5).

INSTALLATION



1. Insert mirror (1) into door (5).
2. Install nuts (2) onto mirror studs.
3. Tighten nuts to 5 N·m (4 ft. lbs.)
4. Connect wire connector (4) to wire harness (6).
5. Install mirror flag cover (3).

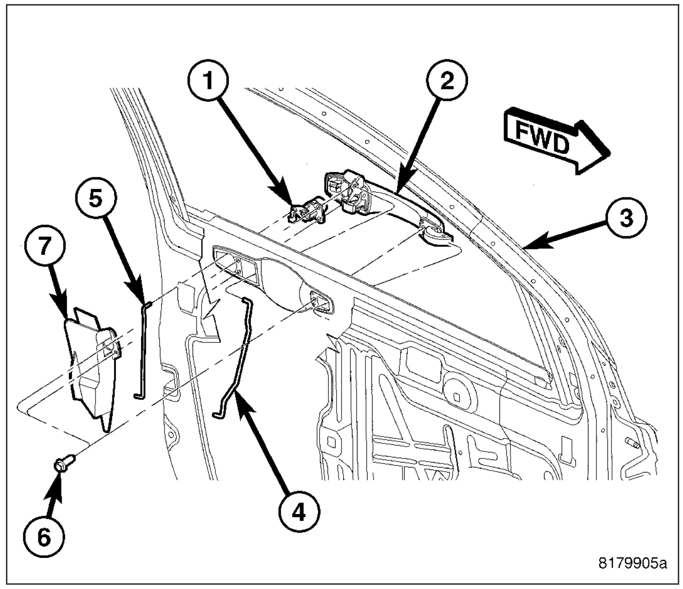
DOOR-PLUGS



REMOVAL

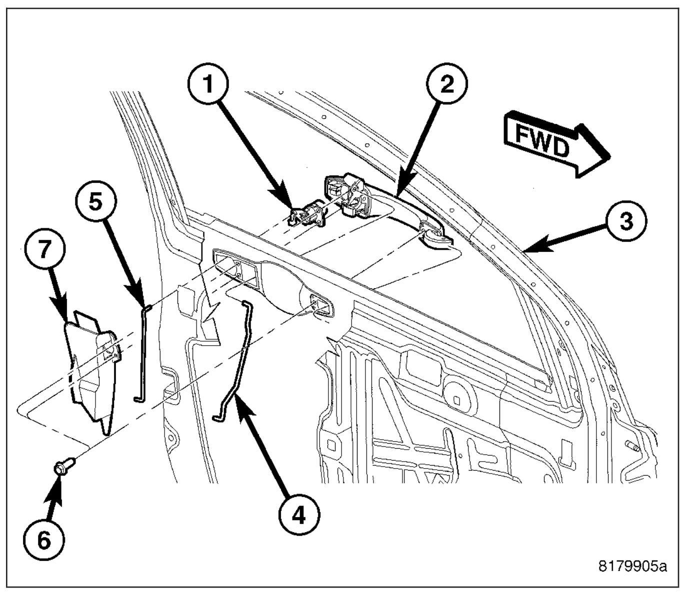
1. Remove screw (1) and handle plug (6).
2. Using trim stick C-4755, remove mirror flag plug (2).
3. Using trim stick C-4755 remove speaker grille (5).
4. Remove screws (3) and (4) fastening speaker to door (7).

INSTALLATION



1. Install speaker screws (3) and (4) fastening speaker to door.
2. Hand tap speaker grille to door (7).
3. Install handle plug (6) and screw (1) to door.
4. Hand tap mirror flag (2) to door (7).

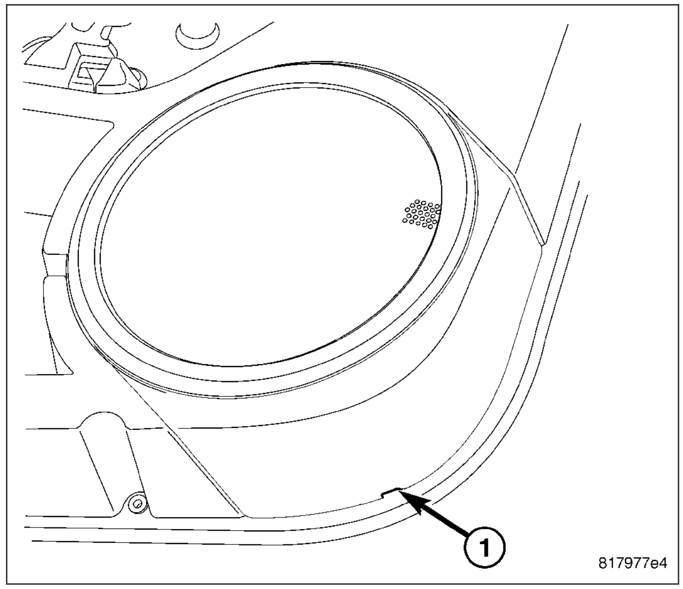
FRONT DOOR OUTSIDE HANDLE



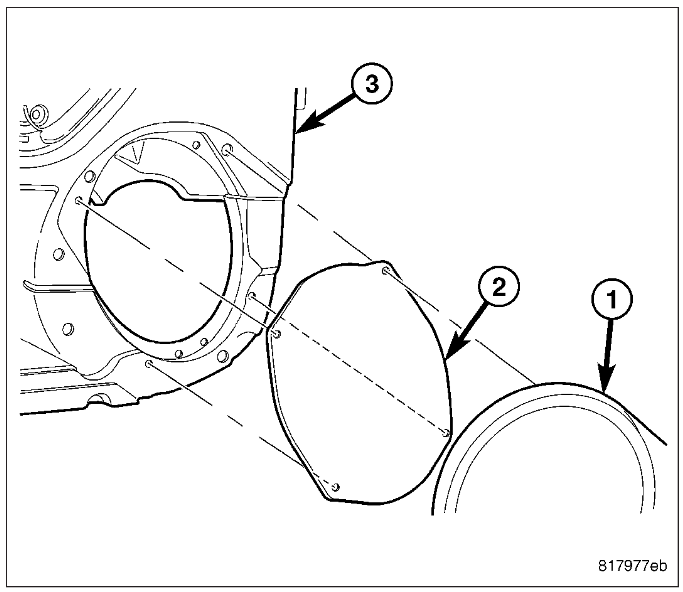
REMOVAL

1. Remove bolster. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
2. Remove door plugs. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
3. Remove door module. (Refer to 23 - BODY/DOOR - FRONT/DOOR MODULE - REMOVAL)
4. Raise window to up position.
5. Remove key cylinder lock link rod (5) from lock cylinder (1).
6. Remove handle link rod (4) from handle (2).
7. Remove screws (6) from handle assembly (2).
8. Remove handle assembly (2) from door (3).

INSTALLATION



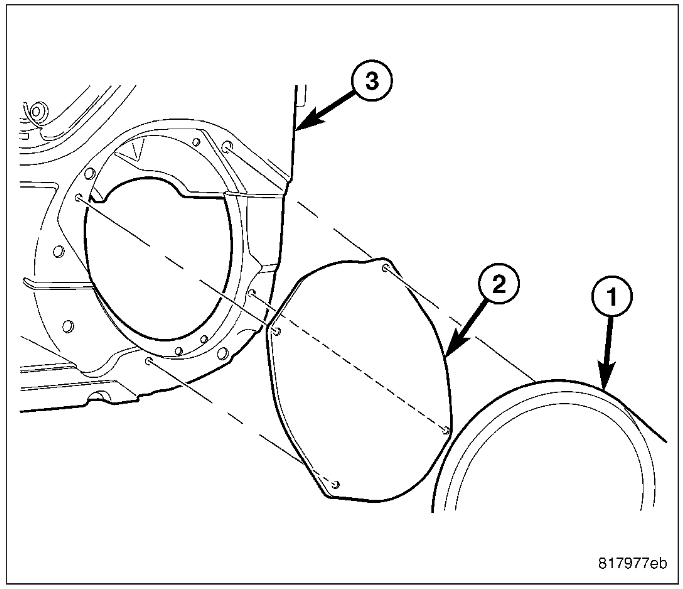
1. Raise window to up position.
2. Insert lock cylinder (1) into door handle (2) then into door opening.
3. Tighten screws (6) to 8 N·m (6 ft. lbs.)
4. Connect lock cylinder link rod (5) on to lock cylinder (1).
5. Connect handle link rod (4) on to door handle (2).



SPEAKER AND GRILLE

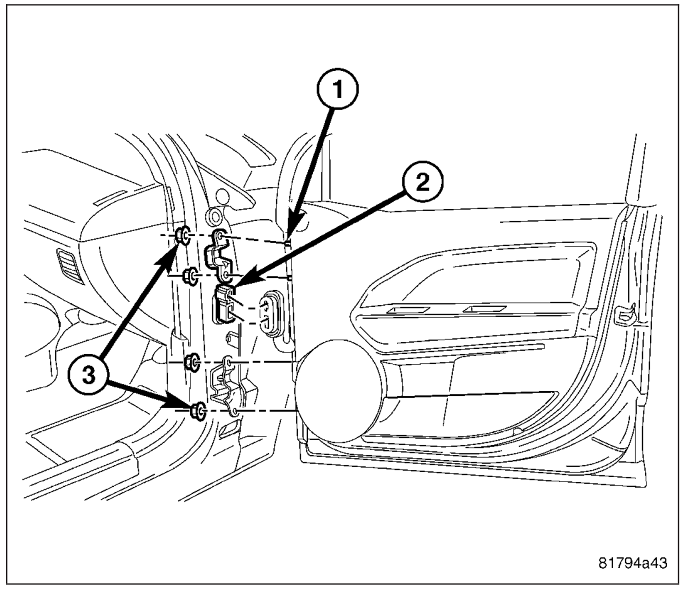
REMOVAL

1. Using trim stick C–4755, find service notch (1) located at the bottom of speaker grille and pry up speaker grille.



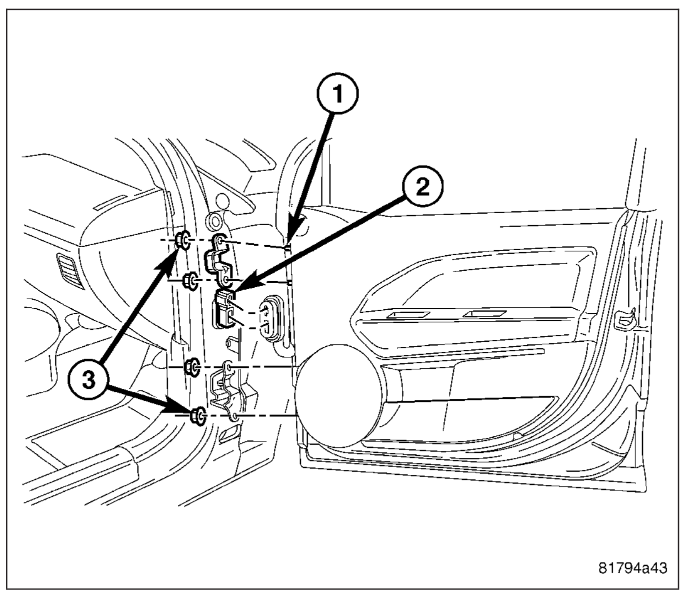
2. Remove two screws attaching speaker to door panel (3).
3. Remove two screws attaching speaker (2) to door module (1).
4. Disconnect wire connector.

INSTALLATION



1. Connect wire connector.
2. Install speaker (2) into panel (3) and install two screws into door panel.
3. Install two screws into trim panel (1).
4. Install speaker grille (1) onto trim panel (3).

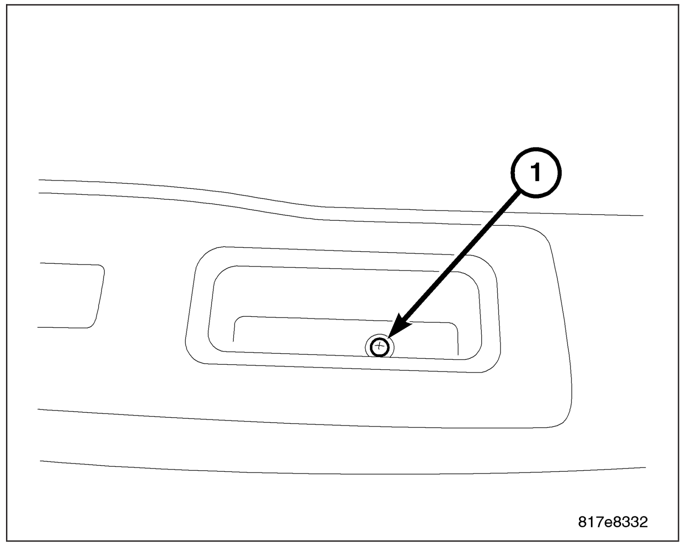
FRONT DOOR HINGE



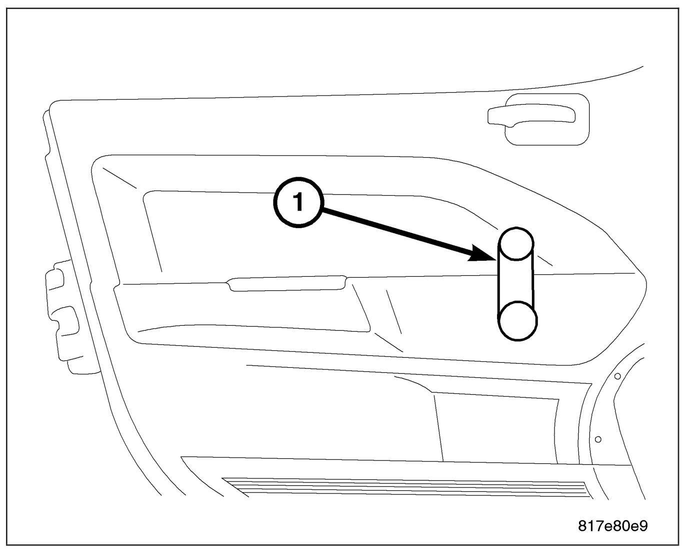
REMOVAL

1. Remove nuts (3) from door studs (1).
2. Remove door.
3. Disconnect door harness (2).

INSTALLATION

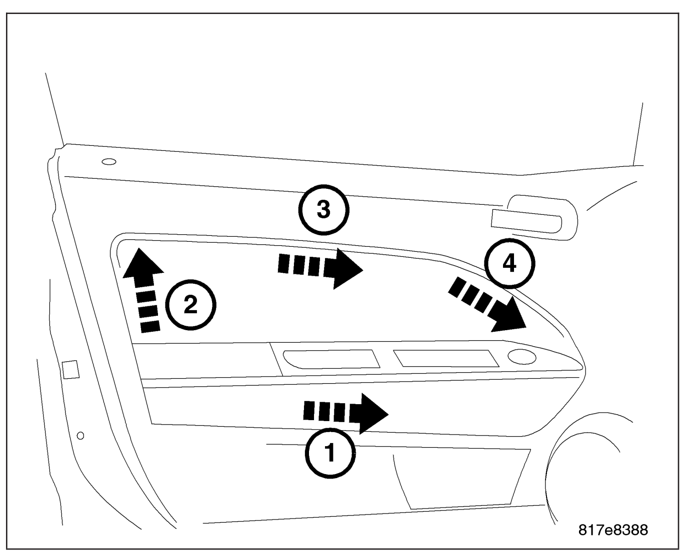


1. Connect door harness (2).
2. Install door studs (1) into door hinges.
3. Install nuts (3) onto door studs. Tighten to 26 N·m (19 ft. lbs.)

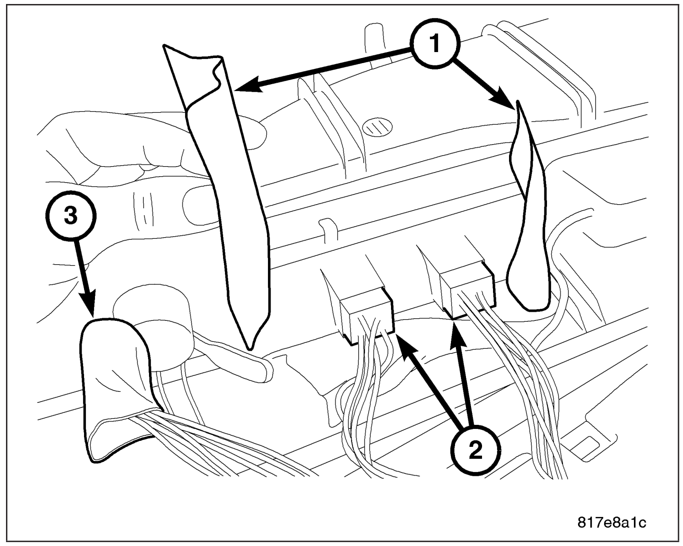


FRONT DOOR - BOLSTER

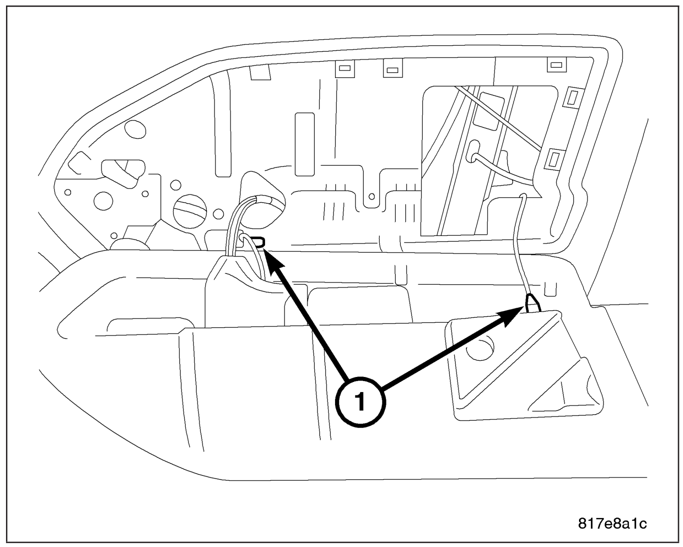
REMOVAL



1. Remove pull-cup screw (1).

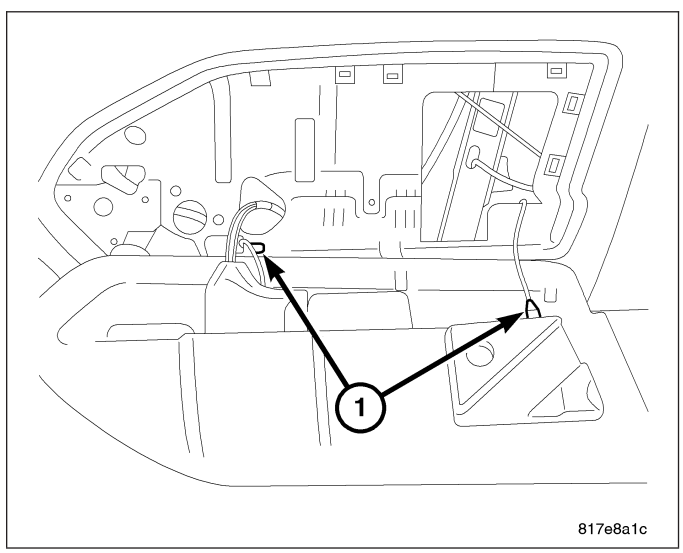


2. Remove window crank (1) from spindle if equipped.

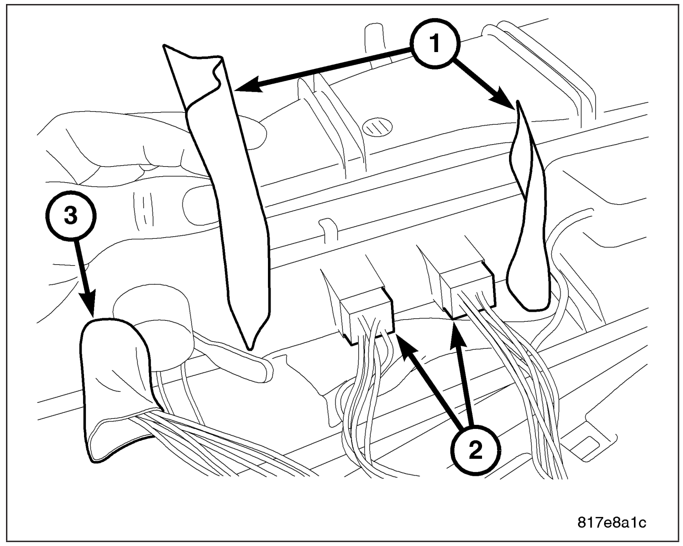


3. Using trim stick C-4755, start at the lower corner and pull in the direction of the arrows. Bolster should unsnap.

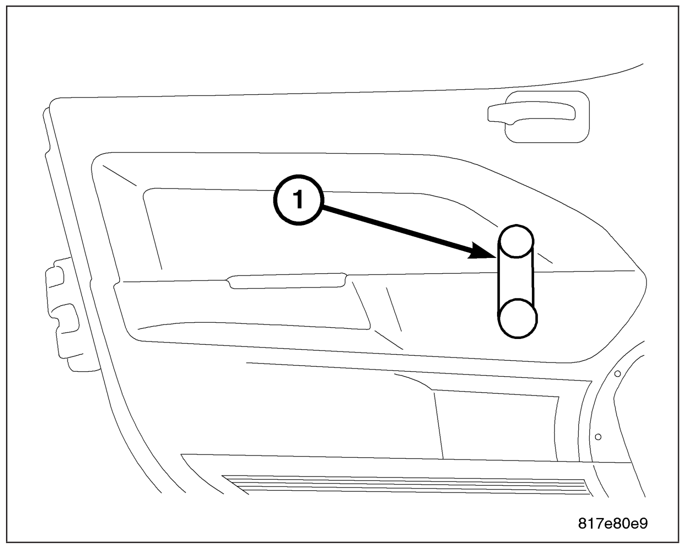
4. Remove sock seal (1) and (3) that wraps around switch bezel and wire harness. Disconnect wire connectors (2).
5. Remove switch bezel from bolster.



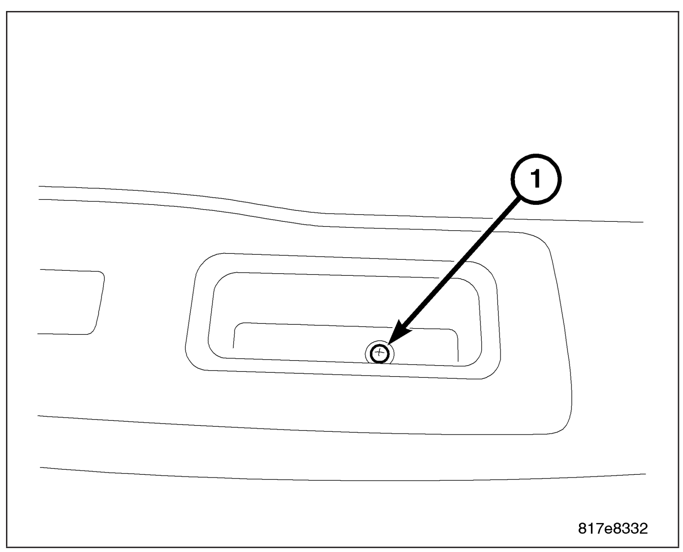
6. Remove bolster by unsnapping plastic tethers (1) from bolster back side of surface.



INSTALLATION

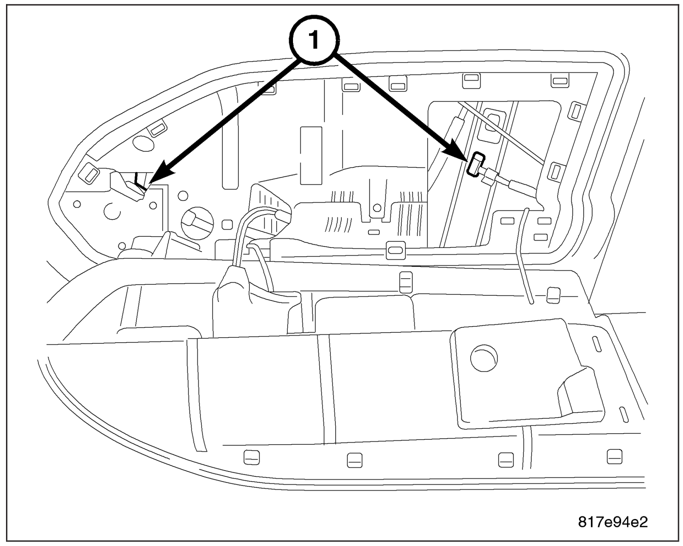


1. Connect bolster to door module tethers (1).

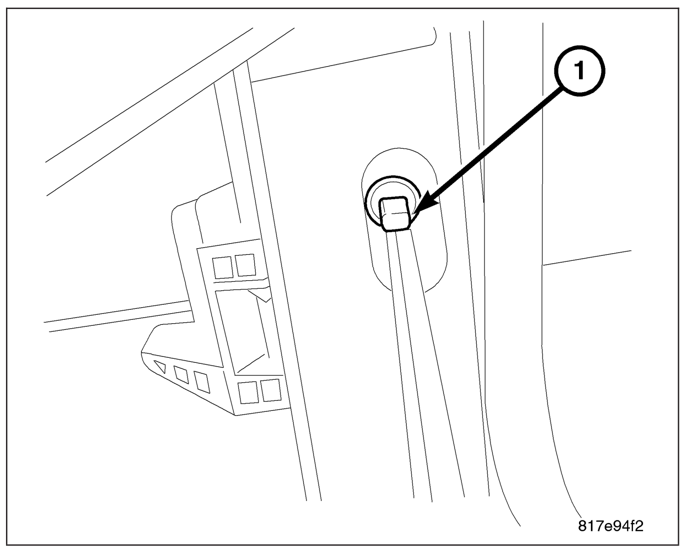


2. Connect wire connectors (2) and close sock seal (1).

3. Replace window crank (1) to spindle.



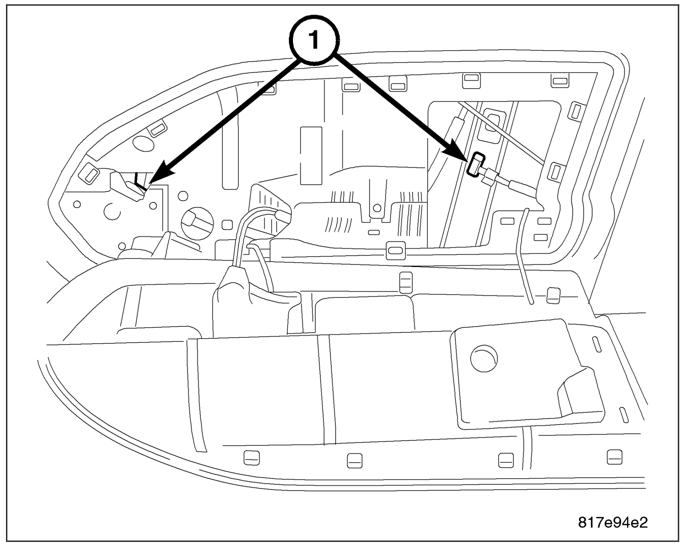
4. Replace pull cup screw.



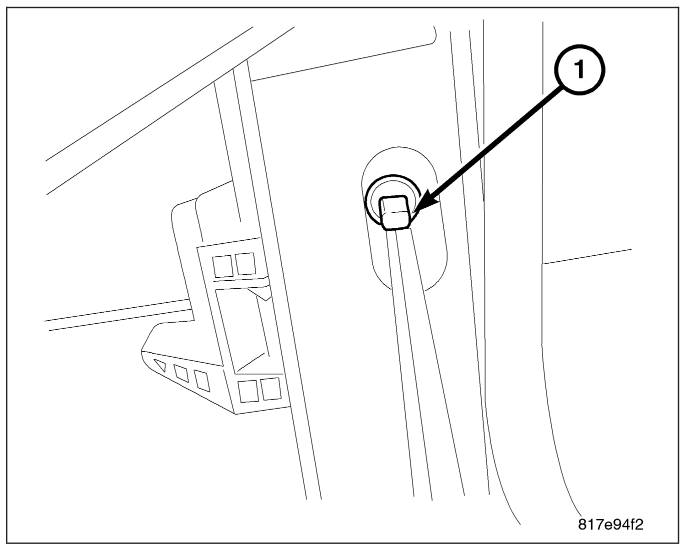
FRONT DOOR GLASS

REMOVAL

1. Remove bolster. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
2. Move glass to line up snap plates with access holes (1).

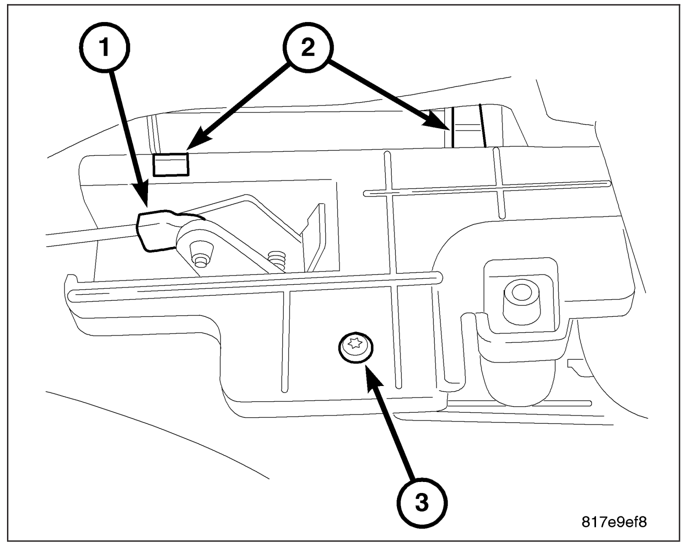


3. Using a punch or equivalent, press tabs releasing glass from window regulator.
4. Manually move glass upward to full up position and remove from window frame.



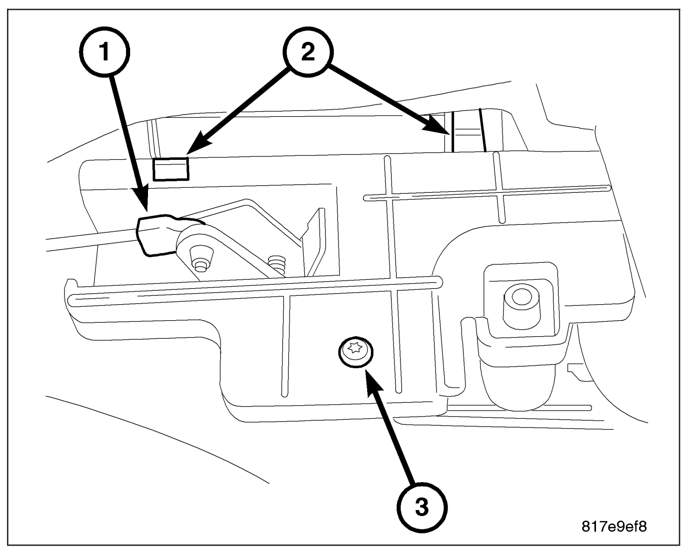
INSTALLATION

1. Insert glass into glass channel and slide down ensuring access holes (1) align with snaps.



2. Ensure access holes properly lock into snaps (1).
3. Install bolster. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)

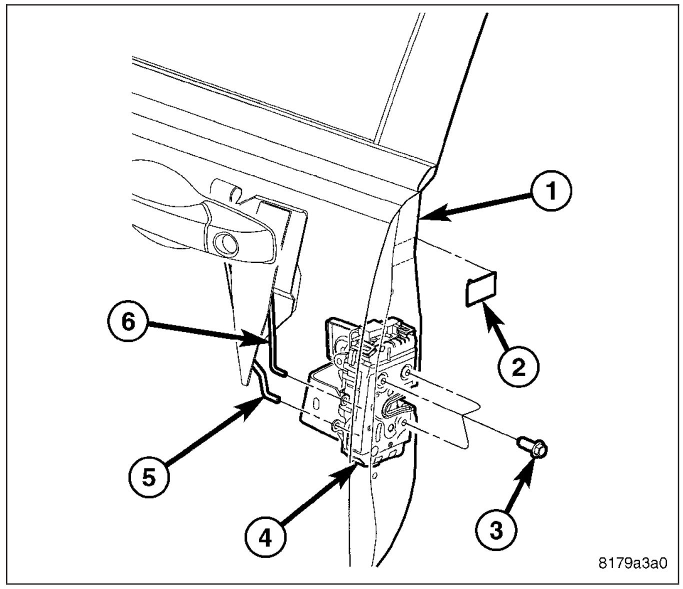
FRONT DOOR INSIDE HANDLE



REMOVAL

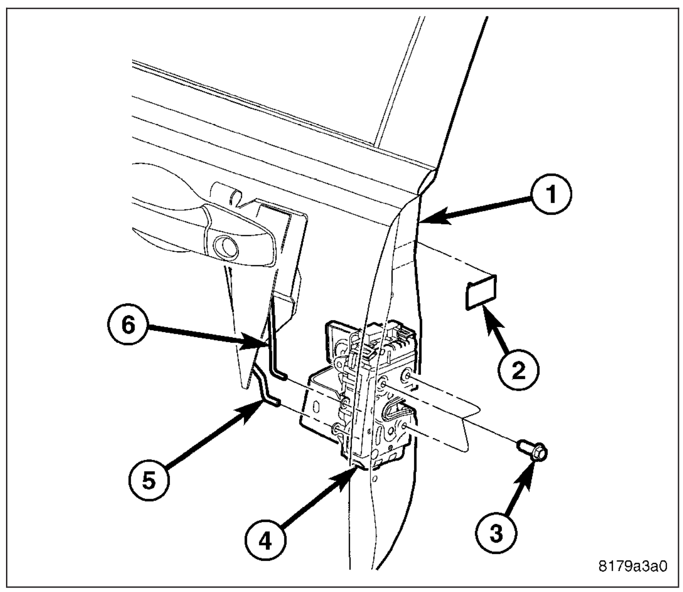
1. Unsnap link rod to latch (1).
2. Remove screw (3) attaching plate to panel.
3. Unsnap housing snaps from (2) belt line ribs on trim panel.
4. Pull up on trim panel belt line to aid in unsnapping of housing.

INSTALLATION



1. Snap inside handle to belt line ribs (2) on trim panel.
2. Install screw (3) attaching handle to panel.
3. Snap link rod to latch.

FRONT DOOR LATCH



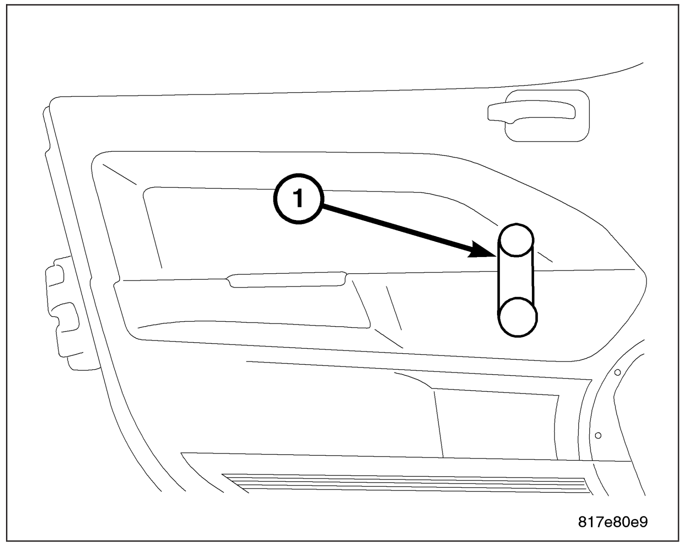
REMOVAL

1. If equipped, disconnect wire harness from Latch.
2. Disconnect inside hand link (5) and lock rod (6) from latch (4).
3. Unscrew latch presenter or unsnap latch from presenter.

INSTALLATION

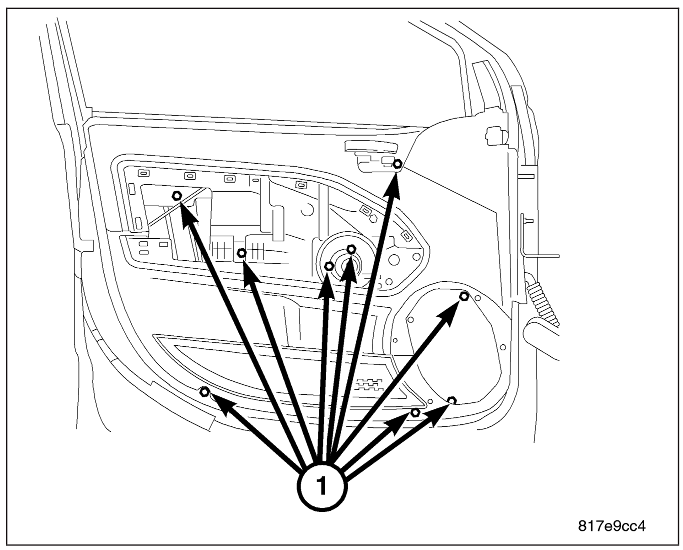
1. Move glass to the full up position.
2. Install latch assembly into door face (1).
3. Connect hand link (5) and lock rod (6) into latch.
4. Install fasteners and torque to 9 N·m (7 ft. lbs.)

ADJUSTMENTS



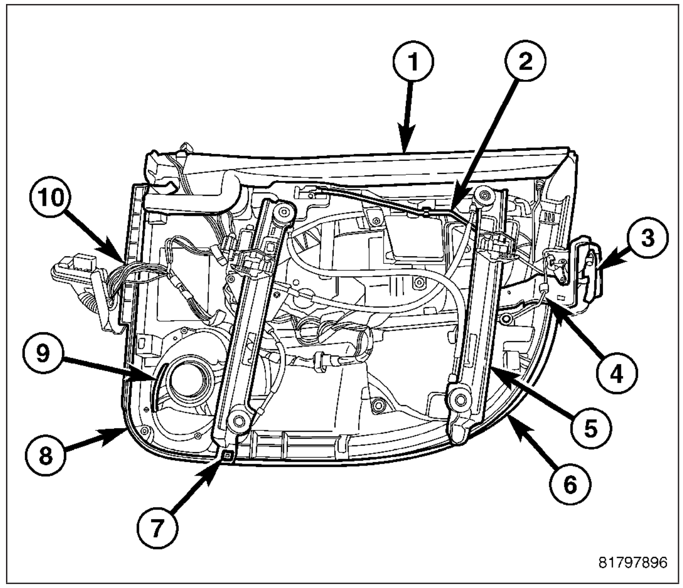
FRONT DOOR LATCH ADJUSTMENT

1. Insert a Torx®-wrench through the elongated hole in the door end frame near the latch striker opening.
2. Loosen Torx® head screw on the side of the latch linkage.
3. Push button on outside door handle and release it.
4. Tighten Torx® head screw on latch.
5. Verify latch operation.



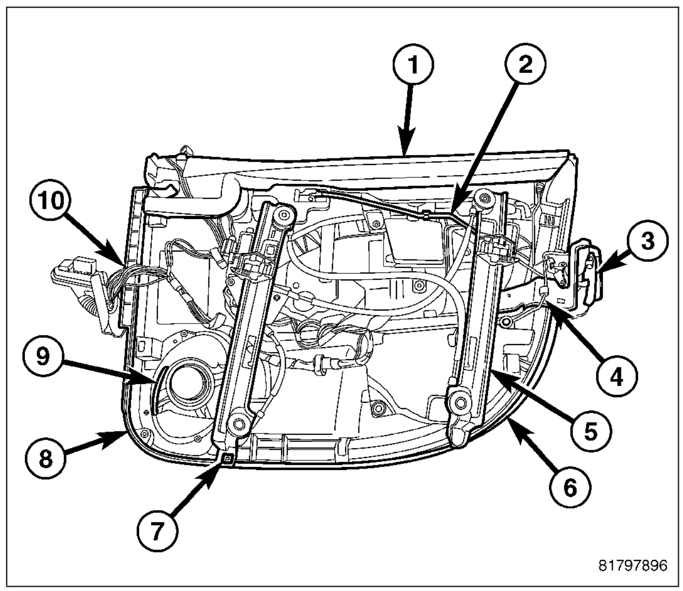
FRONT DOOR WINDOW REGULATOR

REMOVAL



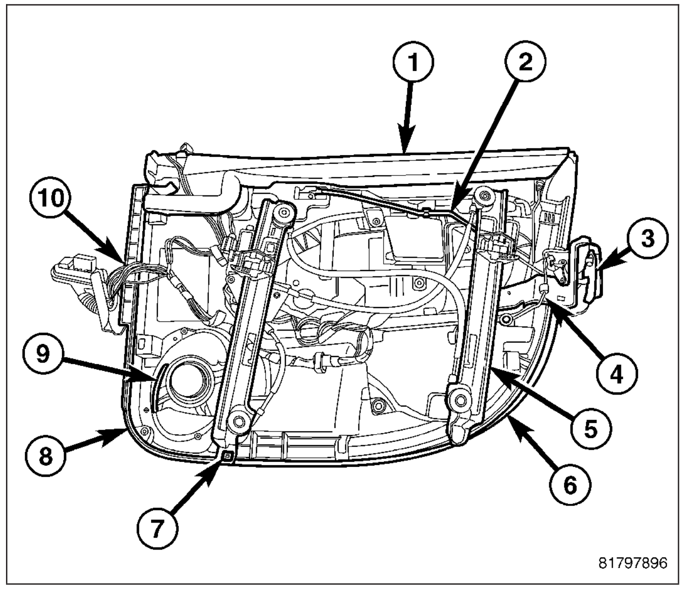
1. Remove bolster. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
2. Remove door plugs. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)
3. If equipped, remove window crank (1).
4. Remove glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)

5. Remove power motor attachment screws (1) from front side of trim panel. (For manual windows only, unsnap manual drive from drum housing).

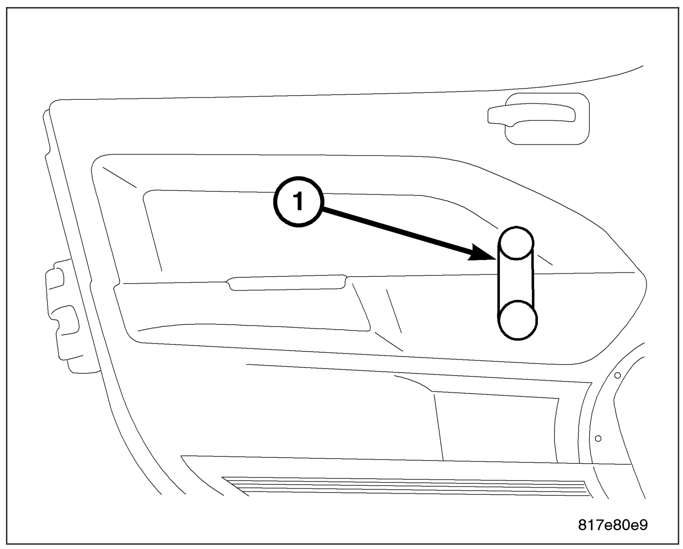


6. Remove lower attachment bolts through front side of trim panel for Window Regulator rails (7).
7. Disconnect wire harness (10) from power motor on back of trim panel.
8. Remove rails for towers on back side of trim panel.
9. Remove window regulator (5) from trim panel.

INSTALLATION

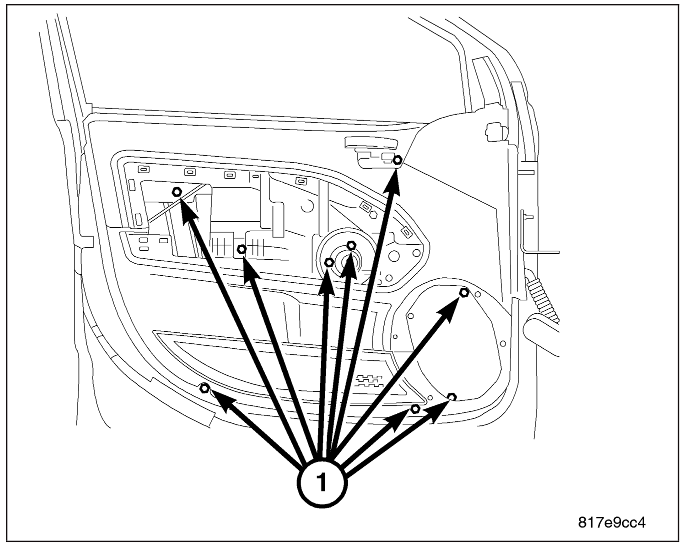


1. Install window regulator (5) to door module (6).
2. Install rails (5) back to trim panel.
3. Connect wire harness (10).



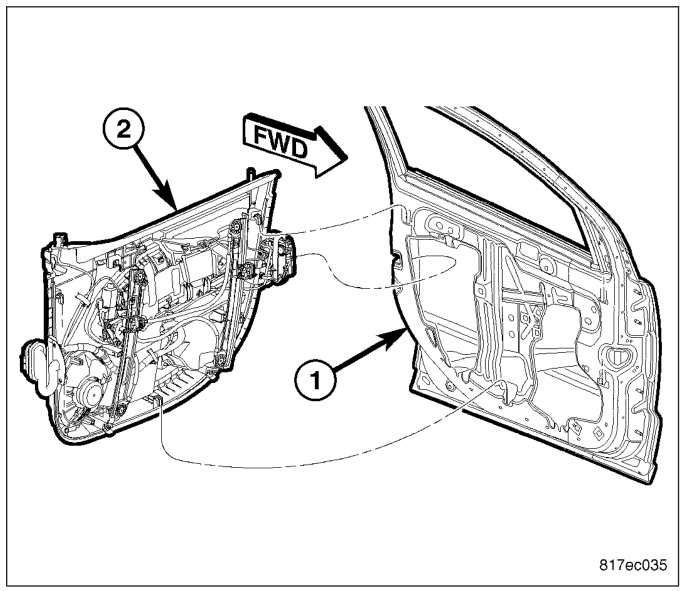
DOOR MODULE

REMOVAL

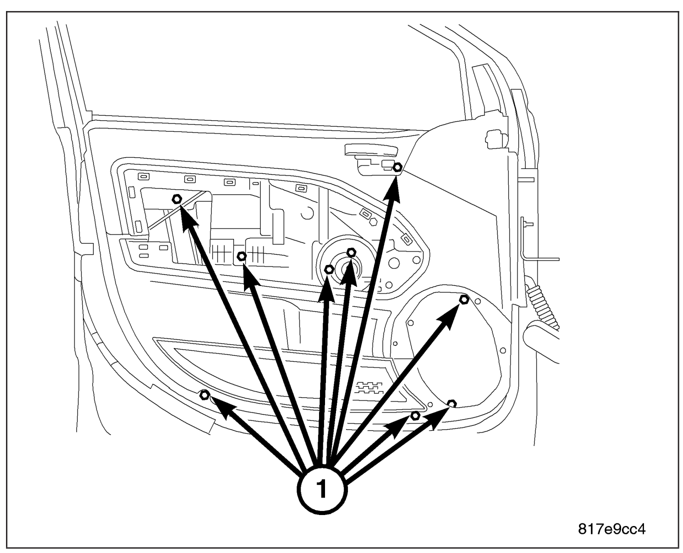


1. Remove door plugs. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL)

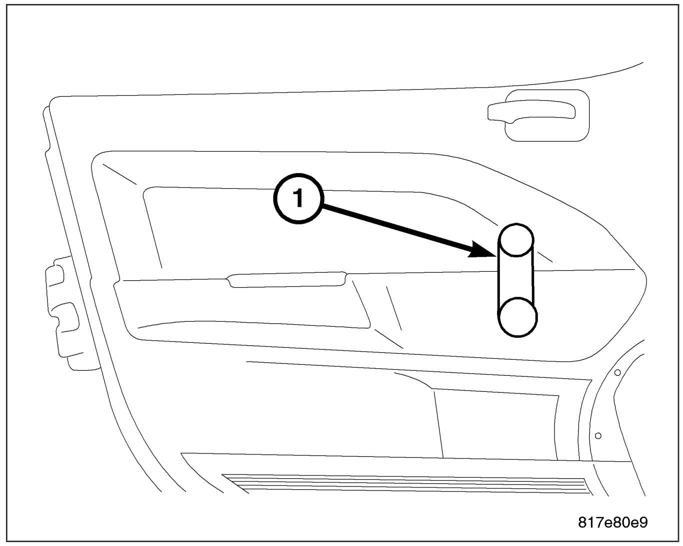
2. Remove manual window crank if equipped.
3. To remove bolster using trim stick C-4755 start at the lower left corner and pry and slide special tool until bolt unsnaps from clips.
4. Remove glass. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL)



5. Remove fasteners from locations.



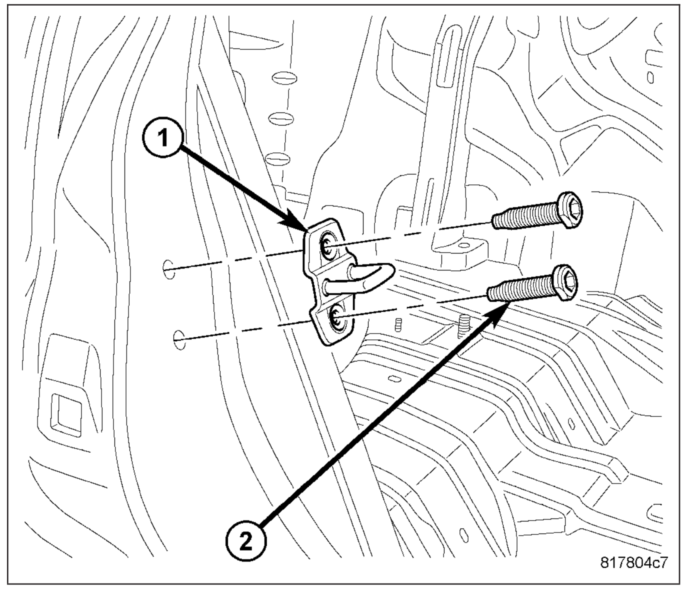
INSTALLATION



1. Install door module (2) to door (1) aligning module clips with door access holes.

2. Install fasteners to module ensuring proper seat.
3. Install glass into window regulator clips. (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - INSTALLATION)

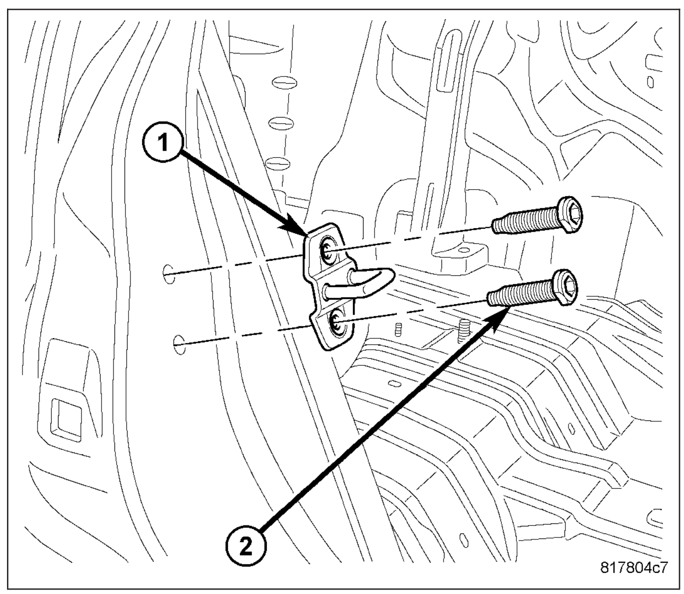
4. Install window crank (1) if equipped.
5. Install bolster. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)
6. Install door plugs. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION)



DOORS - REAR

TABLE OF CONTENTS

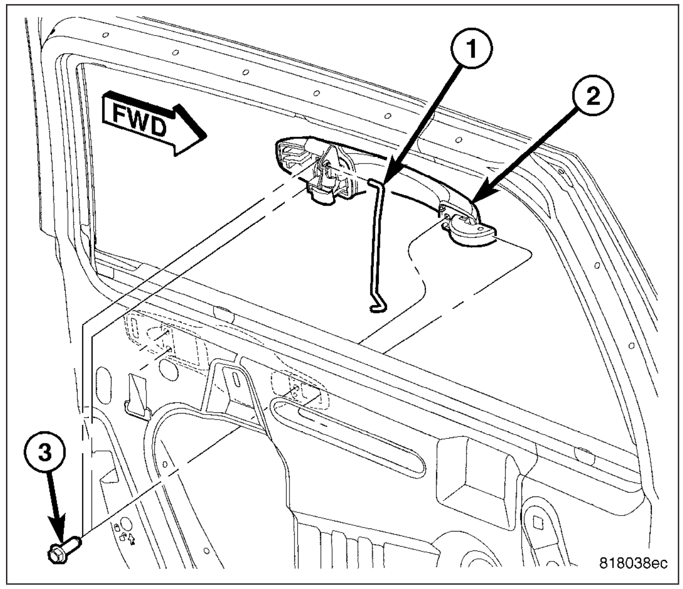
REAR DOOR LATCH STRIKER



REMOVAL

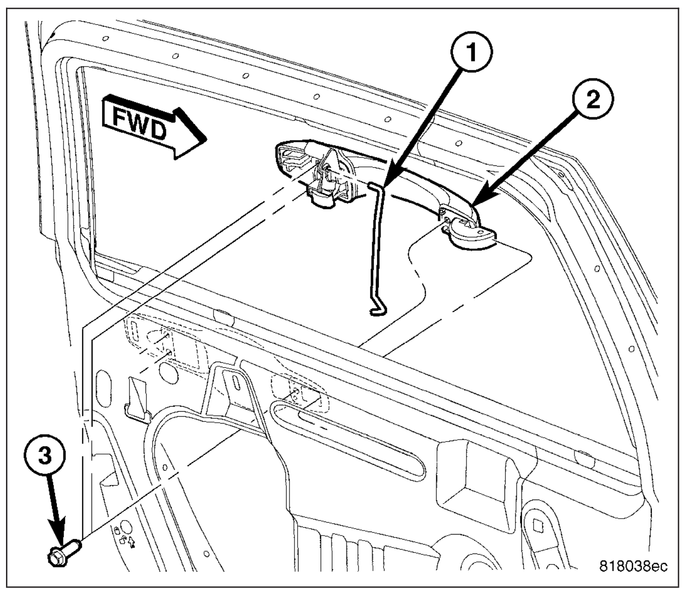
1. Open door.
2. Remove fasteners (2).
3. Remove striker (1).

INSTALLATION



1. Align striker (1) with holes in body.
2. Install fasteners.
3. Tighten fasteners to 26 N·m (19 ft. lbs.)

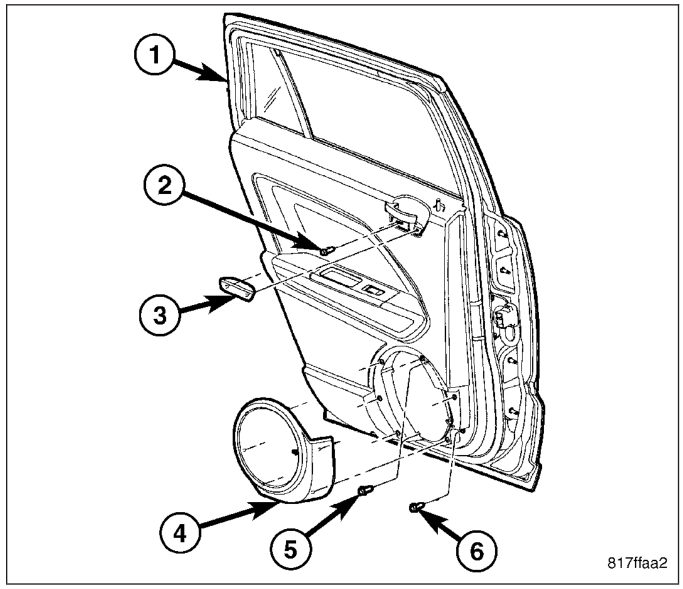
REAR DOOR OUTSIDE HANDLE



REMOVAL

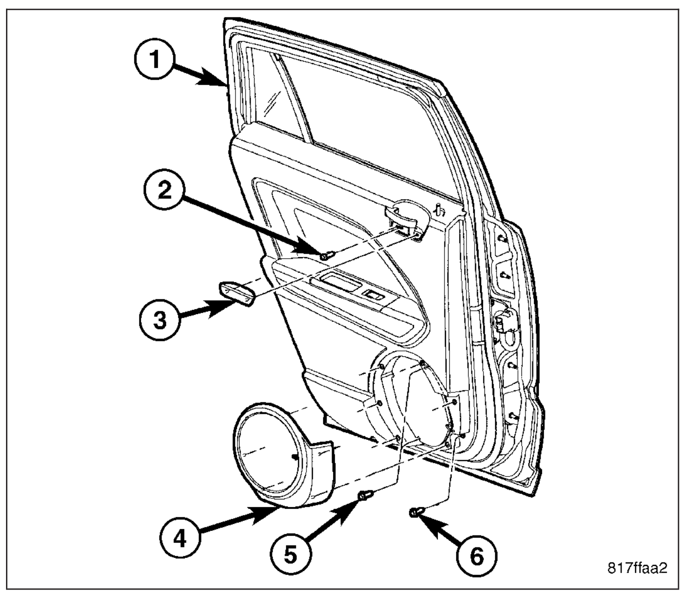
1. Remove door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - REMOVAL)
2. Remove bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
3. Remove door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
4. Remove rod link (1).
5. Remove fasteners (3).
6. Remove handle (2) from door.

INSTALLATION



1. Install door handle (2).
2. Install three fasteners. Tighten to 8 N·m (6 ft. lbs.).
3. Install rod link (1).
4. Install door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)
5. Install bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)
6. Install door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - INSTALLATION)

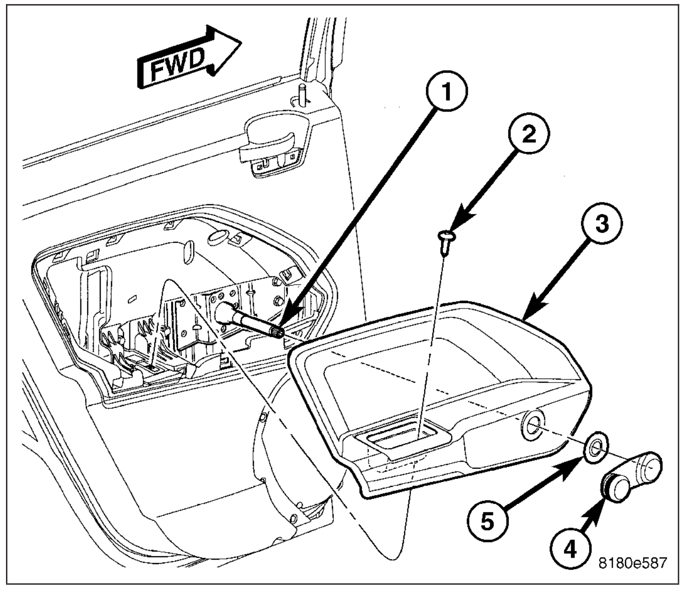
REAR DOOR PLUGS



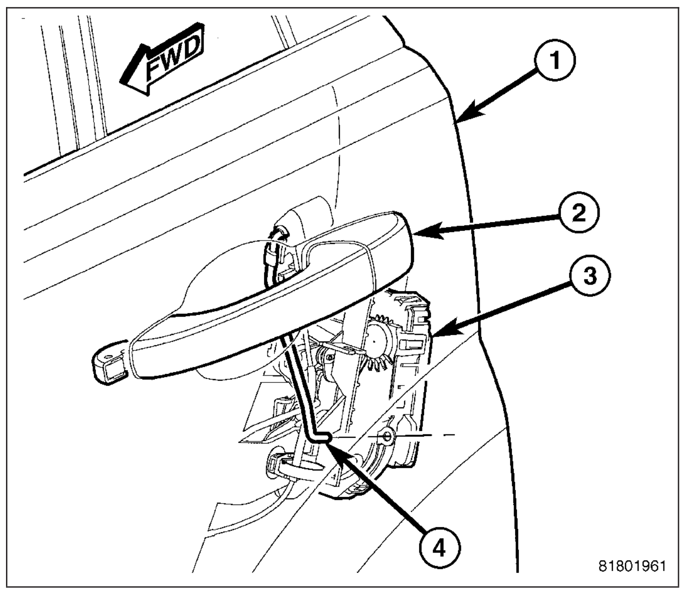
REMOVAL

1. Using special tool C-4755, pry up handle plug (3) from door (1).
2. Using special tool C-4755, pry up speaker grille (4) from door.

INSTALLATION

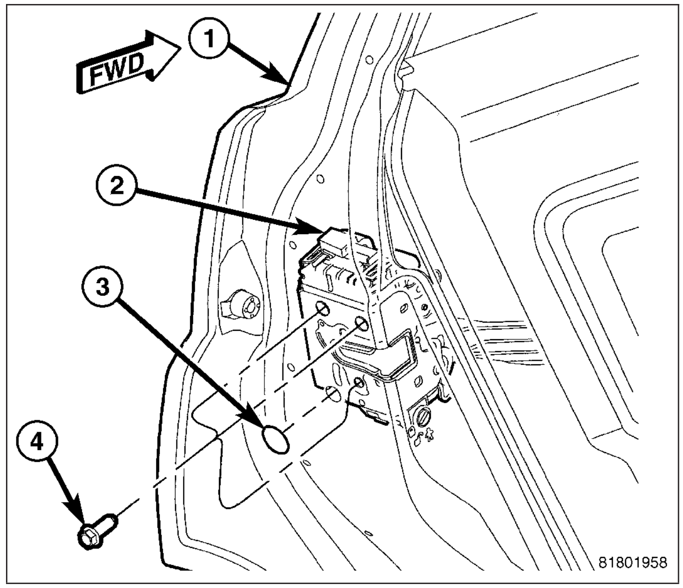


1. Align speaker grille (4) with speaker opening and hand tap speaker grille (4) to door ensuring fit.
2. Align handle plug with handle plug opening and hand tap ensuring fit.



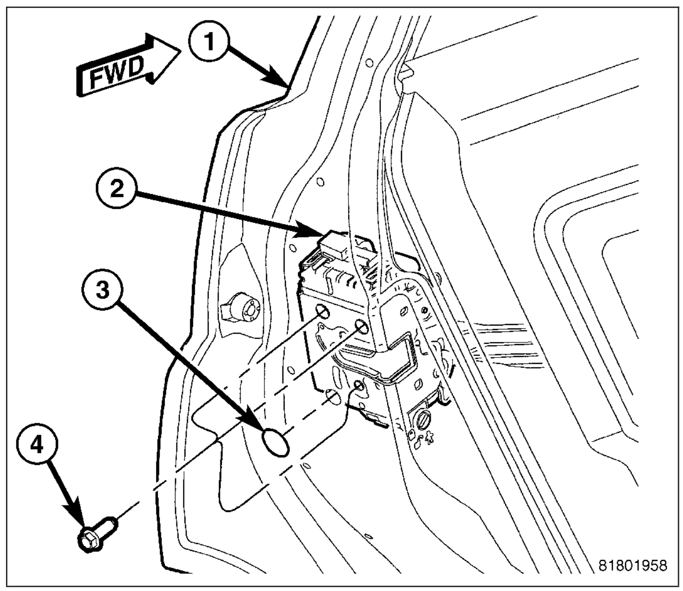
REAR DOOR LATCH

REMOVAL

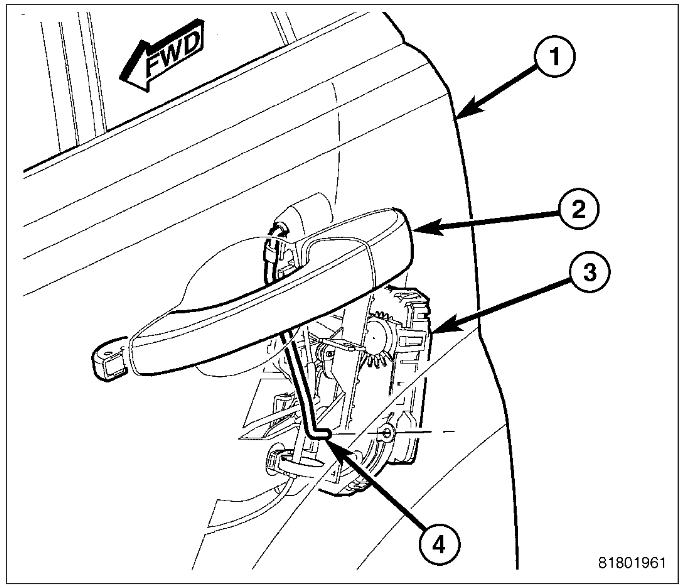


1. Remove window crank handle (4) and washer if equipped.
2. Remove rear door trim bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
3. Remove door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - REMOVAL)
4. Remove rear door module.
5. If equipped, remove wire connector.

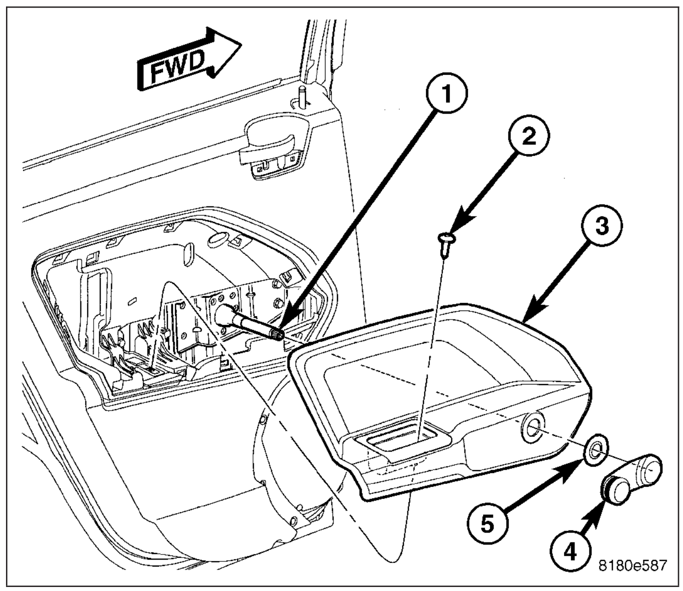
6. Remove latch rod (4) from latch (3).



7. Remove fasteners (4) from latch (2).
8. Remove latch from door.



INSTALLATION

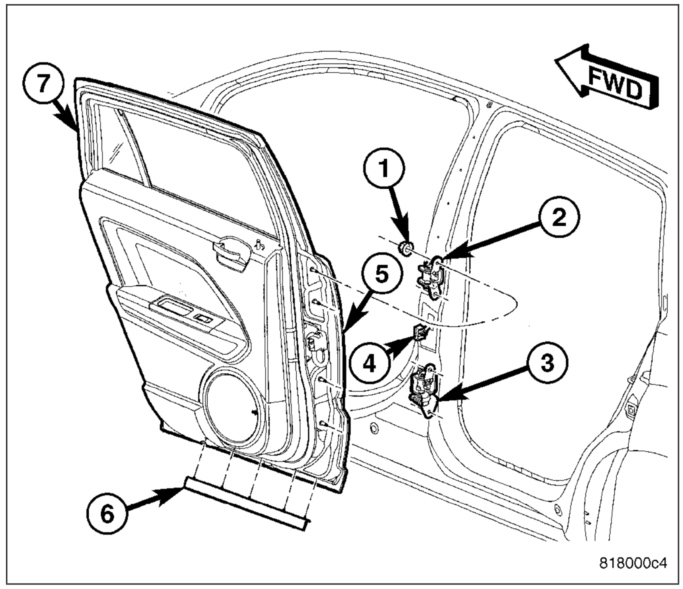


1. Install latch into door (1) and align latch (2) with fastener openings.
2. Install fasteners (4) into latch (2). Tighten to 9 N·m (7ft.lbs.)

3. Connect rod (4) to latch (3).
4. If equipped, connect wire connector to latch.
5. Install door module.
6. Install bolster. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - REMOVAL)
7. Install door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - REMOVAL)

8. If equipped, install window crank (4) and washer.

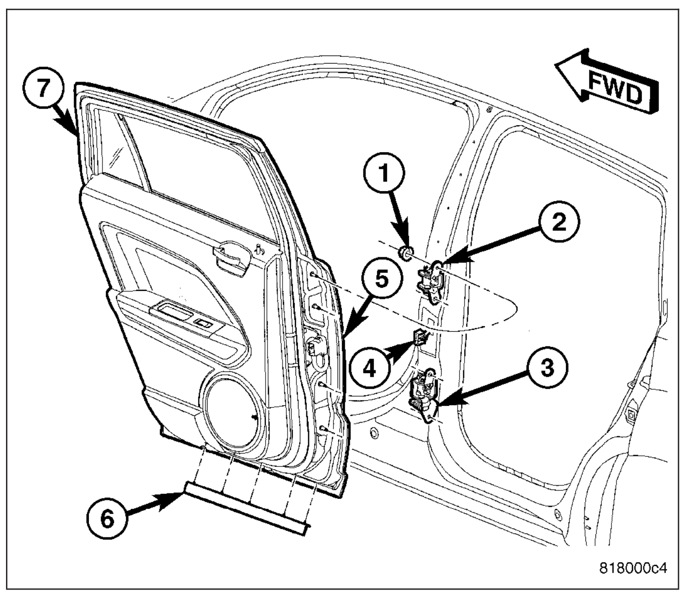
ADJUSTMENTS



REAR DOOR LATCH ADJUSTMENT

1. Insert a Torx® wrench through the elongated hole in the door end frame near the latch striker opening.
2. Loosen screw on the side of the latch linkage.
3. Push button on outside door handle and release it.
4. Tighten screw on latch.
5. Verify latch operation.

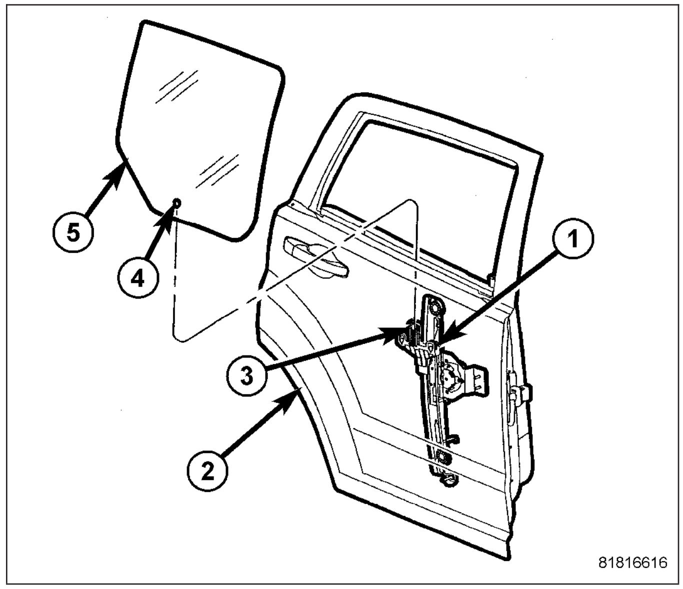
REAR DOOR



REMOVAL

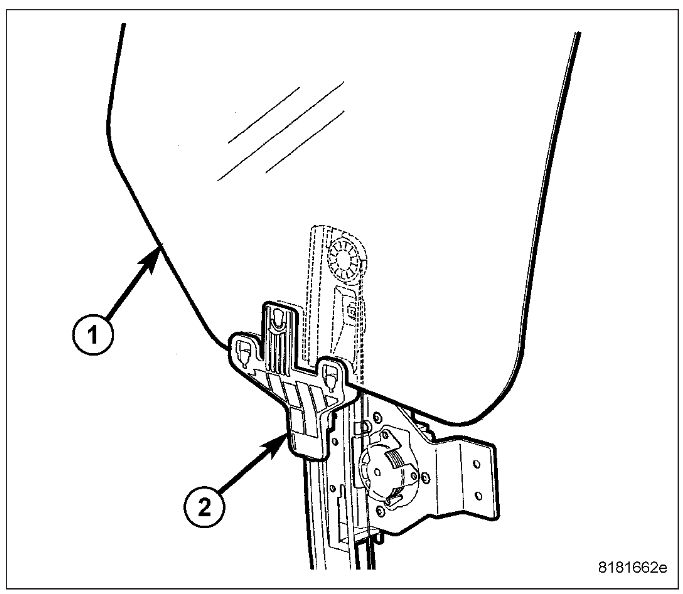
1. With the help of an assistant, carefully remove nuts (1) from door studs.
2. Remove door (7) from vehicle.
3. Disconnect door harness (4).

INSTALLATION



1. Connect wire harness (4) to door (7).
2. With the help of an assistant, insert door studs through hinges.
3. Tighten nuts (1) to 26 N·m (19 ft. lbs).

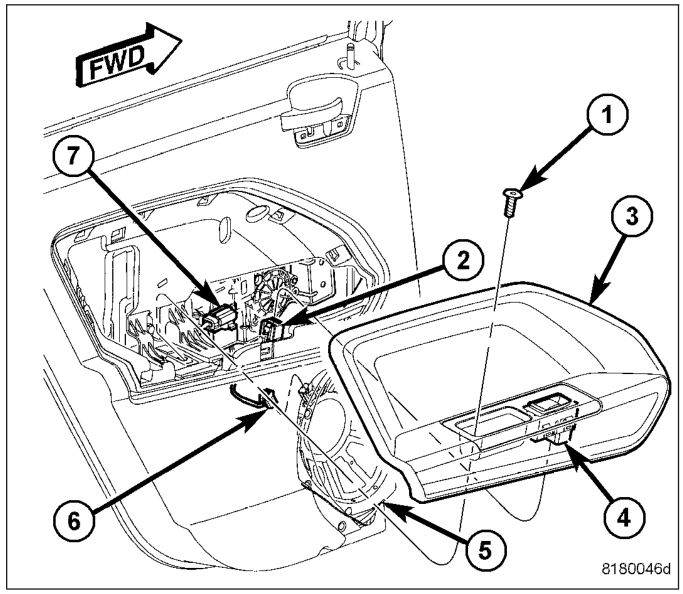
REAR DOOR GLASS



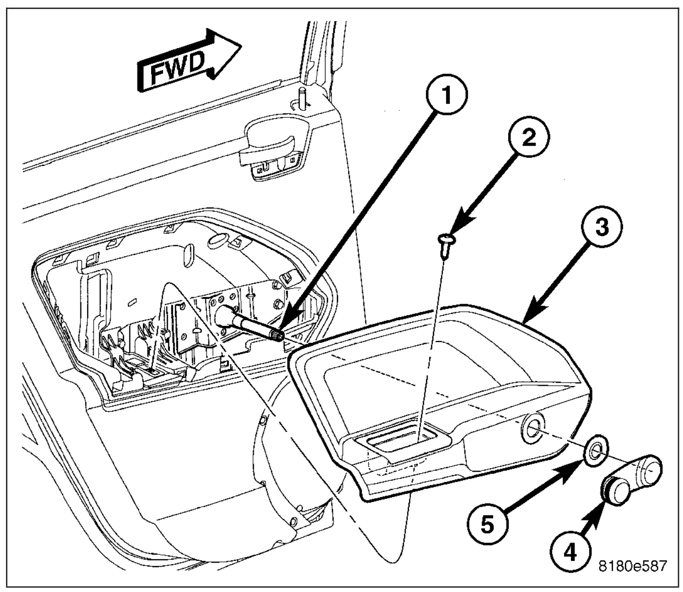
REMOVAL

1. Remove speaker and grille. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)
2. Remove bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
3. Remove door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
4. Raise window (5) gaining access to window tabs.
5. With a punch or equivalent, press regulator tabs holding window in regulator (3).
6. Carefully, remove window (5).

INSTALLATION

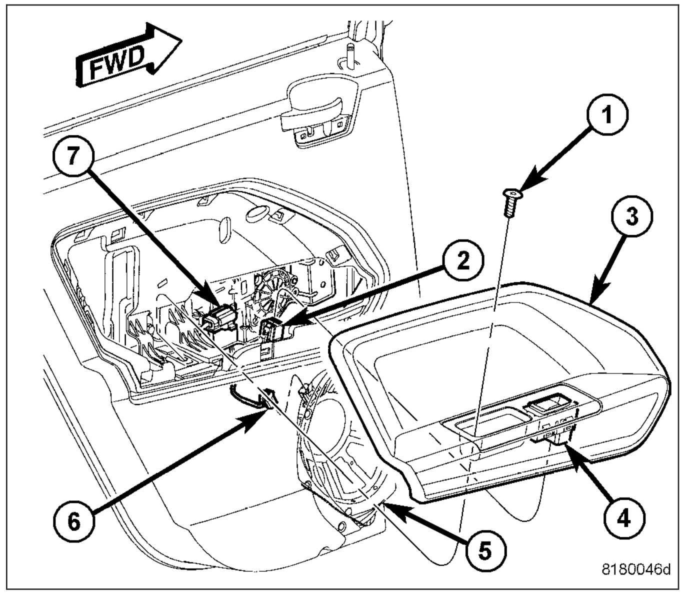


1. Install window regulator to door panel. (Refer to 23 - BODY/DOORS - REAR/WINDOW REGULATOR - INSTALLATION)
2. Install glass (1) down through window channel into window regulator (2) ensuring glass properly seats in access holes.
3. Connect wire connectors.
4. Install door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)
5. Install bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)
6. Install speaker and grille. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL)



REAR DOOR TRIM BOLSTER

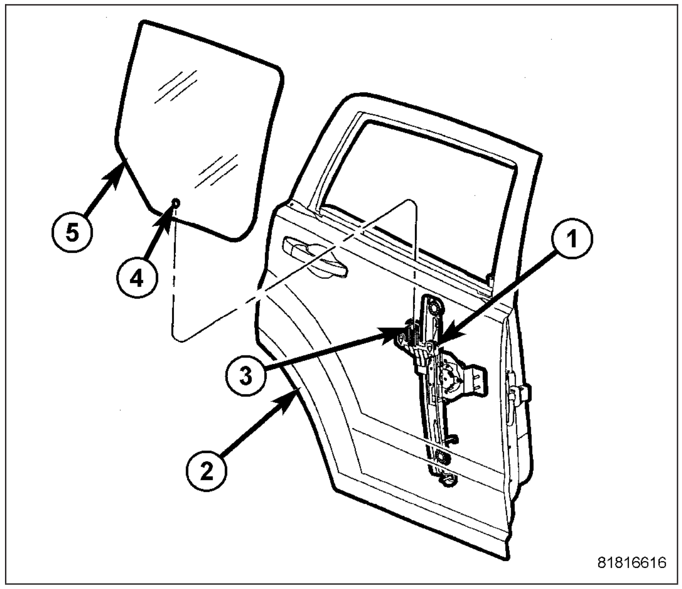
REMOVAL



1. Remove screw (1) from pull cup.

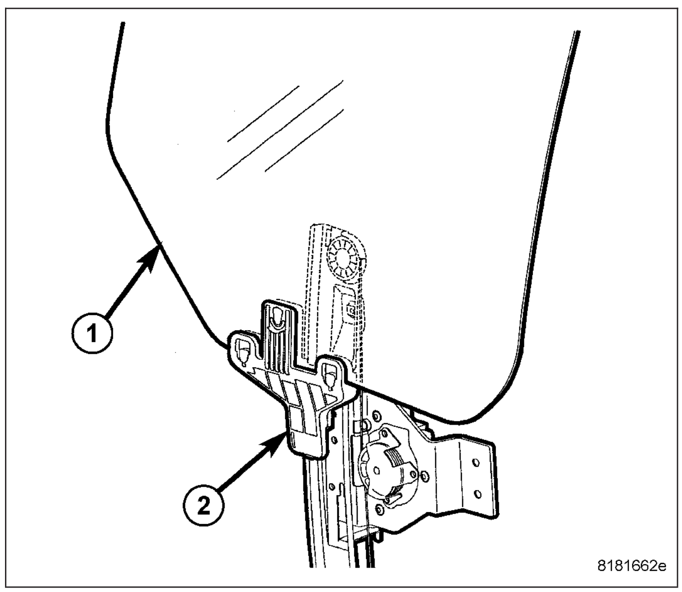
2. If equipped, remove window crank (4) and washer (5) from bolster (3).
3. Using trim stick C-4755, unsnap bolster from door panel.
4. If equipped, disconnect wire connector from window switch.

INSTALLATION



1. Connect wire harness (7) to window switch connector (4).
2. Align bolster (3) with door and hand tap bolster to door ensuring fit.
3. Insert screw (1) into pull cup and tighten.

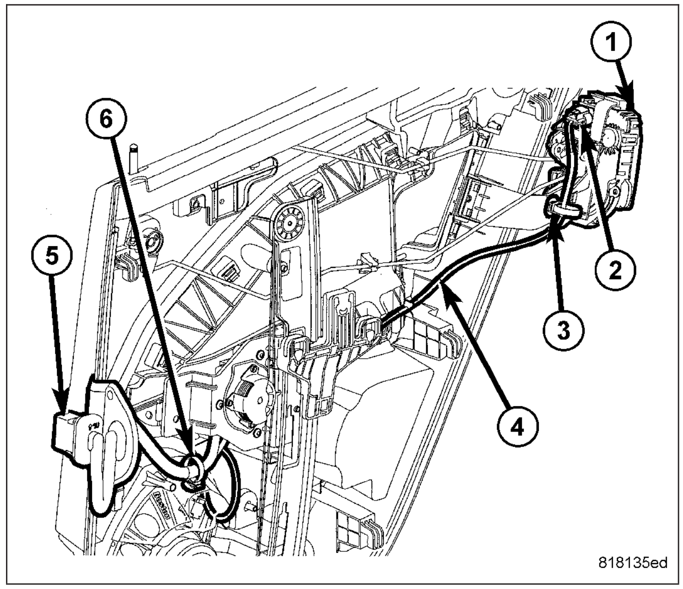
REAR DOOR WINDOW REGULATOR



REMOVAL

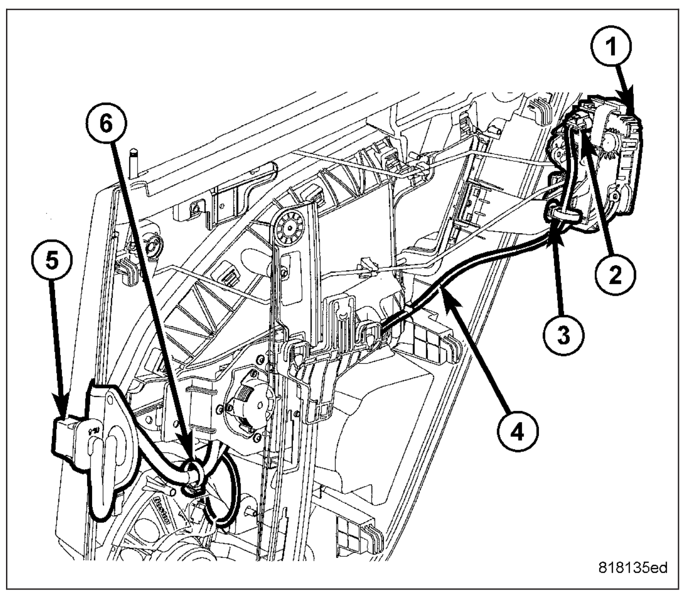
1. Remove door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
2. Remove door glass (5). (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)
3. Remove fasteners, wire connectors and remove window regulator (1) from door panel.

INSTALLATION



1. Fasten window regulator to door panel.
2. Connect wire connectors.
3. Install glass ensuring proper seat. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)
4. Install door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)

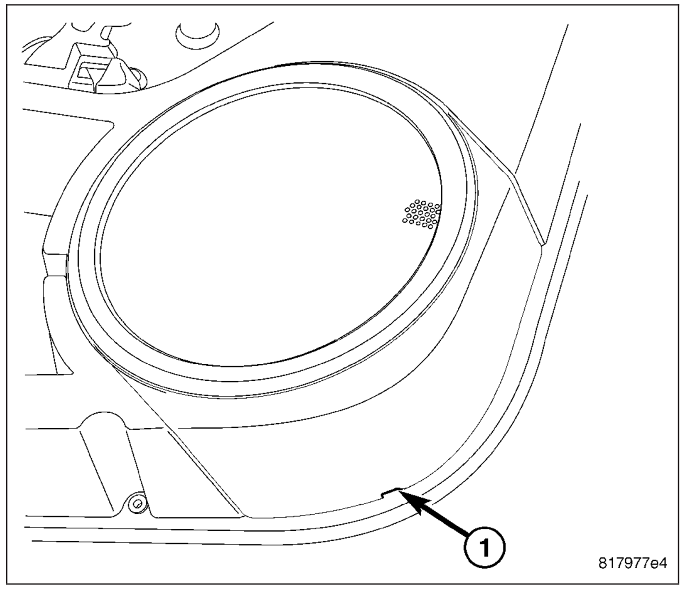
DOOR-MODULE



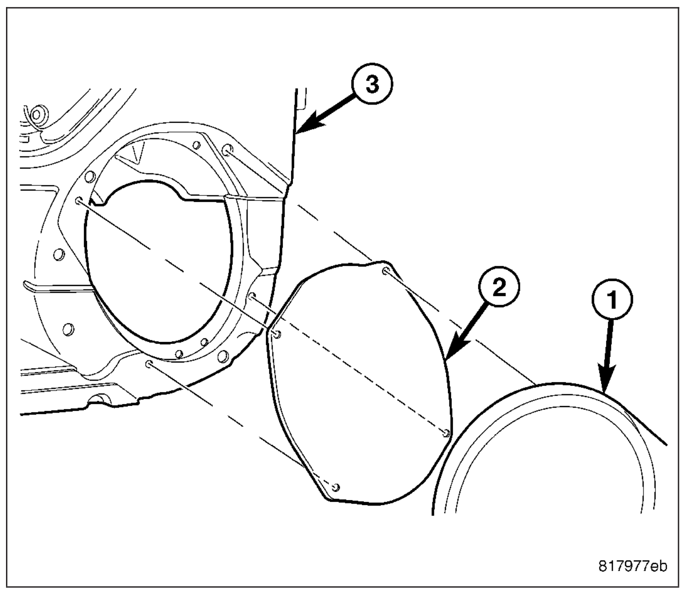
REMOVAL

1. Remove door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - REMOVAL)
2. Remove speaker and grille. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
3. Remove handle if equipped. (Refer to 23 - BODY/DOORS - REAR/EXTERIOR HANDLE - REMOVAL)
4. Remove trim bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL)
5. Remove glass. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - REMOVAL)
6. Remove module fasteners.
7. Disconnect wire connector (5).

INSTALLATION



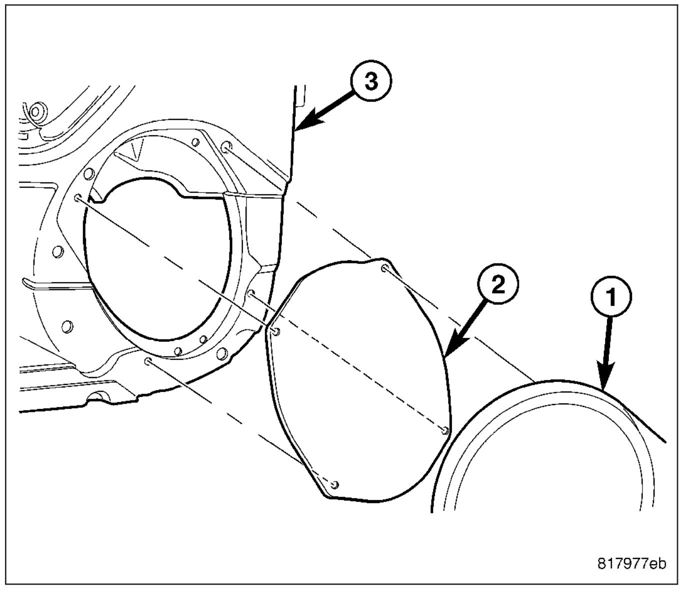
1. Install glass. (Refer to 23 - BODY/DOORS - REAR/DOOR GLASS - INSTALLATION)
2. Place panel up to door, and plug in electrical connectors (5).
3. Connect wire connector to latch (3).
4. Install module to door and tighten fasteners.
5. If equipped, install window handle crank.
6. Install trim bolster. (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION)
7. Install door plugs. (Refer to 23 - BODY/DOORS - REAR/APPLIQUE - INSTALLATION)
8. Install door speaker and grille. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)



SPEAKER AND GRILLE

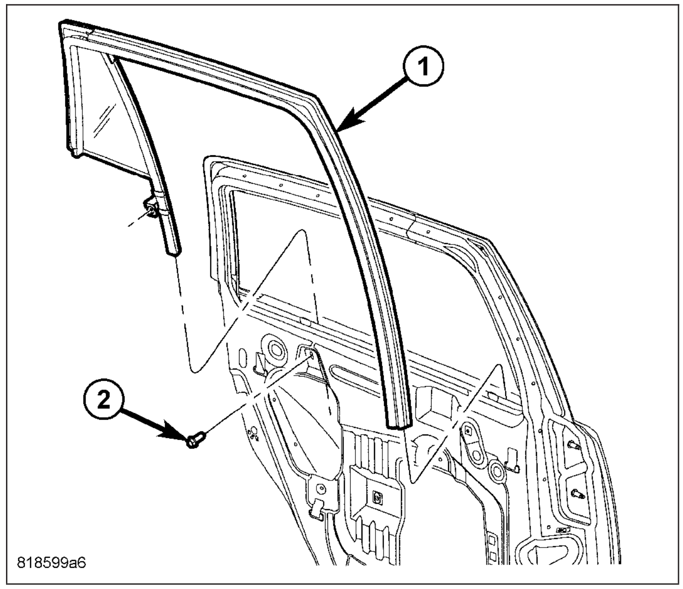
REMOVAL

1. Using trim stick C–4755, find service notch (1) located at the bottom of speaker grille and pry up speaker grille.



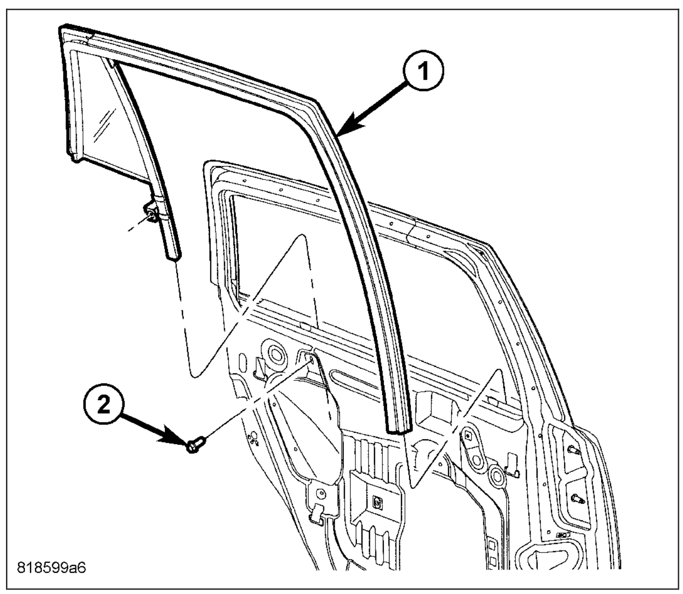
2. Remove two screws attaching speaker to door panel (3).
3. Remove two screws attaching speaker (2) to door module (1).
4. Disconnect wire connector.

INSTALLATION



1. Place speaker (2) up to door module (3).
2. Connect wire connector.
3. Install screws fastening speaker to door module.
4. Place speaker grille (1) up to door module and install fasteners.

GLASS RUN CHANNEL

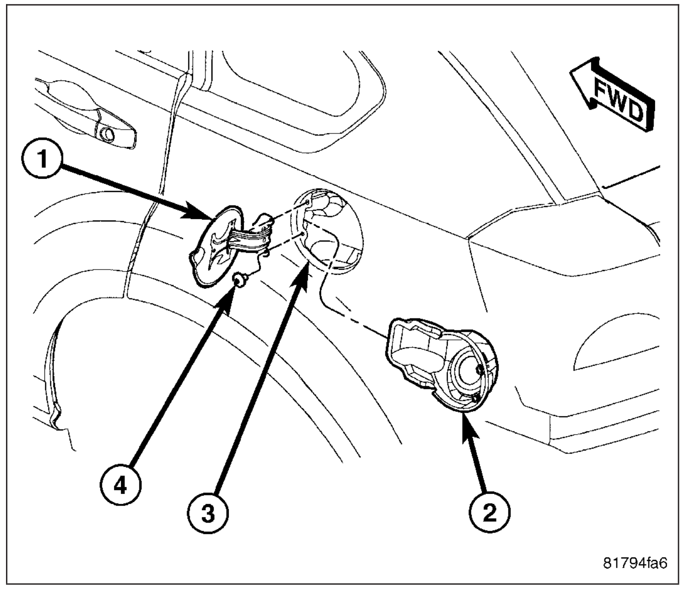


REMOVAL

1. Remove door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - REMOVAL)
2. Remove glass run fastener (2).
3. Remove glass run from door.

INSTALLATION

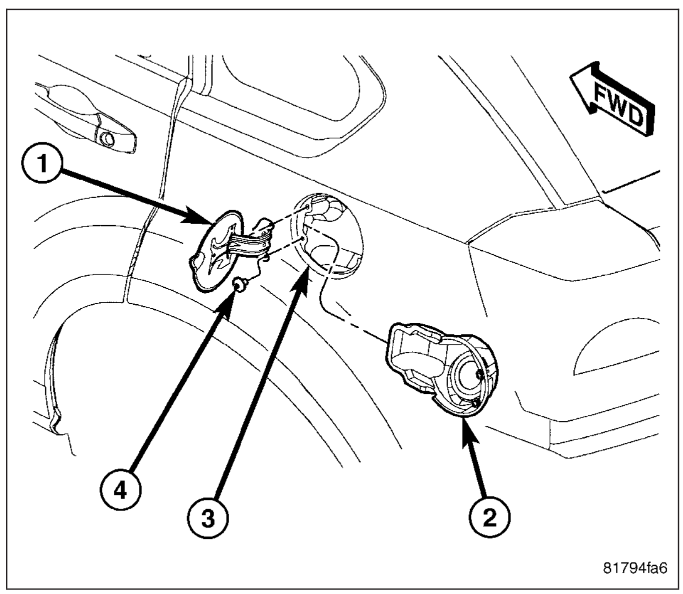
1. Lower glass run into glass run door channel.
2. Install fastener (2).
3. Install door module. (Refer to 23 - BODY/DOORS - REAR/DOOR - INSTALLATION)



EXTERIOR

TABLE OF CONTENTS

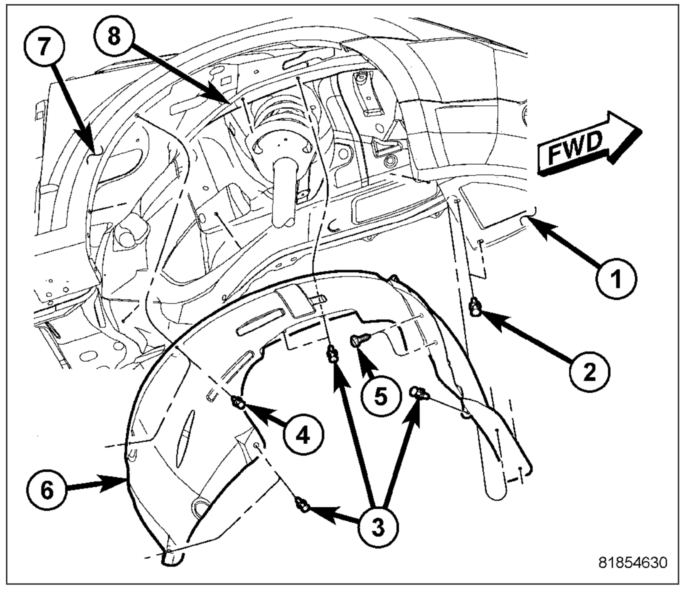
DOOR-FUEL FILL



REMOVAL

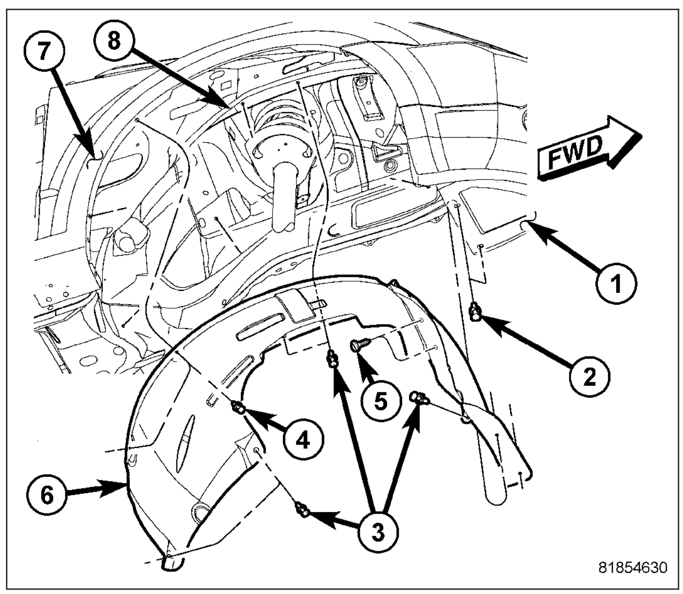
1. Remove fuel filler door fasteners (4).
2. Remove fuel filler door.
3. Remove fuel filler housing screws.
4. Remove fuel filler housing.

INSTALLATION



1. Install fuel filler housing (2).
2. Install fuel housing screws.
3. Align fuel door (1) with fuel door holes.
4. Fasten fuel door (1) to fender (3) with fasteners.

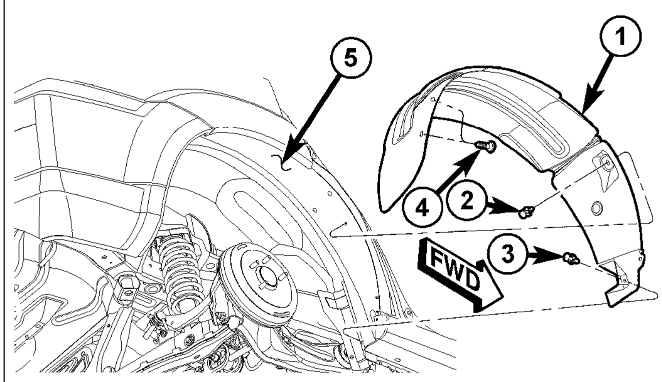
SPLASH SHIELD-FRONT WHEELHOUSE



REMOVAL

1. Raise and support the vehicle.
2. Remove the front wheels. (Refer to 22 - TIRES/ WHEELS - REMOVAL).
3. Remove push pins (2) and (3).
4. Remove screws (4) and (5)
5. Remove splash shield (6) from wheelhouse.

INSTALLATION

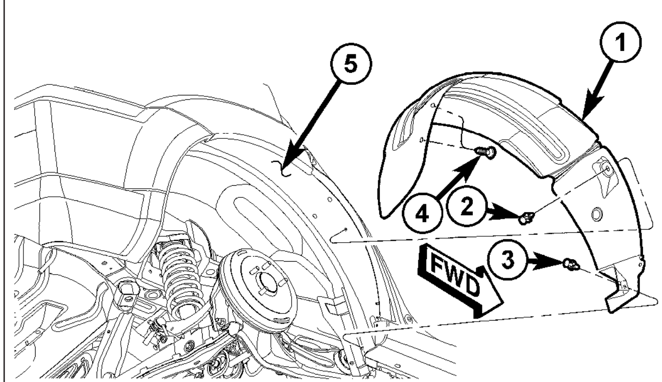


1. Raise and support vehicle.
2. Remove rear wheels. (Refer to 22 - TIRES/ WHEELS - REMOVAL)
3. Raise splash shield (5) up to wheel house and align with holes in quarter panel (6).
4. Install push pins (2)and (3).
5. Install screws (6) and (4).

SPLASH SHIELD-REAR WHEELHOUSE

REMOVAL

1. Raise and support the vehicle.
2. Remove the left and right front wheel. (Refer to 22 - TIRES/WHEELS - REMOVAL)
3. Remove push pins (2) and (3)..
4. Remove fasteners (4).

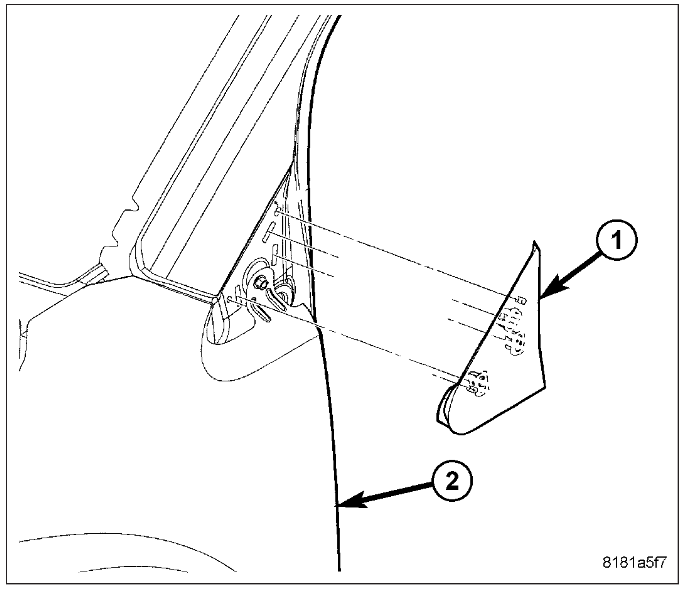


818546d3

INSTALLATION

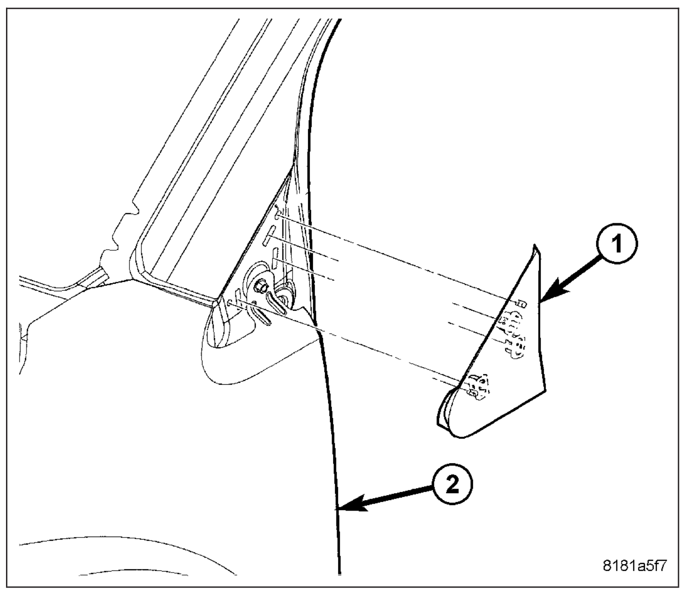
NOTE: Left hand side has 2 additional push pins as it has additional material to cover the fuel filler tube.

1. Raise and support vehicle.
2. Remove the front wheels. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
3. Place splash shield (1) up to wheel house (4) and align splash shield holes with fender.
4. Install push pins (2) and (3).
5. Remove fasteners (4).



818546d3

SIDE VIEW MIRROR



REMOVAL

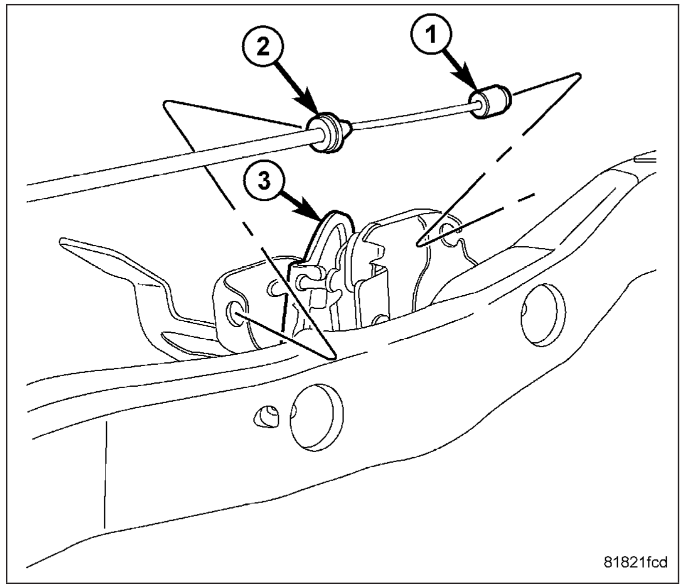
1. Using trim stick C-4755, pry up mirror flag (1) and remove from door (2).

INSTALLATION

1. Place mirror flag over location ensuring tabs are aligned with tab locations.
2. Hand tap mirror flag (1) into place.

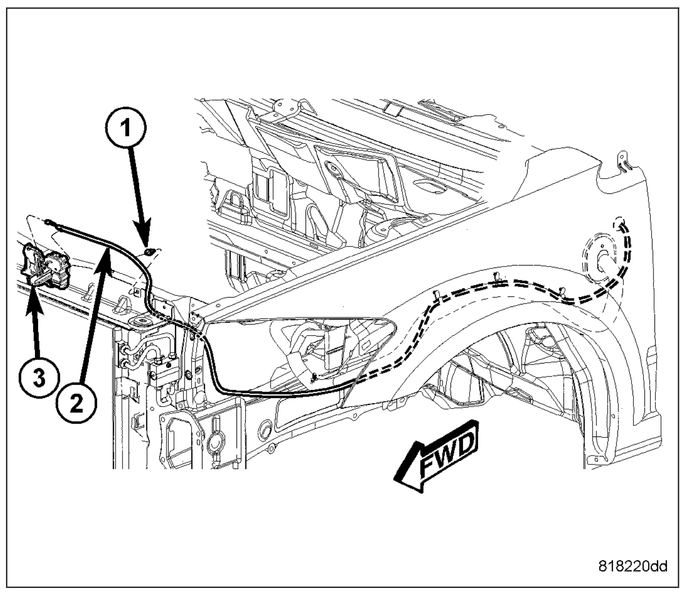
HOOD

TABLE OF CONTENTS



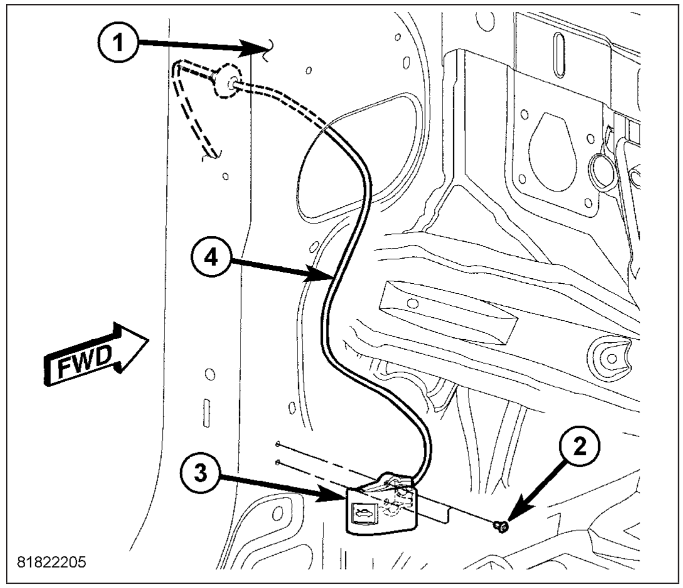
CABLE-LATCH RELEASE

REMOVAL



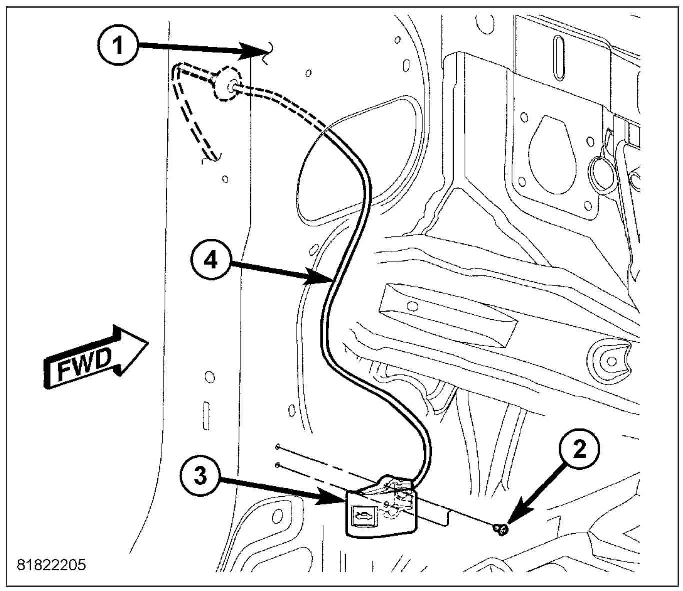
1. Remove the wheel mounting nuts, then the front drivers side tire.
2. Remove front drivers side splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL)

NOTE: See cable route.

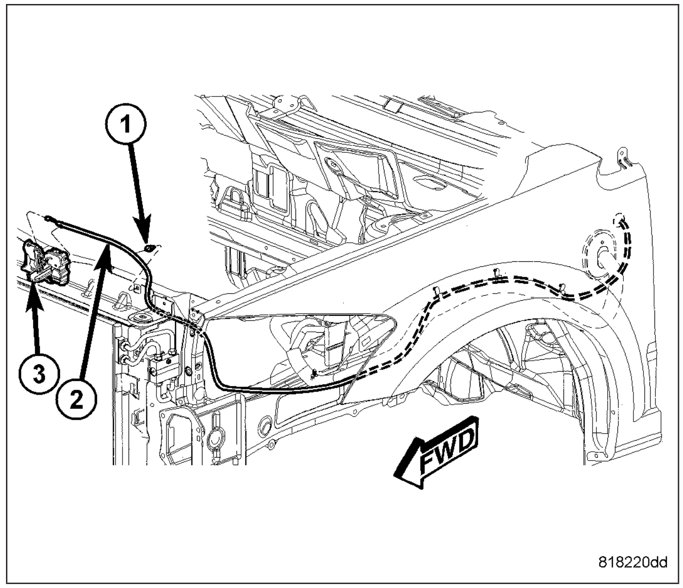


3. Press down latch release (3) and remove cable (2) from grommet (1).

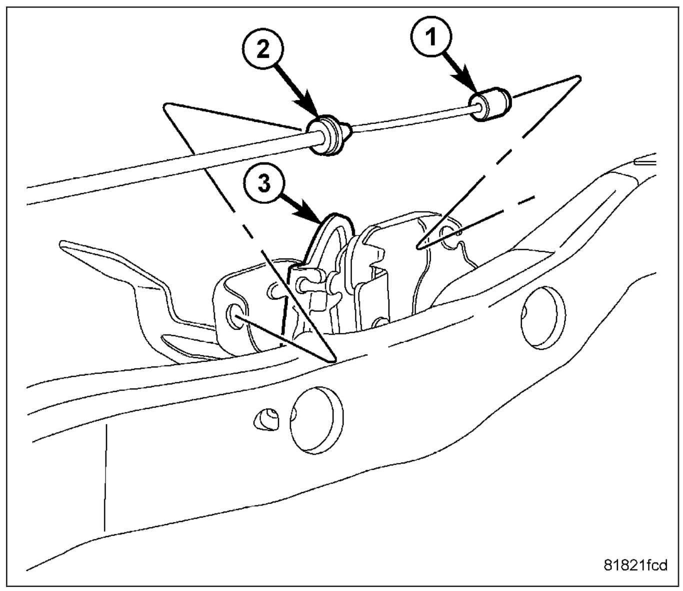
4. Remove cable (2) from latch (3).
5. Follow cable and remove cable from push pin grommets.



6. Remove fasteners (2) from hood release located inside vehicle.
7. Remove cable from hood release (3).

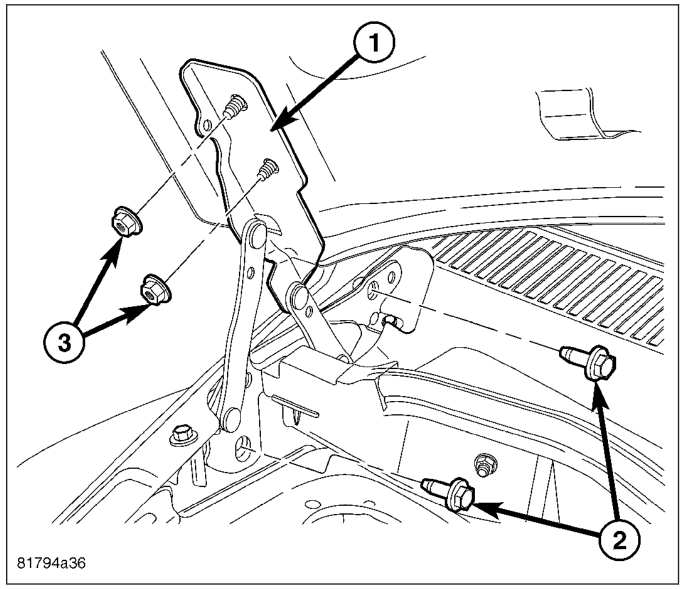


INSTALLATION



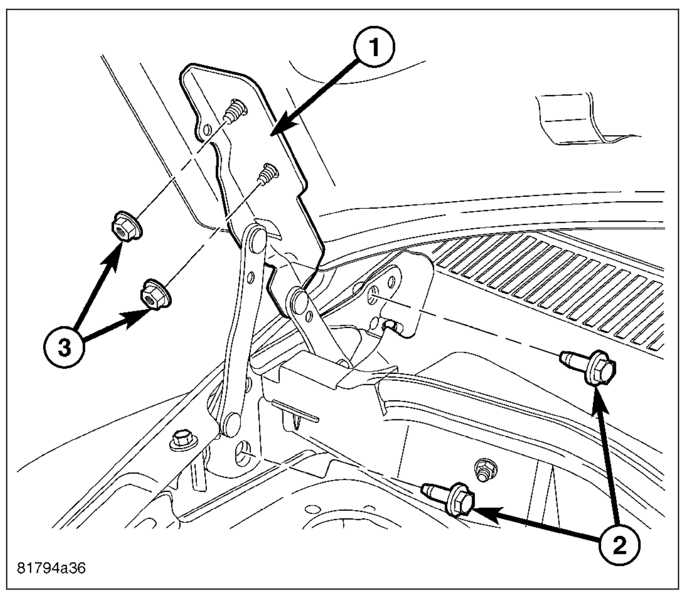
1. Install fasteners (2).
2. Install cable into hood release lever (3), and route cable (4) through grommet.
3. Remove splash shield. (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL)

4. Route cable along underneath splash shield and route toward radiator support.



5. Insert cable (2) into latch (3) and route front of cable (1) into access hole.

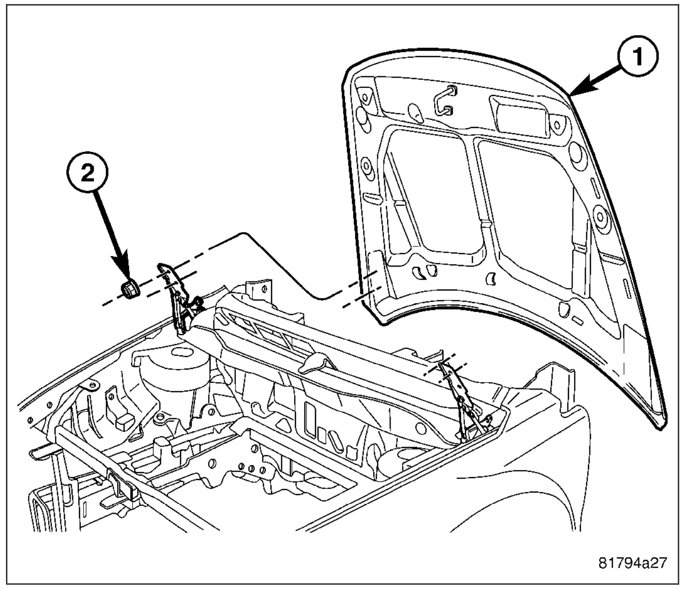
HINGE



REMOVAL

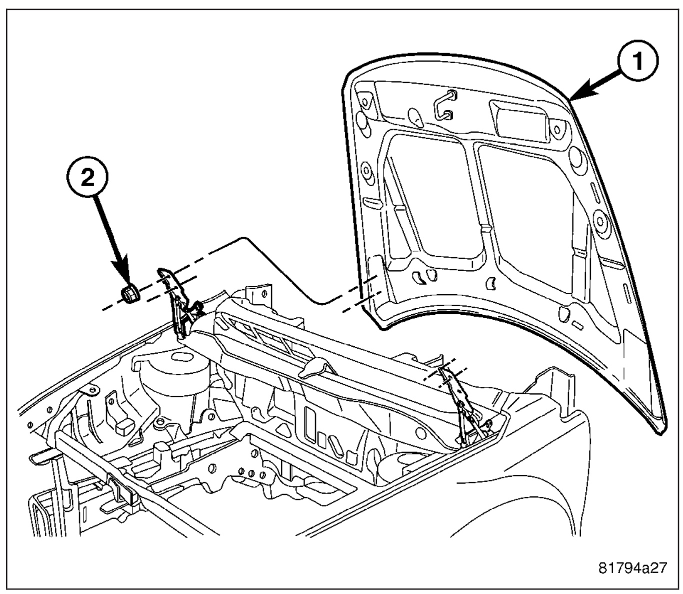
1. With the help of an assistant, have the assistant hold the opposite side of hood that is being worked on.
2. Remove fasteners (2) from hinge (1).
3. Remove hood from hinge (1). (Refer to 23 - BODY/HOOD/HOOD - REMOVAL)
4. Repeat step if necessary.

INSTALLATION



1. Align hood hinge with fastener holes.
2. Install fasteners (2) in to hinge holes.
3. Tighten nuts (3) to 20 N·m (15 ft.lbs.).
4. Install hood to hinge. (Refer to 23 - BODY/HOOD/HOOD - INSTALLATION)

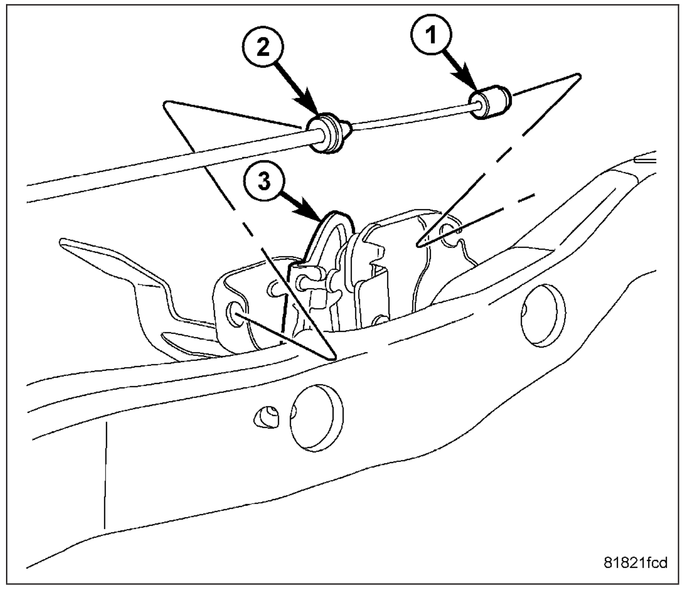
HOOD



REMOVAL

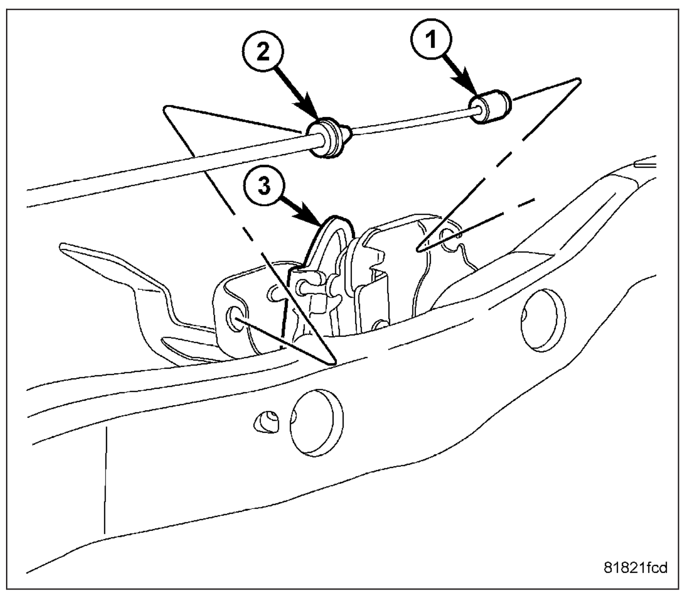
1. Disconnect wire connector if equipped.
2. Mark nut locations with a grease pencil or scribe to provide reference marks for installation.
3. With the help of an assistant, have the assistant hold the opposite side of the hood while removing nuts (2) from hinge.
4. Move to opposite side of hood (1) and repeat step.
5. Remove hood.

INSTALLATION



1. With the help of an assistant, align hood with hinge holes.
2. Align nuts with scribed marks and install nuts on studs.
3. Tighten nuts to 20 N·m (15 ft. lbs.).
4. Connect wire connector if necessary.

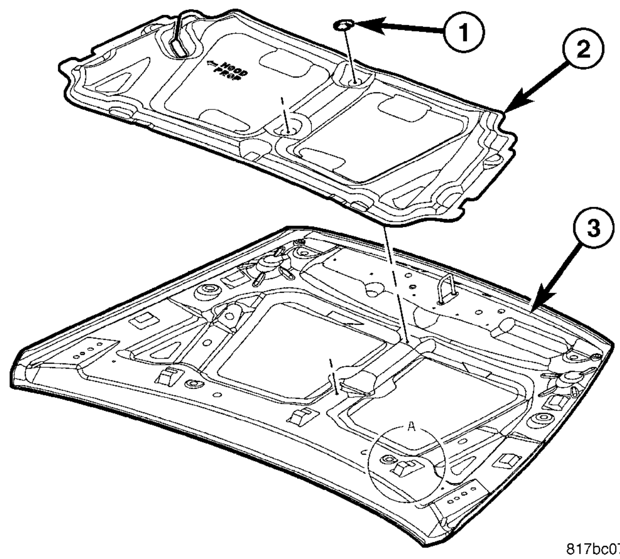
LATCH



REMOVAL

1. Press down latch release (3) and remove cable (2) from grommet.
2. Remove cable from latch (3).
3. Remove fasteners.

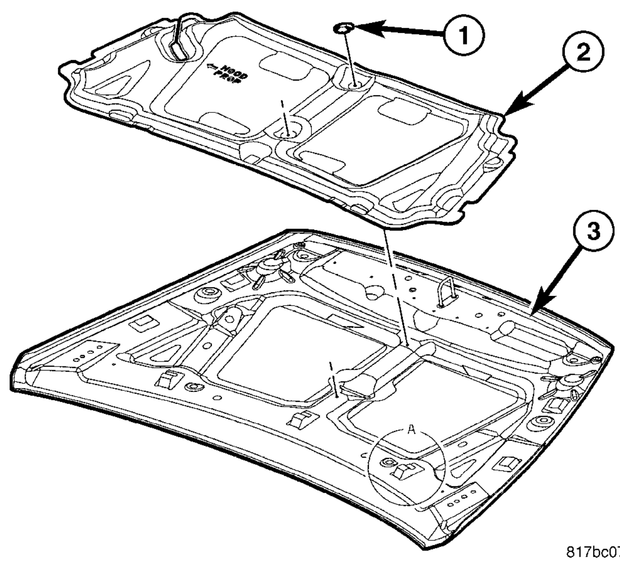
INSTALLATION



1. Install cable (2) into latch (3) and route end of cable (1). Pull cable into latch (3) ensuring proper seat.

INSULATION - HOOD

REMOVAL



1. Remove two push pins (1) fastening hood insulation (2) to hood (3).
2. Remove insulation from hood by pulling insulation outward from hood tabs.

817bc072

INSTALLATION

1. Insert hood insulation (2) into hood tabs.
2. Insert push two pins (1).

817bc072

INSTRUMENT PANEL

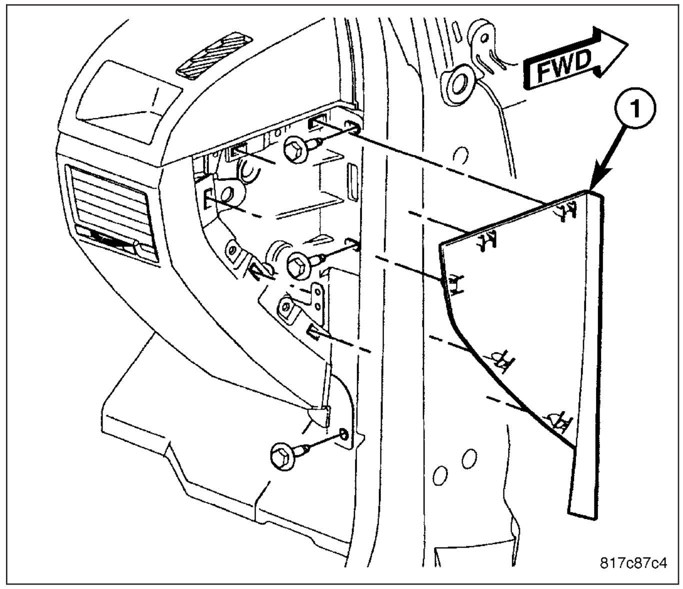


TABLE OF CONTENTS

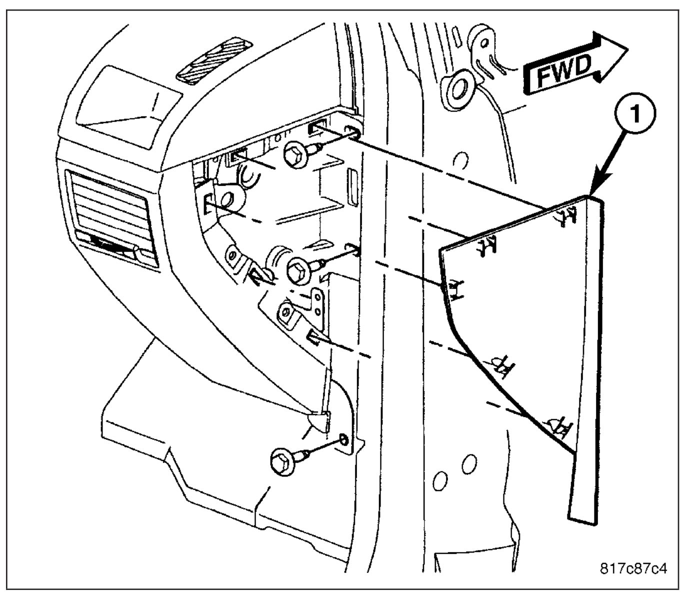
END CAP-INSTRUMENT PANEL

REMOVAL

NOTE: Right hand shown. Left hand similar.

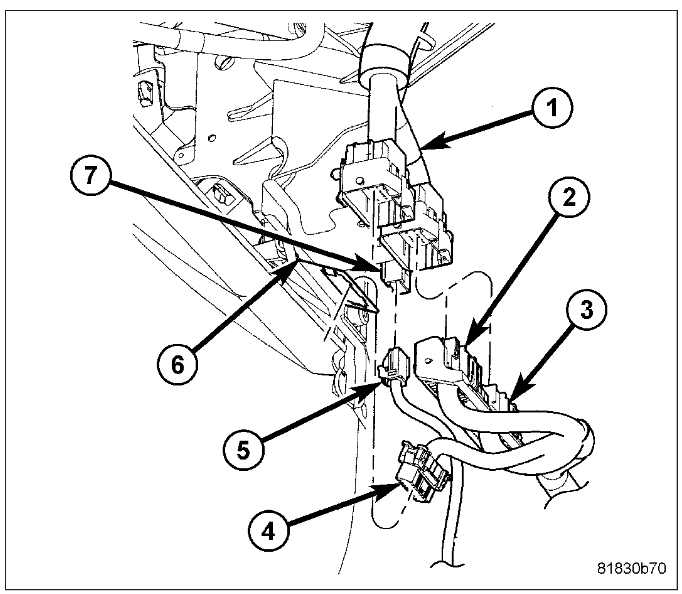


1. Using trim stick C-4755, pry up end cap (1) and remove.

INSTALLATION

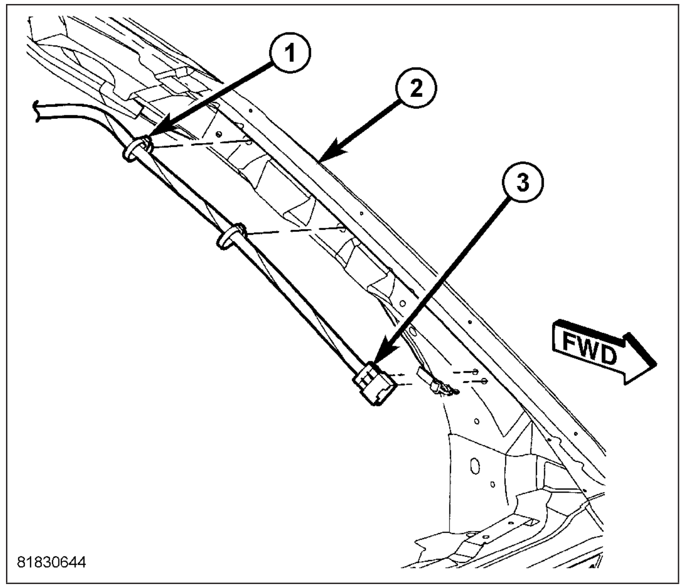
NOTE: Right hand shown. Left hand similar.

1. Place end cap clips over instrument panel inner.
2. Tap on end cap clip locations ensuring proper seat.



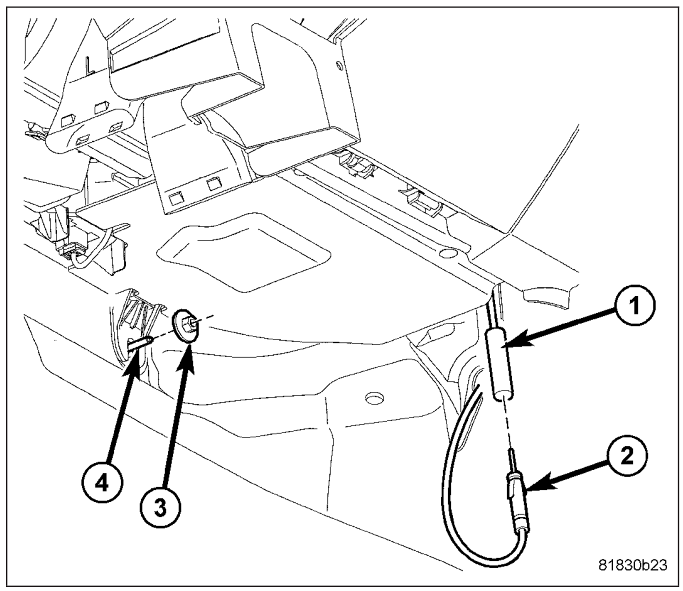
ASSEMBLY-INSTRUMENT PANEL MODULE

REMOVAL

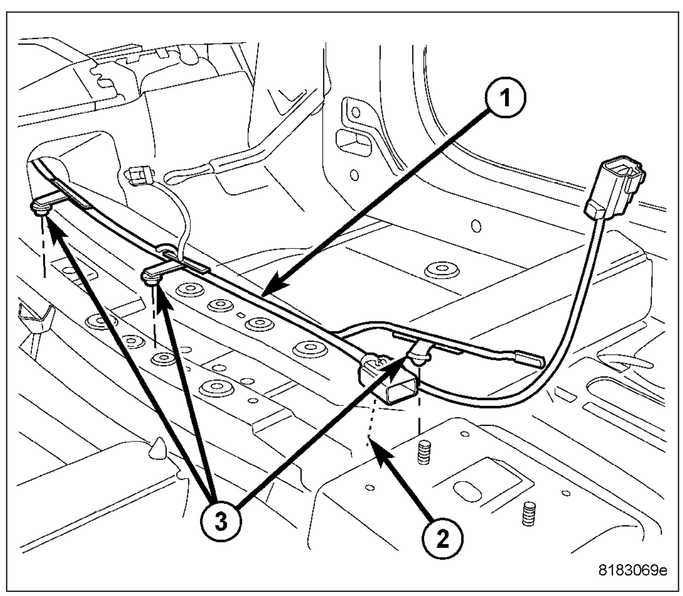


WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

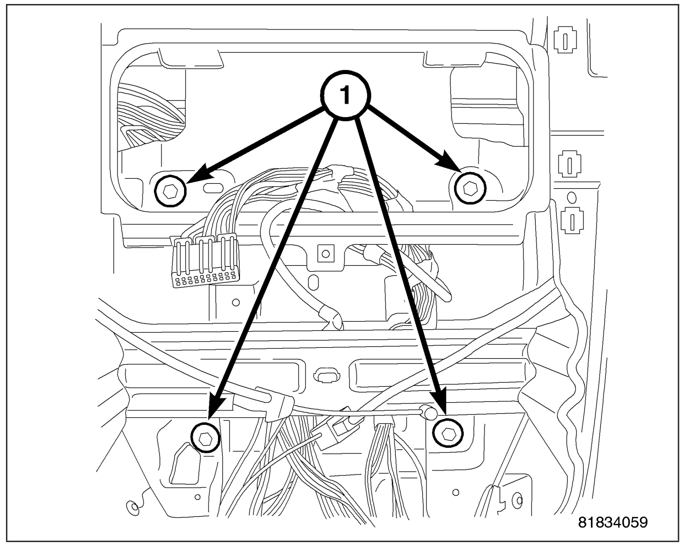
NOTE: Left hand drive shown. Right hand drive similar.



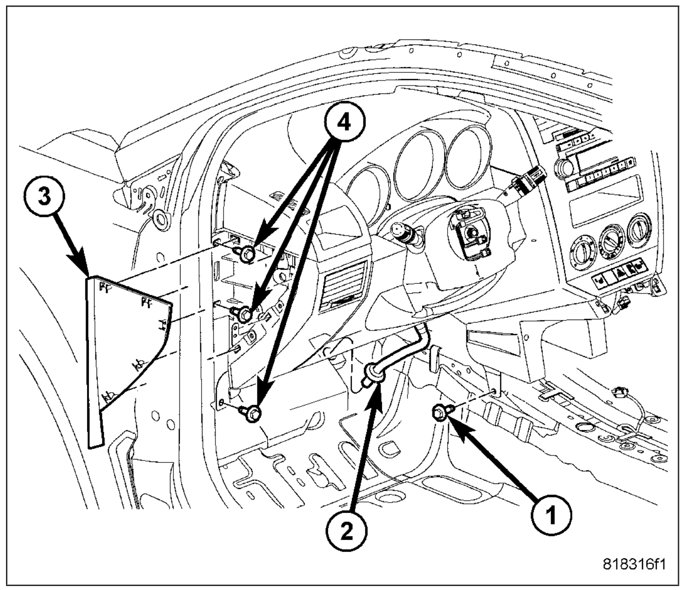
1. Disconnect and isolate the negative battery cable.
2. Remove left and right end caps. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL)
3. If equipped, remove both left and right knee air bag covers.
4. Remove the steering shrouds. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN SUPPORT BKT - REMOVAL)
5. Disconnect steering column wire harness.
6. Remove steering column assembly. (Refer to 19 - STEERING/COLUMN - REMOVAL)
7. Remove automatic or manual shifter bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL)
8. Remove center console shifter housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
9. Remove center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
10. Remove shifter assembly.
11. Remove left and right A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
12. Remove top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
13. Remove left cowl panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)
14. Disconnect instrument panel wire harness (1) from (2) and (3),(7) and (5) located behind cowl panel.



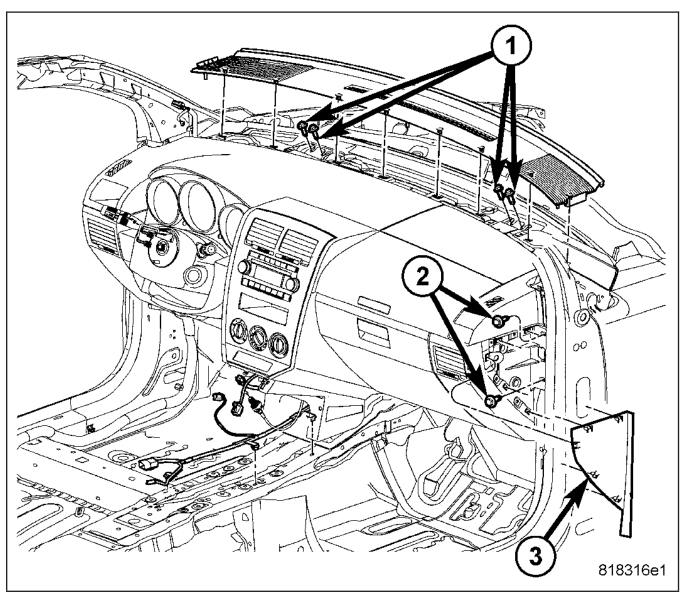
15. Disconnect wire harness (3) clipped (1) along A - pillar (2).
16. Remove glove box. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)
17. Remove right side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)



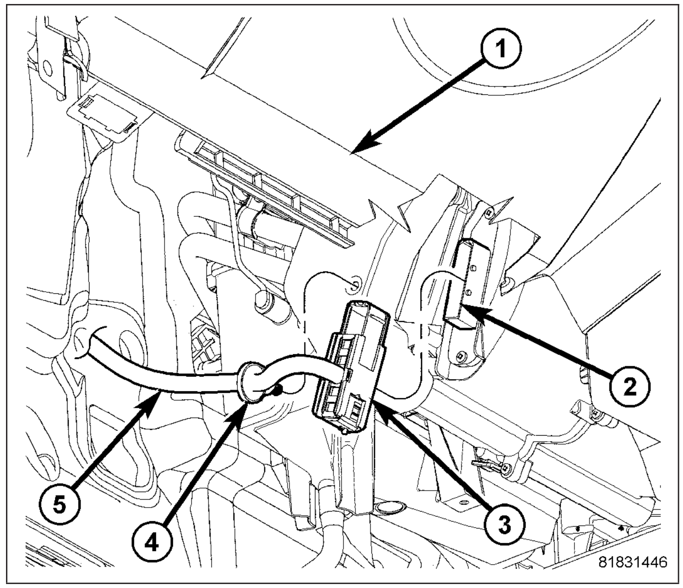
18. Disconnect antenna wire (2) from radio harness (1)
19. Remove left and right front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
20. Remove center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
21. Remove right and left B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
22. Remove right and left lower B-pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
23. Remove left and right door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL)



24. Pull back carpet gaining access to center console wire connectors.
25. Disconnect instrument panel center console wire harness (1).
26. Remove left and right floor ducts. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FLOOR DISTRIBUTION DUCTS - REMOVAL)



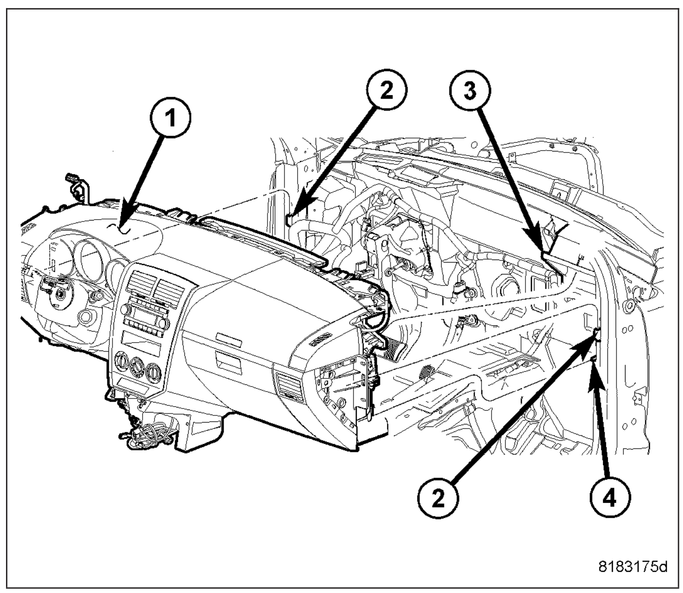
27. Remove four bolts (1) behind center bezel and one behind glove box.



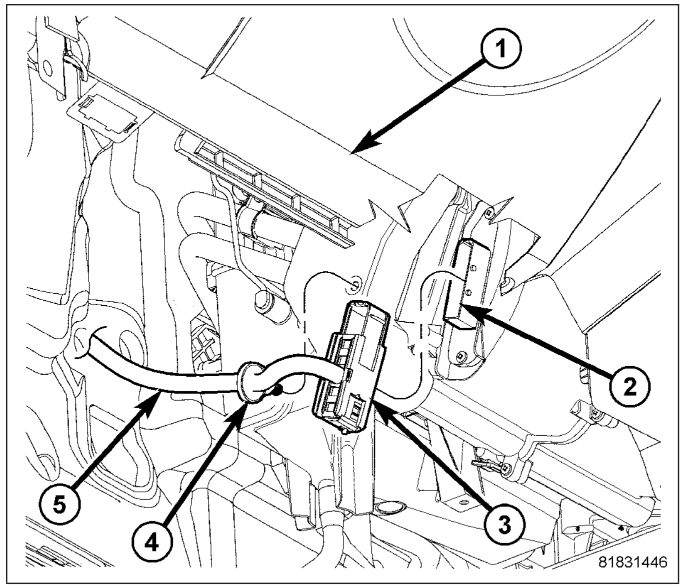
28. Remove bolts fastening Instrument panel to cowl panel. Three bolts (4) located behind left end cap, and one at the bottom of the instrument panel (1).
29. Remove condensation drain tube (2). (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ WATER VALVE - REMOVAL)

30. Remove two bolts (2) behind the left end cap and four screws (1) located under the top cover.

31. Disconnect wire harness from HVAC (2).
32. With the help of assistant, remove instrument panel through driver side door.

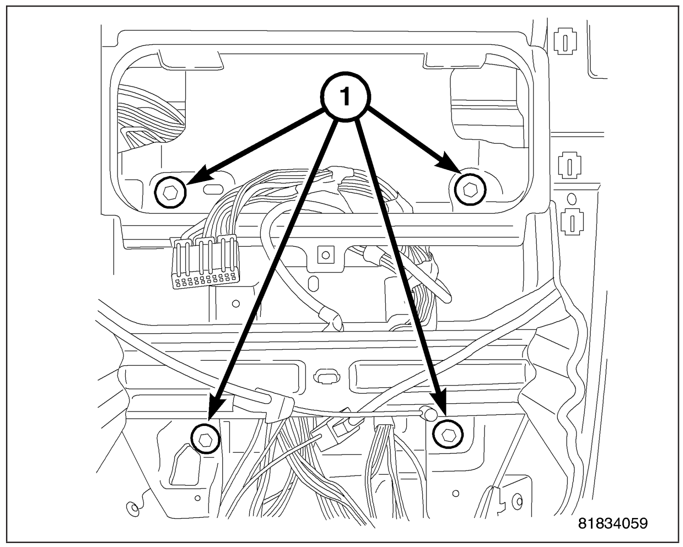


INSTALLATION

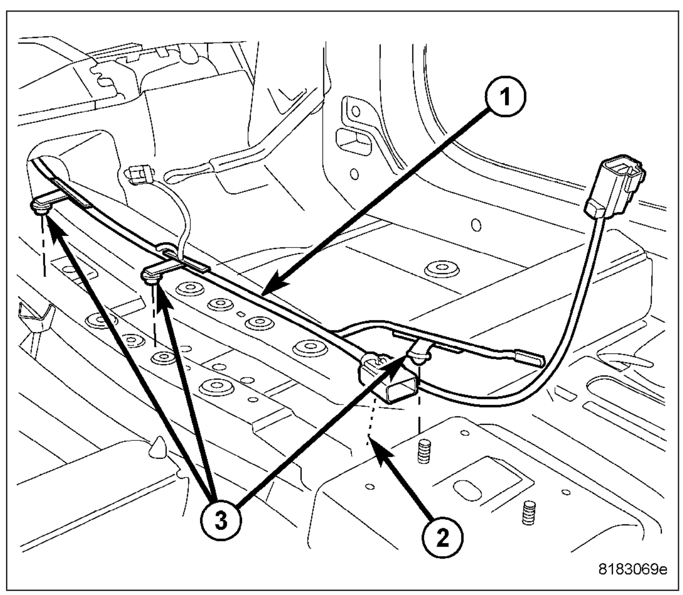


WARNING: On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

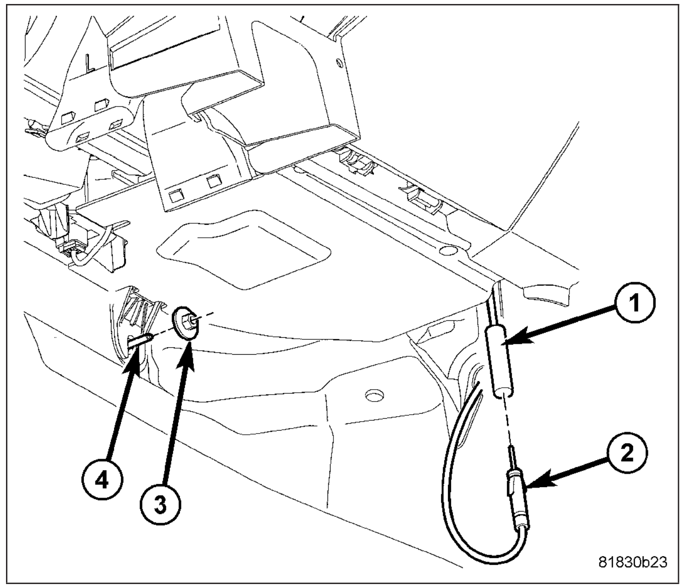
NOTE: Left hand drive shown. Right hand drive similar.



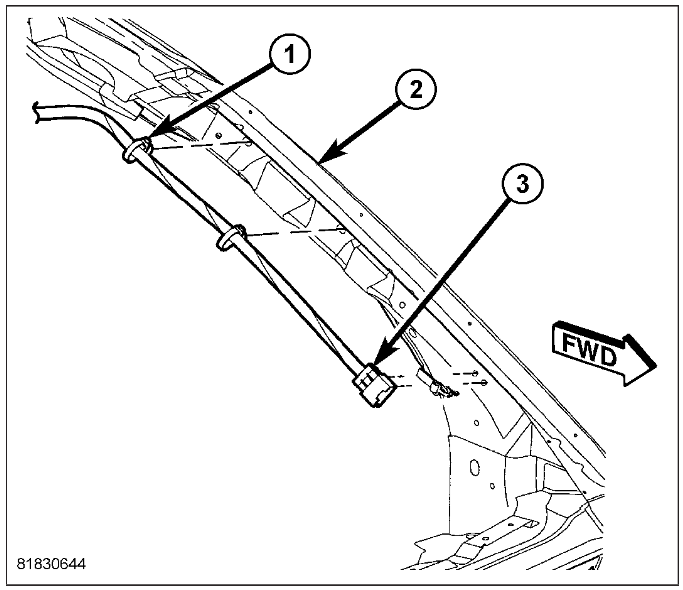
1. With the help of an assistant, load instrument panel into vehicle inserting stud (2) into dash and ensuring instrument panel hangs on reinforcement (2).
2. Install condensation drain tube into floor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ WATER VALVE - REMOVAL)



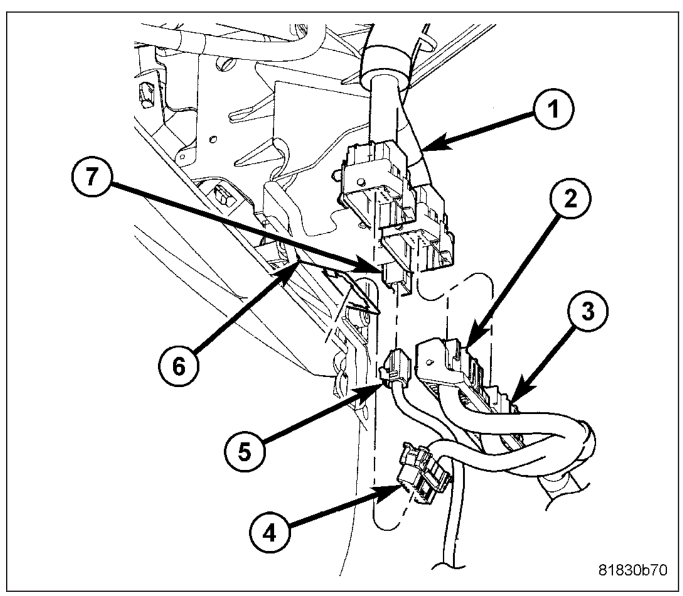
3. Connect HVAC wire harness (2).
4. Install 11 instrument panel to cowl panel fasteners. Tighten to 21 N·m (15 ft. lbs.).



5. Install four fasteners (1) behind center bezel and one behind glove box.
6. Install left and right floor ducts. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/WATER VALVE - REMOVAL)



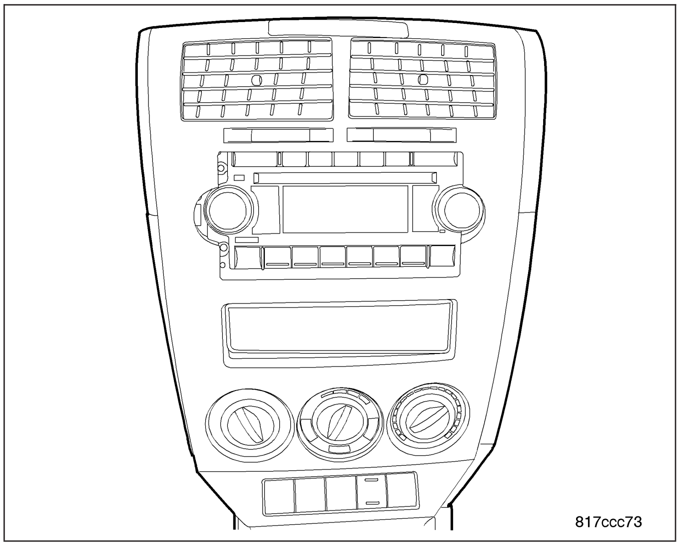
7. Connect instrument panel center console wiring harness.
8. Install left and right door scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION)
9. Install lower B - Pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
10. Install B - Pillar trim panels. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)
11. Install Center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
12. Install left and right seats. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)



13. Connect radio harness (1) to antenna (2).
14. Install right cowl panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)
15. Install glove box.

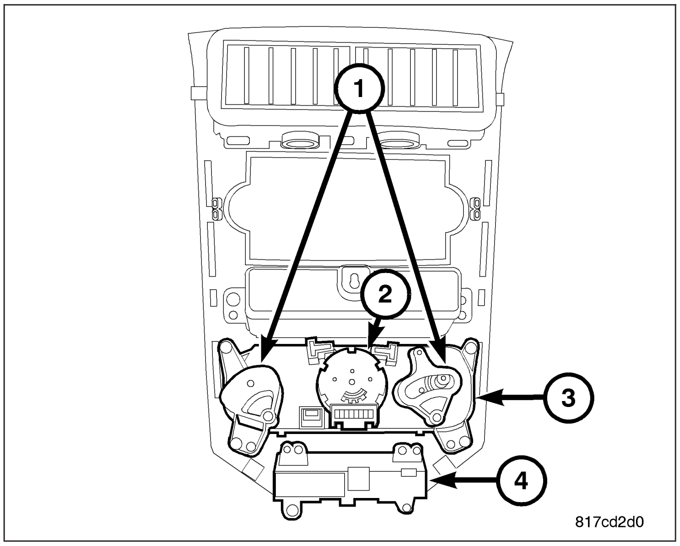
16. Connect A-Pillar (2) wiring harness (3).

17. Connect instrument panel wiring harness (1) to (2) and (3), (7), and (5).
18. Install left cowl panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)
19. Install Top Panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)
20. Install left and right A - Pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)
21. Install shifter assembly.
22. Install center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
23. Install center console shifter housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)



24. Install manual or automatic shifter bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION)
25. Connect steering column wire harness.
26. Connect steering column. (Refer to 19 - STEERING/COLUMN - INSTALLATION)
27. Install steering cover shrouds. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN SUPPORT BKT - INSTALLATION)
28. If equipped, install left and right airbag covers.
29. Install left and right end caps. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION)
30. Connect the negative battery cable.

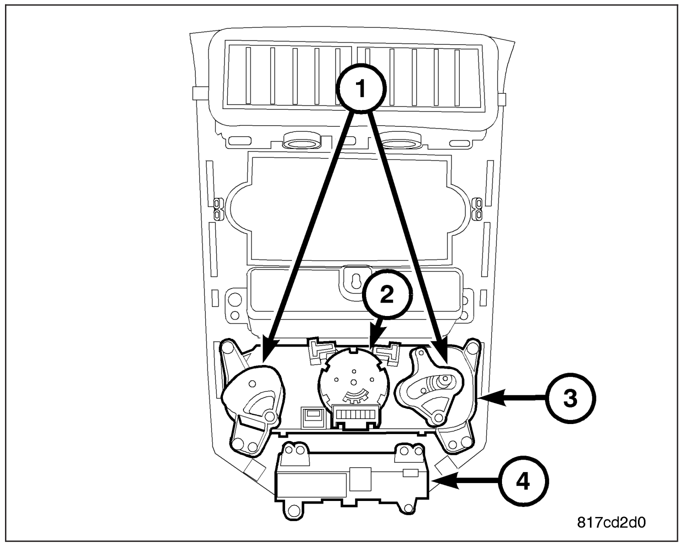
BEZEL-CENTER



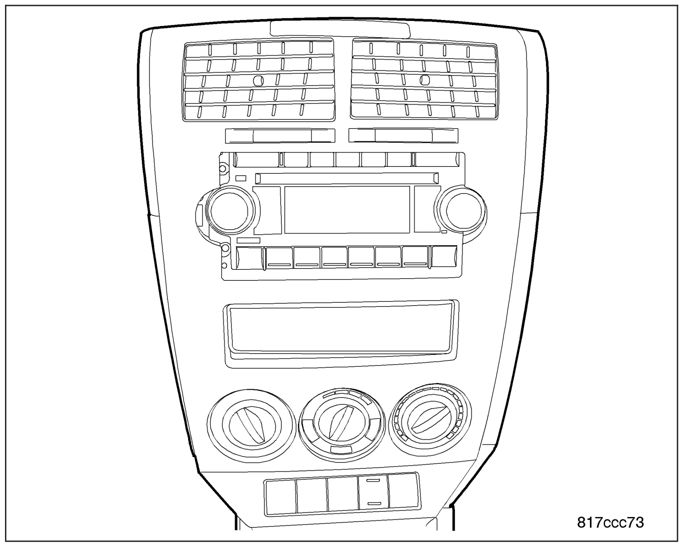
REMOVAL

1. Remove shifter bezel.
2. Using trim stick C-4755, remove center bezel.

817ccc73



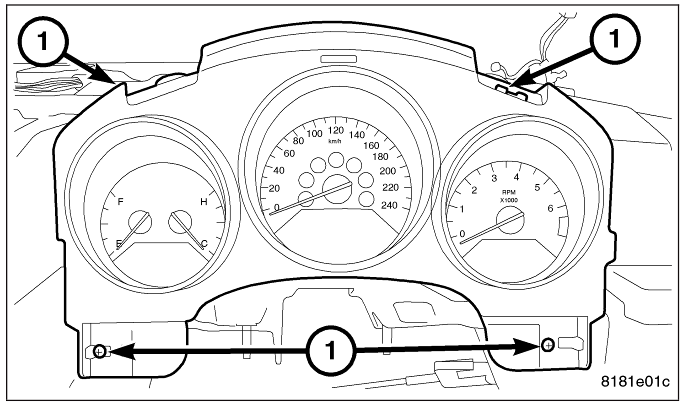
3. Disconnect wire harness from accessory switch bank (2).
4. Disconnect HVAC control cables (1).
5. Remove fasteners attaching HVAC control head (3) to bezel.
6. Remove switch bank (4) from bezel.



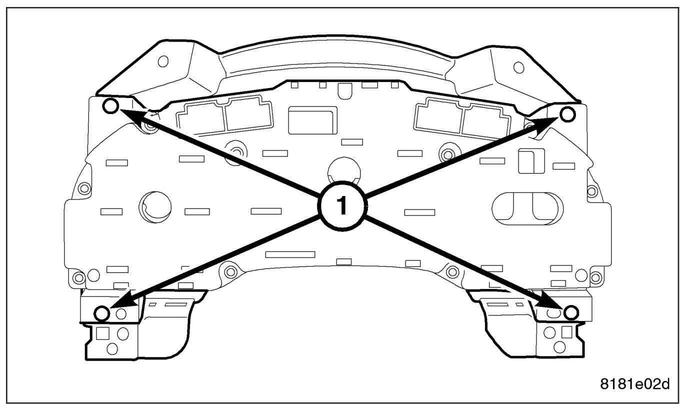
817cd2d0

INSTALLATION

1. Install switch bank (4) onto bezel).
2. Route cables through center bezel and connect to HVAC control head (3).
3. Connect control head (3) to center bezel.
4. Connect wire harness connectors to accessory switch bank (2).



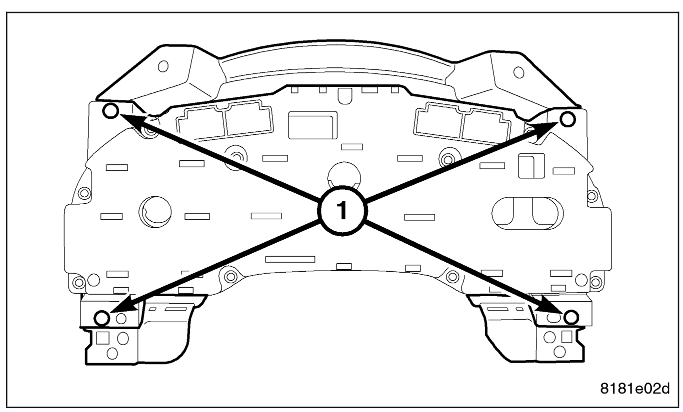
5. Hand tap center bezel on to instrument panel to ensure proper seating.



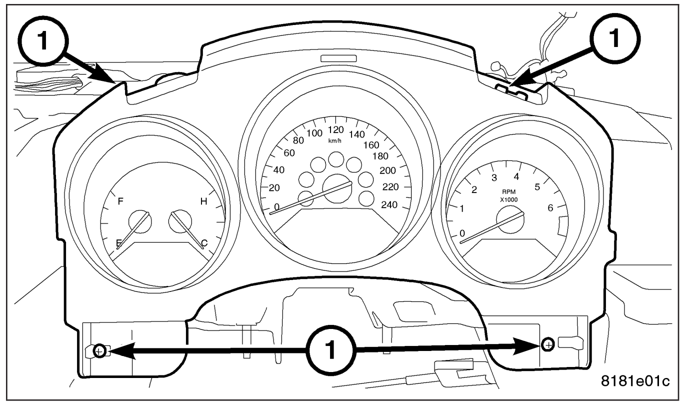
BEZEL-CLUSTER

REMOVAL

1. Remove A - pillar trim.
2. Remove top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
3. Remove fasteners and upper panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
4. Remove cluster bezel fasteners (1).
5. Pull instrument cluster rearward to expose the four electrical connectors.
6. Disconnect electrical connectors.
7. Remove cluster assembly with cluster attached.

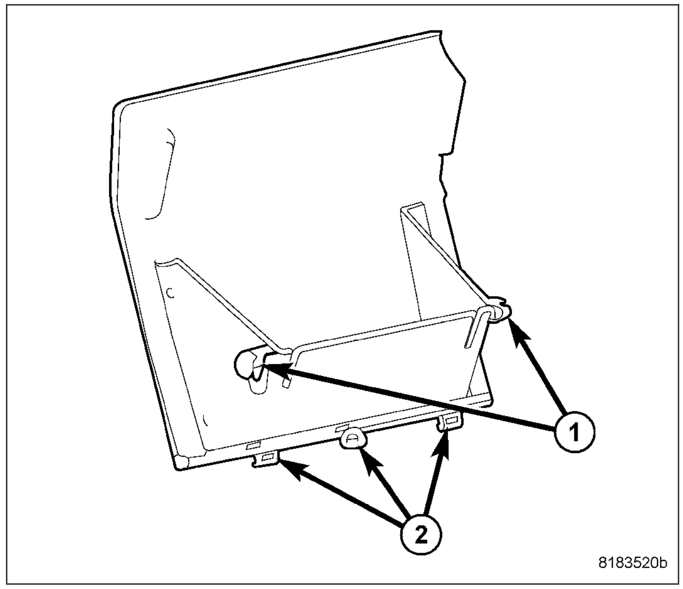


8. Remove fasteners (1) attaching cluster to bezel.



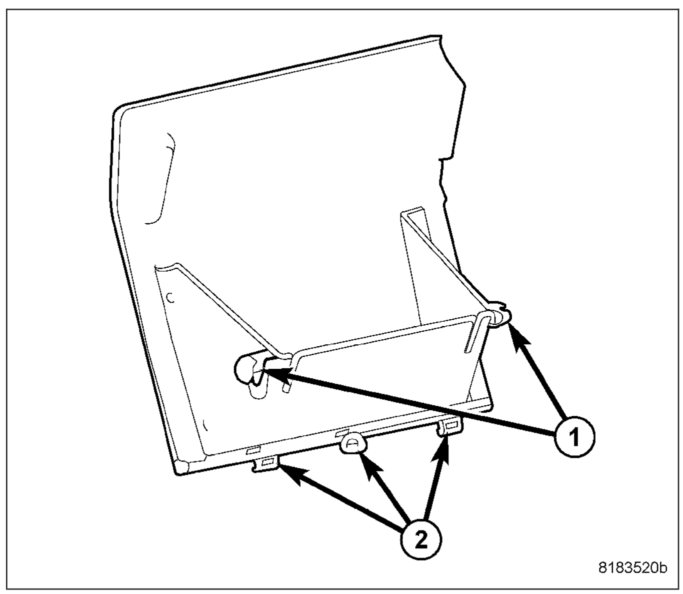
INSTALLATION

1. Install cluster to bezel by installing four fasteners (1).
2. Position cluster into instrument panel opening.
3. Connect wire connectors.



4. Install four fasteners (1) fastening cluster to instrument panel.
5. Install instrument panel upper panel. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ FLOOR DISTRIBUTION DUCTS - REMOVAL)

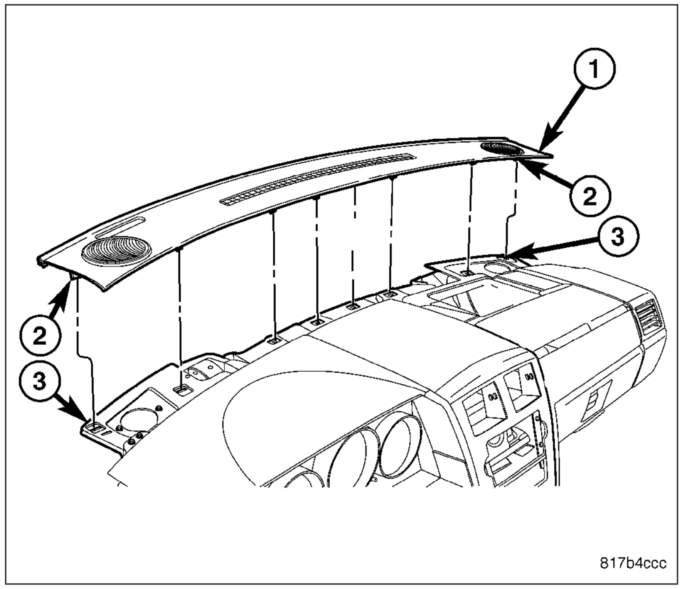
BIN-GLOVE BOX



REMOVAL

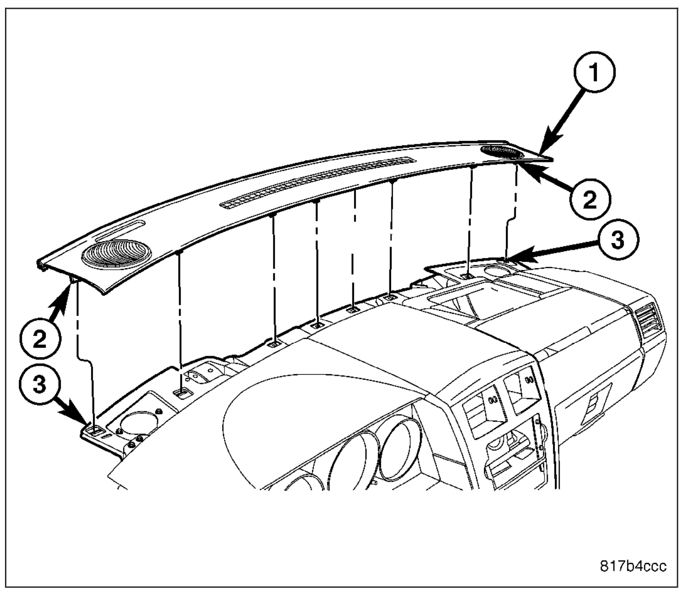
1. Open glove box latch.
2. Unsnap glove box damper from glove box bin.
3. Flex glove box open position stops (1) inboard and rotate past stops.
4. Unsnap glove box door from base panel lower hinge pins (2).

INSTALLATION



1. Align glove box door with glove box opening.
2. Snap glove box door hinge pins (2) to lower base panel hinges.
3. Flex glove box inboard and rotate inward past stops (1).
4. Close glove box.

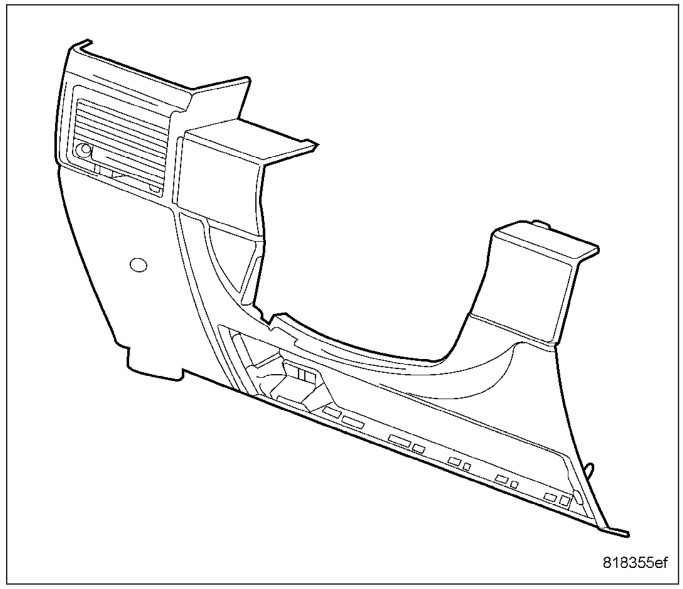
COVER-INSTRUMENT PANEL TOP



REMOVAL

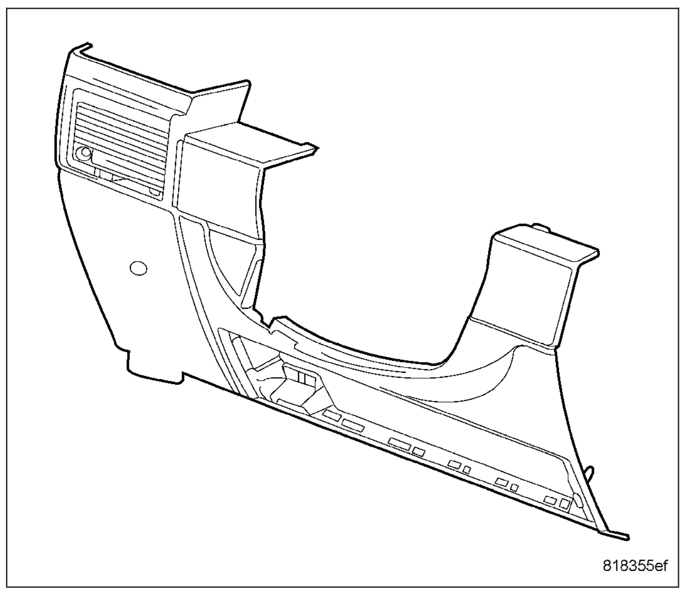
1. Remove A- pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
2. Using trim stick C-4755, pry up on panel cover (1) disengaging panel clip (2) from instrument panel inner (3).
3. Remove from vehicle.

INSTALLATION



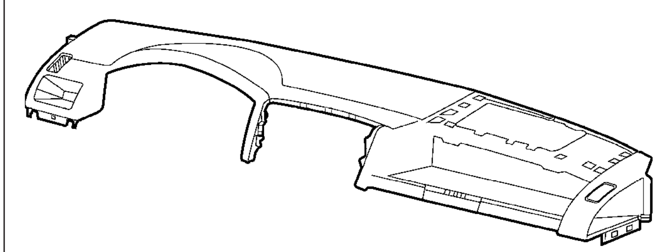
1. Place instrument panel cover (1) over instrument panel aligning instrument panel cover clips over instrument panel inner.
2. Tap on clip locations ensuring instrument panel clips seat.
3. Install A - Pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)

STEERING COLUMN COVER I/P



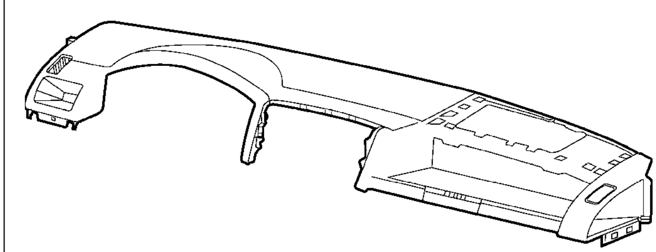
REMOVAL

1. Using trim stick C–4755, disengage clips on column cover top edge.
2. Remove from vehicle.



INSTALLATION

1. Align top of column cover tabs with instrument panel.
2. Hand tap top of column cover ensuring column cover tabs seat.



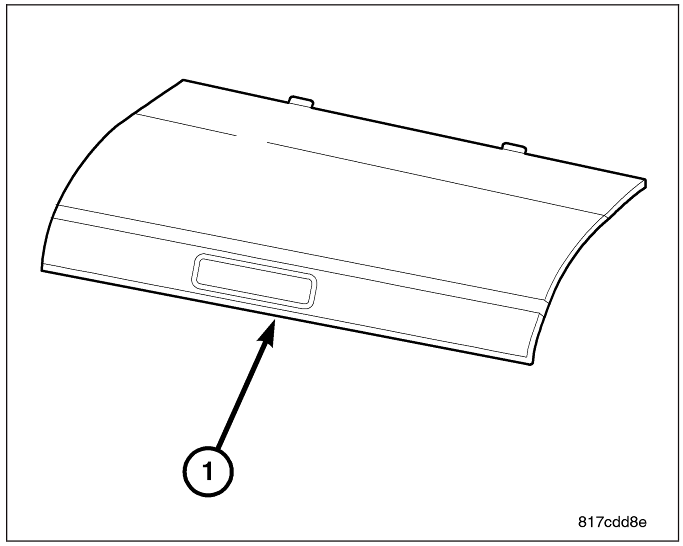
INSTRUMENT PANEL UPPER PANEL

REMOVAL

81835578

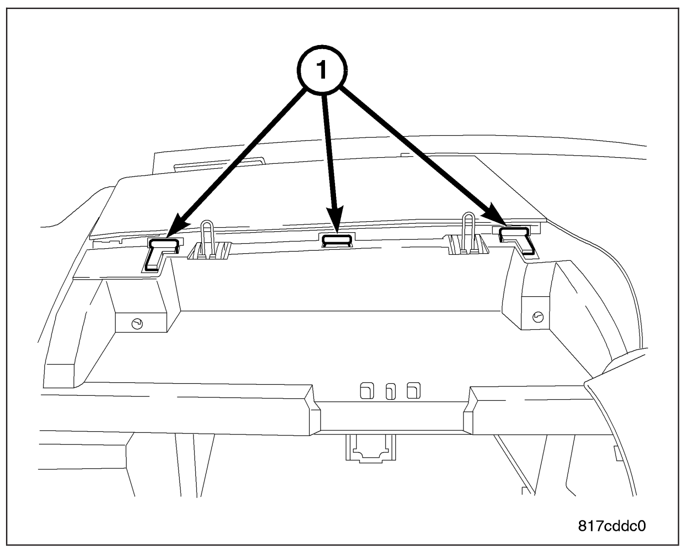
1. Remove top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
2. Remove left and right end caps. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL)
3. Remove steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN SUPPORT BKT - REMOVAL)
4. Remove shifter bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL).
5. Remove center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
6. Remove ten upper trim panel screws, five screw attachments along forward edge under top cover, two screw attachments under each end cap, two screw attachments under center bezel, two clip attachments in the cooler bin, one screw attachment under the steering cover, one clip attachment on passenger side near outboard outlet, and two clips in the cluster bezel area.

INSTALLATION



81835578

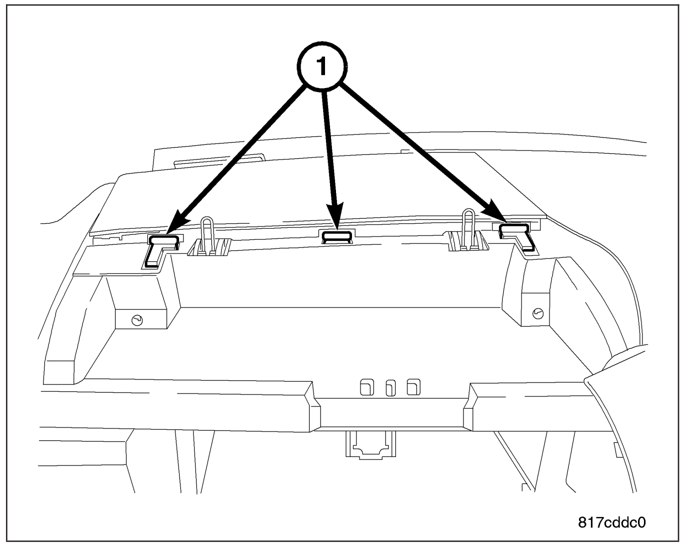
1. Install upper trim panel over structure.
2. Install five screw attachments along forward edge under top cover, screw attachments under each end cap, two screw attachments under center bezel, two clip attachments in the upper cooler bin, one screw attachment under the steering column cover, one clip attachment on the passenger side near outboard outlet, and two clips in the cluster area.
3. Install center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
4. Install manual or automatic shifter bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
5. Install steering column shrouds. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
6. Install column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
7. Install right and left end caps. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
8. Install instrument panel top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)



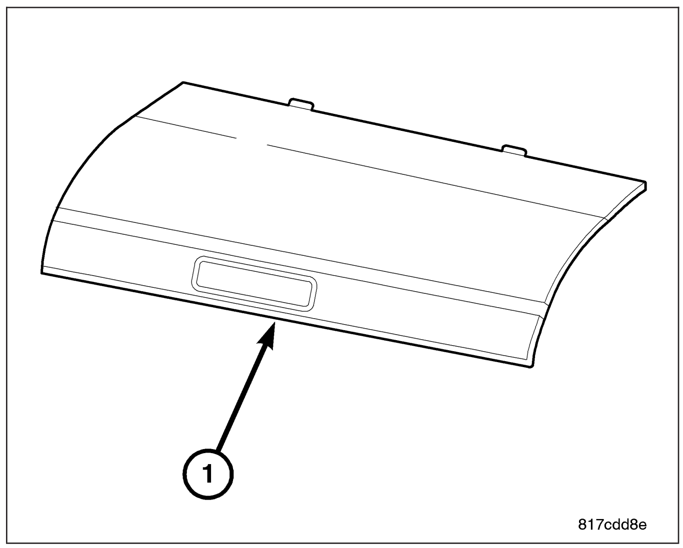
GLOVE BOX-COOLER DOOR

REMOVAL

1. Open glove box cooler door (1).

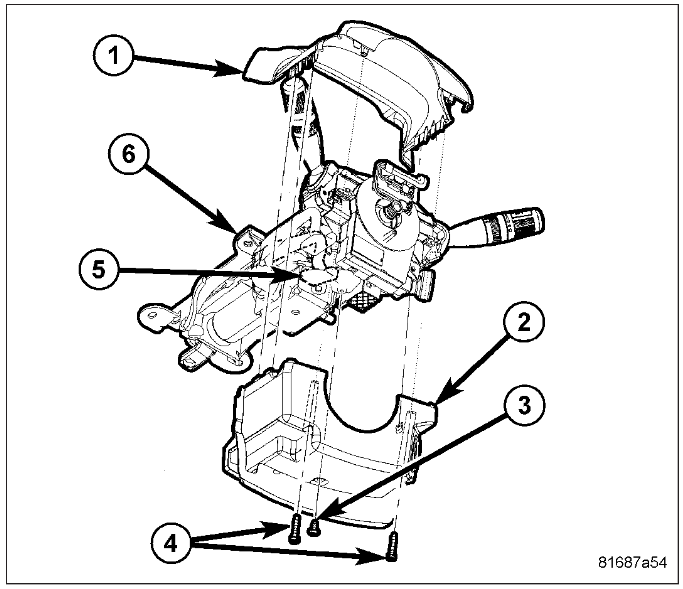


2. Unsnap glove box cooler door from glove box door opening tabs (1).
3. Remove glove box cooler door from vehicle.



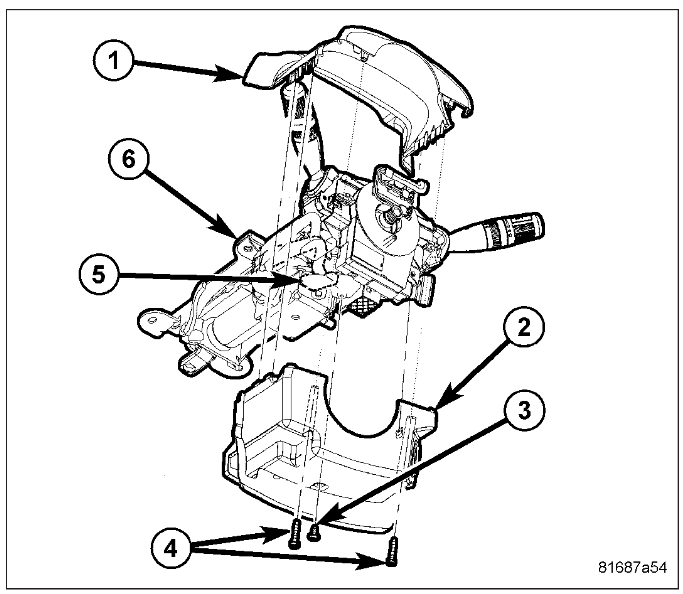
INSTALLATION

1. Align cooler door with cooler door opening tabs (1).



2. Snap cooler door (1) on to door opening tabs.
3. Shut cooler door.

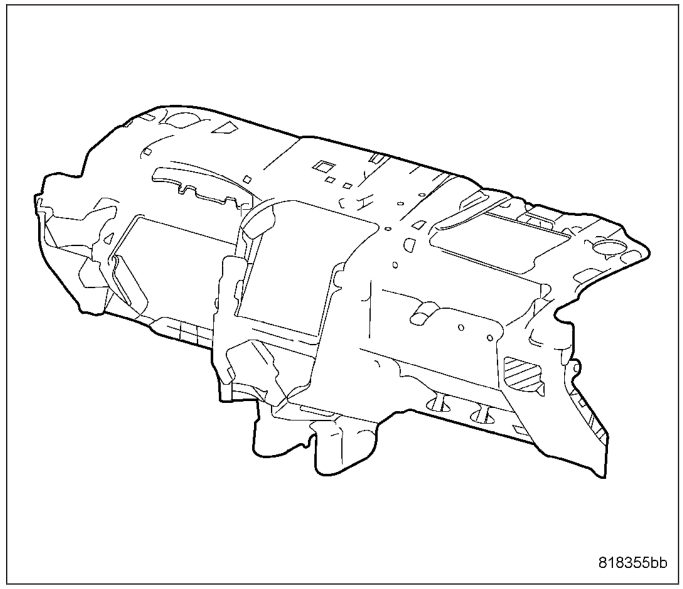
UPPER AND LOWER STEERING BEZEL



REMOVAL

1. Remove the two screws (4) attaching the upper shroud (1) to the lower shroud (2). After removing the screws, unclip the shrouds from each other by applying hand pressure along the seams where the shrouds connect on the sides, then remove the upper shroud and lower steering column cover.

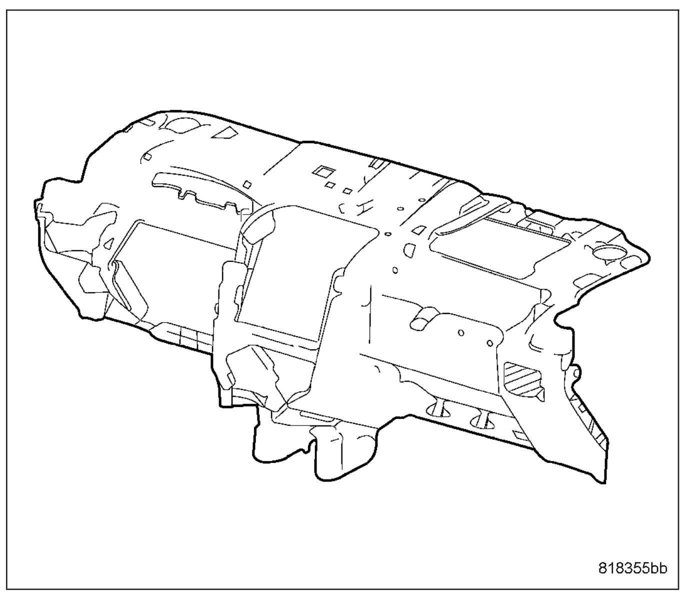
INSTALLATION



1. Position the column tilt at the full-downward position and lock it in place.
2. Install the upper shroud over the lower shroud, clipping the shrouds to one another.
3. Install the two screws (4) attaching the upper shroud (1) to the lower shroud (2).

INSTRUMENT PANEL BASE PANEL

REMOVAL



1. Remove instrument panel top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL)
2. Remove end caps. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL)
3. Remove shift bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL) or (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL)
4. Remove shift housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
5. Remove center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL)
6. Remove steering column cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL)

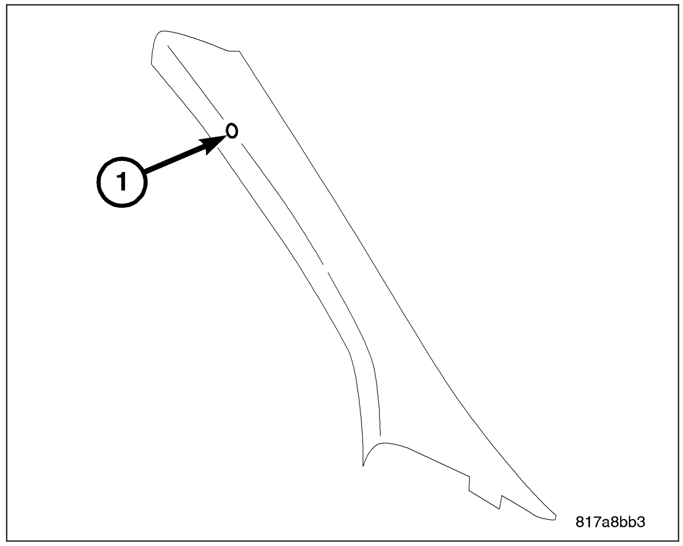
7. Remove upper panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL)
8. Remove radio. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL)
9. Remove shifter bracket.
10. Remove glove box door. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL)
11. If equipped, remove knee blocker.
12. Remove 25 base panel fasteners from structure.

INSTALLATION

1. Place instrument panel base structure over base panel.
2. Install 25 fasteners.
3. If equipped, install knee blocker.
4. Install glove box door. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION)
5. Install shifter bracket.
6. Install radio. (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION)
7. Install upper panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION)
8. Install steering column shrouds. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN SUPPORT BKT - INSTALLATION)

9. Install steering cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION)
10. Install center bezel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION)
11. Install shifter housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)

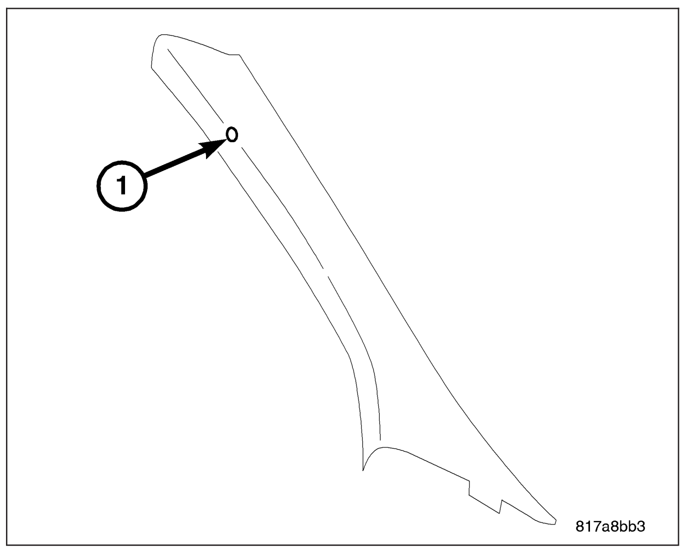
12. Install shifter bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION) and (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION)
13. Install right and left end caps.
14. Install top cover. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION)



INTERIOR

TABLE OF CONTENTS

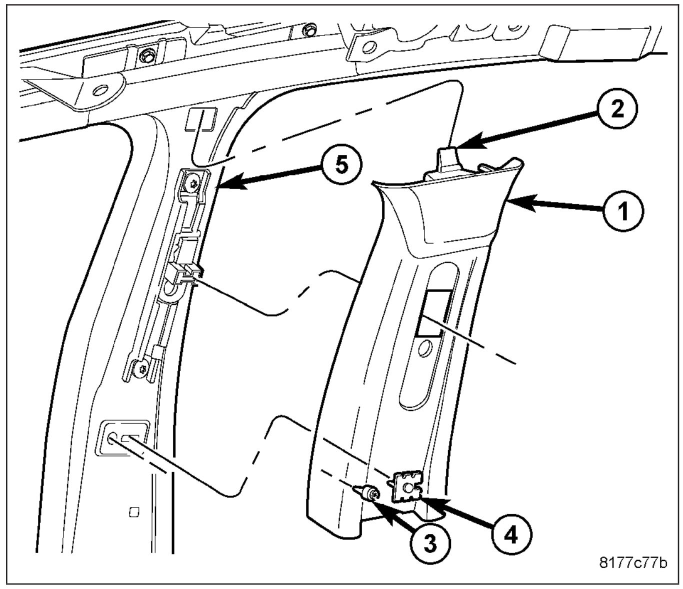
A-PILLAR TRIM



REMOVAL

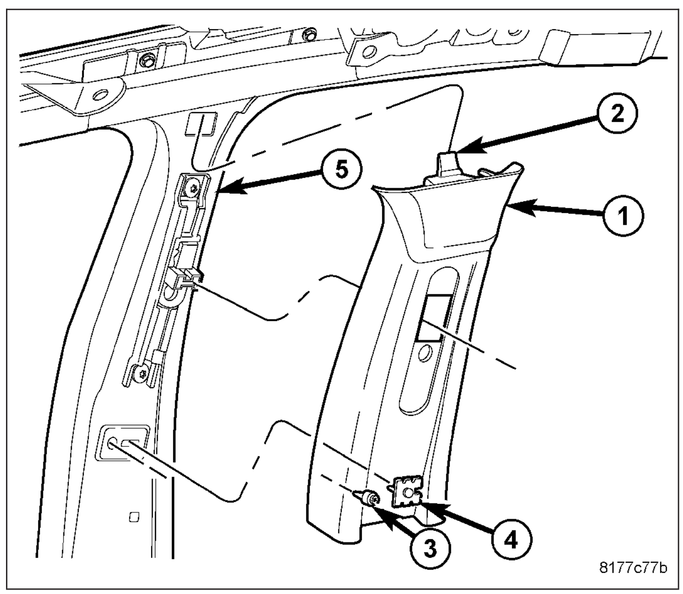
1. Remove plug (1).
2. Remove screw.
3. Remove trim by pulling from top.

INSTALLATION



1. Insert bottom first and ensure trim has seated into clips.
2. Install screw.
3. Install plug.

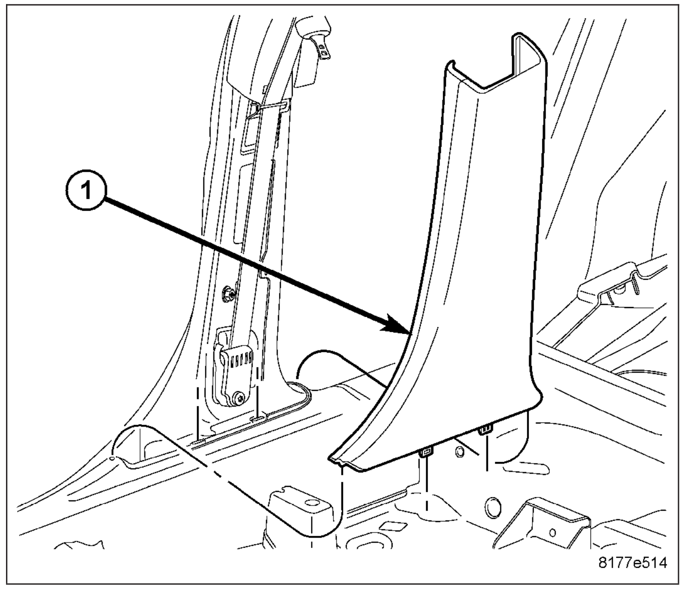
B-PILLAR TRIM



REMOVAL

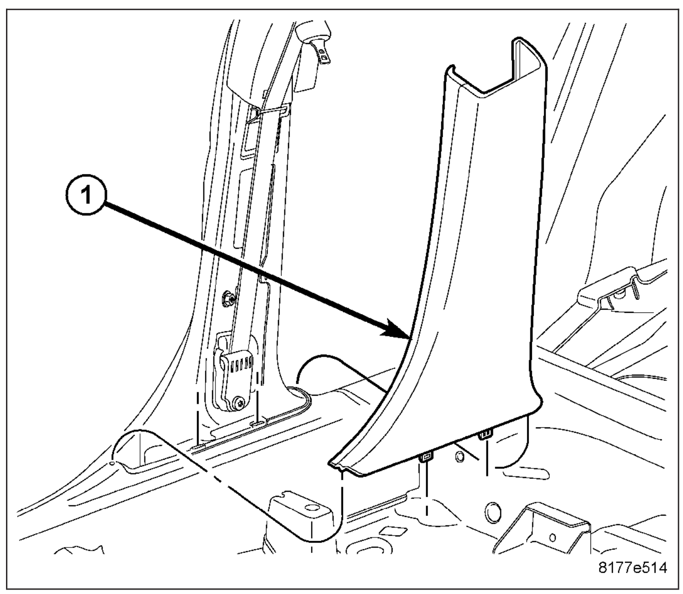
1. Remove lower B-pillar trim from B-pillar (5).
2. Remove plug.
3. Remove screw (3).
4. Remove trim (1) by pulling tab (2) on top outward.

INSTALLATION



1. Install B-pillar (1) trim to B-pillar (5) by inserting B-pillar trim tab (2) into B-pillar slot.
2. Push B-pillar trim into position ensuring bottom clip (4) has seated.
3. Add screw (3) and reinstall plug.

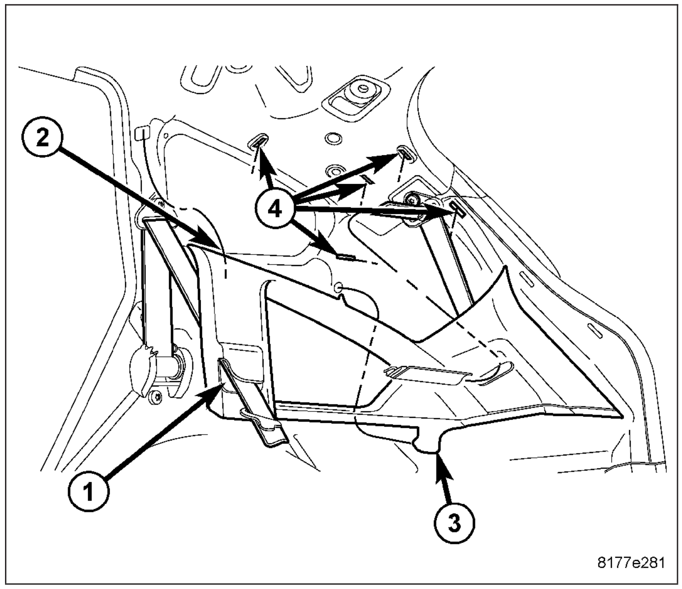
B-PILLAR LOWER TRIM



REMOVAL

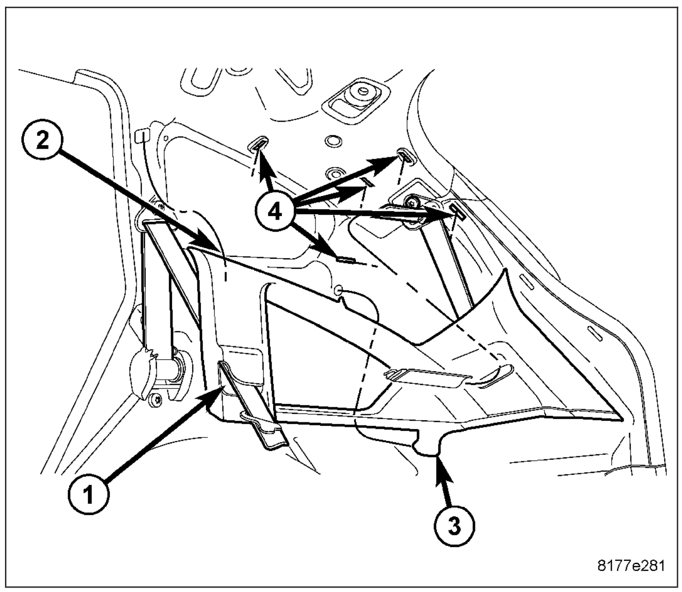
1. Using special tool C-4755, pry off B-pillar lower trim.
2. Remove from vehicle.

INSTALLATION



1. Insert lower tabs on B-pillar lower trim (1) onto sill panel.
2. Hand tap on clip locations ensuring clips are properly seated.

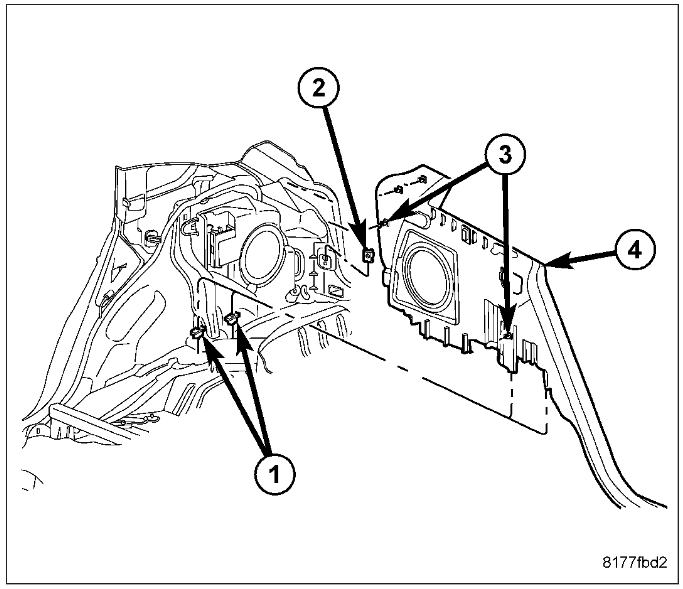
UPPER C-PILLAR TRIM



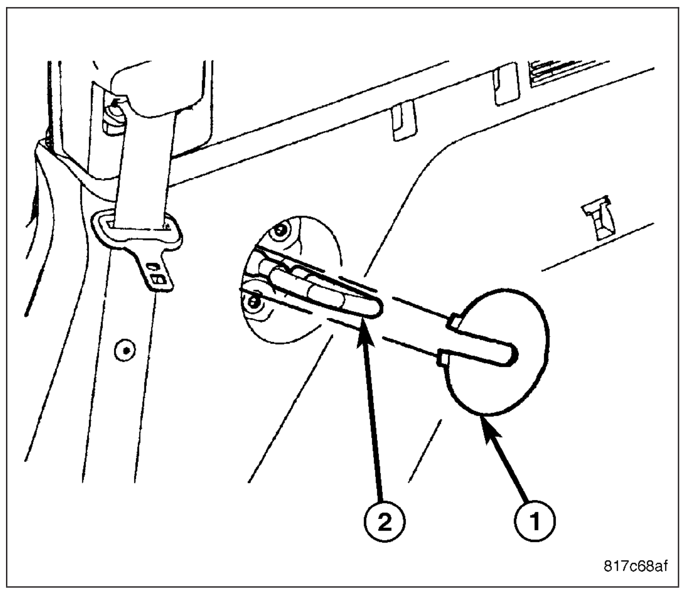
REMOVAL

1. Remove lower quarter.
2. Remove lower seat anchors from seat belt opening (1).
3. Remove upper quarter by pulling on rear portion of upper quarter disengaging clips from metal holes in body (4).
4. Remove front lower portion (3) by pulling clip loose.
5. Slide quarter panel (2) downward and remove from vehicle.

INSTALLATION

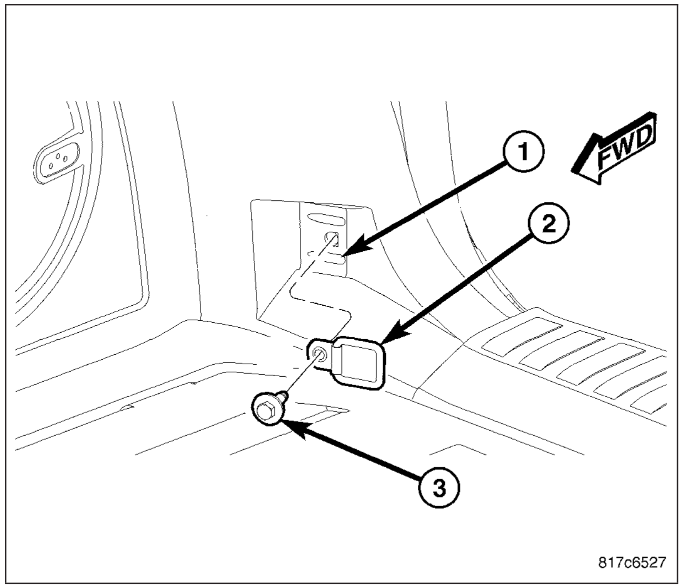


1. Pass seat belt anchors through trim openings (1).
2. Install quarter trim (2) by sliding hook at top and locating 4–way locator into the body side sheet metal holes (4).
3. Complete installation by aligning metal clips and snaping until properly seated.



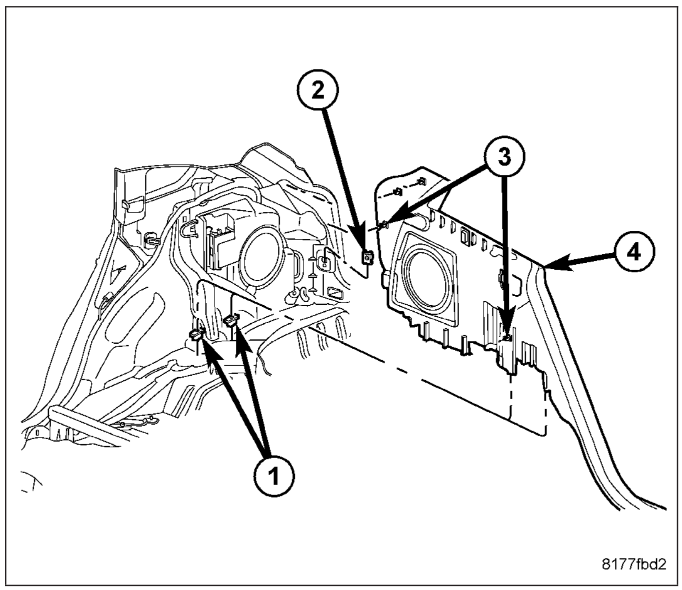
REAR QUARTER PANEL TRIM

REMOVAL



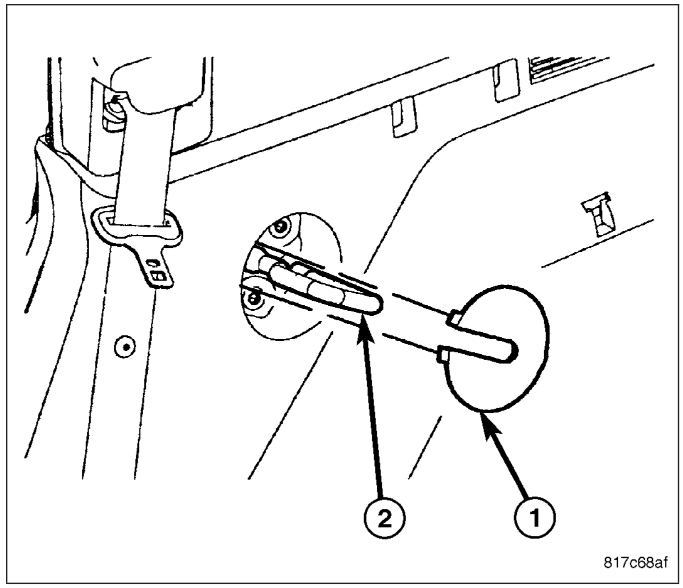
1. Remove liftgate scuff plate. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL)
2. Remove cargo floor. (Refer to 23 - BODY/INTERIOR/COVER - REMOVAL)
3. Remove B - pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
4. Remove scuff plate door sill. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL)

5. Using trimstick C-4755, remove the seat striker bezel.



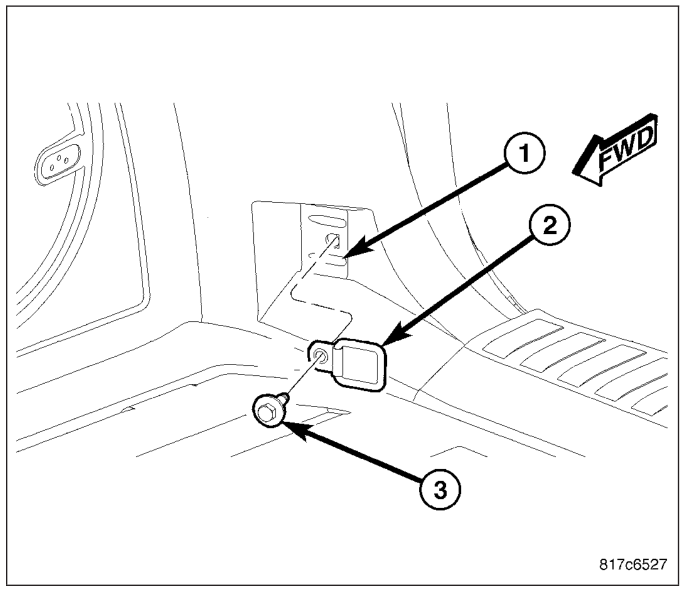
6. Remove the rear quarter trim cargo loop (2) fastener (3).
7. Remove the rear quarter panel.

817c6527



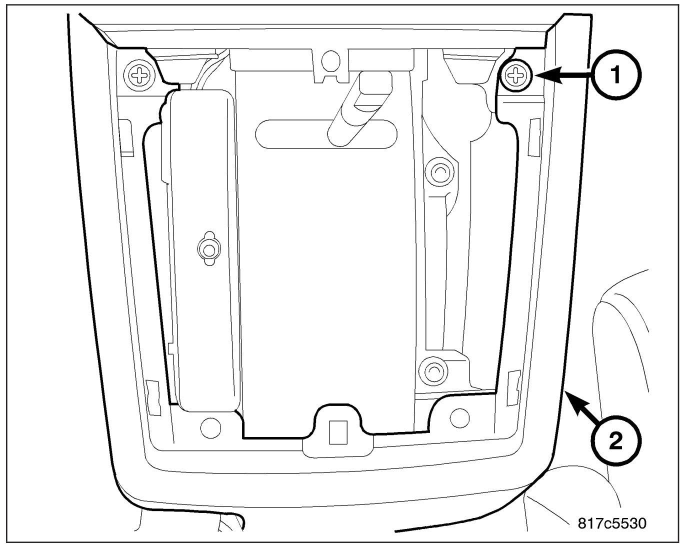
INSTALLATION

1. Twist quarter trim toward quarter body side seating tabs on to clips.
2. Seat four - way and two - way locator on panel to holes on body inner.
3. Tap on panel at each clip location until seated.

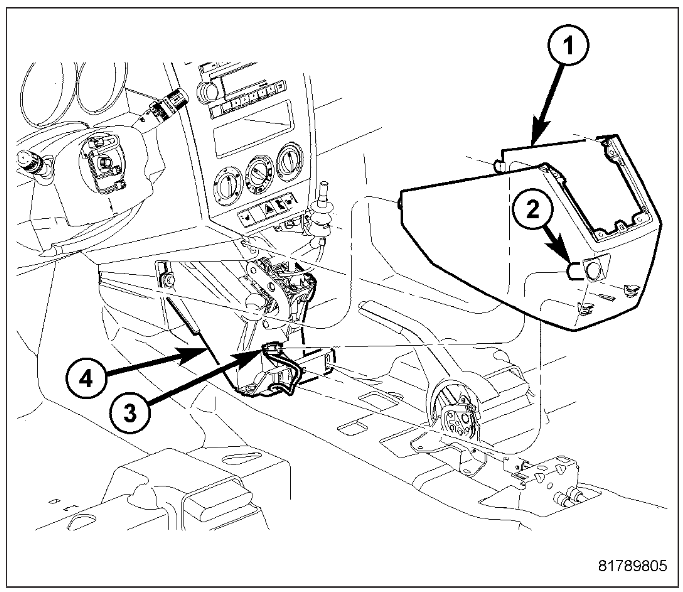


8177fbd2

4. Snap striker bezel to quarter panel.



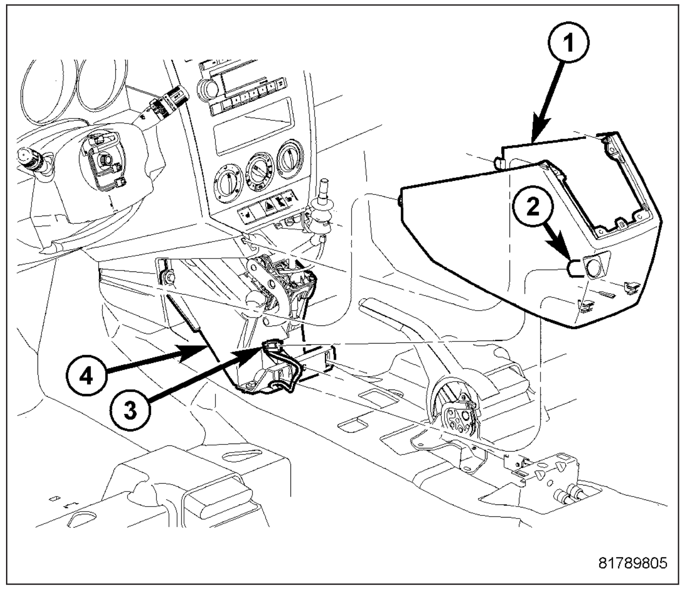
5. Install cargo loop fastener (3).



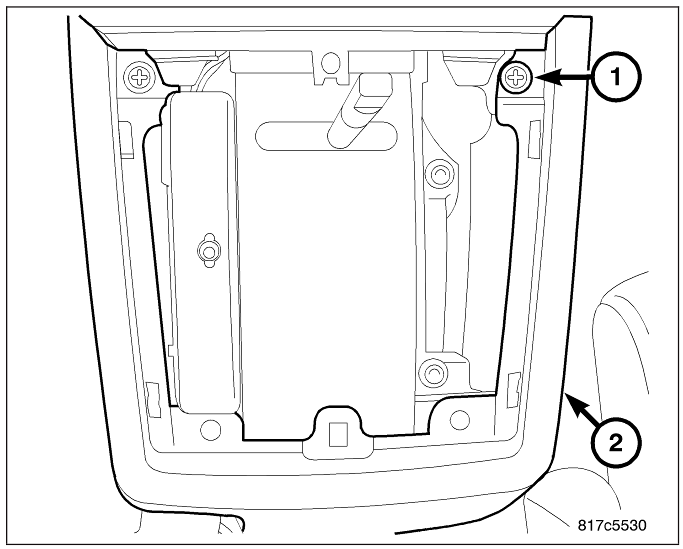
CENTER CONSOLE SHIFTER HOUSING

REMOVAL

1. Remove shift knob and shift bezel. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL) (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - REMOVAL)
2. Remove two screws (1).

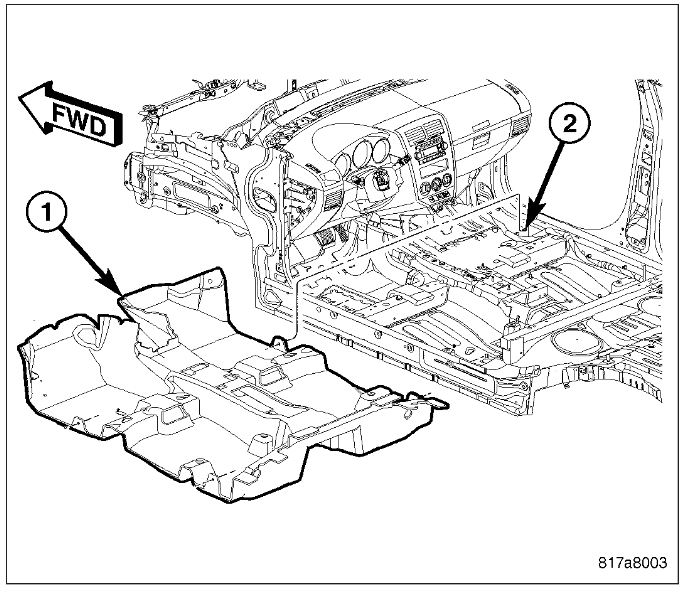


3. Pull on side of housing (1) and unsnap housing tabs.
4. Disconnect console housing wire connector (2) and instrument panel connector (3).
5. Remove from vehicle.



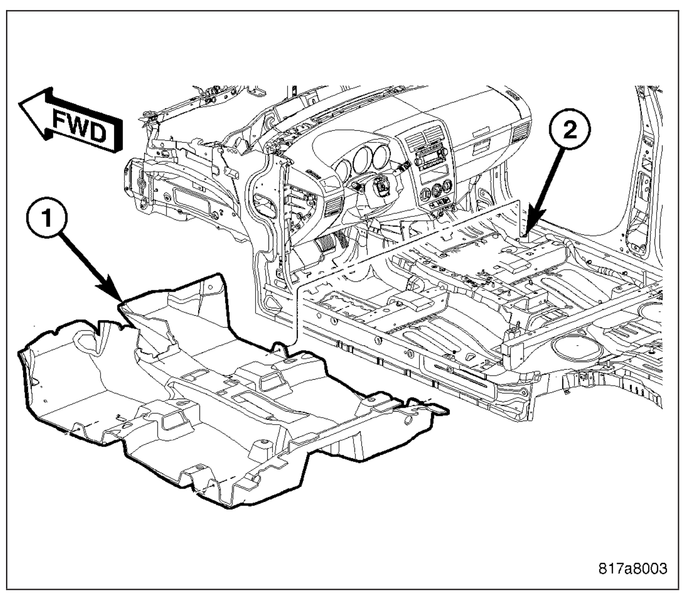
INSTALLATION

1. Connect center console housing wire connector (2) with instrument panel connector (3).
2. Place console housing (1) over shifter lever ensuring console tabs seat properly.



3. Install screws (1).
4. Replace shift bezel and knob. (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION) (Refer to 23 - BODY/INTERIOR/SHIFT BEZEL - INSTALLATION).

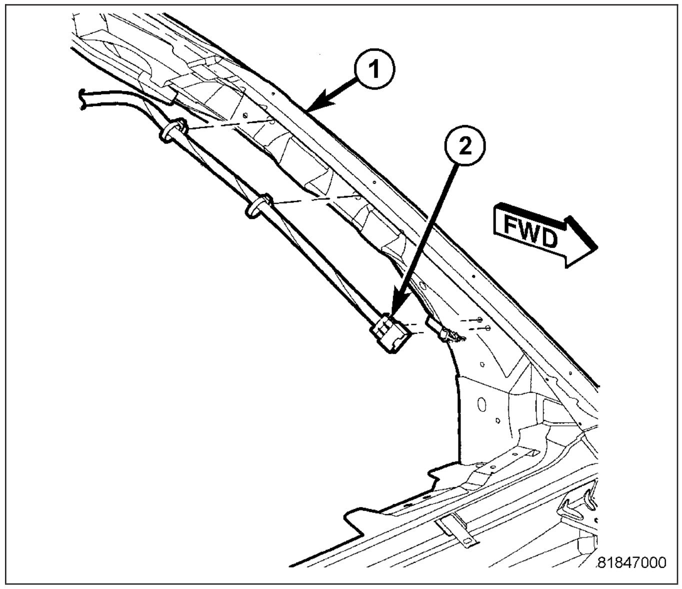
FLOOR CARPET



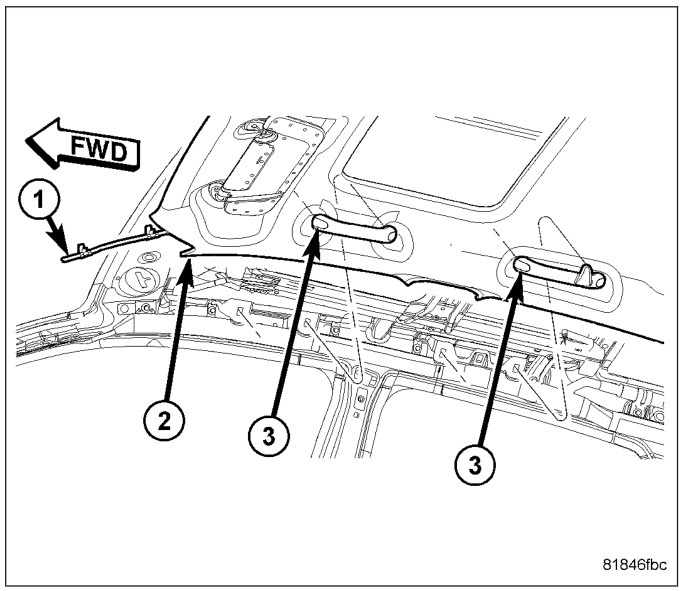
REMOVAL

1. Remove front seats. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
2. Remove rear seats cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL)
3. Remove rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - REMOVAL)
4. Remove cargo load floor. (Refer to 23 - BODY/INTERIOR/COVER - REMOVAL)
5. Remove center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
6. Remove center console shifter housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL)
7. Remove lower B-Pillar trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
8. Remove door sill plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL)
9. Remove side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL)
10. Remove liftgate scuff plate. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL)
11. Remove rear quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)
12. Remove carpet from vehicle.

INSTALLATION



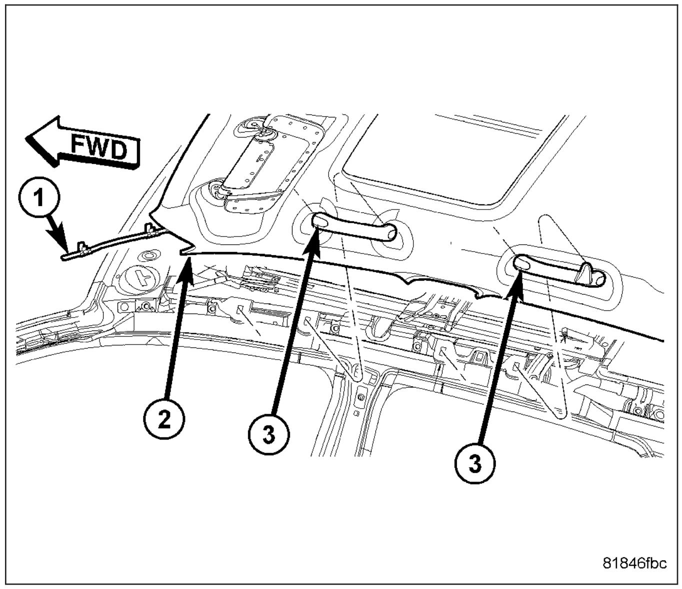
1. Install carpet into vehicle ensuring carpet (1) is aligned with tabs (2).
2. Install rear quarter panel trim. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
3. Install liftgate scuff plate. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - INSTALLATION)
4. Install cargo load floor. (Refer to 23 - BODY/INTERIOR/COVER - INSTALLATION)
5. Install side cowl trim panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION)
6. Install B-pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
7. Install door sill scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION)
8. Install center console. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
9. Install center console shifter housing. (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION)
10. Install rear seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION)
11. Install rear seat back. (Refer to 23 - BODY/SEATS/SEAT BACK - INSTALLATION))
12. Install front seats.



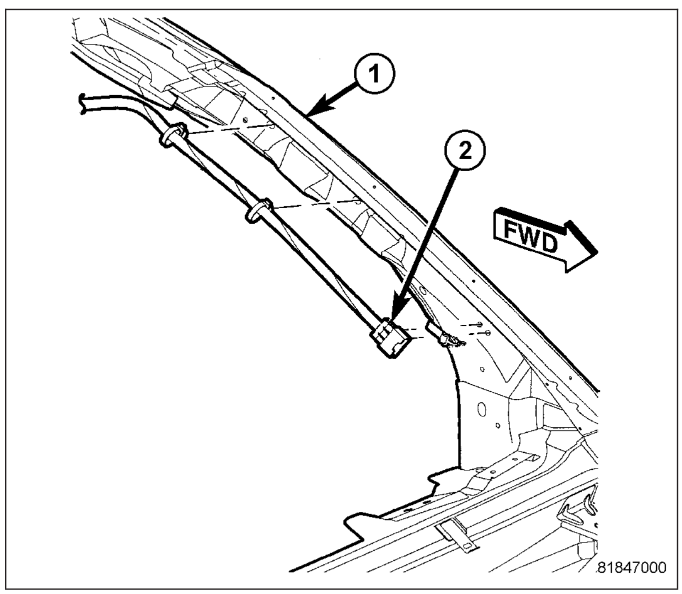
HEADLINER

REMOVAL

1. Remove front windshield. (Refer to 23 - BODY/STATIONARY GLASS/WINDSHIELD - REMOVAL)
2. Remove A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL)
3. Disconnect A-pillar trim wire connector (2).
4. Remove sunvisors. (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL)
5. Remove sun visor screws and retainers. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)



6. Disconnect front washer hose (1).
7. Remove universal homelink module and connector. (Refer to 8 - ELECTRICAL/MESSAGE CENTER/UNIVERSAL TRANSMITTER - REMOVAL).
8. Remove and disconnect dome lamp. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL)
9. Remove front and rear grab handles (3).
10. Remove seat belt turning loops.
11. Remove B-pillar upper trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL)
12. Remove B-pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL)
13. Remove fastener attaching cargo loop to rear quarter trim.
14. Remove rear seat striker bezel.
15. Remove C-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL)

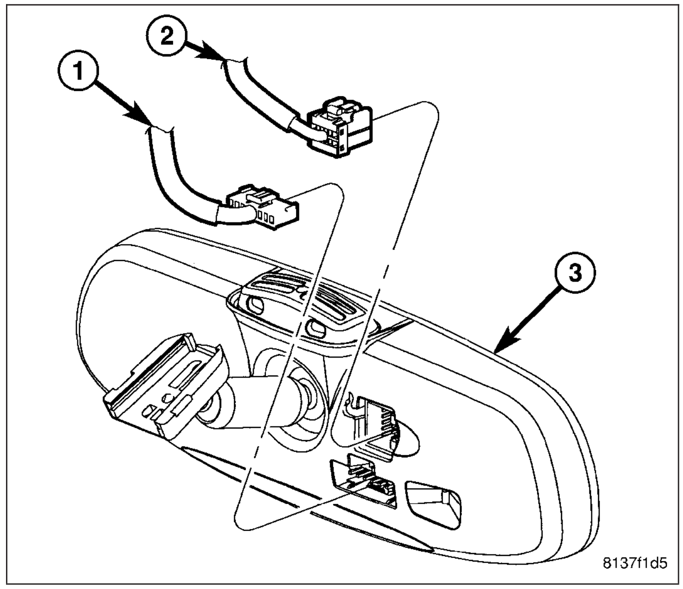


16. Remove rear quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL)
17. Remove cargo load floor. (Refer to 23 - BODY/INTERIOR/COVER - REMOVAL)
18. Remove liftgate scuff plate. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL)
19. Remove rear cargo dome light and disconnect connector.. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - REMOVAL)
20. Remove rear headliner push pins.
21. Disconnect rear washer hose connector
22. Lower headliner.
23. With the help of an assistant, remove headliner through front windshield opening.

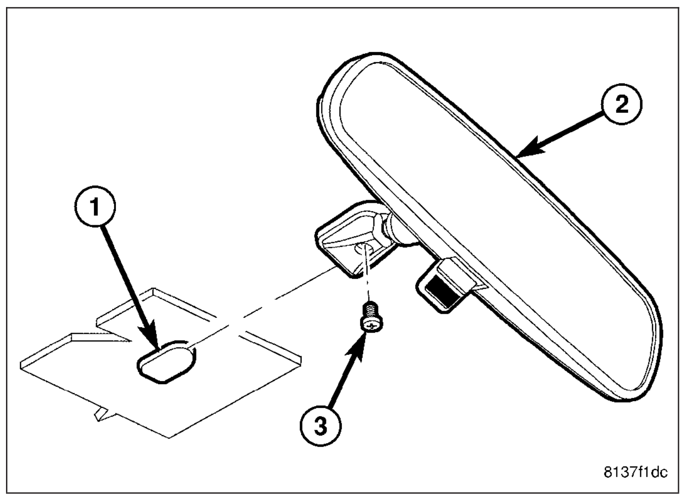
INSTALLATION

1. Before headliner installation, install courtesy lamp, cargo lamp, and Universal transmitter module to headliner. (Refer to 8 - ELECTRICAL/MESSAGE CENTER/UNIVERSAL TRANSMITTER - INSTALLATION)
2. With the help of an assistant, Install headliner through windshield opening.
3. Connect rear cargo lamp connector. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/CARGO LAMP - INSTALLATION)
4. Install headliner push pins located at rear of headliner.
5. Connect front dome lamp connector. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/DOME LAMP - INSTALLATION)
6. If equipped, connect home link module connector. (Refer to 8 - ELECTRICAL/MESSAGE CENTER/UNIVERSAL TRANSMITTER - INSTALLATION)
7. Connect front rear view mirror hardware. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)
8. Install rear view mirror. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)
9. Install grab handles (3).
10. Connect rear washer hose.
11. Install sunvisor retainers. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)
12. Install sun visors.

13. Connect A-pillar wire connector.
14. Install A-pillar trim. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION)
15. Install scuff plate. (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION)
16. Install B-pillar lower trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION)
17. Install B-pillar upper trim. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION)
18. Install cargo load floor. (Refer to 23 - BODY/INTERIOR/COVER - INSTALLATION)
19. Install rear quarter trim. (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION)
20. Install C-pillar trim. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION)



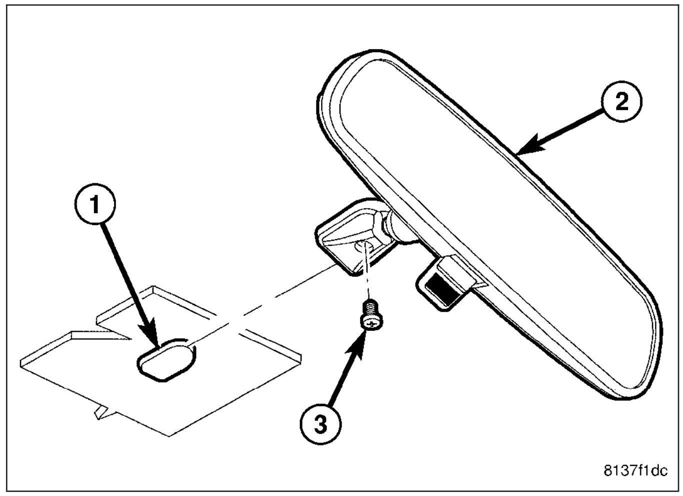
21. Install rear seat striker bezel.
22. Install seat belt turning loops.
23. Install rear cargo scuff plate. (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION)



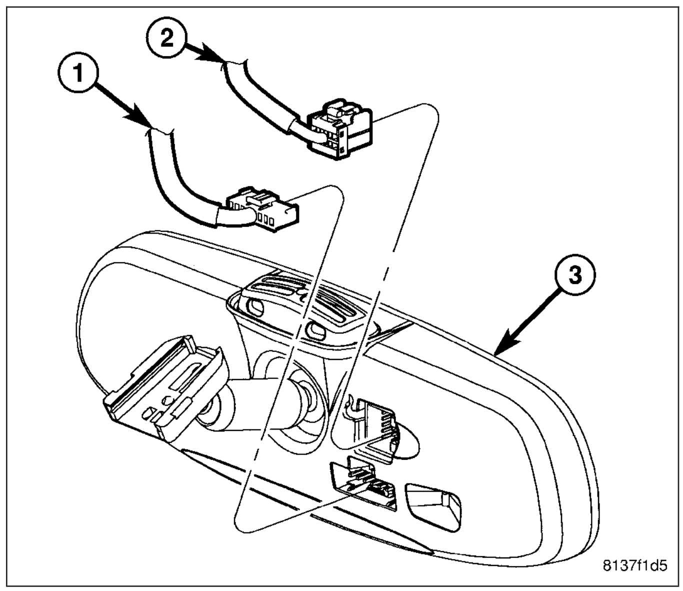
INSIDE REAR VIEW MIRROR

REMOVAL

1. If the vehicle is equipped with either the electrochromic (automatic dimming) or the telematic (hands-free phone) mirror option, disconnect and isolate the battery negative cable.
2. If the vehicle is so equipped, disconnect the electrochromic mirror takeout and connector (1) and/or the telematic mirror takeout and connector (2) of the headliner wire harness from the connector receptacle on the back (windshield side) of the mirror housing (3).



3. Remove the set screw (3) that secures the rear view mirror (2) to the support bracket/button (1) on the inside of the windshield glass.
4. Slide the rear view mirror upward far enough to disengage it from the support bracket/button.



INSTALLATION

MIRROR

1. Position and slide the rear view mirror (2) downward over the support bracket/button (1) on the inside of the windshield glass.
2. Install and tighten the set screw (3) that secures the rear view mirror to the support bracket/button. Tighten the screw to 2 N·m (17 in. lbs.).

3. If the vehicle is so equipped, route the electrochromic (automatic dimming) mirror takeout and connector (1) and/or the telematic (hands-free phone) mirror takeout and connector (2) of the headliner wire harness to the left of the mirror support bracket and reconnect it to the connector receptacle on the back (windshield side) of the mirror housing (3).
4. If the vehicle is equipped with either the electrochromic or the telematic mirror option, reconnect the battery negative cable.

SUPPORT BRACKET

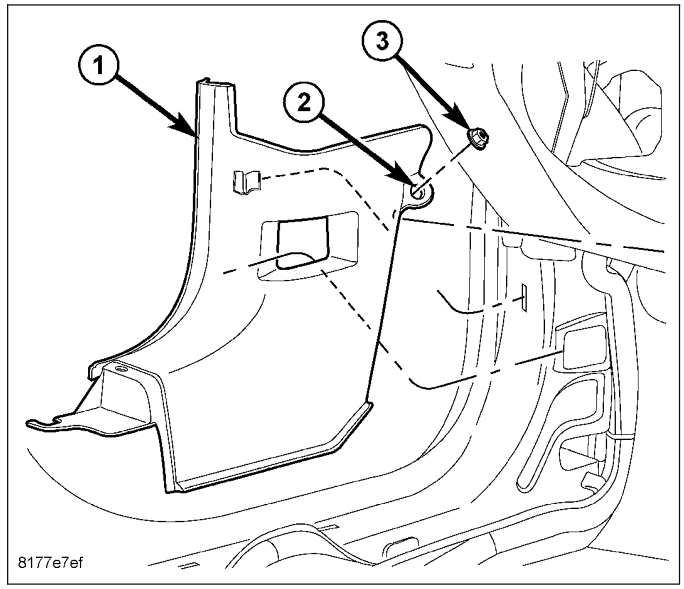
NOTE: The rear view mirror support bracket (or button) is permanently bonded to the inside of the windshield glass. If the bracket should become separated from the glass, it may be rebonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar™ in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror bracket on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror bracket installation can be used as a guide.
2. Clean the bracket contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the bracket according to the following instructions:
   - Crush the accelerant vial to saturate the felt applicator.
   - Remove the paper sleeve.
   - Apply accelerant to the bonding surface of the bracket.

- Allow the accelerant to dry for five minutes.
- Do not touch the bracket bonding surface after the accelerant has been applied.

5. Apply adhesive accelerant to the bracket contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the bracket contact area of the glass after the accelerant has been applied.
6. Install the bracket according to the following instructions:
   - Apply one drop of adhesive at the center of the bracket contact area on the inside of the windshield glass.
   - Apply an even coat of adhesive to the bonding surface of the bracket.
   - Align the bracket with the marked position on the windshield glass.
   - Press and hold the bracket in place for at least one minute.

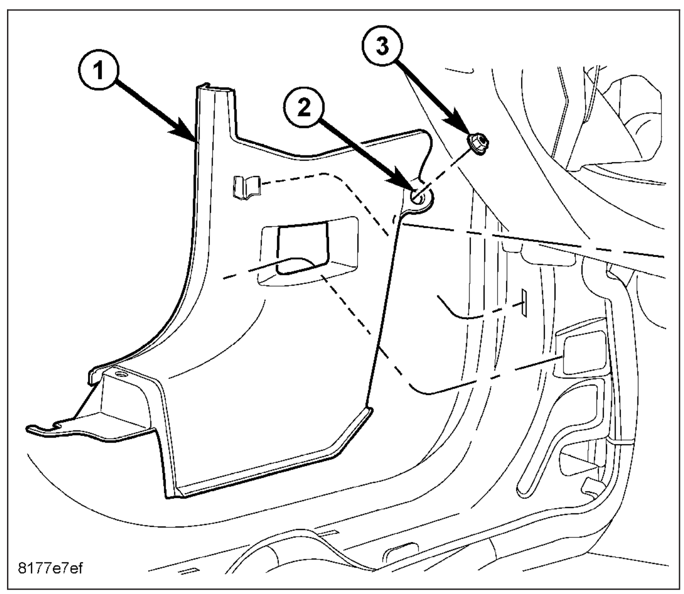
NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.



7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

SIDE COWL TRIM PANEL

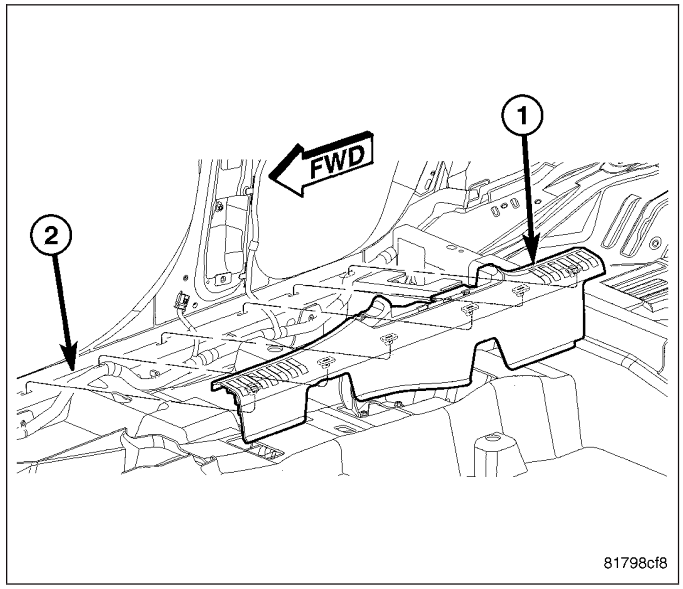
REMOVAL



NOTE: Left hand shown, right side similar.

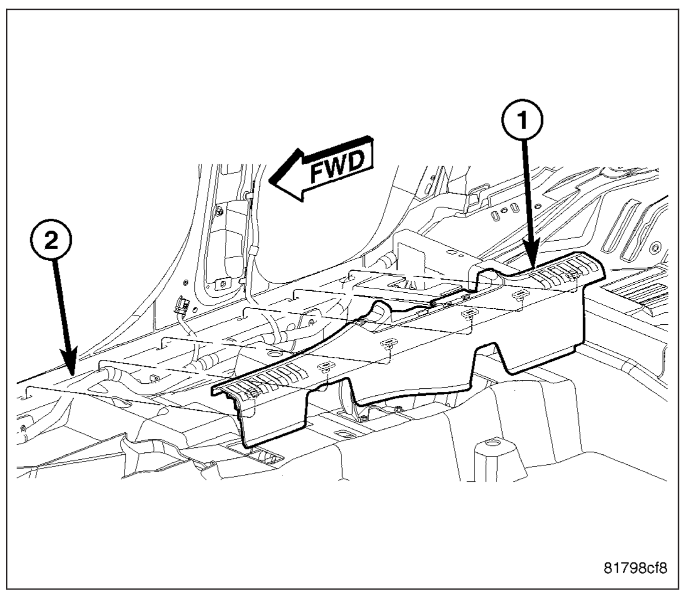
1. Remove door sill scuff plate. (Refer to 23 - BODY/ INTERIOR/DOOR SILL TRIM - REMOVAL)
2. Remove nut (3) securing trim (1) to dash.
3. Using trim stick C-4755, pry up on cowl trim and remove from vehicle.

INSTALLATION



1. Place tab cowl trim (1) over stud on dash and wrap door flange.
2. Align hole for park brake release handle and clip on trim to hole (2) in cowl side.
3. Install nut (3) and fasten until cowl trim is seated.

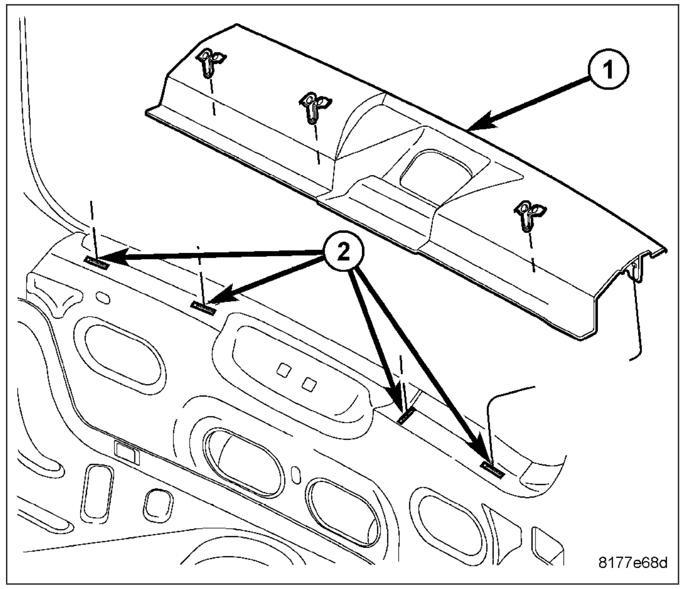
SCUFF PLATE-DOOR SILL



REMOVAL

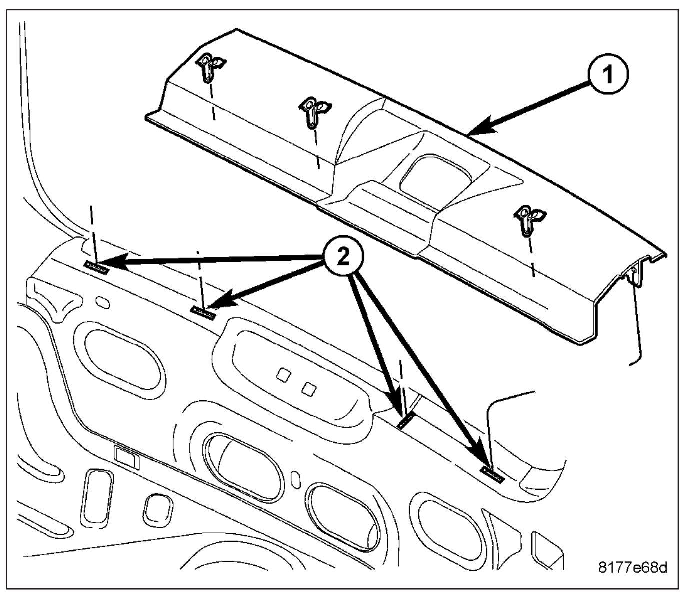
1. Using trim stick C-4755, pry up scuff plate.
2. Remove scuff plate from vehicle.

INSTALLATION



1. Place scuff plate (1) onto door sill (2).
2. Align scuff plate tabs with door scuff holes.
3. Hand press scuff plate ensuring tabs are properly seated.

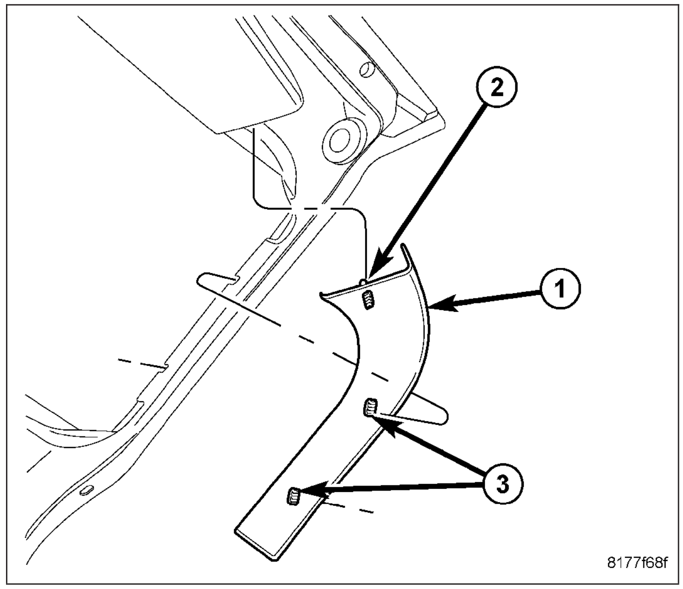
SCUFF PLATE-LIFTGATE SILL



REMOVAL

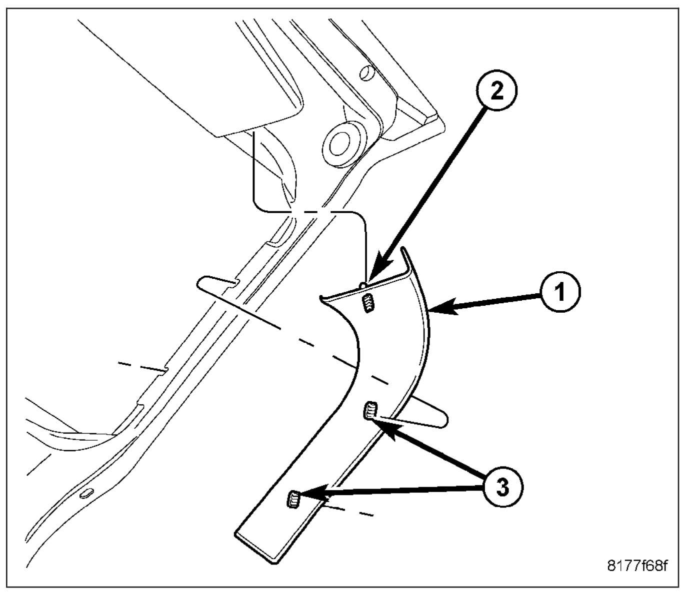
1. Using trim stick C-4755 or equivalent, pry up on each scuff plate clip location hole (2).
2. Remove scuff plate (1).

INSTALLATION



1. Locate trim clips and align metal clips to liftgate inner.
2. Tap on panel at each trim clip location (2) until properly seated.

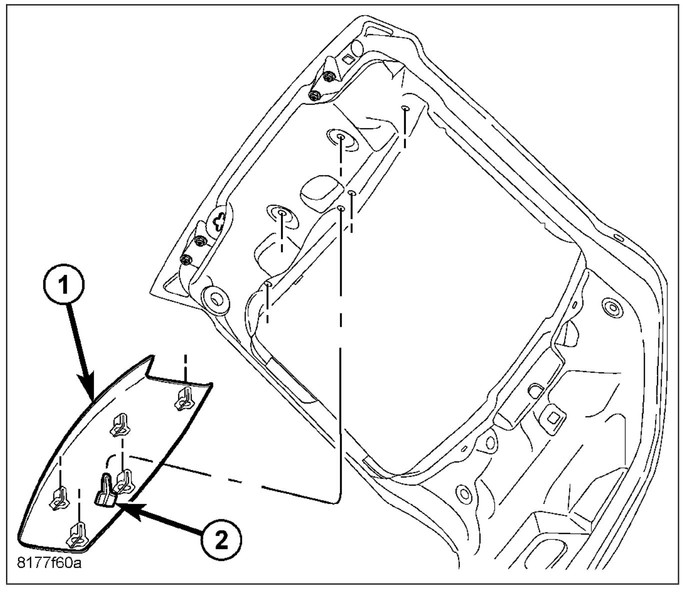
LIFTGATE UPPER SIDE MOLDING



REMOVAL

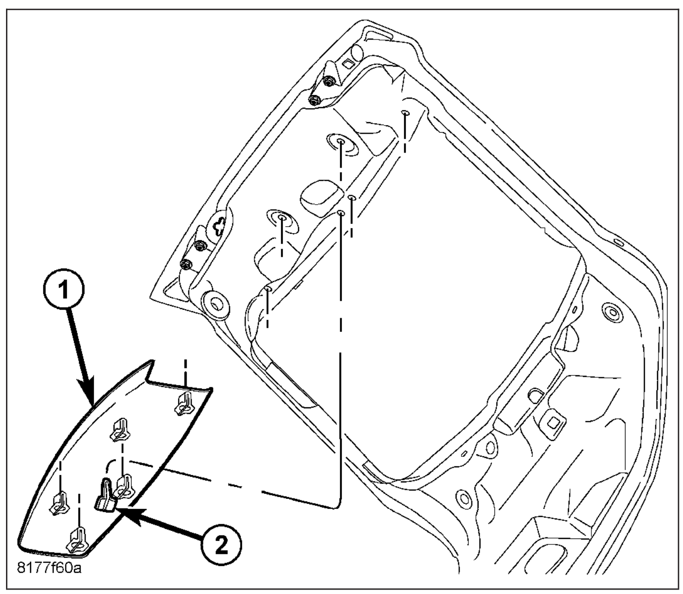
1. Using trim stick C4755 or equivalent, pry up at each clip location.
2. Remove upper side trim.

INSTALLATION



1. Locate and align metal clips to holes in liftgate inner.
2. Start at top clip (2) and work downward to bottom clips (3).
3. Tap on panel at each clip location until side trim (1) is properly seated.

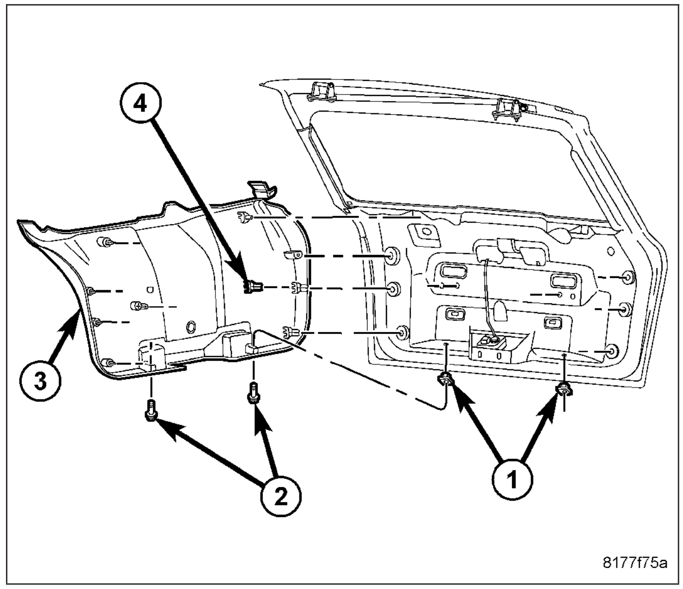
LIFTGATE UPPER MOLDING



REMOVAL

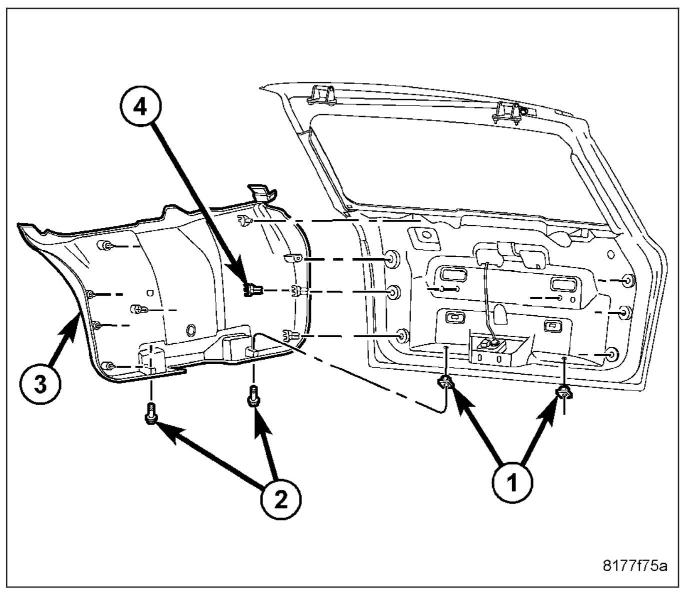
1. Using trim stick C-4755 or equivalent, pry up on upper trim(1) ensuring trim tabs disengage.
2. Remove from vehicle.

INSTALLATION



1. Align molding tabs (2) with holes in liftgate.
2. Hand tap trim (1) onto liftgate holes at clip locations.

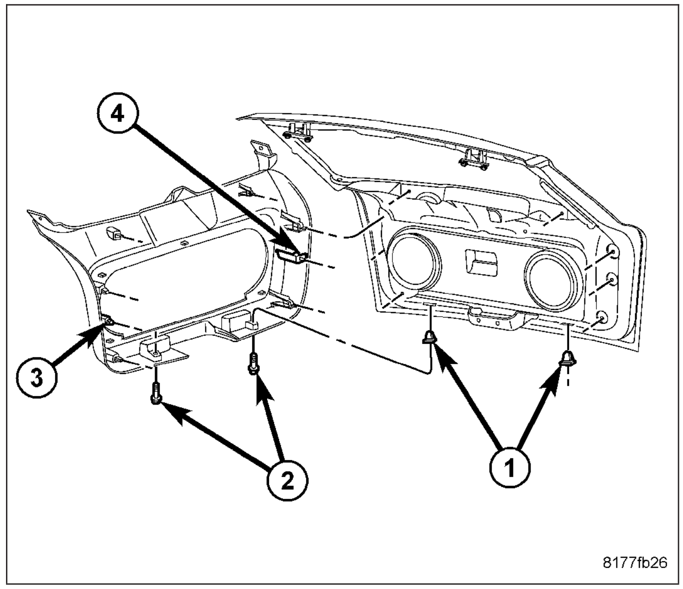
LOWER LIFTGATE TRIM W/OUT SPEAKER



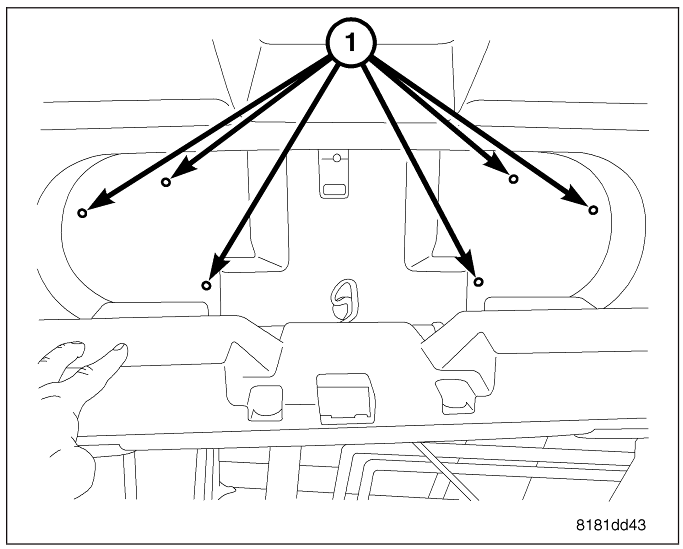
REMOVAL

1. Remove upper liftgate molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - REMOVAL)
2. Remove liftgate upper side molding. (Refer to 23 - BODY/INTERIOR/LGATE UPPER SIDE MOLDING - REMOVAL)
3. Remove liftgate screws (2) from liftgate nuts (1).
4. Using special tool C-4755, pry up liftgate trim tabs (4) from liftgate.
5. Remove lower liftgate trim (3) from vehicle.

INSTALLATION

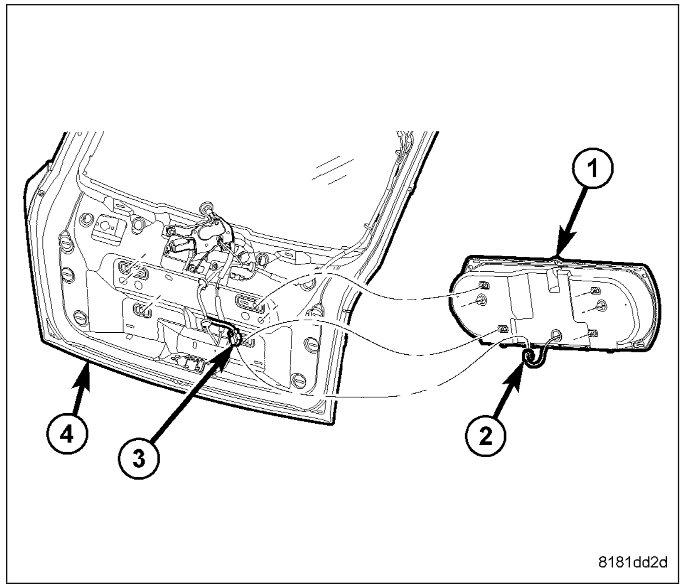


1. Align lower liftgate trim tabs (4) with liftgate holes.
2. Hand tap liftgate panel ensuring liftgate tabs are properly seated.
3. Install liftgate screws (2) into liftgate nuts (1).
4. Install upper side molding. (Refer to 23 - BODY/INTERIOR/LGATE UPPER SIDE MOLDING - INSTALLATION)
5. Install upper liftgate molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - INSTALLATION)



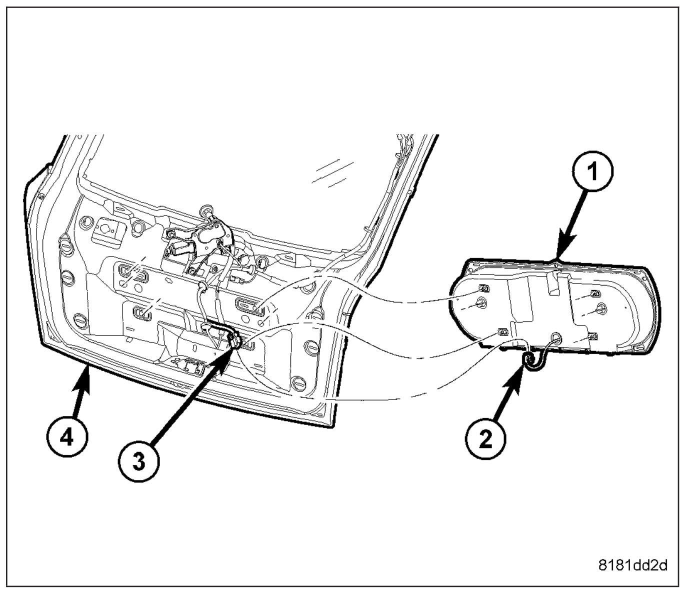
LOWER LIFTGATE TRIM W/ SPEAKER

REMOVAL



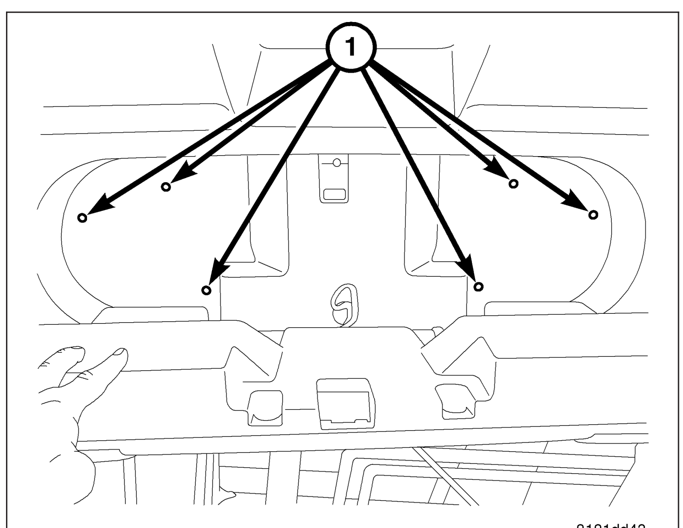
1. Remove trim panel fasteners (2).
2. Using trimstick C-4755, pry up on trim panel and remove trim panel from liftgate.

3. Remove six speaker fasteners.



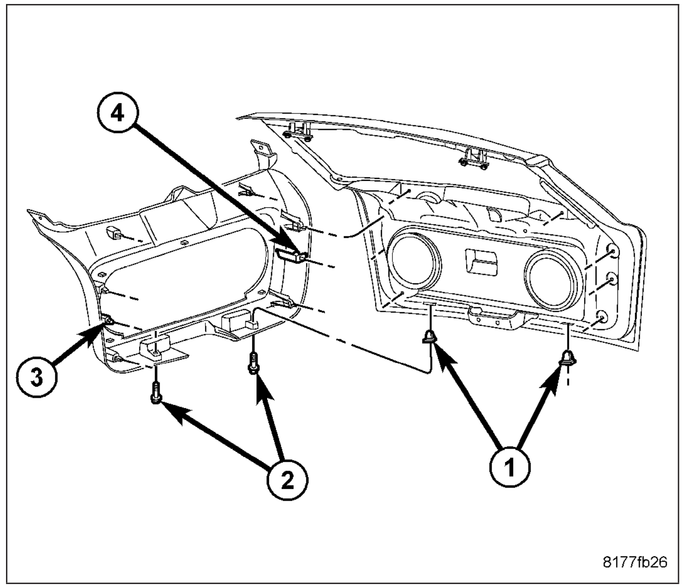
4. Disconnect speaker wire from harness.

8181dd2d



INSTALLATION

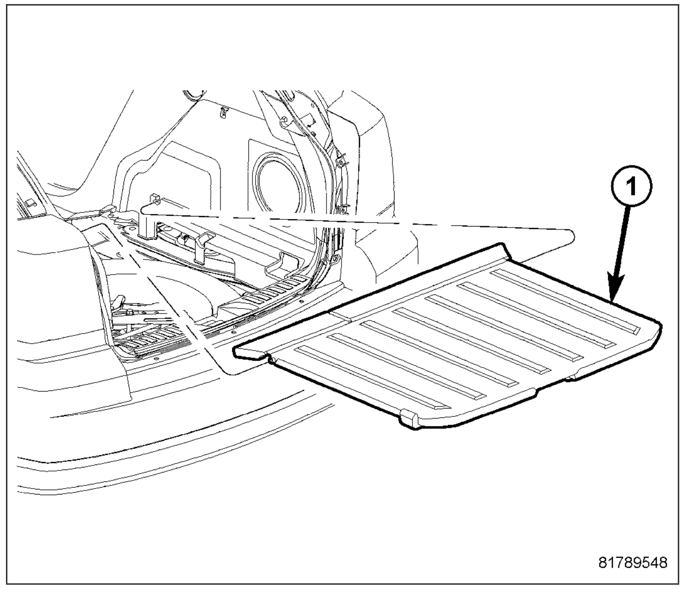
1. Connect speaker connector to wire harness.



8181dd2d

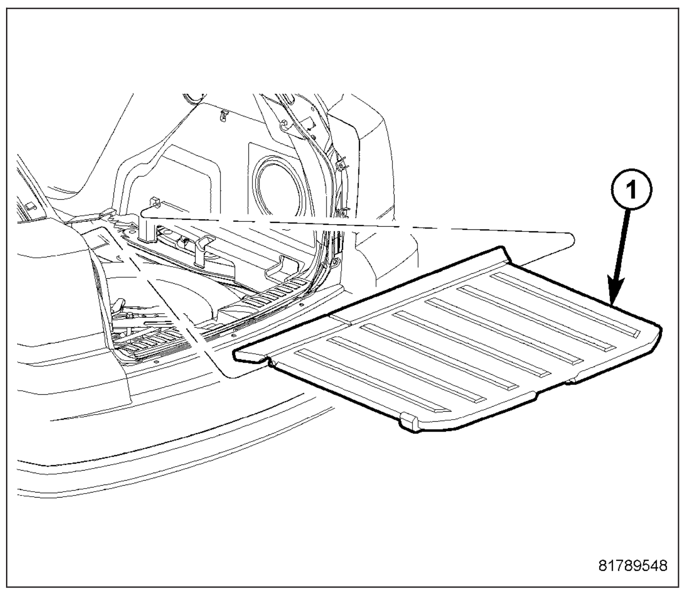
2. Fasten speaker to liftgate.

8181dd43



3. Align trim panel to liftgate holes and install trim panel fasteners.

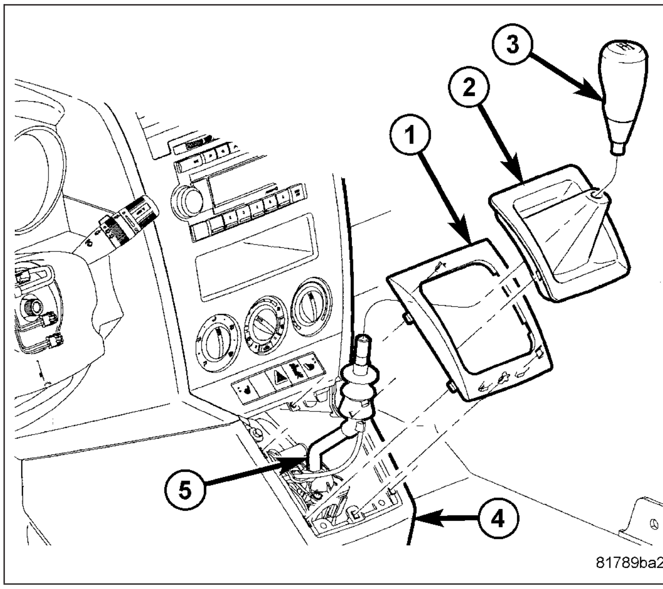
COVER ASSEMBLY CARGO FLOOR



REMOVAL

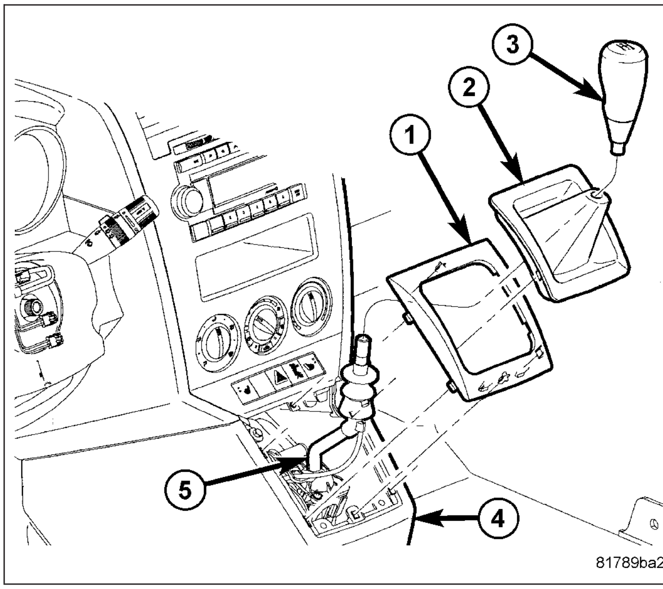
1. Pull upward on cargo load floor (1) disengaging tabs.
2. Pull outward at rear of cargo load floor removing cargo load floor disengaging cargo load floor from rear quarter panel pockets.
3. Remove from vehicle.

INSTALLATION



1. Load cargo load floor (1) into vehicle, ensuring cargo load floor pivots fit into pockets onto the rear quarter trim panel.
2. Once rear cargo load floor pivots are properly seated into pockets, snap down the front cargo load floor tabs ensuring cargo load floor is seated.

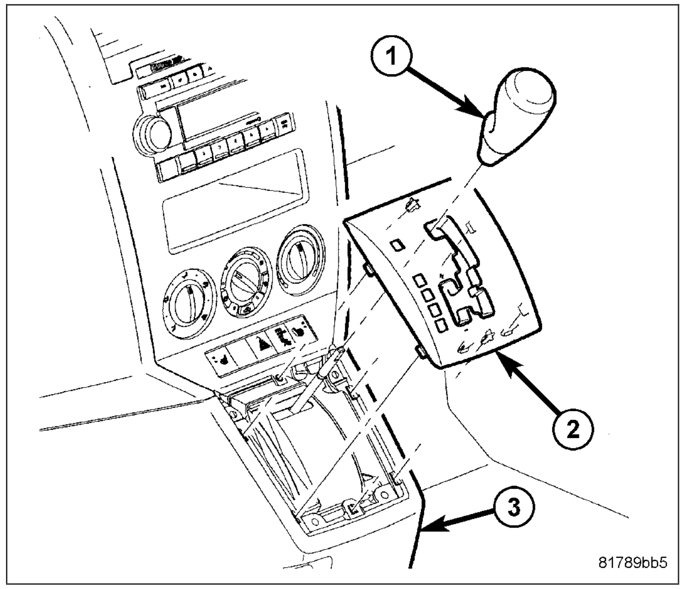
SHIFT BEZEL - MANUAL



REMOVAL

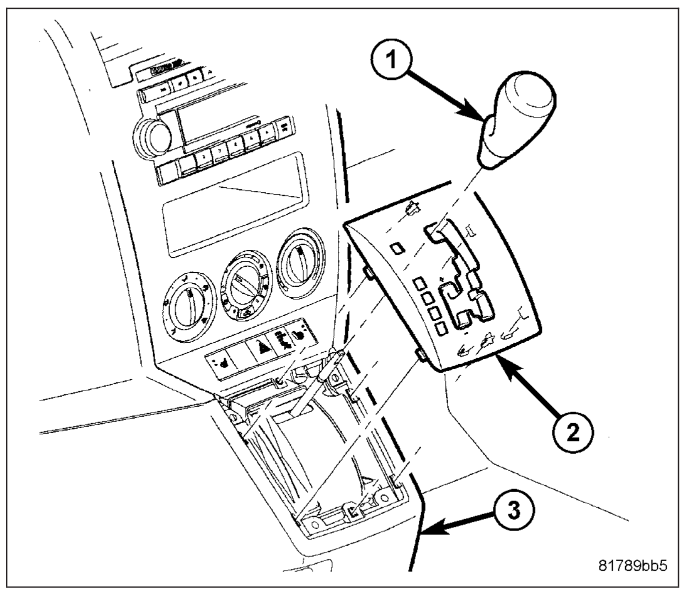
1. Pull up on shifter knob (3) and remove.
2. Using trim stick C-4755 or equivalent, pry up on bezel (1) and remove from shifter pod (4).

INSTALLATION



1. Locate bezel (1) over shifter lever (5) and into shifter pod (4).
2. Insert bezel locator to shifter pod (4).
3. Apply hand pressure to bezel (1) until clips are seated.
4. Slide boot (2) over shift lever (5) to bezel (1).
5. Apply hand pressure to snap bottom of boot (2) into bezel (1).
6. Snap shifter knob (3) onto shifter lever (5).
7. Pull up on know to verify seated correctly.

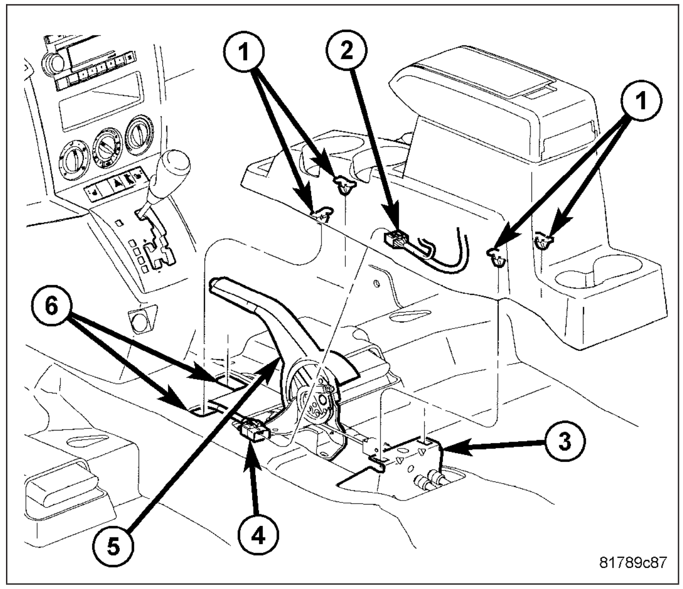
SHIFT BEZEL- AUTOMATIC



REMOVAL

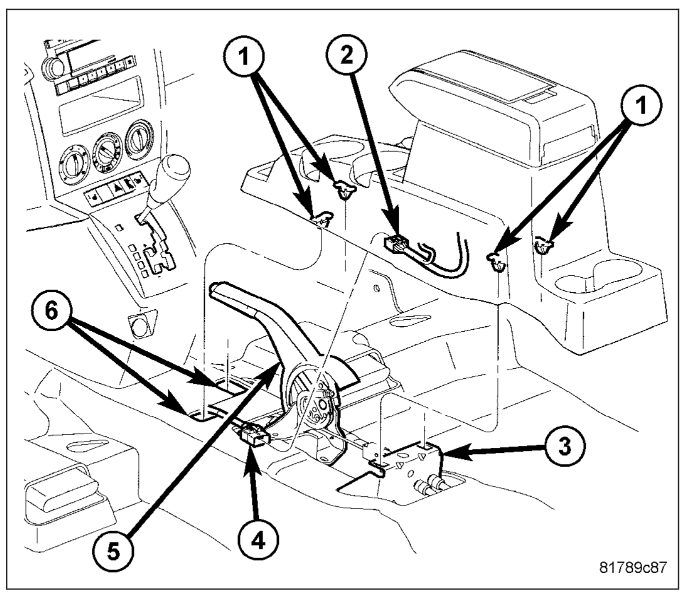
1. Pull up on shifter knob (1) and remove.
2. Using trim stick C-4755 or equivalent, pry up on bezel (2) and remove from shifter pod (3).

INSTALLATION



1. Insert bezel (2) locator to shifter pod (3).
2. Apply hand pressure until clips are seated.
3. Snap shifter knob (1) onto shifter shaft.
4. Pull up on knob (1) to verify seated correctly.

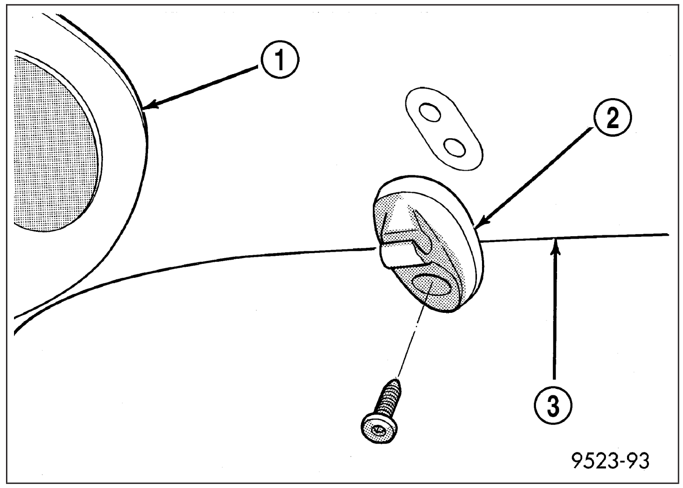
CENTER CONSOLE



REMOVAL

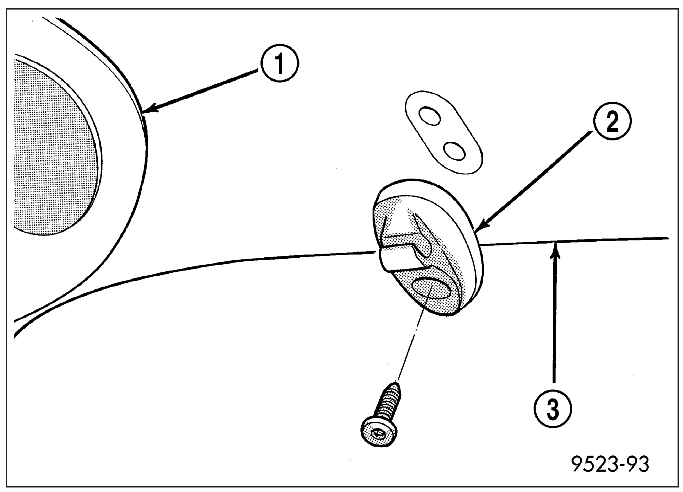
1. Pull back on parking brake (5) to the upright position.
2. Remove front screws (1) fastening center console to front floor bracket (6).
3. Open console door and remove two screws (1) fastening console to rear floor bracket (3).
4. Disconnect center console wire connector (2) to instrument panel connector.
5. Remove from vehicle.

INSTALLATION



1. Pull parking brake (5) into upright position.
2. Insert center console over parking brake.
3. Connect console wiring connector (2) to instrument panel connector (4).
4. Insert and fasten two front screws (1) into front floor bracket (6).
5. Insert and fasten two rear screws (1) into rear floor bracket (3).

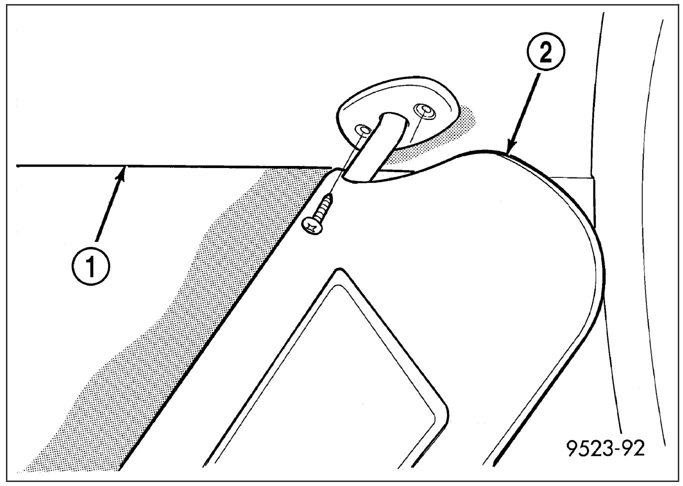
SUPPORT-VISOR



REMOVAL

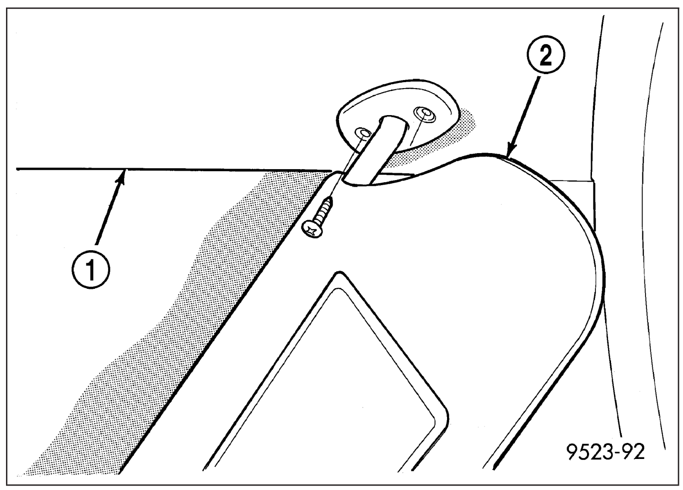
1. Disengage the sun visor (1) from the sun visor support (2).
2. Remove the screw that secures the support to the roof panel and remove the support from the headliner (3).

INSTALLATION



1. Position the sun visor support (2) on the headliner (3) and install the screw that secures the support to the roof panel.
2. Engage the sun visor (1) and sun visor support.

SUN VISOR

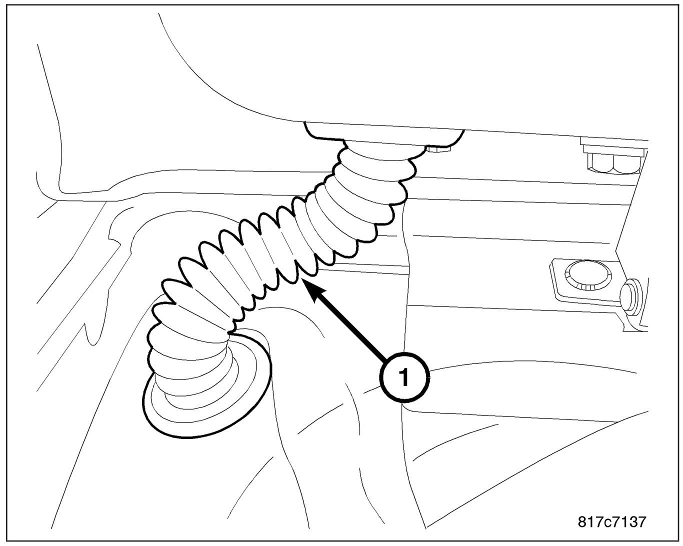


REMOVAL

1. Disengage the sun visor (2) from the sun visor support.
2. Remove the two screws that secure the sun visor to the roof panel and remove the sun visor from the headliner (1).
3. If equipped, disconnect the illuminated vanity mirror wire harness connector.

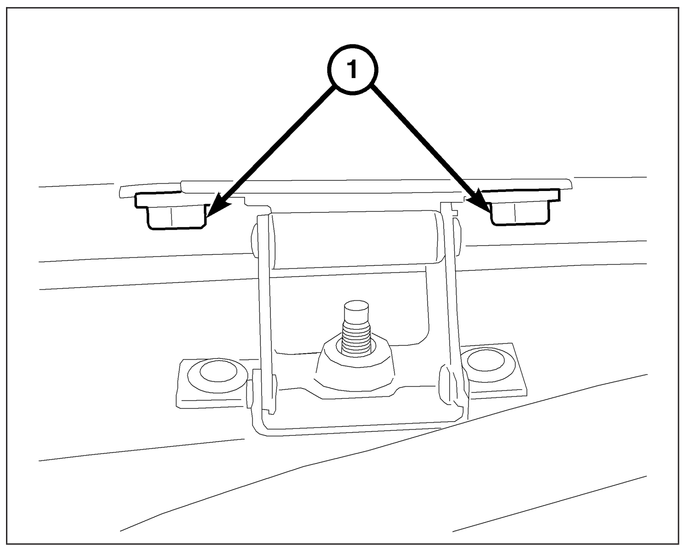
INSTALLATION

1. If equipped, connect the illuminated vanity mirror wire harness connector.
2. Position the sun visor (2) on the headliner (1) and install the two screws that secure the sun visor to the roof panel.
3. Engage the sun visor and sun visor support.



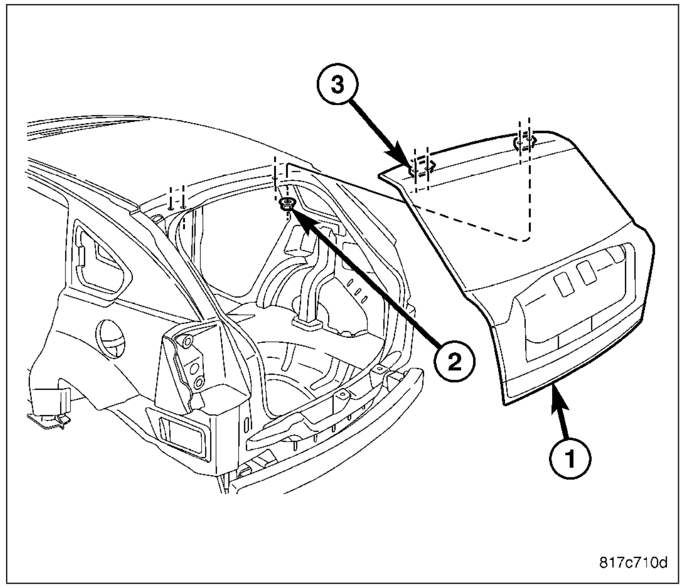
LIFTGATE

TABLE OF CONTENTS



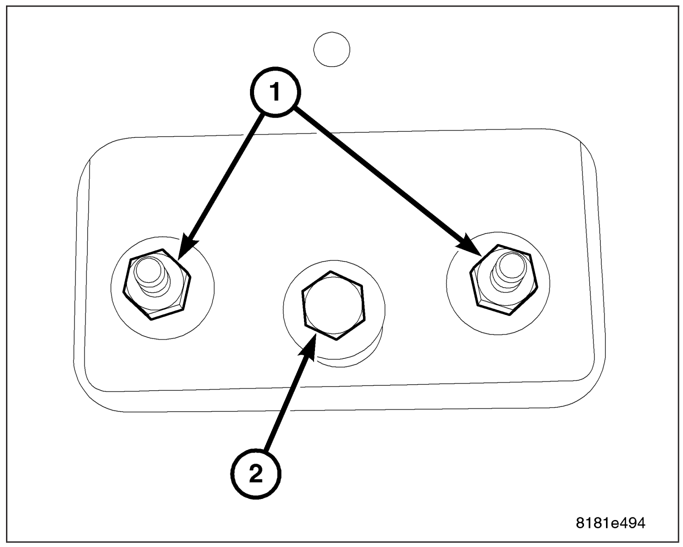
HINGE

REMOVAL



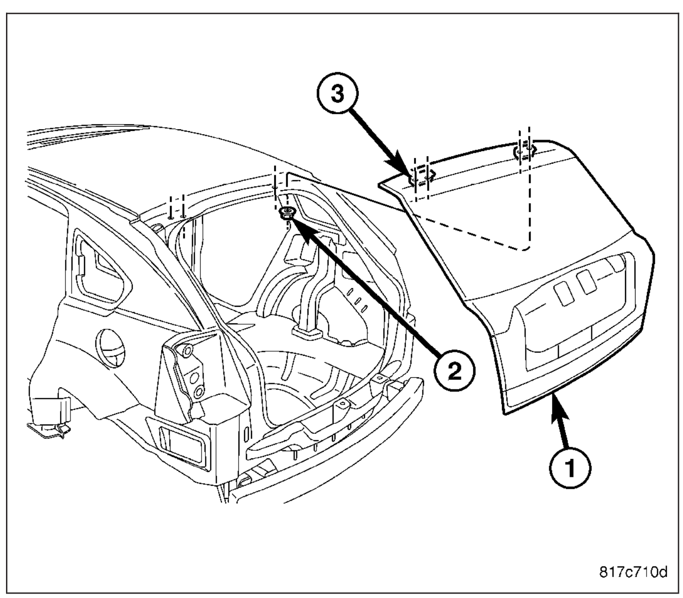
1. Release liftgate latch and open liftgate.
2. Disconnect liftgate harness and washer hose..
3. Support liftgate with a suitable lifting device in the full open position on the side of the vehicle being serviced.

4. Remove the two screws that secure the liftgate hinge (1) to the liftgate.



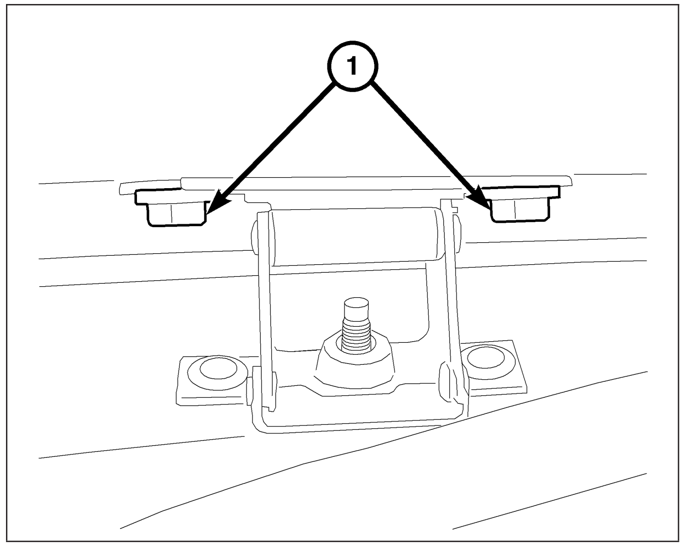
5. Remove liftgate (1) from hinge (3).

817c710d



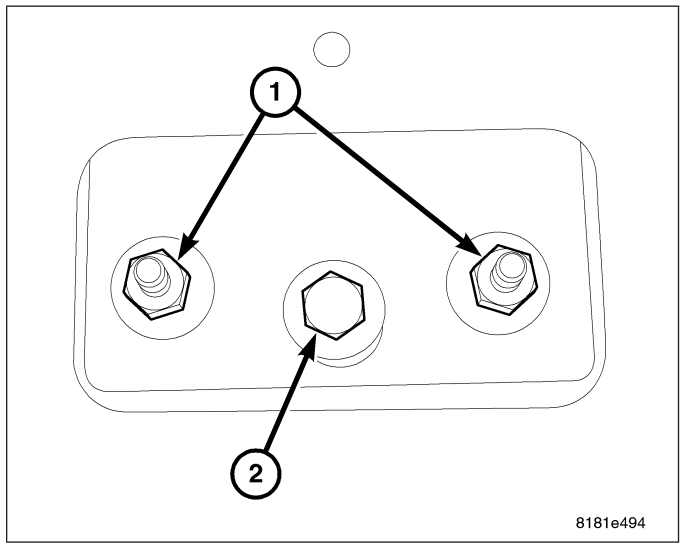
6. Carefully, move down headliner and remove two nuts and one fastener. Remove hinge from vehicle.

8181e494

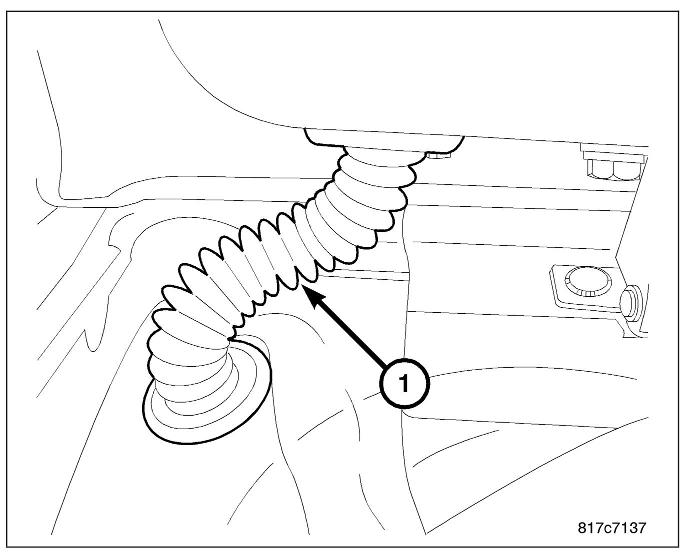


INSTALLATION

1. With the help of an assistant, align liftgate (1) with liftgate hinge (3).

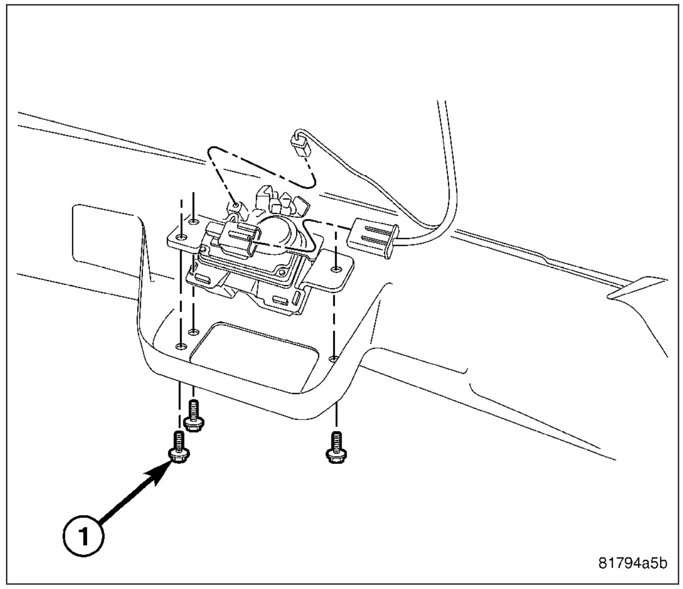


817c710d



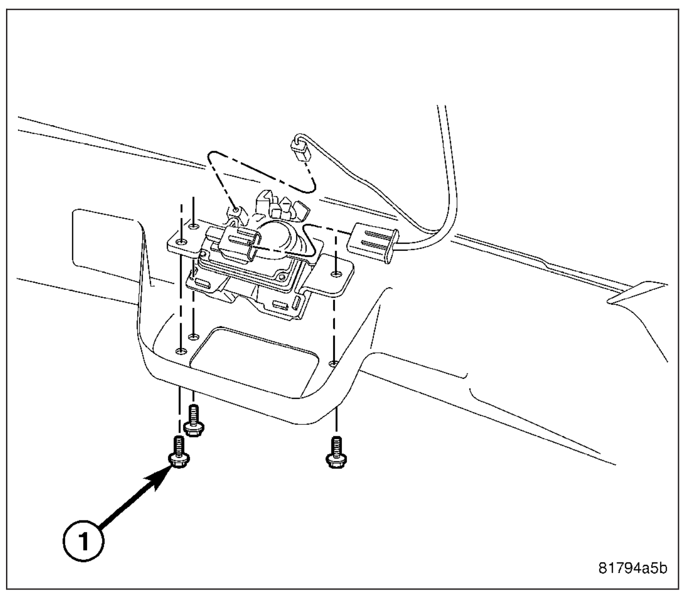
2. Carefully, pry down headliner and install fastener, washers and nuts.

3. Tighten nuts 20 N·m (15 ft. lbs).
4. Install gas props.



5. Connect liftgate harness (1).

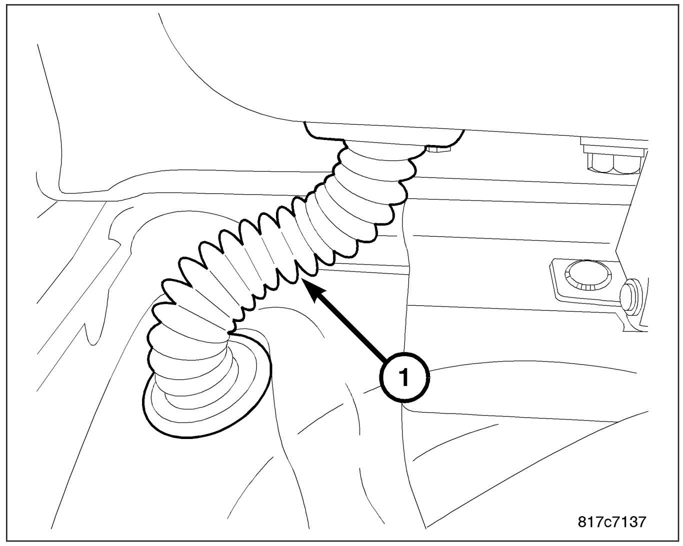
LATCH



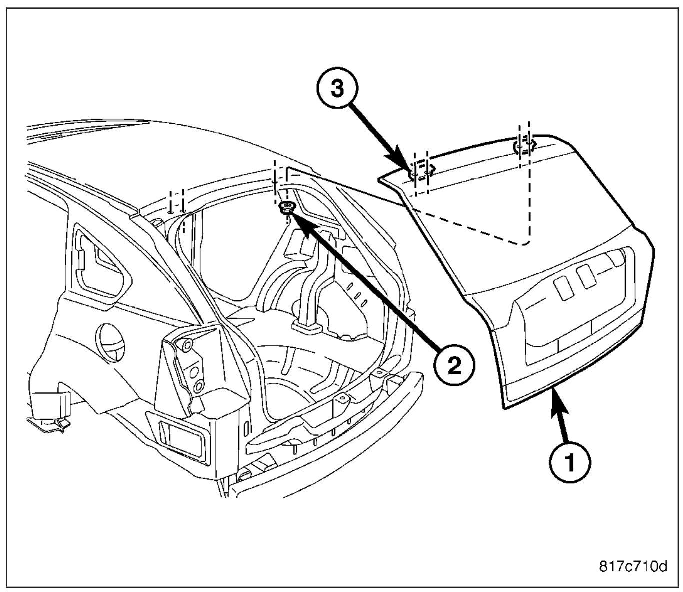
REMOVAL

1. Remove three fasteners (1).
2. Disconnect wire connectors.
3. Disconnect cable from outer handle hole.
4. Disconnect cable from latch.

INSTALLATION



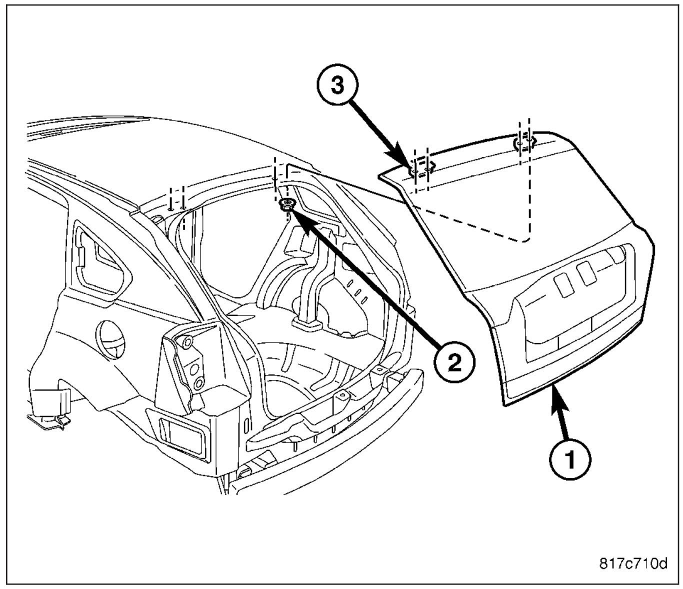
1. Connect wire connectors.
2. Install latch assembly into liftgate pocket.
3. Install three fasteners (1).
4. Tighten fasteners to 8 N·m (6 ft. lbs.).
5. Install cable fastener to liftgate inner while working the cable upward.
6. Guide cable upward through opening and tuck into the outer handle hole.



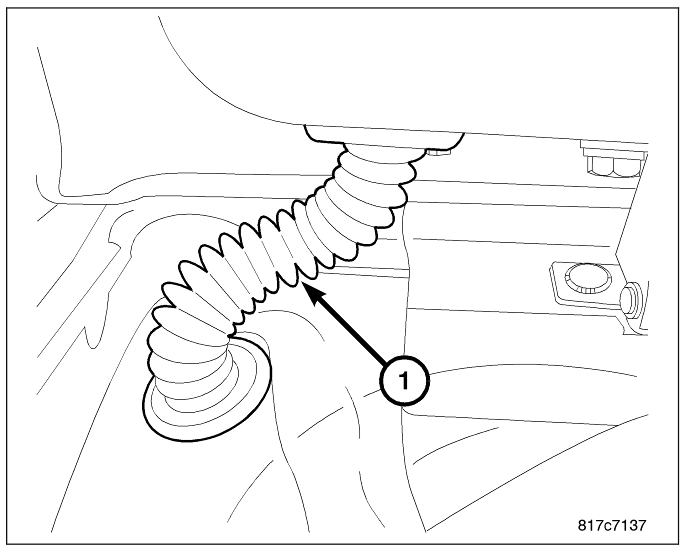
LIFTGATE

REMOVAL

1. Open liftgate.
2. Disconnect washer hose.
3. Disconnect liftgate harness (1).
4. Disconnect cable from handle.
5. With the help from an assistant, support liftgate and disconnect Prop rods. (Refer to 23 - BODY/ DECKLID/HATCH/LIFTGATE/TAILGATE/PROP ASSEMBLY - REMOVAL)



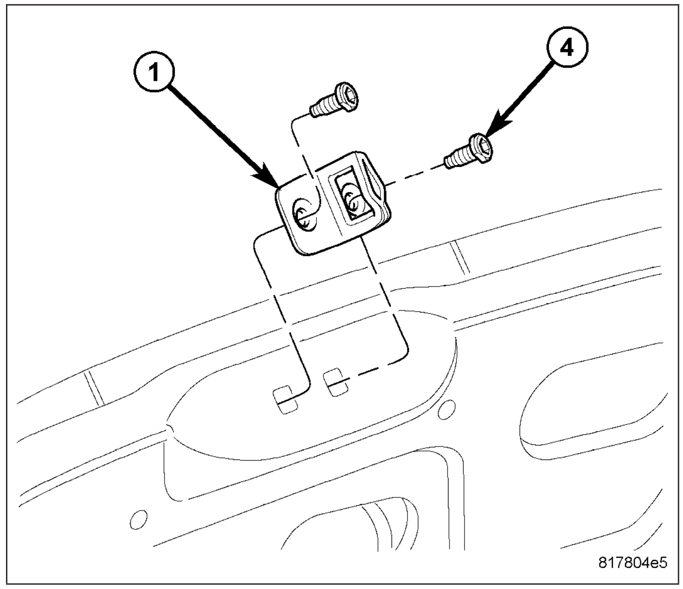
6. Remove fasteners (2) attaching liftgate (1) to liftgate hinge (3).



INSTALLATION

1. With the help of an assistant, place liftgate (1) onto liftgate hinges (3).
2. Torque nuts (2) to 15 N ·m (11 ft. lbs).
3. Install prop rods. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/PROP ASSEMBLY - INSTALLATION)

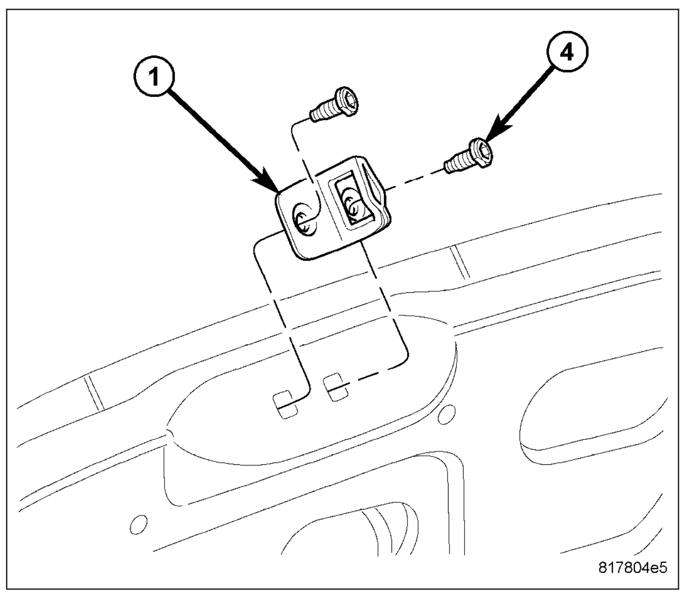
4. Install liftgate harness (1).
5. Install washer hose.



STRIKER

REMOVAL

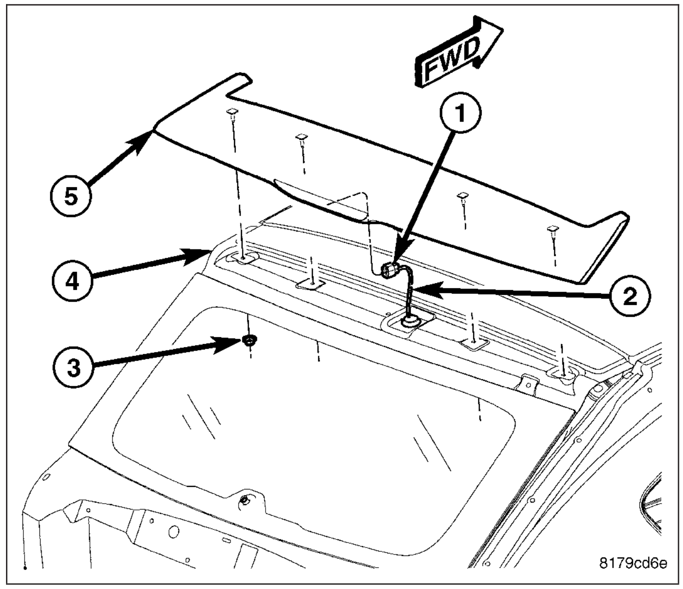
1. Open the liftgate.
2. Remove the liftgate sill scuff plate (Refer to 23 - BODY/INTERIOR/SCUFF PLATE-LIFTGATE SILL - REMOVAL).



NOTE: Place a reference mark along the outer edge of the striker to ensure it is reinstalled to its original position.

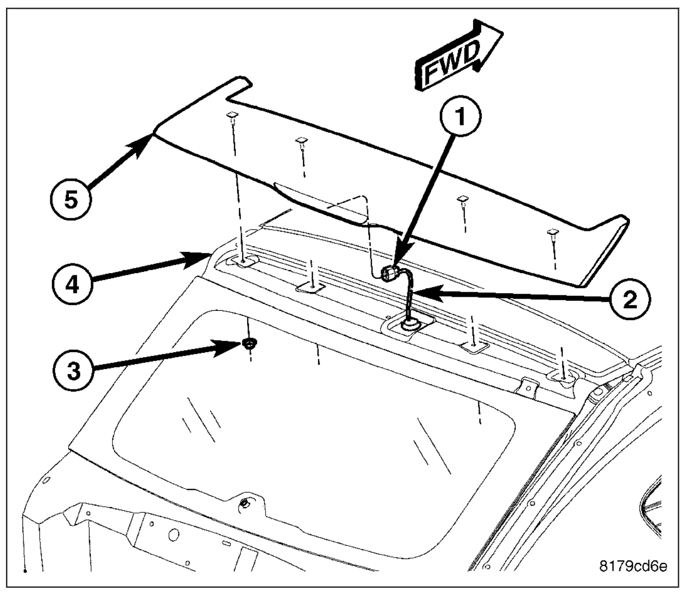
3. Mark the position of the striker (1) on the liftgate opening lower panel to aid installation.
4. Remove the two screws (4) that secure the striker to the lower panel and remove the striker.

INSTALLATION



1. Position the liftgate striker (1) onto the liftgate opening lower panel and align the striker to the previously marked location.
2. Install the two bolts (4) that secure the striker to the lower panel. Tighten the bolts to 23 N·m (17 ft. lbs.).
3. Verify liftgate alignment and latch operation. The liftgate should fit flush and have even gaps to adjacent body panels. Gap specifications are as follows:
   - 7 mm (0.280 in.) to the fascia.
   - 6 mm (0.240 in.) to the roof header.
   - 4 mm (0.160 in.) to the body side.
4. Install the liftgate sill scuff plate (Refer to 23 - BODY/INTERIOR/SCUFF PLATE-LIFTGATE SILL - INSTALLATION).

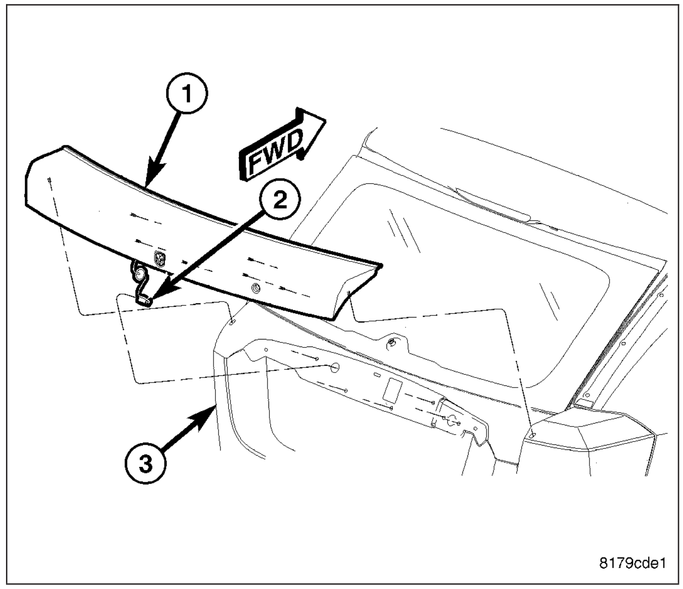
LIFTGATE- SPOILER



REMOVAL

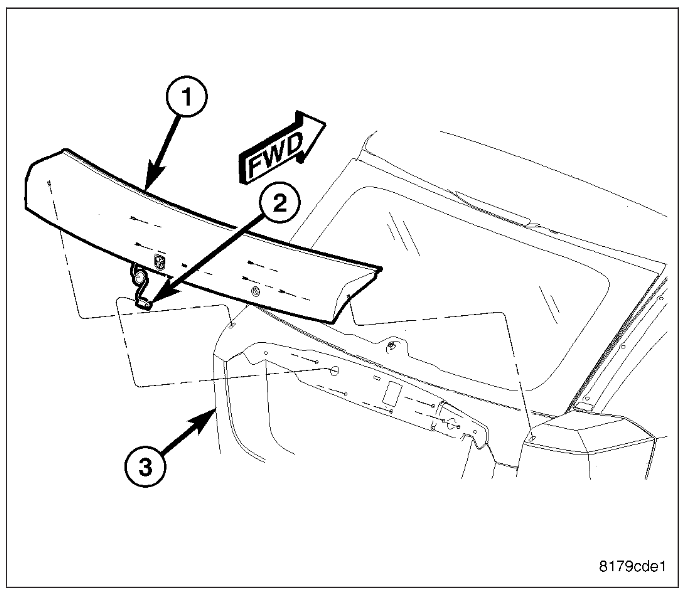
1. Open liftgate.
2. Remove liftgate upper molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - REMOVAL)
3. Remove 5 body plugs.
4. Remove nuts (3) on spoiler studs.
5. If equipped, remove satellite wire (2) connector (1).
6. Remove spoiler (5) from vehicle (4).

INSTALLATION



1. If equipped, connect satellite wire (2) connector (1).
2. Replace seal if necessary.
3. Place spoiler (5) onto vehicle (4).
4. Install spoiler nuts onto spoiler studs.
5. Install spoiler plugs.
6. Install liftgate upper molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - INSTALLATION)

LIGHT BAR

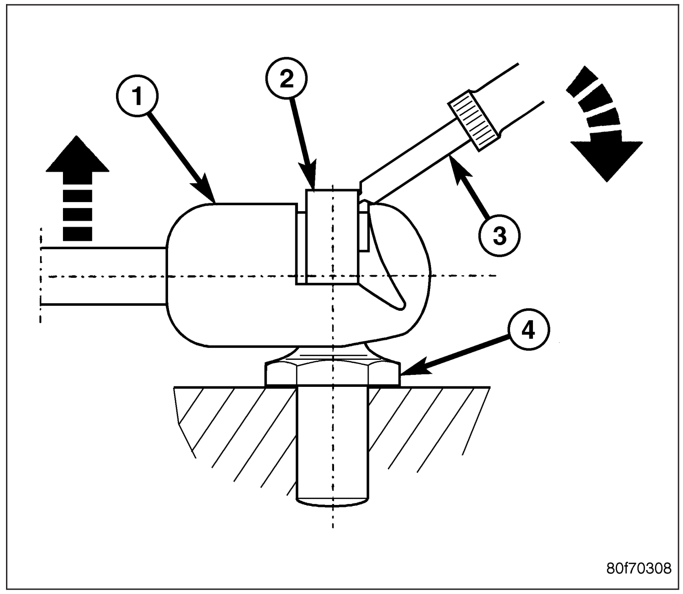


REMOVAL

1. Remove liftgate upper molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - REMOVAL)
2. Remove liftgate upper side molding. (Refer to 23 - BODY/INTERIOR/LGATE UPPER SIDE MOLDING - REMOVAL)
3. Remove liftgate lower molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL)
4. Remove nuts from light bar studs.
5. Disconnect wire connector.
6. Disconnect cable from handle.

INSTALLATION

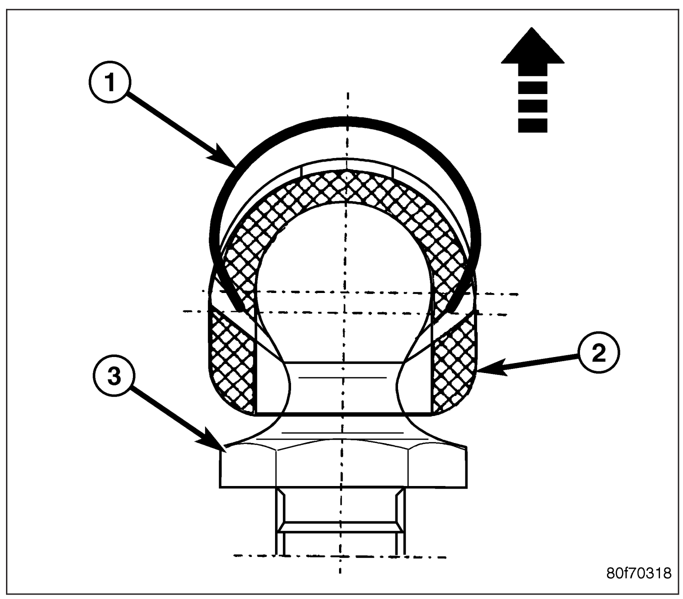
1. Connect wire connector (2).
2. Connect cable to light bar handle.
3. Align light bar studs through liftgate holes.
4. Install nuts to light bar studs.
5. Install liftgate lower trim panel. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION)
6. Install liftgate side moldings. (Refer to 23 - BODY/INTERIOR/LGATE UPPER SIDE MOLDING - INSTALLATION)
7. Install liftgate upper molding. (Refer to 23 - BODY/INTERIOR/LIFTGATE UPPER MOLDING - INSTALLATION)



PROP ROD ASSEMBLY

REMOVAL

1. Open the liftgate and support.
2. Using a small flat bladed tool, or equivalent, release the retaining clips while pulling the ball socket away from the ball stud.



NOTE: Lift the clips only enough to release the ball studs.

3. Remove the support cylinder.

INSTALLATION

1. Make sure the retaining clips are seated into the ball socket (2) fully.
2. Install the support cylinder over the ball studs with the thin end connected to the liftgate and the retaining clips snapping into place.

PAINT

Dark Slate Gray/Pastel Slate Gray	DA
Dark Pebble Beige/Pastel Pebble Beige	KA

BASECOAT/CLEARCOAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clearcoat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result. Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION). The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The codes listed in the Color Code Chart are used for manufacturing purposes.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch Up Paints and Clear Top Coat. (Refer to VEHICLE DATA/VEHICLE INFORMATION/BODY CODE PLATE - DESCRIPTION).

WARNING: Use an osha approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.

TOUCH UP PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch up paint. Do not overlap touch up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch up paint to dry hard.
5. On vehicles without clearcoat, the touch up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

FINESSE SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

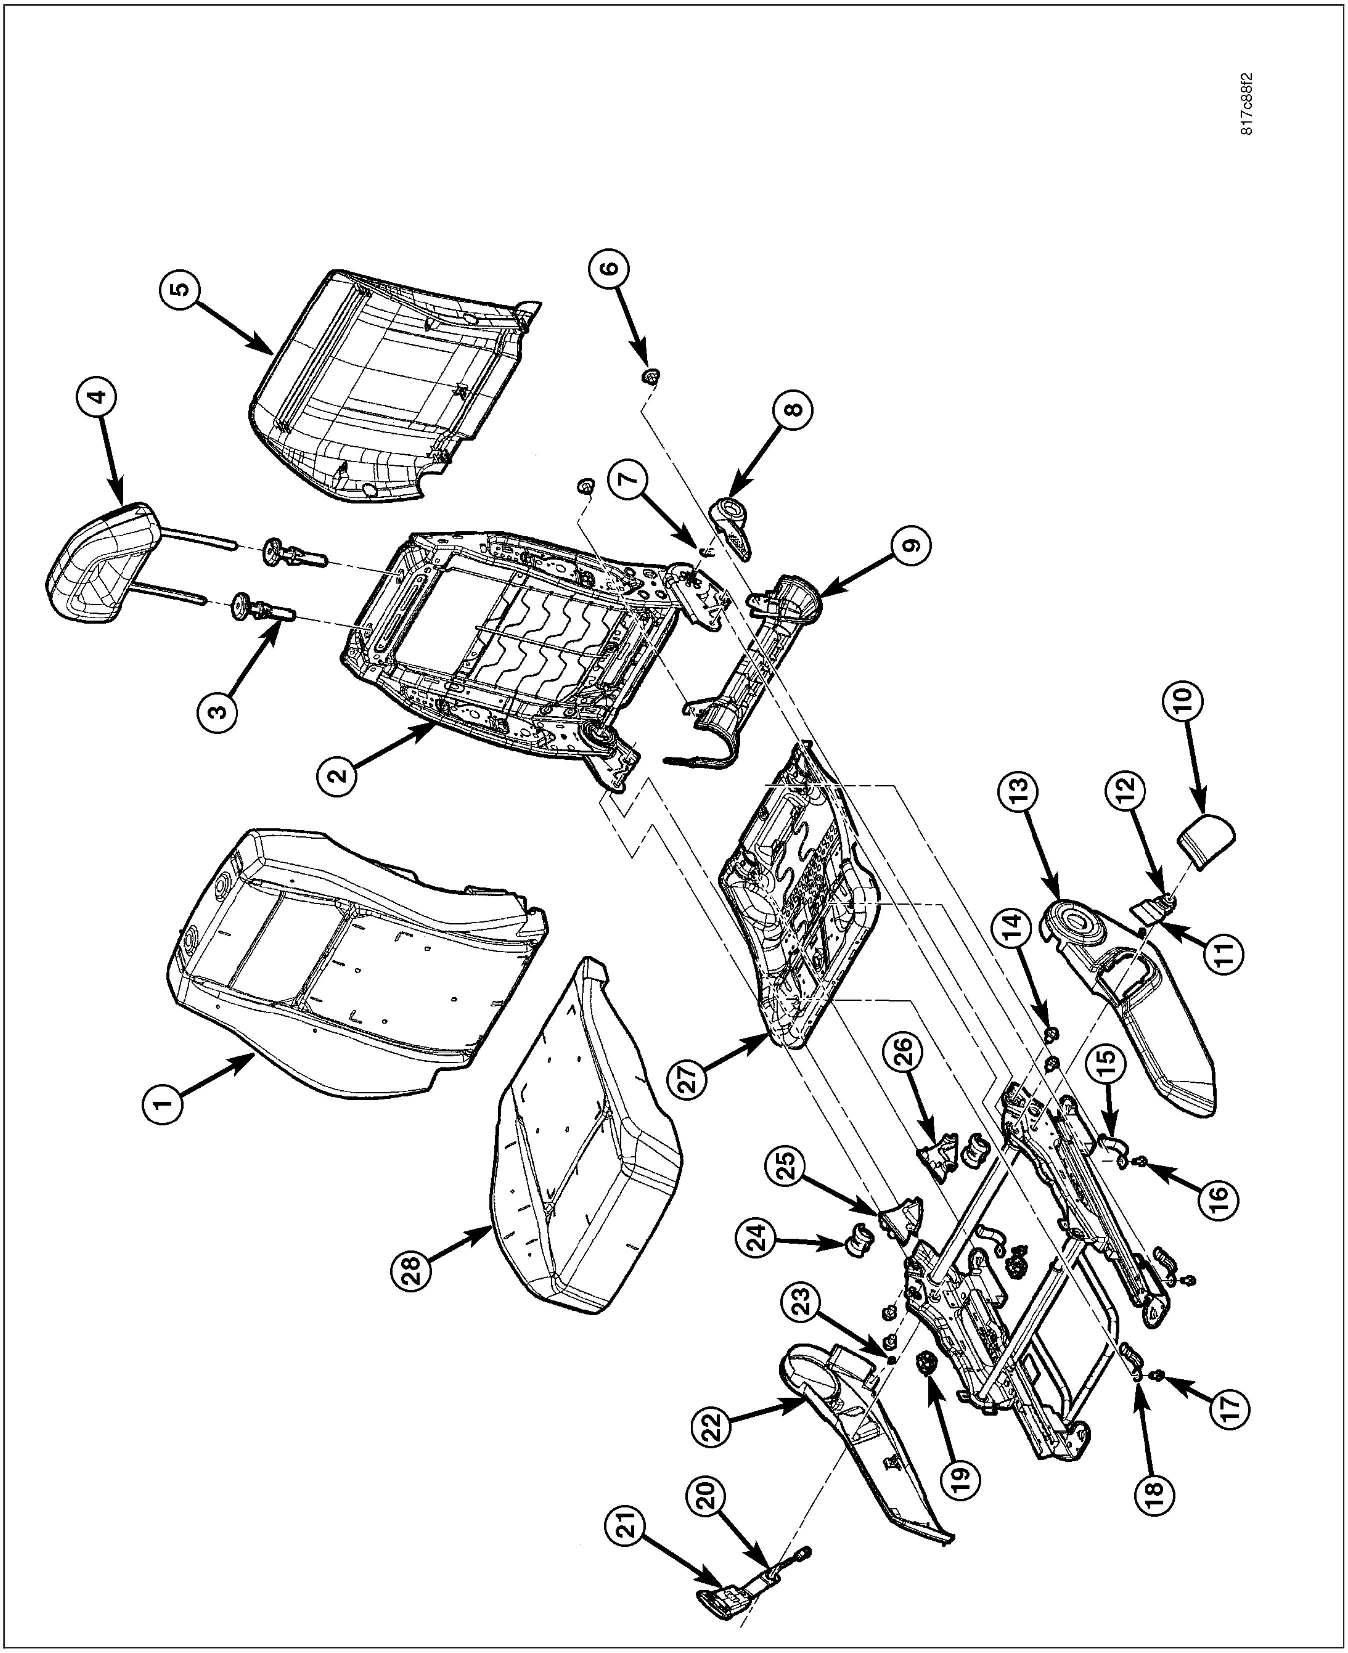
CAUTION: Do not remove clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

SEATS

TABLE OF CONTENTS

SEATS

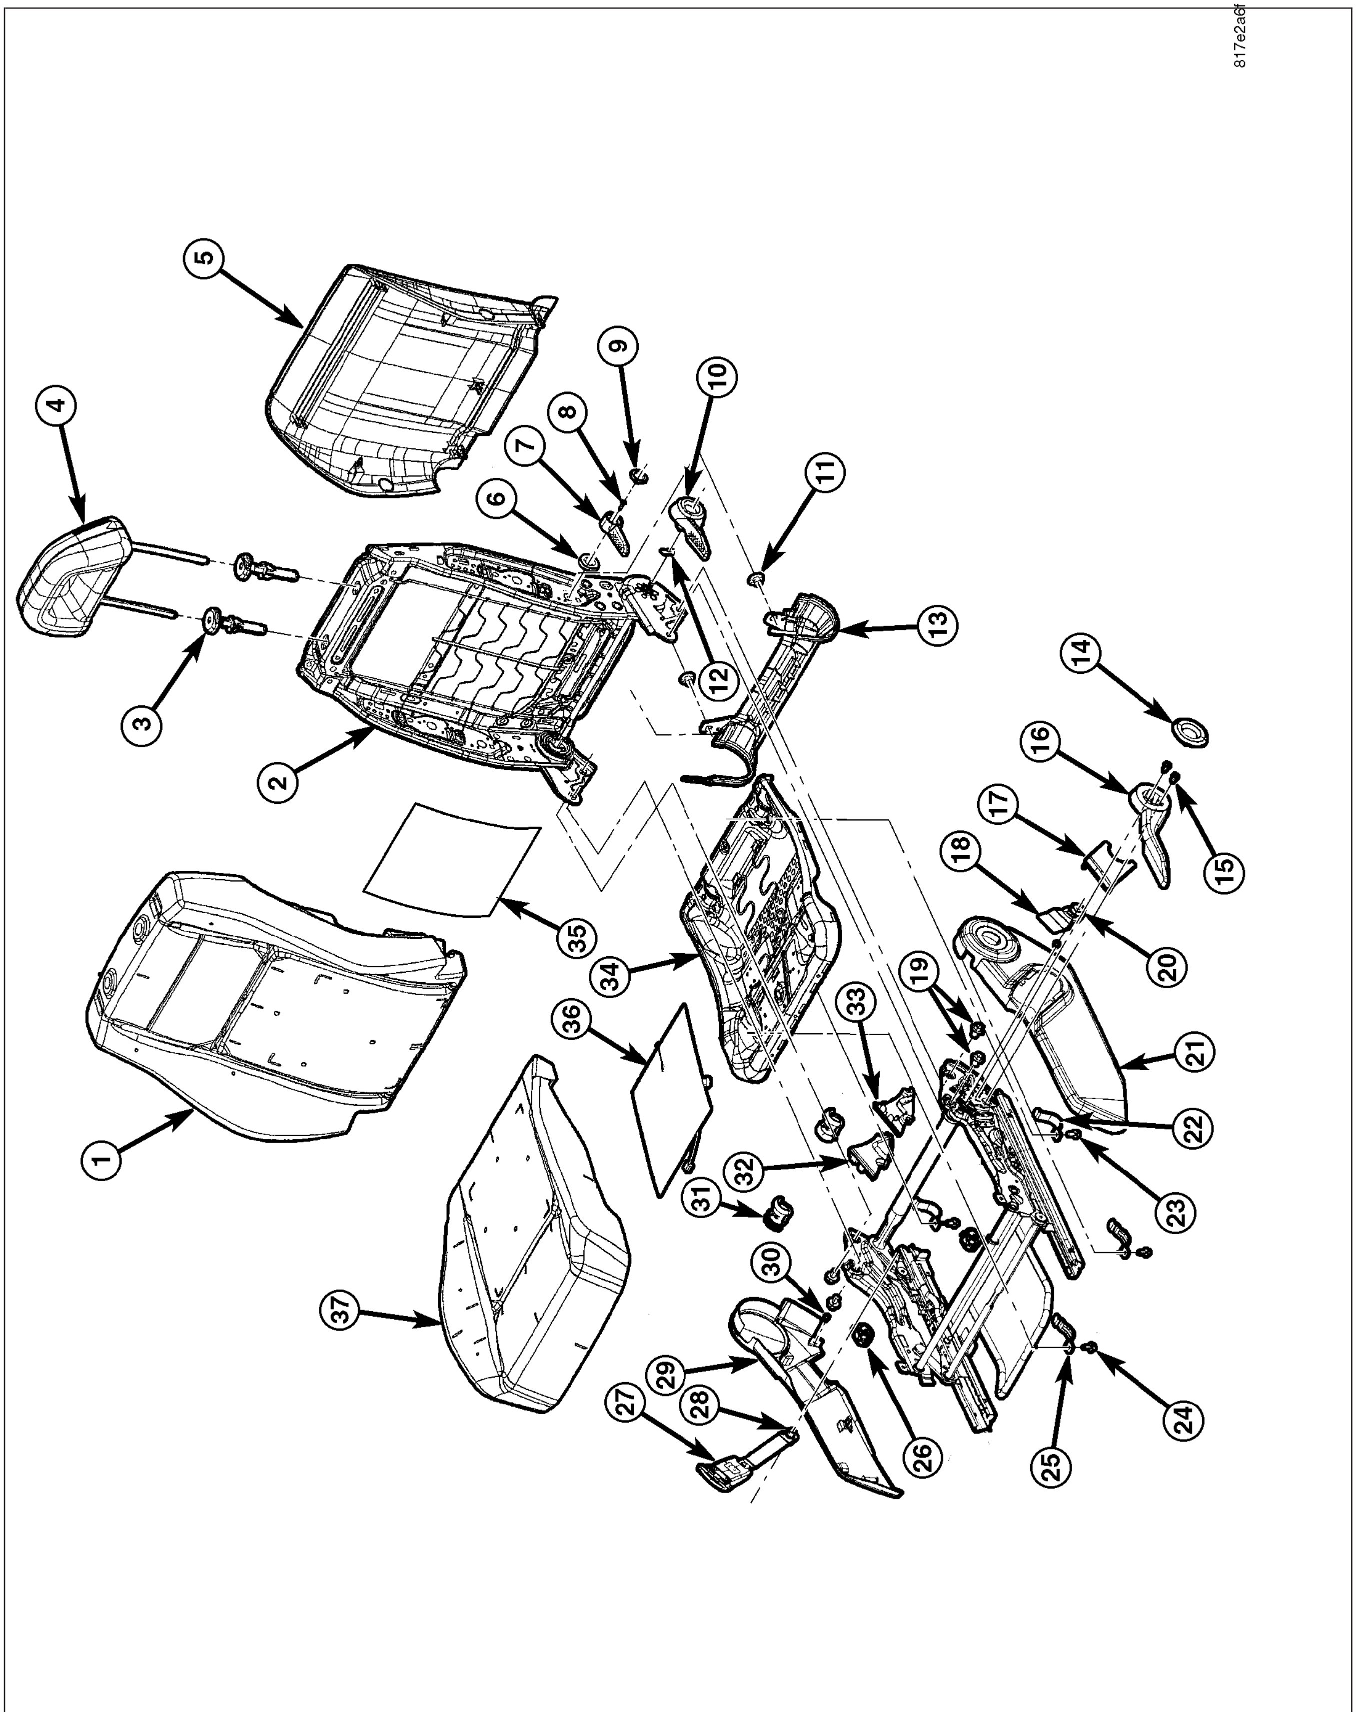
WARNING



RESTRAINT SYSTEM

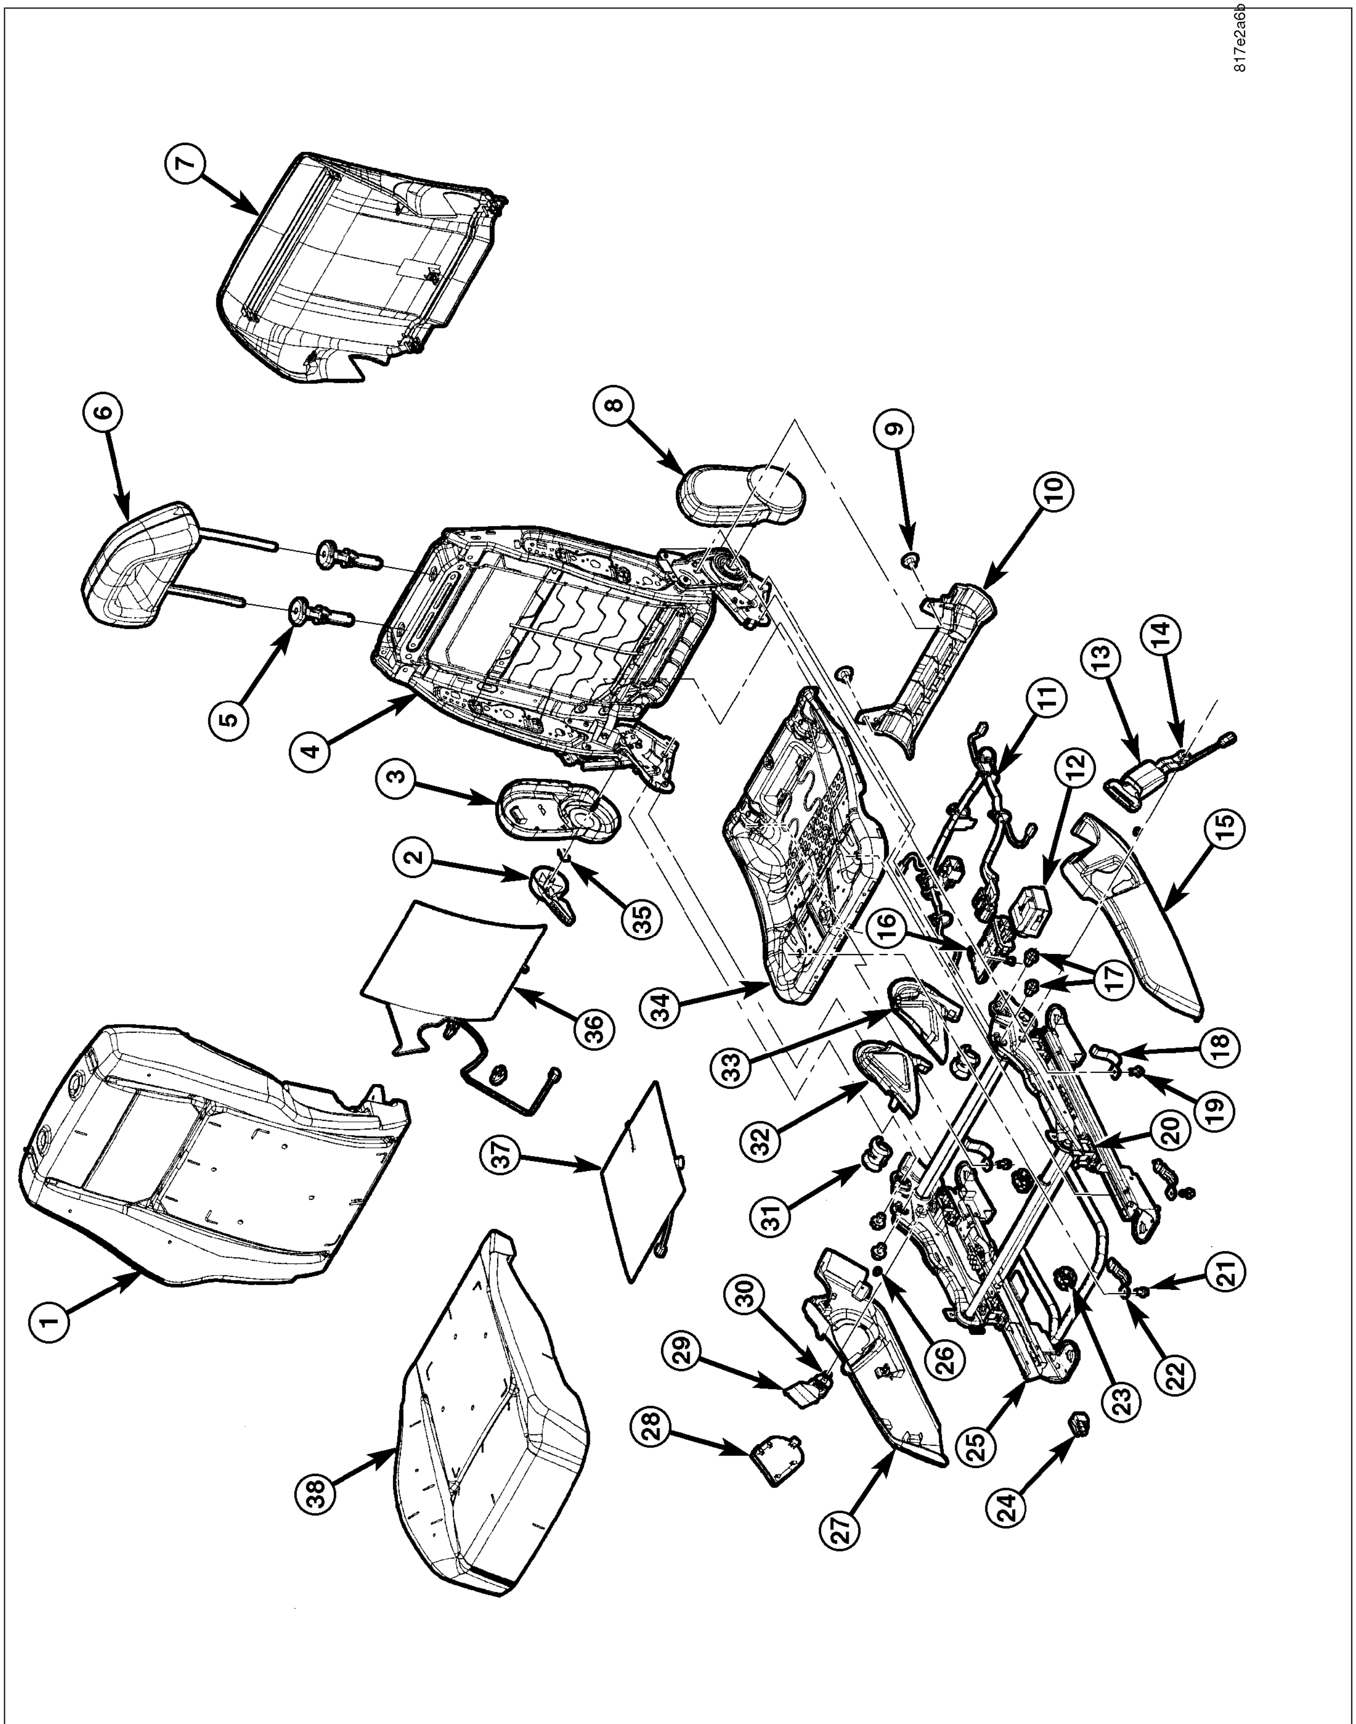
WARNING:

- **During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar ™parts catalog. Failure to follow these instructions may result in personal injury or death.**
- **On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.**
- **On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Occupant Restraint Controller (ORC). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.**
- **Replace all restraint system components only with parts specified in the DaimlerChrysler Mopar™ parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.**
- **The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar ™parts catalog. Failure to follow these instructions may result in personal injury or death.**
- **On vehicles equipped with the Occupant Classification System (OCS), do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.**
- **The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.**
- **The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.**
- **When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.**



SEAT - FRONT

DESCRIPTION



2-WAY DRIVER SEAT

1 - SEAT BACK CUSHION/COVER	15 - SEAT CUSHION STRAPS - REAR (2)
2 - SEAT BACK FRAME	16 - SEAT CUSHION STRAP BOLTS - REAR (2) 11 N·m (8 ft. lbs.)

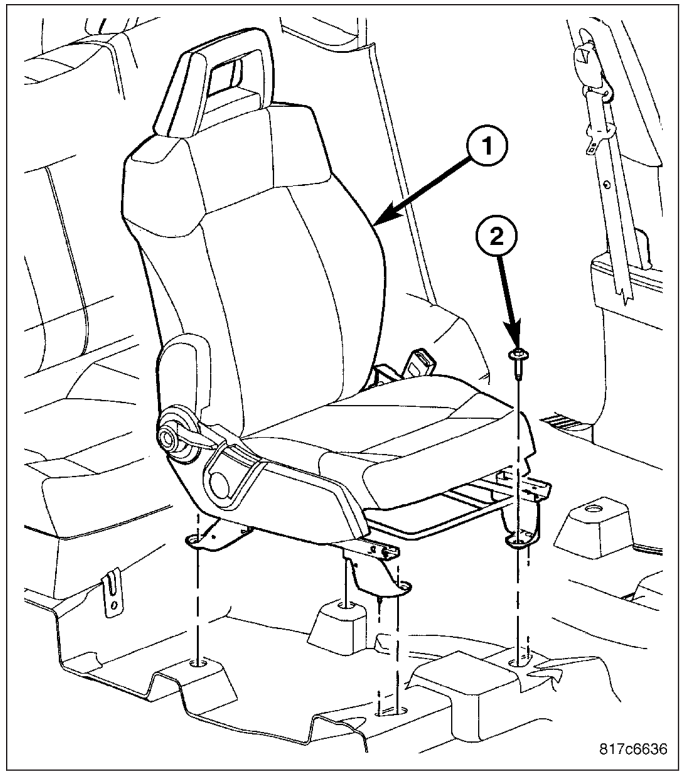
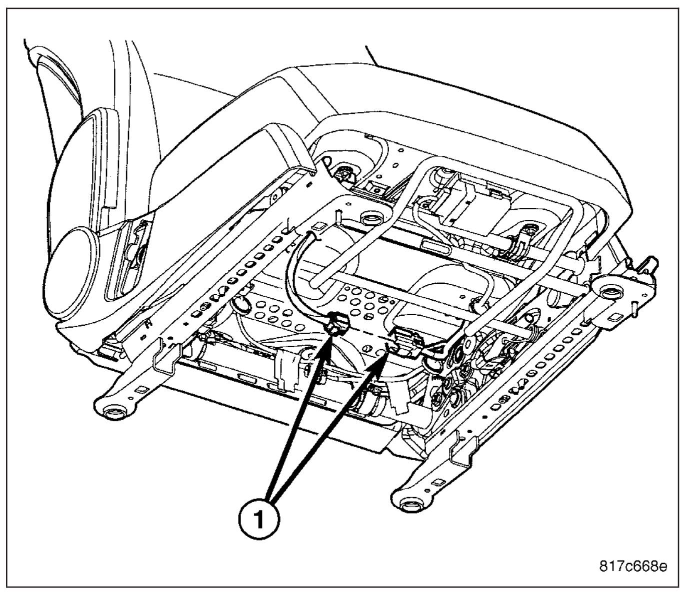
REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)



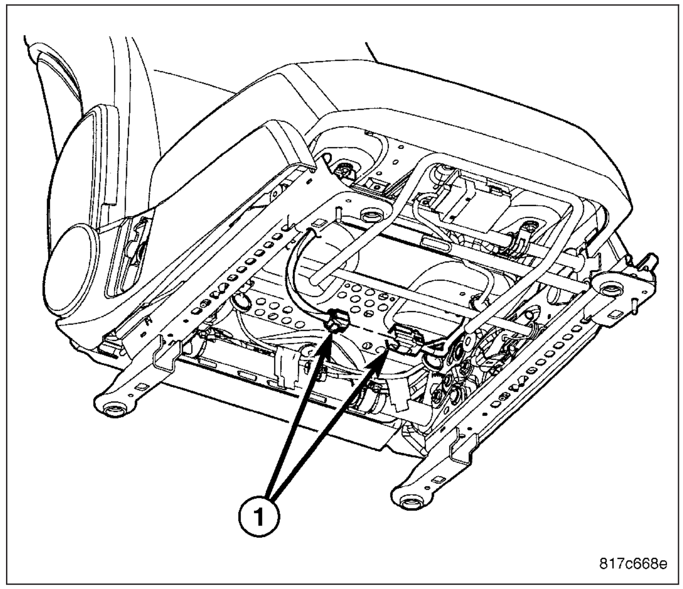
WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.



WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

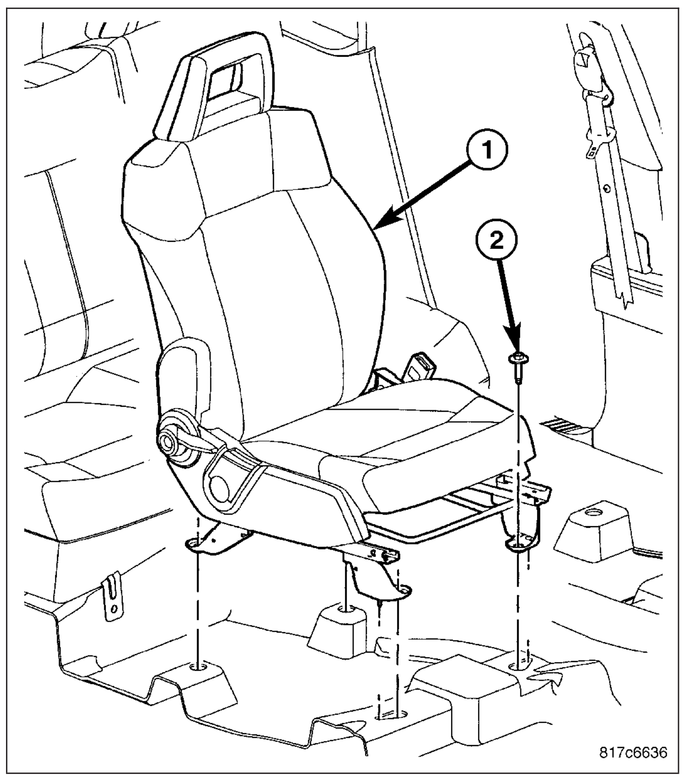
2. Using a trim stick C-4755 or equivalent, remove the seat belt anchor trim (3).
3. Remove the bolt (2) and separate the seat belt anchor (1).



4. Remove the bolts (2).

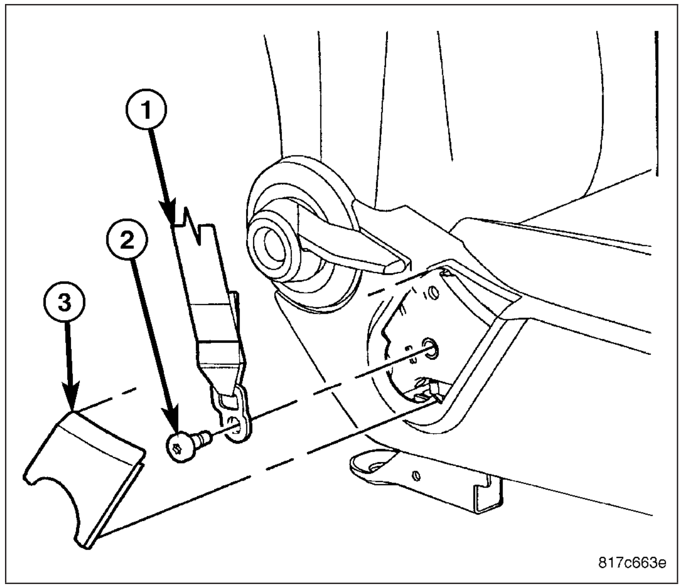
5. Tip the seat back and disconnect the electrical connectors (1).
6. Remove the seat.

INSTALLATION



1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

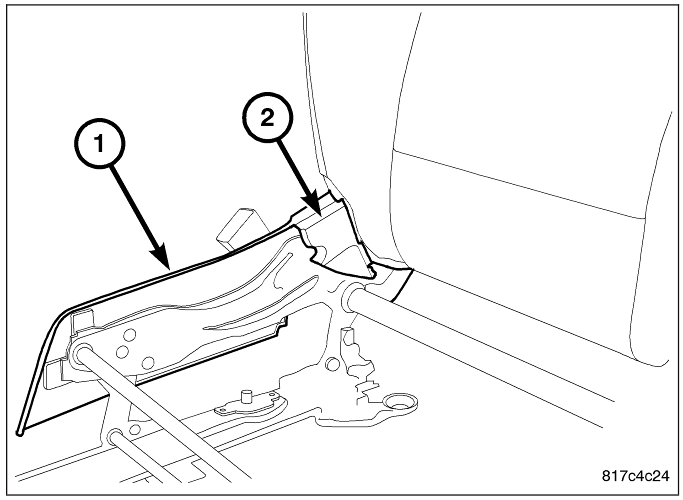


WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

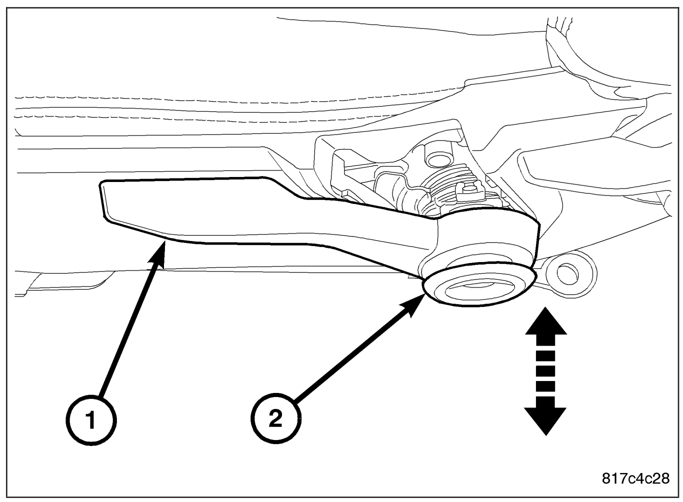
WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Position the seat into the vehicle and connect the electrical connectors (1), if equipped.
3. Install the bolts (2).
   a. Adjust the seat forward.
   b. Tighten the rear outboard bolt to 51 N·m (38 ft. lbs.).
   c. Tighten the rear inboard bolt to 51 N·m (38 ft. lbs.).
   d. Adjust the seat rearward.
   e. Tighten the front outboard bolt to 51 N·m (38 ft. lbs.).
   f. Tighten the front inboard bolt to 51 N·m (38 ft. lbs.).

4. Install the lower seat belt anchor (1) and install the bolt (2).
5. Tighten the bolt (2) to 39 N·m (29 ft. lbs.) and install the trim cover (3).
6. Do not reconnect the battery negative cable at this time. The occupant classification module system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - *OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST)

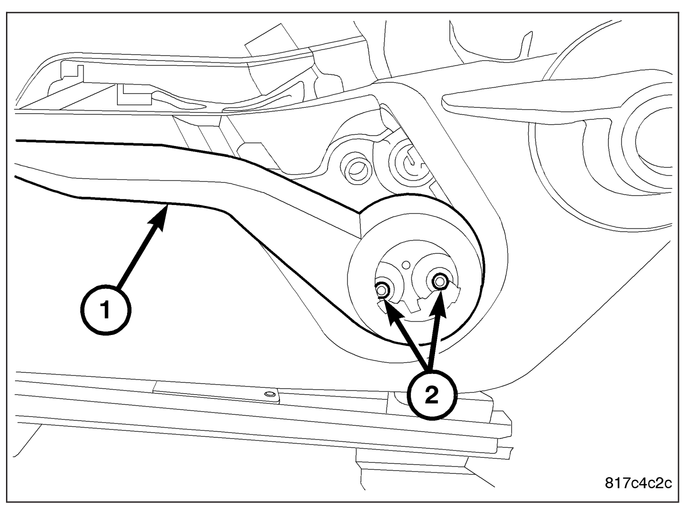


SEAT BACK - FRONT

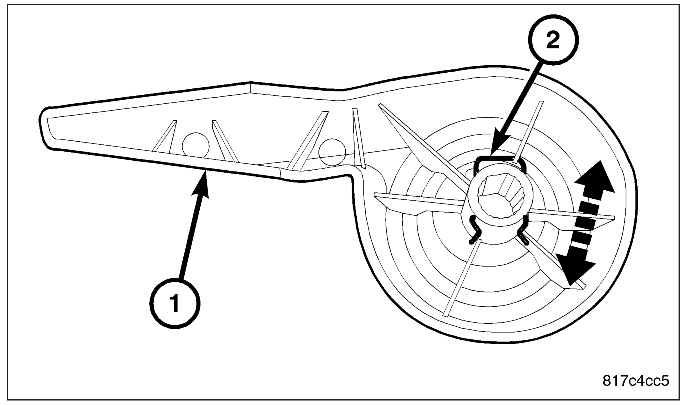


REMOVAL

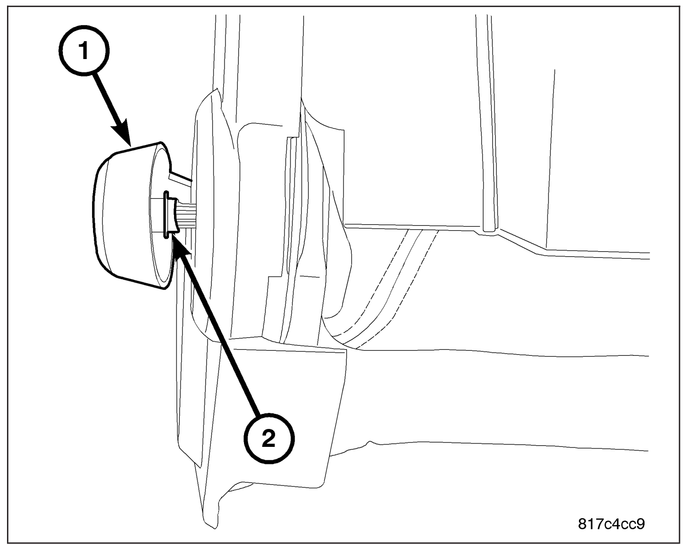
Driver Seat



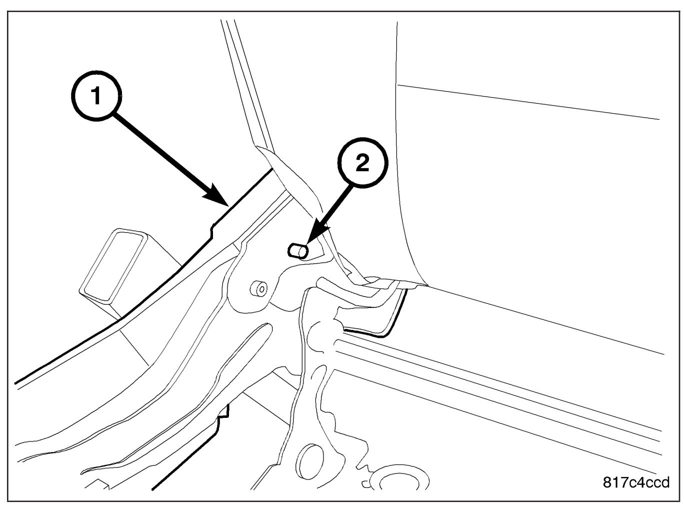
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL).
3. Remove both of the inner side shields (2).



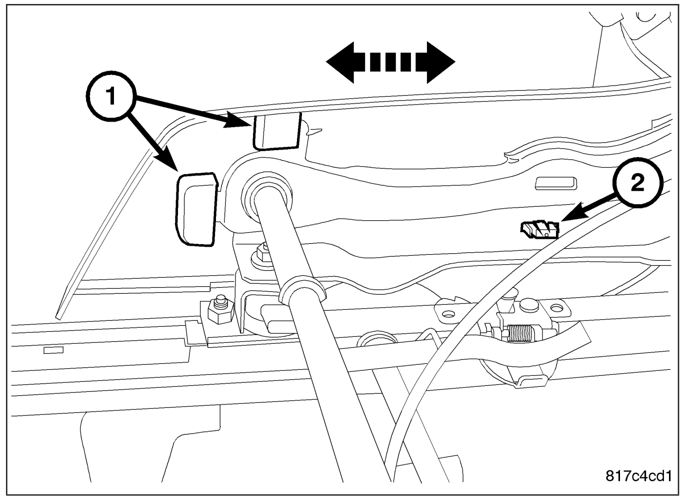
4. Remove the lift lever trim cap (2).



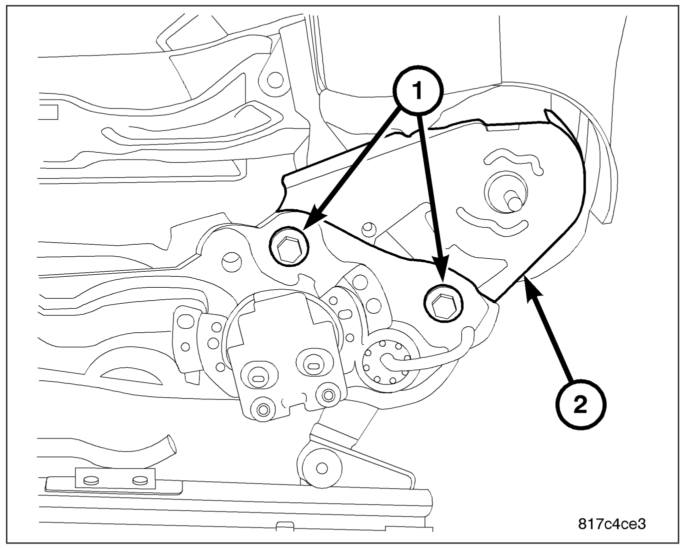
5. Remove the screws (2) and remove the lift lever (1).



6. Separate the clip (2).

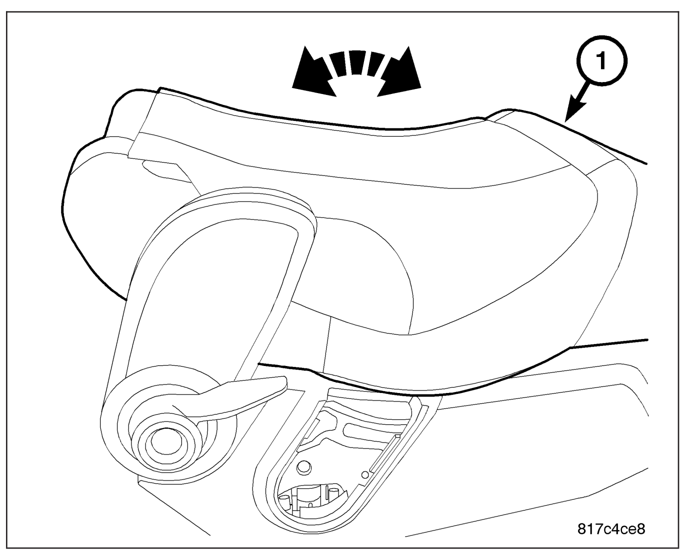


7. Remove the recliner handle (1).

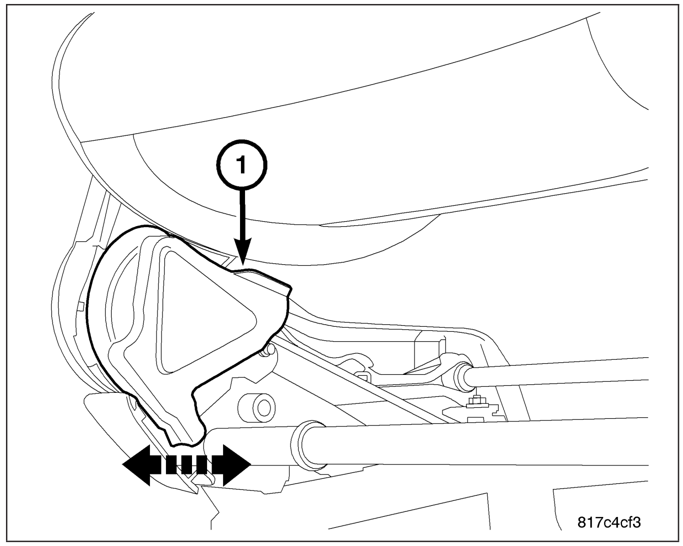


8. Remove the screws (2) attaching the inboard and outboard side shields (1) to the seat frame.

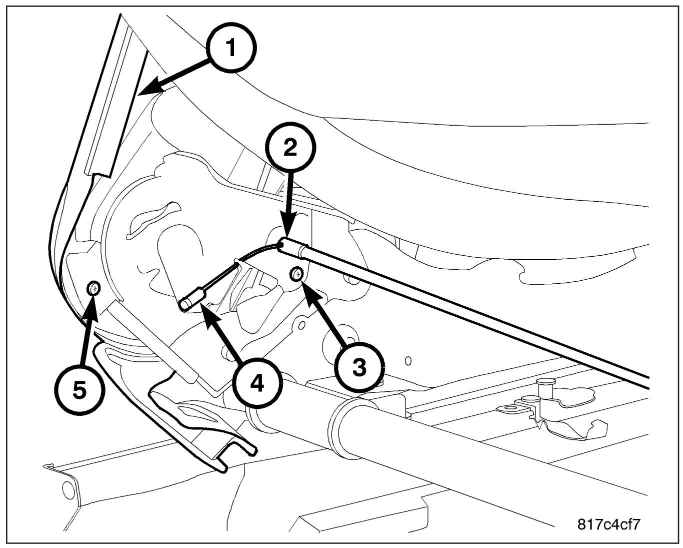
9. Separate the clip fasteners (2) and remove the side shields from the seat cushion frame tabs (1).



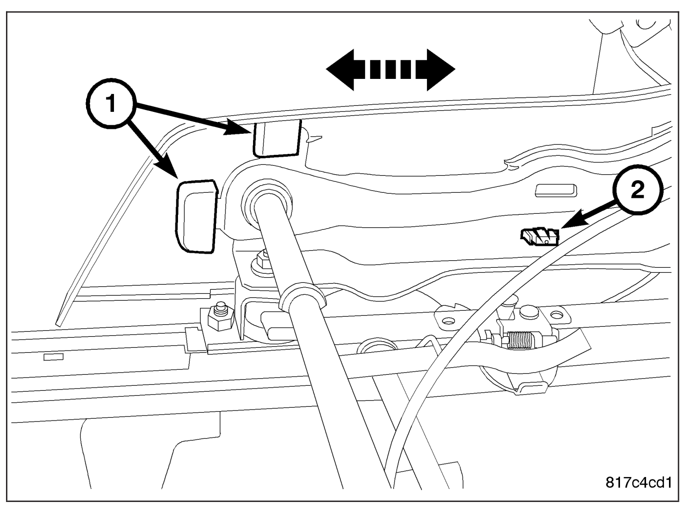
10. Remove the bolts (1) and remove the seat back assembly (2).



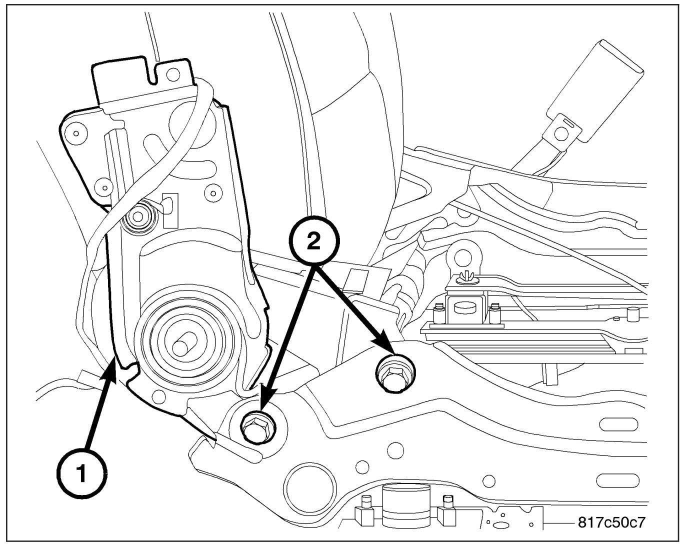
Passenger Seat



1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL).
3. Fold the seat back (1) into the down position.

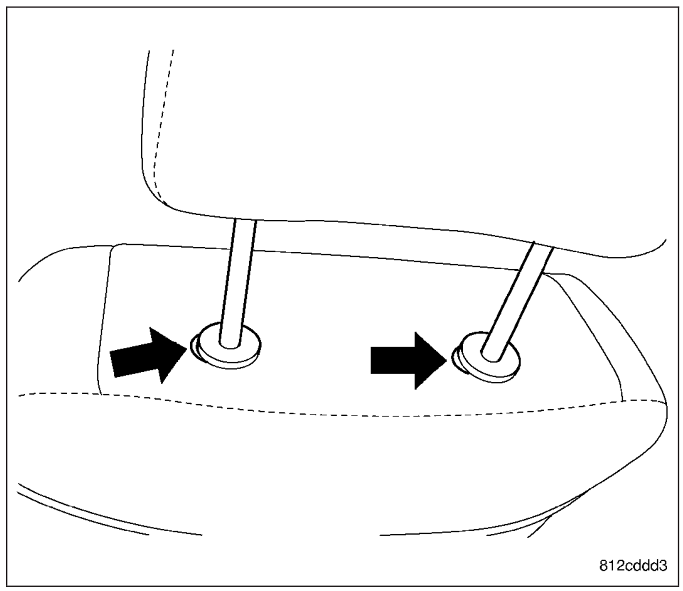


4. Remove both of the inner side shields (1).

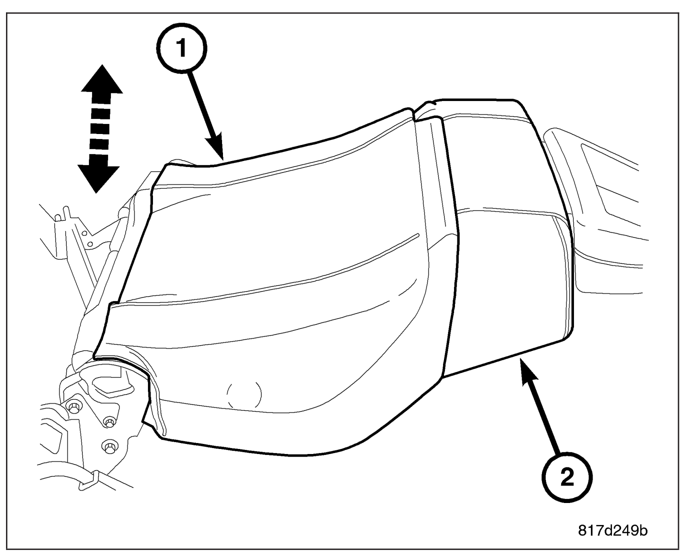


5. Release the cable housing (2) from the seat back frame and disconnect the recliner cable ends (4).
6. Remove the screw (5) and remove the recliner shields (1).
7. Remove the screw (3) attaching the inboard and outboard side shields to the seat frame.

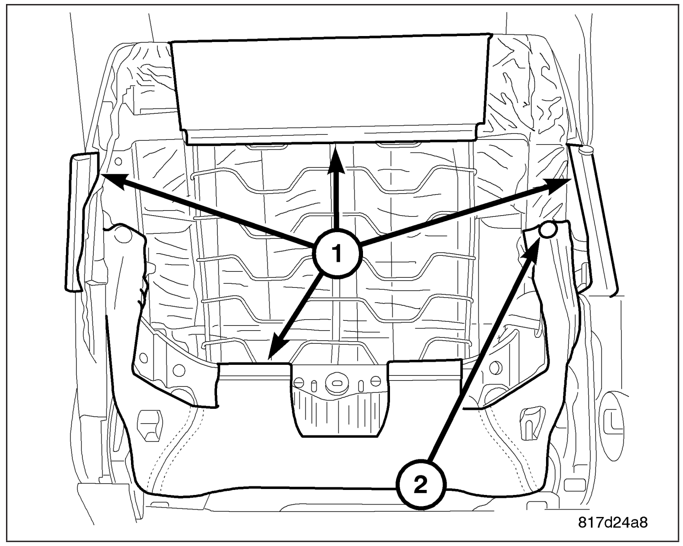
8. Separate the clip fasteners (2) and remove the side shields from the seat cushion frame tabs (1).



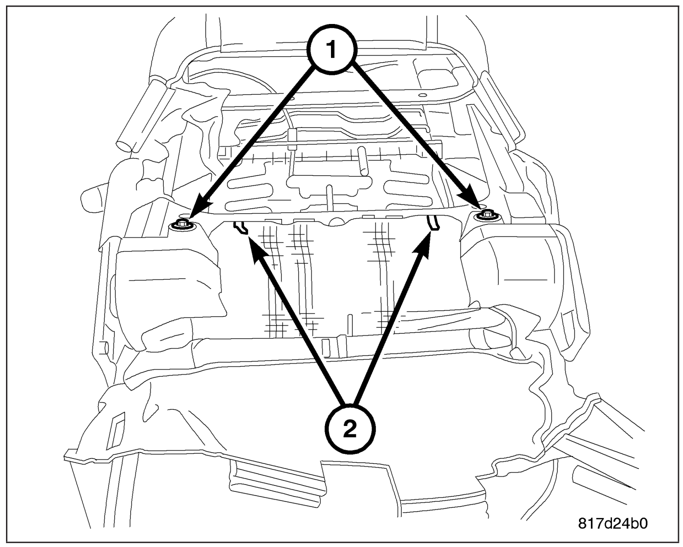
9. Remove the bolts (2) and remove the seat back assembly (1).



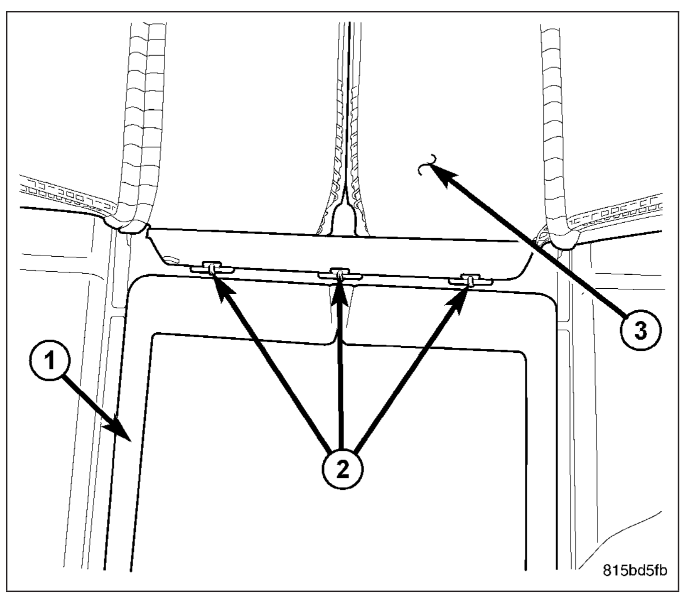
DISASSEMBLY



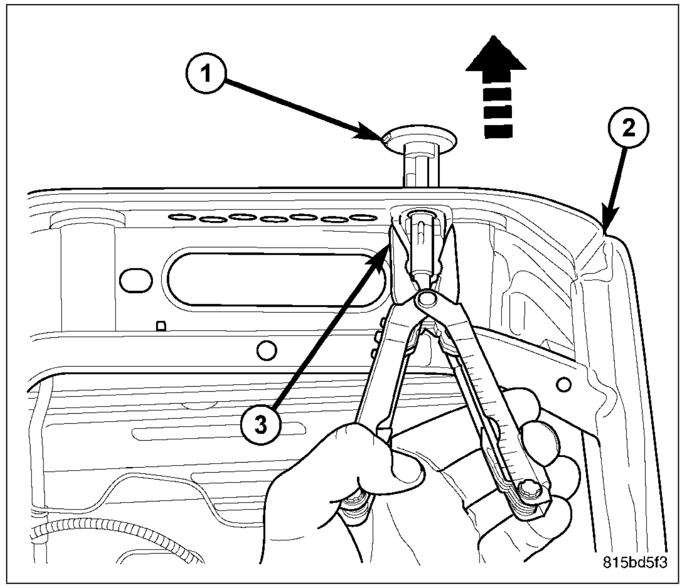
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat back (Refer to 23 - BODY/SEATS/SEAT BACK - FRONT - REMOVAL).
3. Remove the headrest.



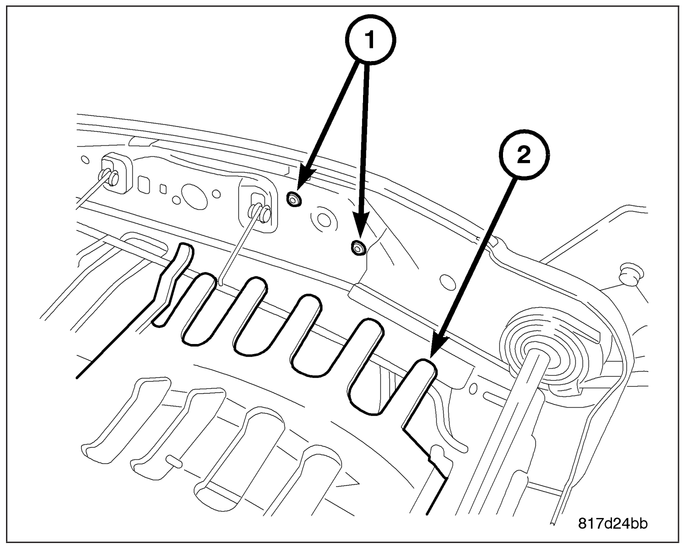
4. Remove the lumbar handle, if equipped.
5. Remove the back panel (1).



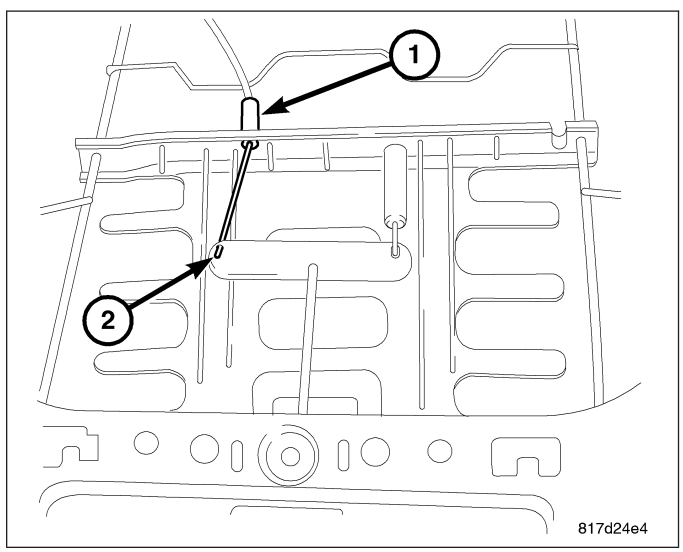
6. Separate the J-straps (1) and the push-pin fasteners (2).



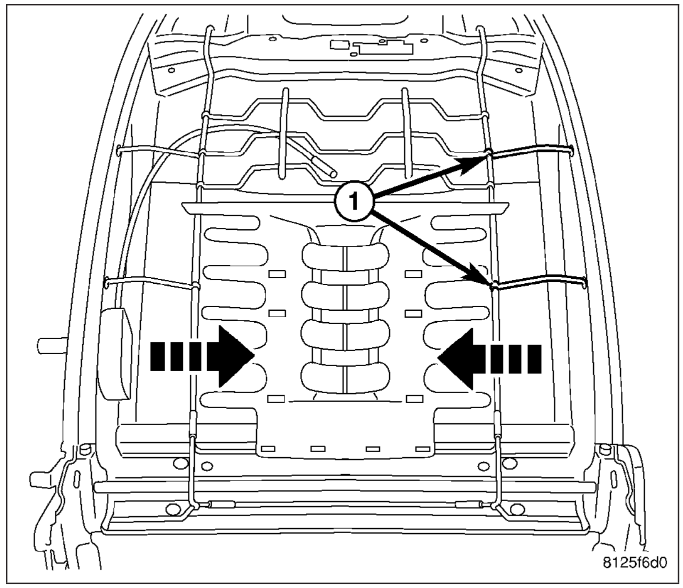
7. Release the push-pin fasteners (1) and release the cover from the hooks (2).



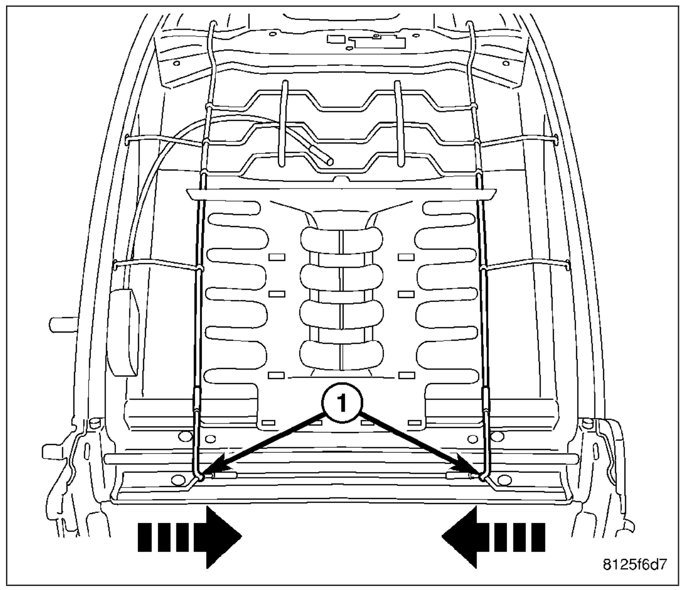
8. Separate the seat cover (3) from the foam cushion (1) and cut off all hog rings (2) attaching cover to the foam.



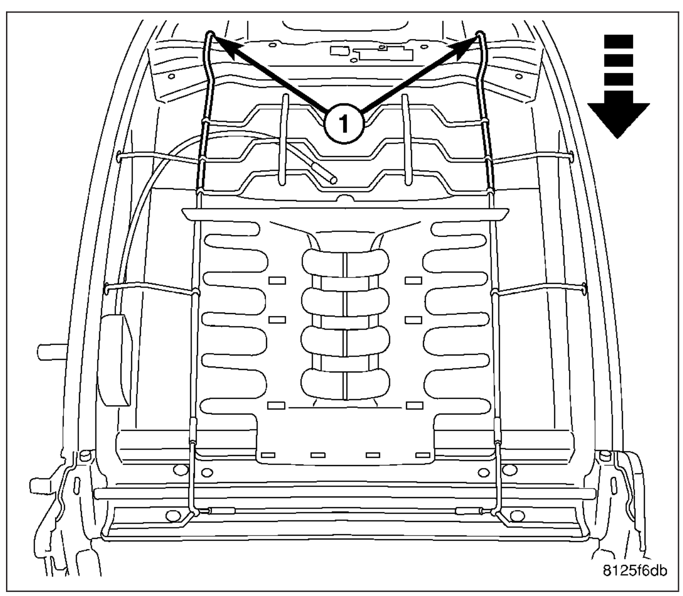
9. Squeeze the locking tab (3) and remove the headrest sleeves (1) and remove the cover.
10. Remove the seat back cover and cushion.



11. Remove the lumbar adjuster screws (1).

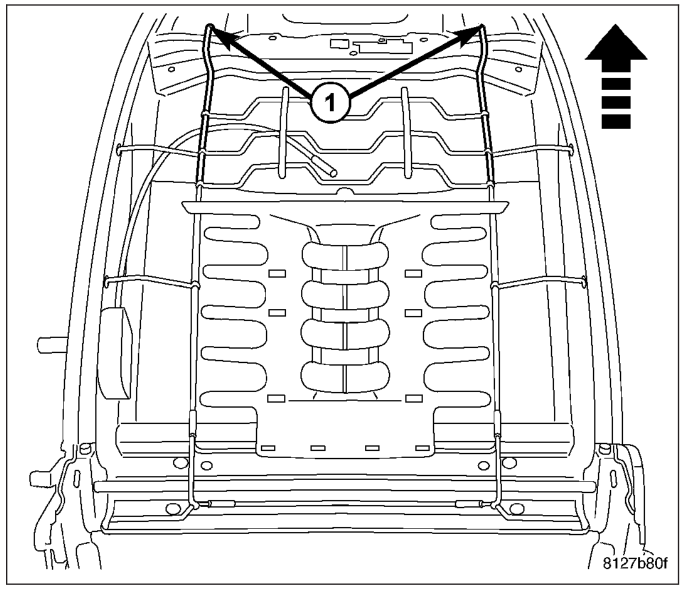


12. Disconnect the lumbar cable (2) and separate the cable housing (1).

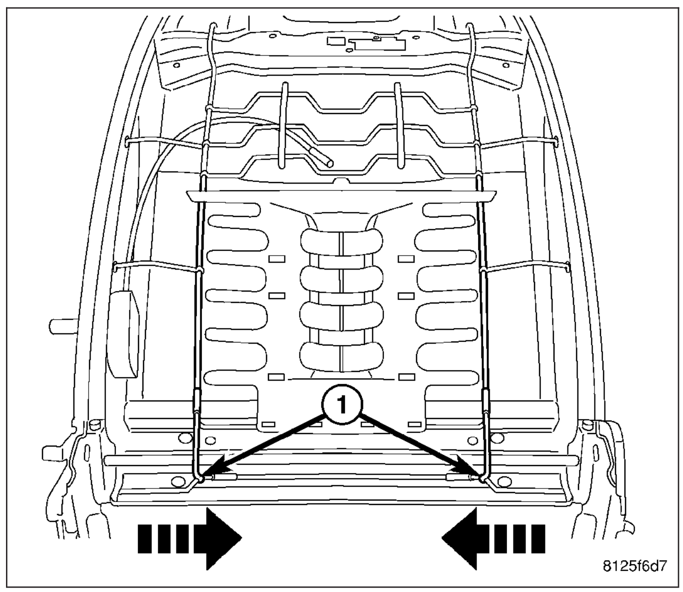


13. Release the lumbar mat side wires (1) by pulling out on the wire supports and then pulling them in.

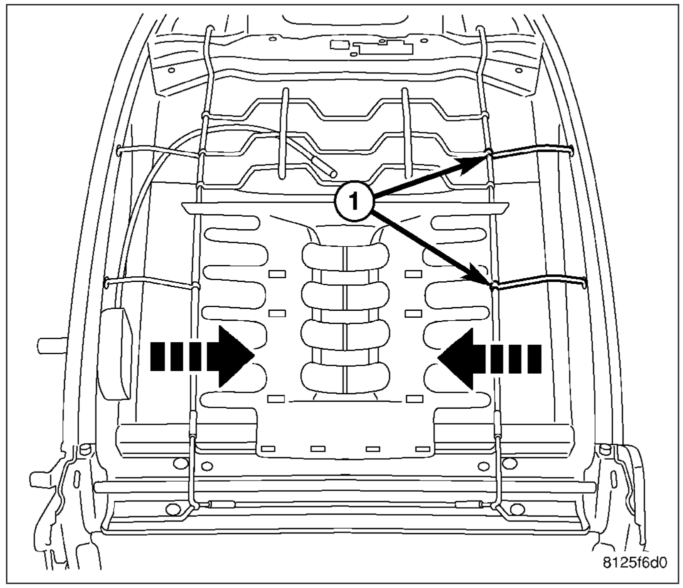
14. Squeeze the lower support wires (1) in and release the lower wires.



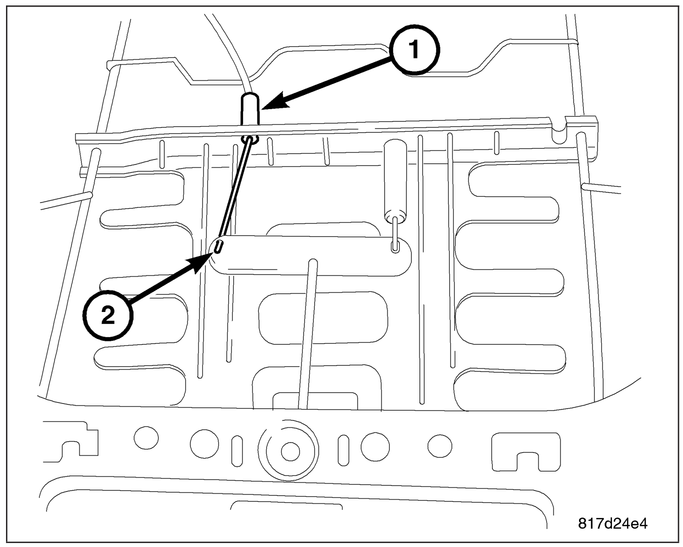
15. Pull the upper support wires (1) down and release the lumbar mat from the seat back frame.



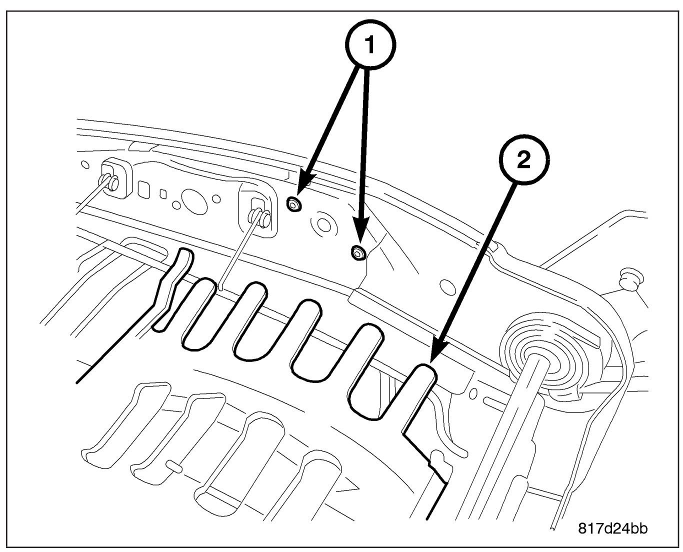
ASSEMBLY



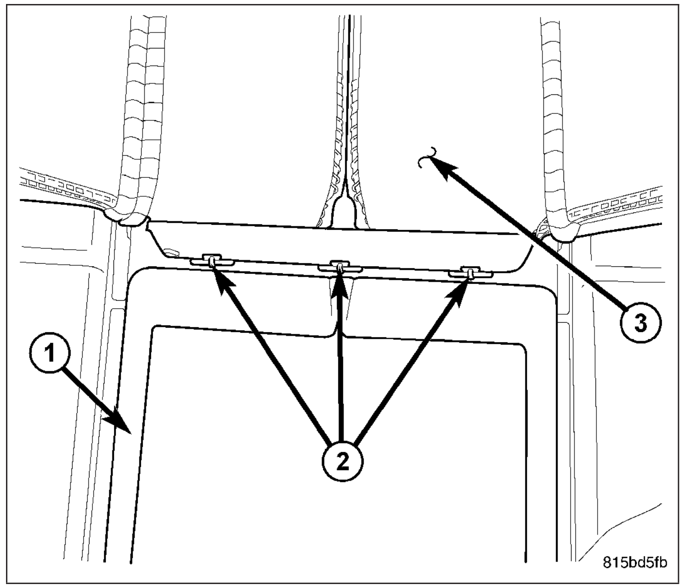
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Place lumbar mat onto seat back frame and insert the upper support wires (1) into the frame.



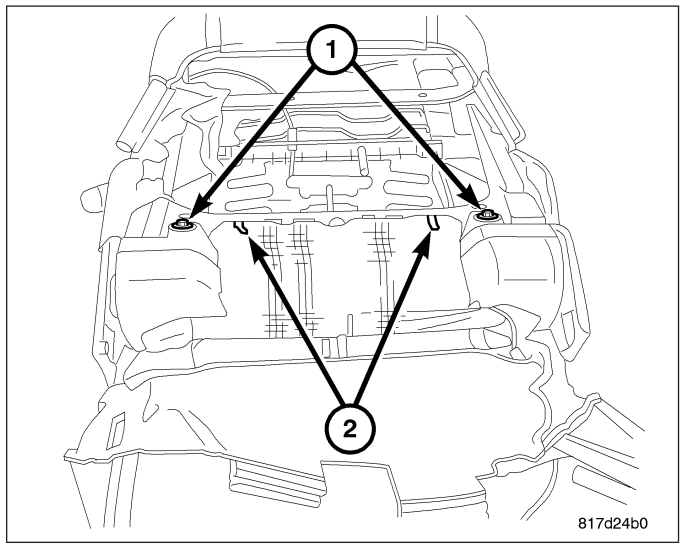
3. Squeeze the lower support wires (1) together and insert into the lower frame.



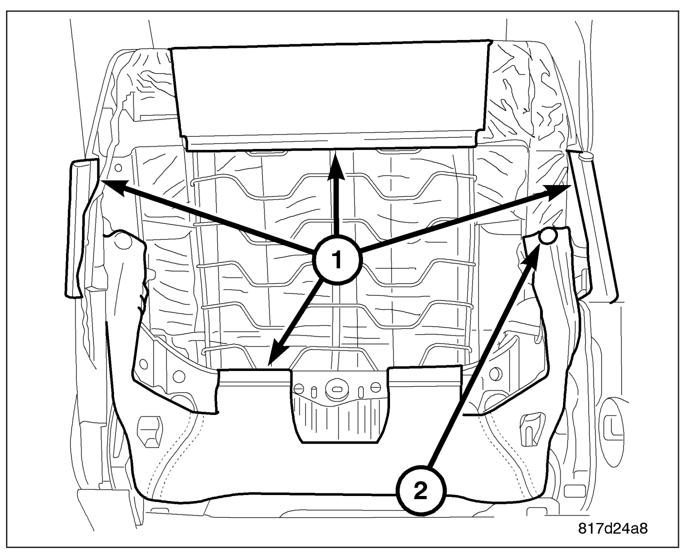
4. Squeeze the side support wires together and insert them into the sides of the seat back frame.



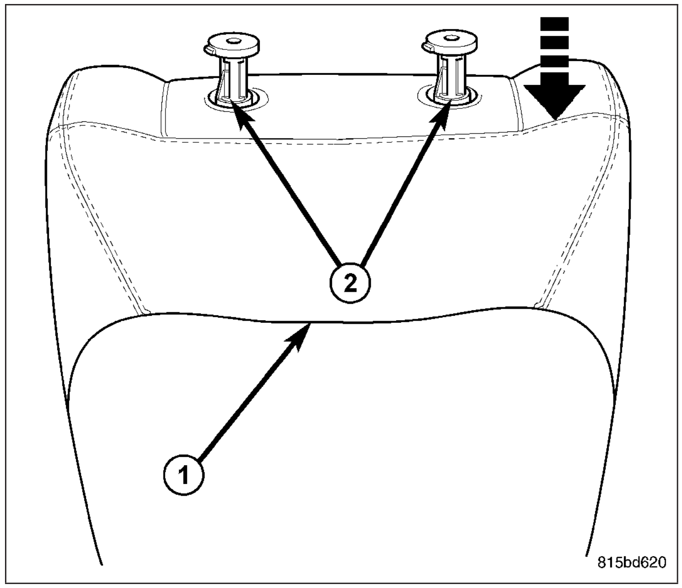
5. Connect the lumbar cable housing (1) and connect the cable end (2) to the anchor.



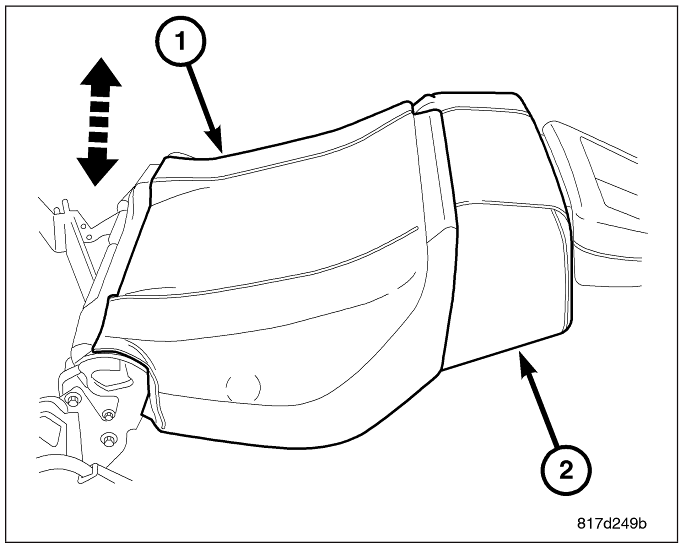
6. Install the lumbar adjuster and install the adjuster screws (1).



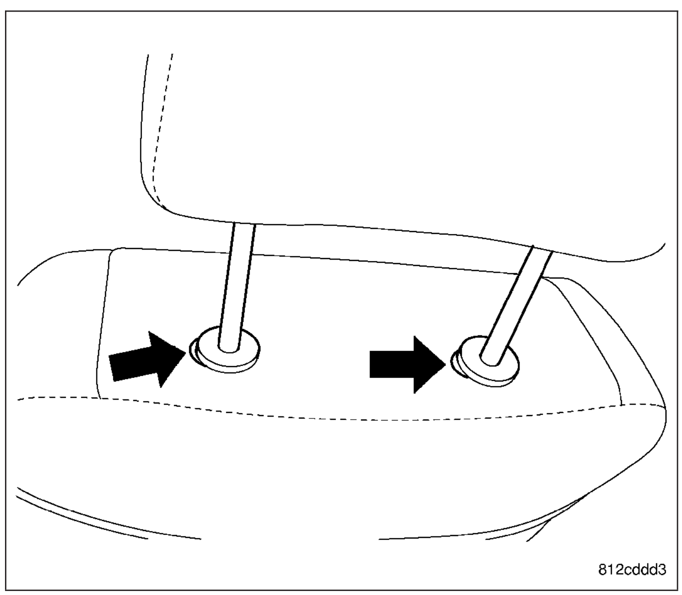
7. Position the seat back cushion on the frame and position the cover over the cushion.
8. Attach the seat cover (3) to the seat back cushion (1) and install new hog rings (2) as required.



9. Install the push pins (1) and connect the inner cover to the hooks (2).

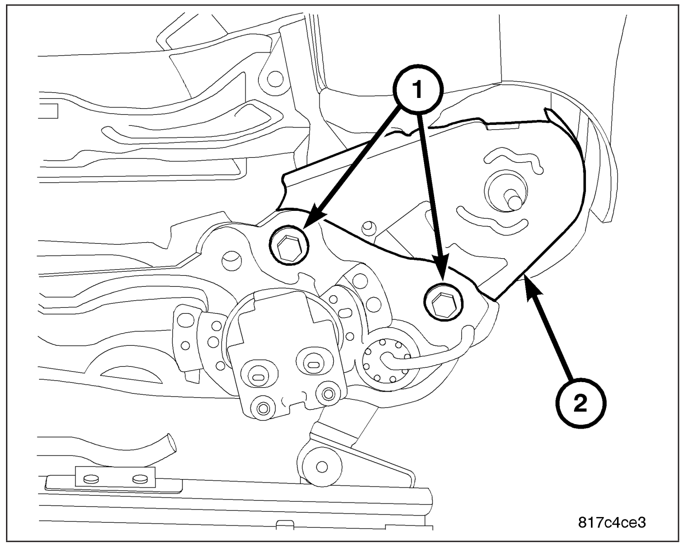


10. Install the push-pin fasteners (2) and connect the J-straps (1).

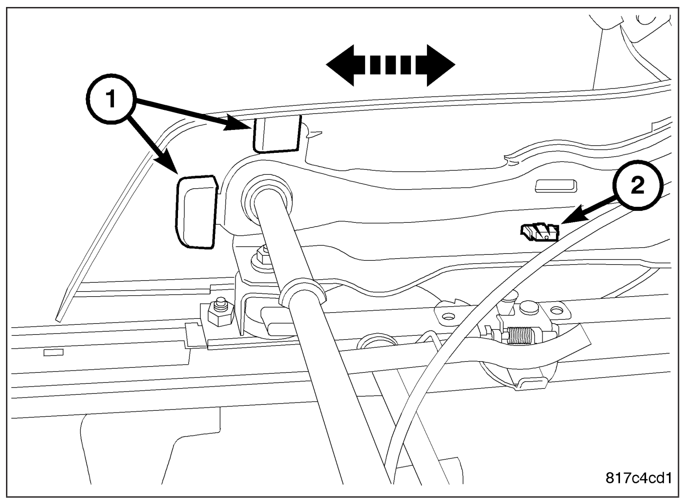


11. Install the headrest sleeves (2).

12. Position the seat back panel (1) onto the seat back (2) and seat fully.

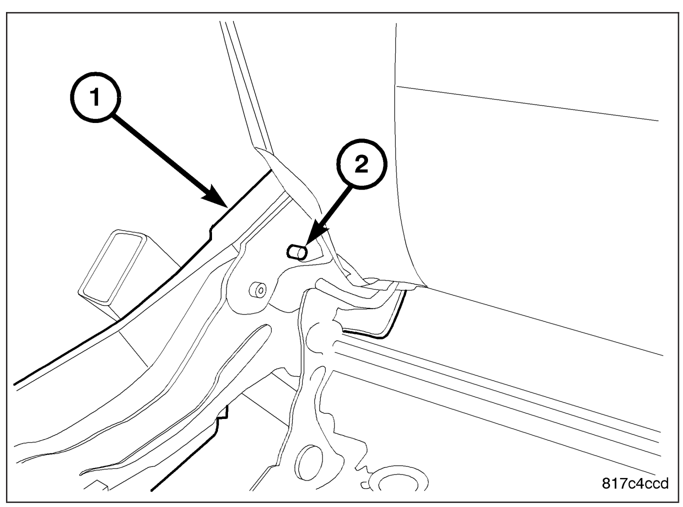


13. Press the headrest sleeve release buttons and install the headrest.
14. Install the seat back (Refer to 23 - BODY/SEATS/ SEAT BACK - INSTALLATION).

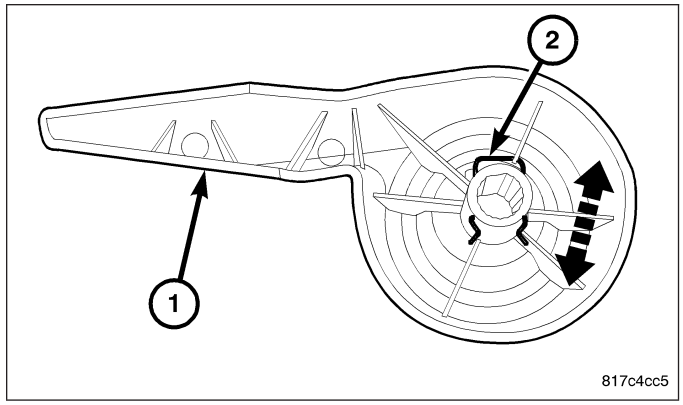


INSTALLATION

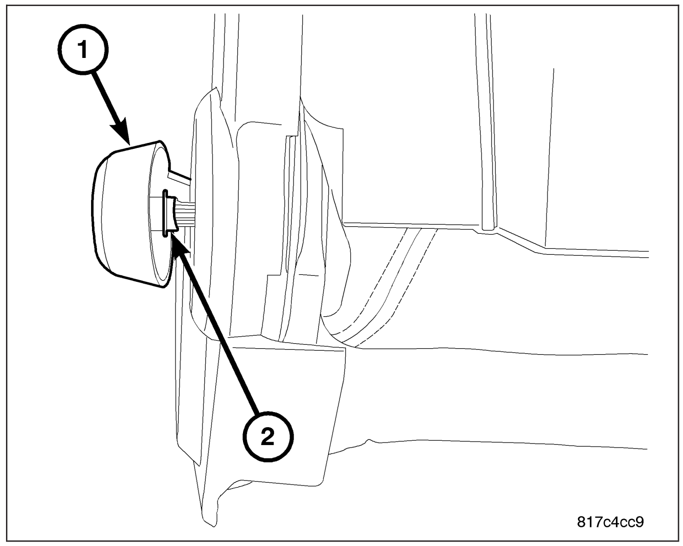
Driver Seat



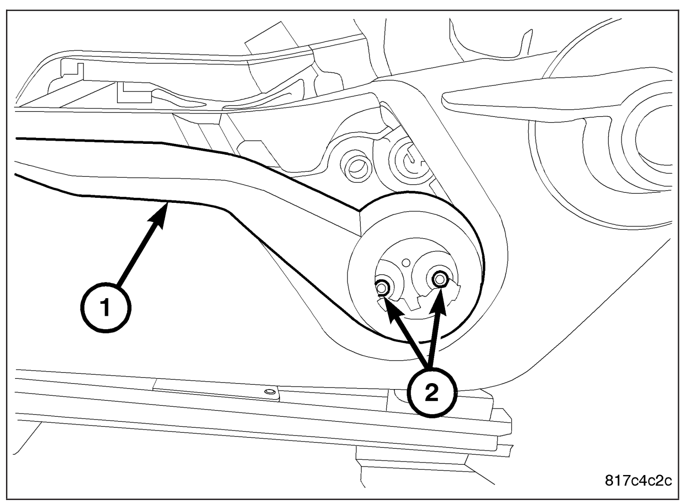
1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Install the seat back assembly (2) and install the bolts (1).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).



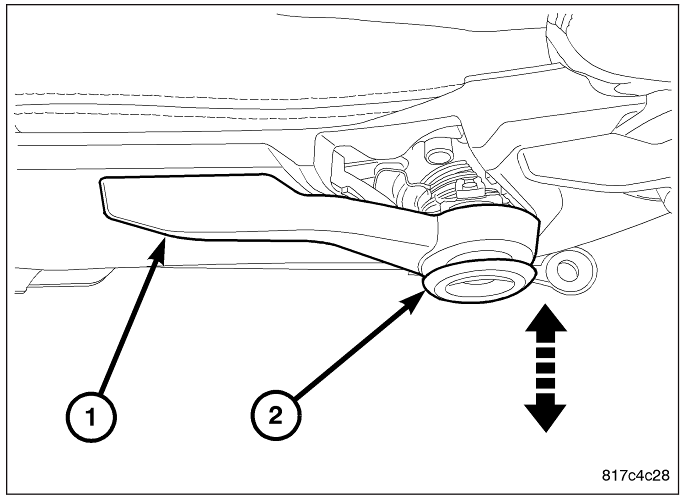
4. Position the side shields onto the seat adjuster tabs (1) and seat the clip (2) fully.



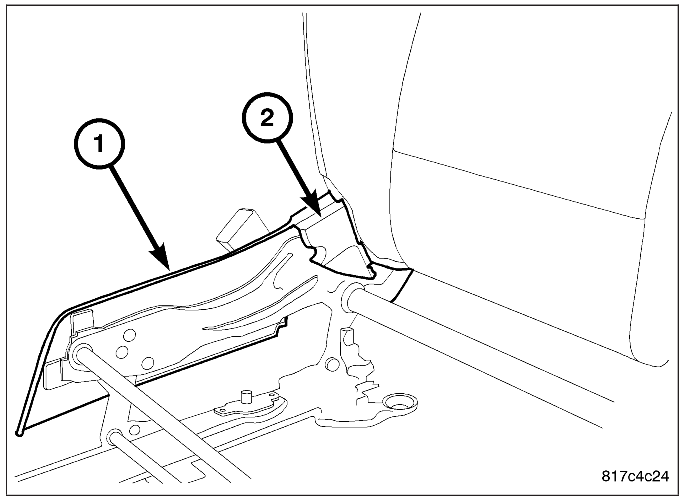
5. Install the outer side shield screw (2).



6. Install the clip (2) onto the recliner handle, if necessary.

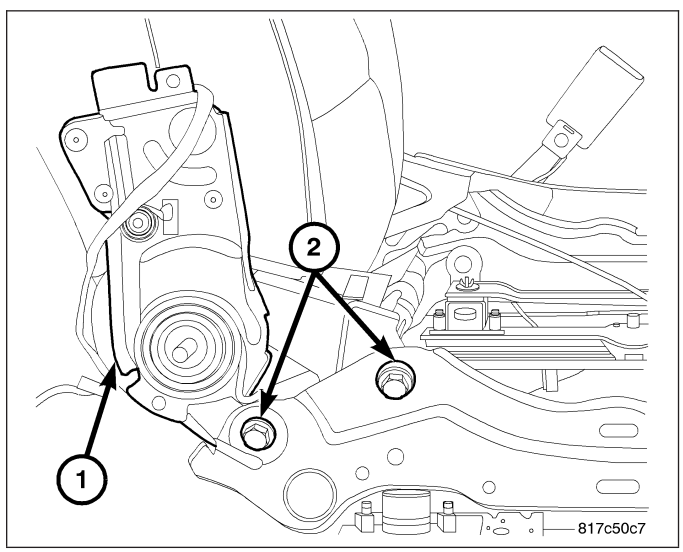


7. Position the recliner handle (1) onto the spined shaft (2) and seat fully.

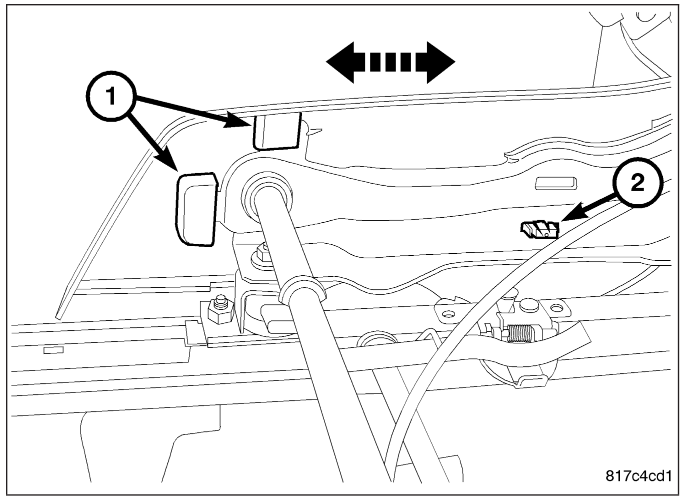


8. Install the height adjuster handle (1) and install the screws (2), if equipped.

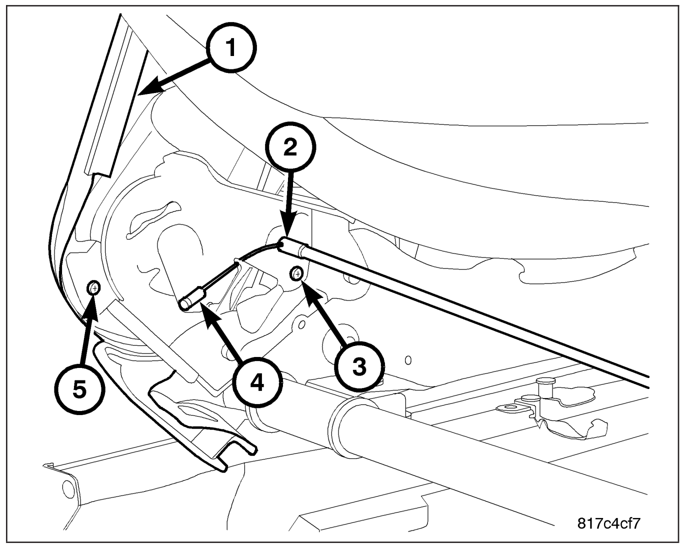
9. Position the lift lever trim cap (2) and seat fully.



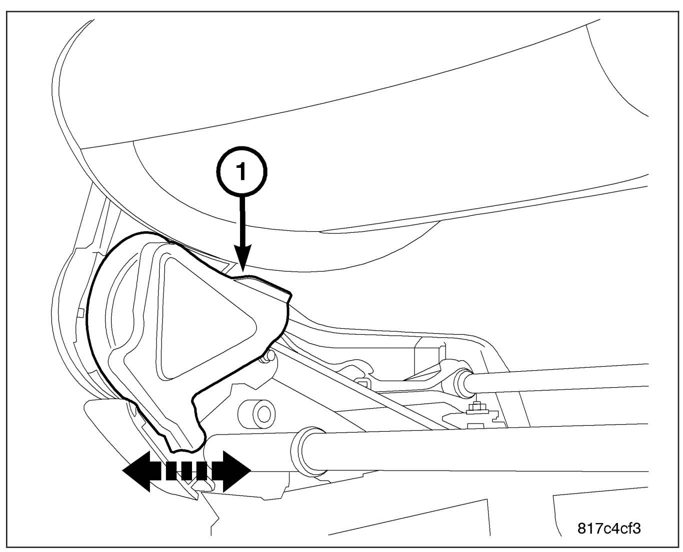
10. Position the inner side shields (2) and seat fully.
11. Install the seat cushion, (Refer to 23 - BODY/ SEATS/SEAT CUSHION - FRONT - INSTALLATION).



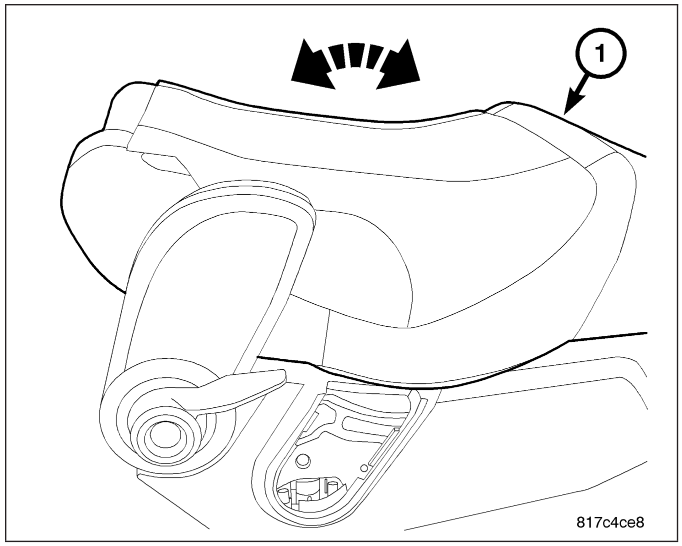
Passenger Seat



1. Install the seat back assembly (1) and install the bolts (2).
2. Tighten the bolts to 40 N·m (30 ft. lbs.).

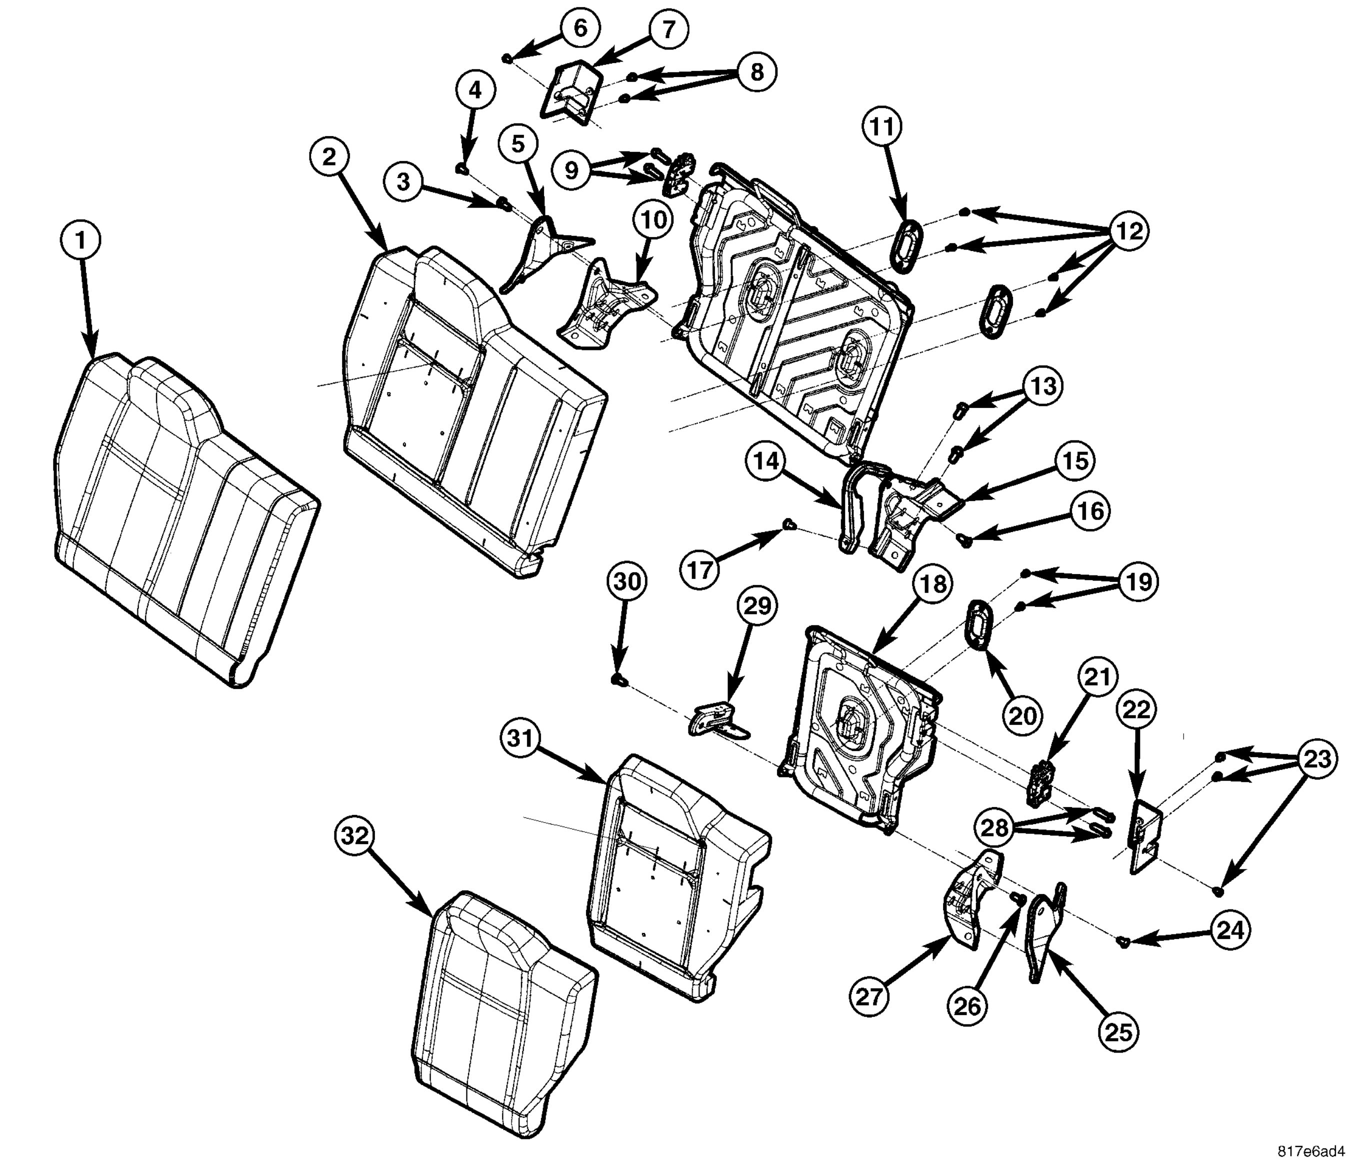


3. Position the side shields onto the seat adjuster tabs (1) and seat the clip (2) fully.



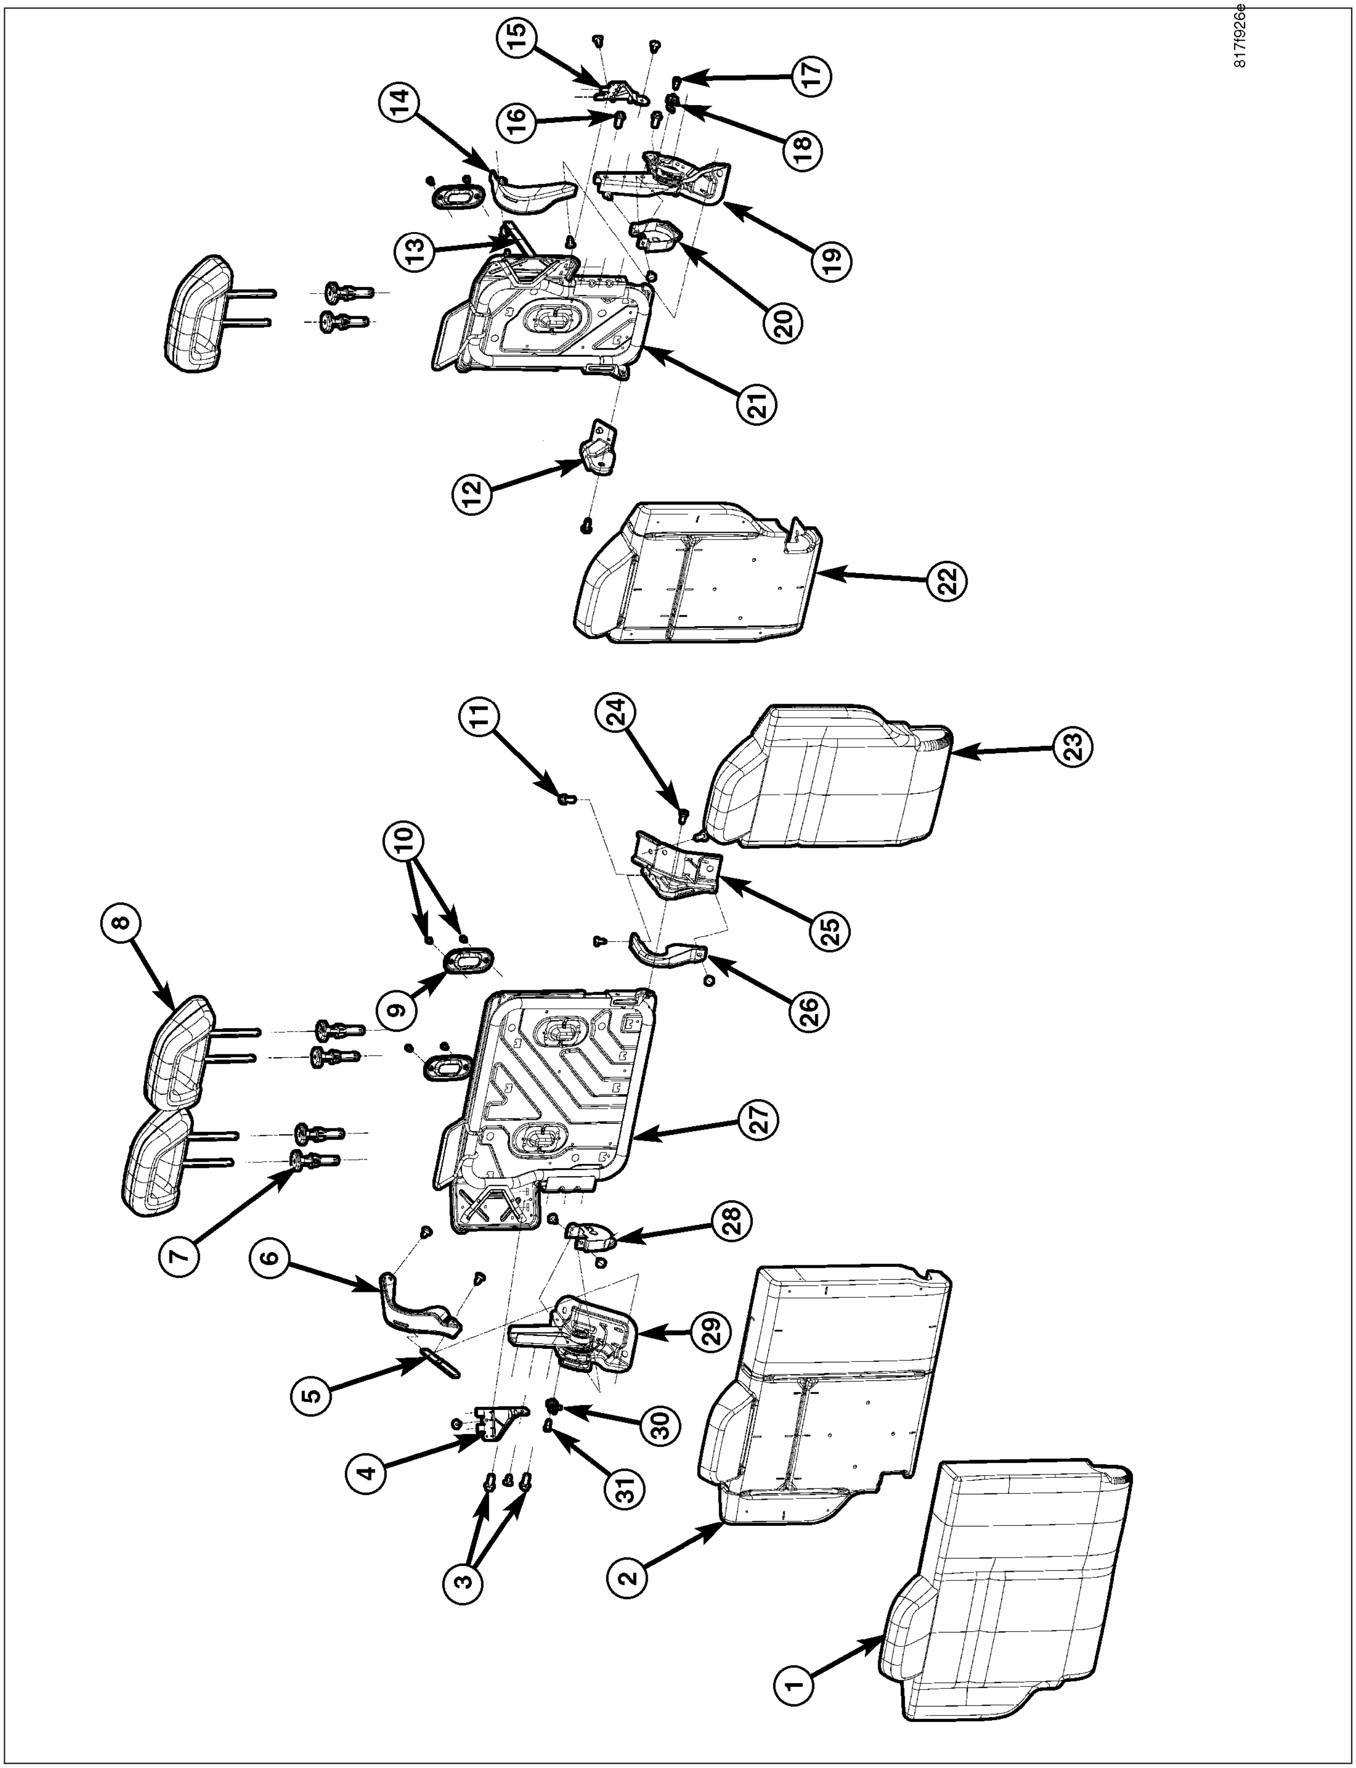
4. Install the screws (3) attaching the inboard and outboard side shields to the seat frame.
5. Install the recliner shields (1) and install the screws (5).
6. Connect the recliner cable ends (4) and fasten the cable housing (2) to the seat back frame.

7. Install both of the inner side shields (1).



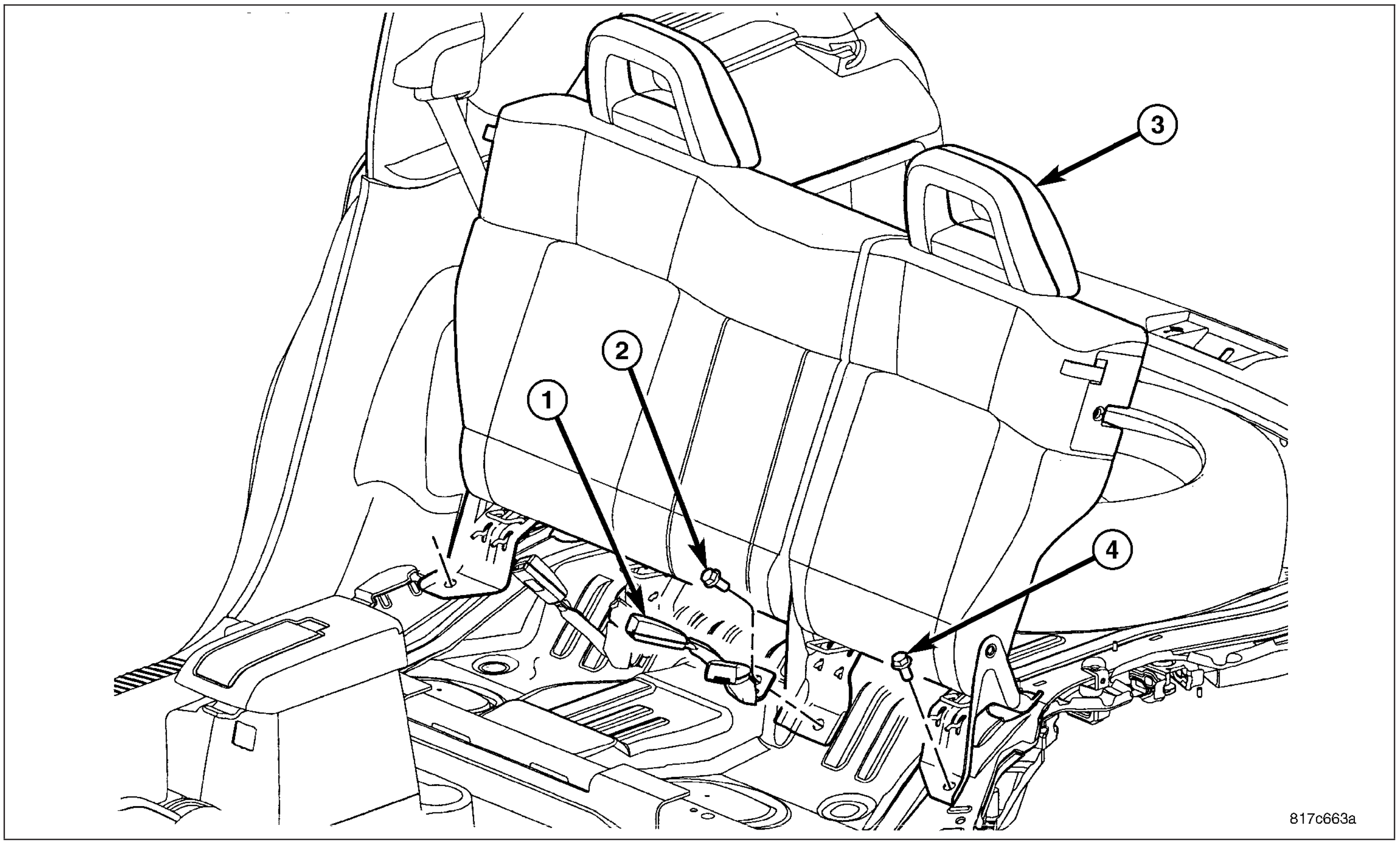
8. Position the seat back (1) into the upright position.
9. Install the seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - INSTALLATION).

SEAT BACK - REAR



DESCRIPTION

REAR SEAT BACK - W/O RECLINER OPTION



REAR SEAT BACK - W/O RECLINER OPTION

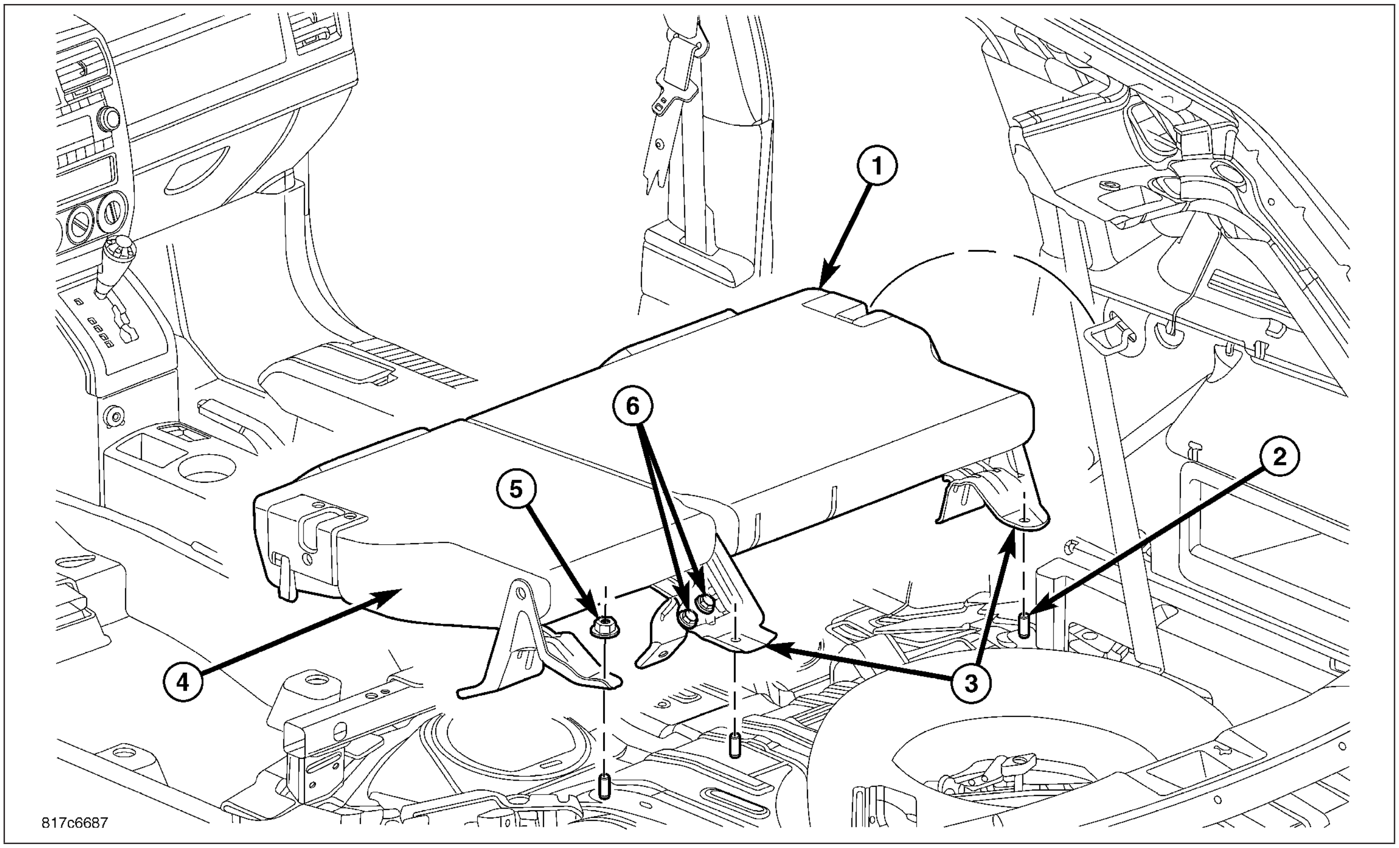
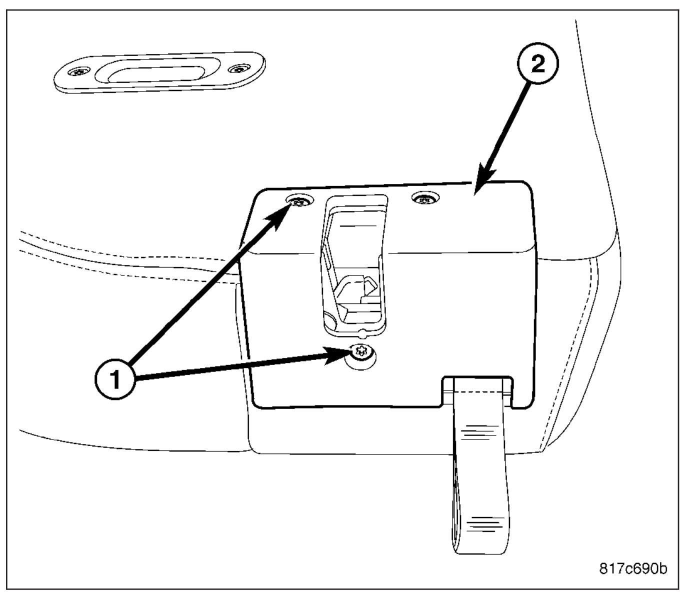
32 - SEAT BACK CUSHION COVER 40%

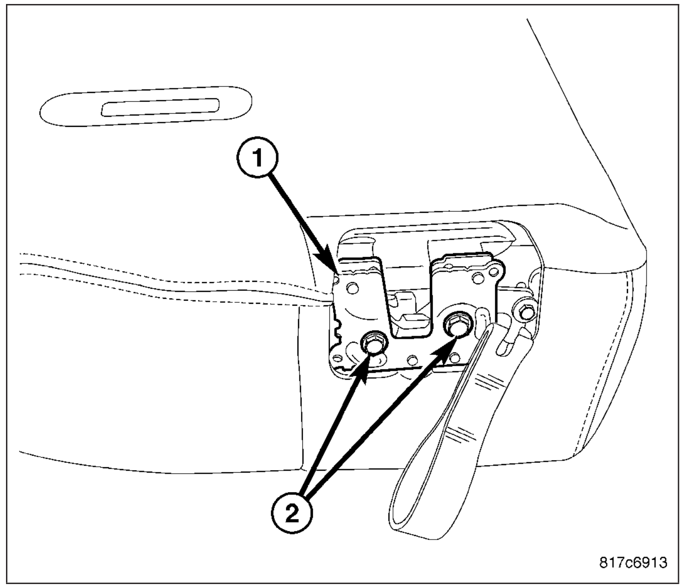


REAR SEAT BACK - RECLINER

REMOVAL

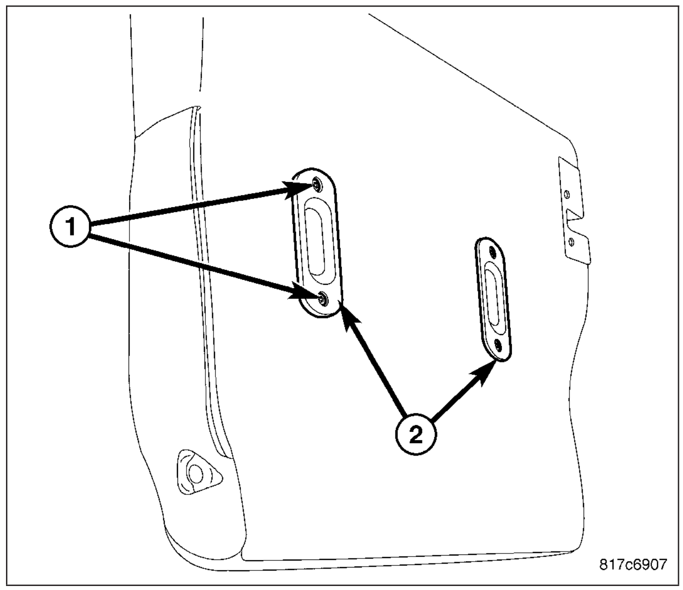


1. Remove the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REAR - REMOVAL)
2. Remove the belt buckle bolt (2) and the buckle (1).
3. Remove the floor bracket or recliner bolts (4).

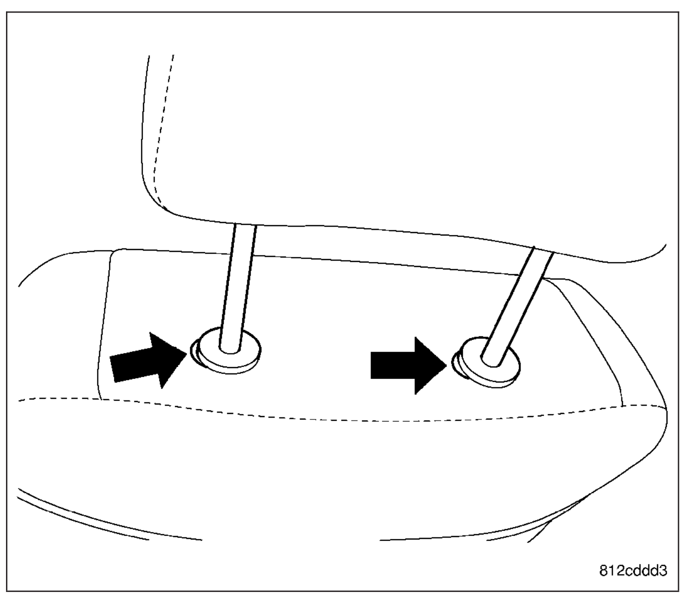


4. Fold the seats forward.
5. Remove the nut (5) and bolts (6) and remove the 40% seat back (4).
6. Remove the nuts from the studs (2) and remove the 60% seat back.

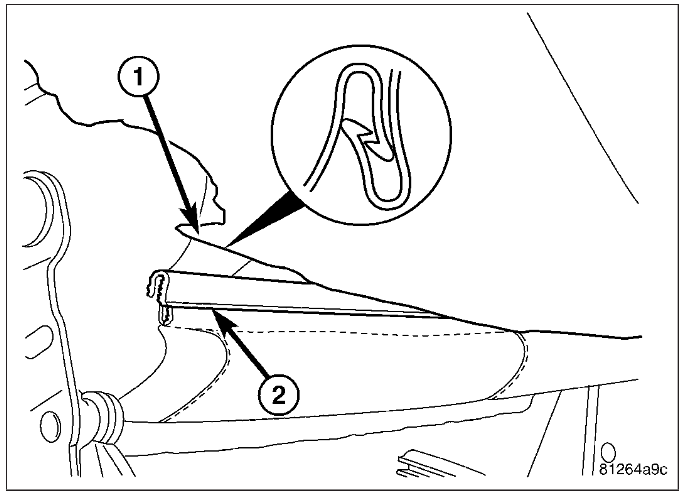
DISASSEMBLY



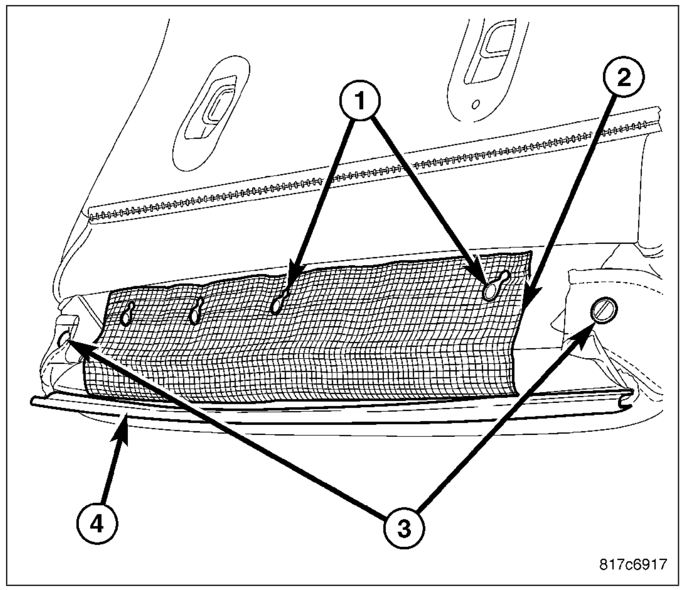
1. Remove the screws (1) and remove the latch bezel (2).



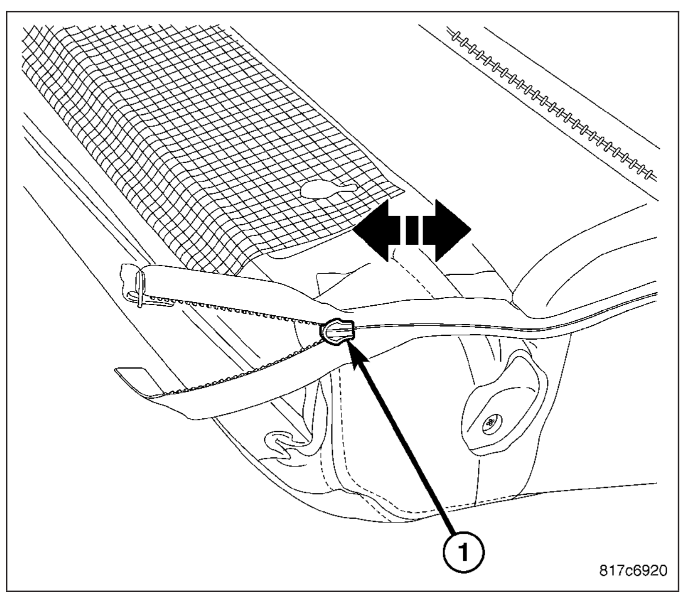
2. Remove the bolts (2) and remove the latch (1).



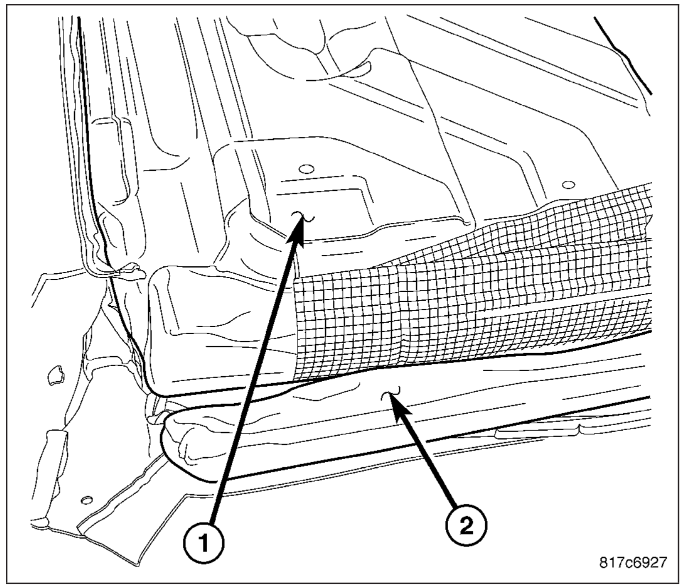
3. Remove the screws (1) and remove the tether trim bezels (2).



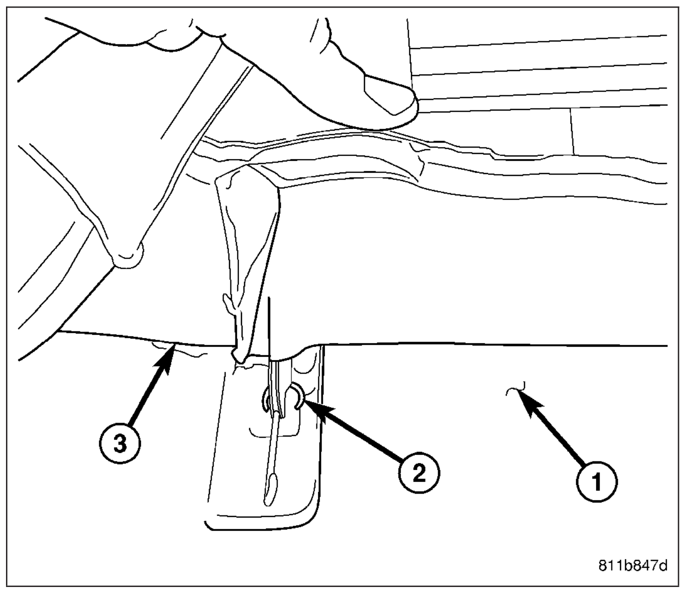
4. Remove the headrest.



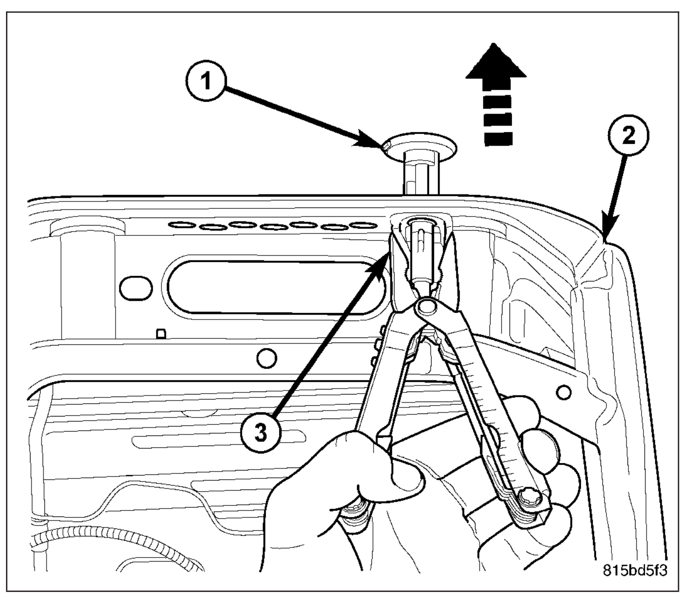
5. Separate the zip strips (1 and 2).



6. Remove the push pin fasteners (3).
7. Separate the inner cover (2) from the hooks (1).

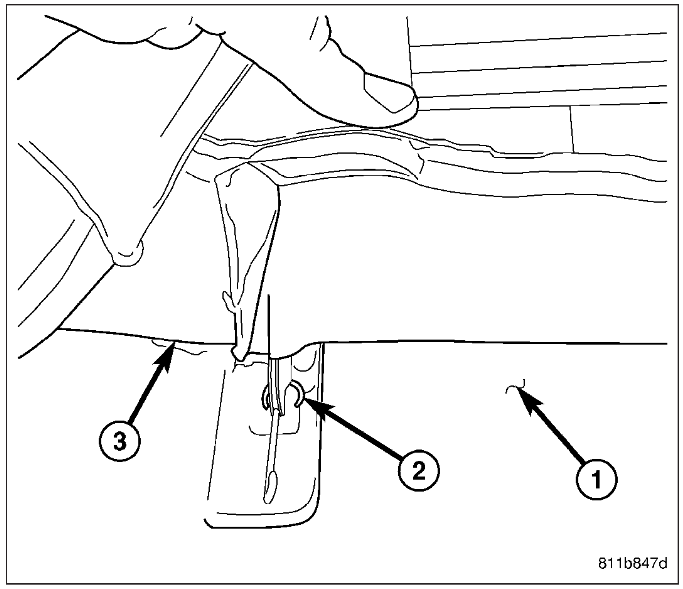


8. Unzip the cover (1).

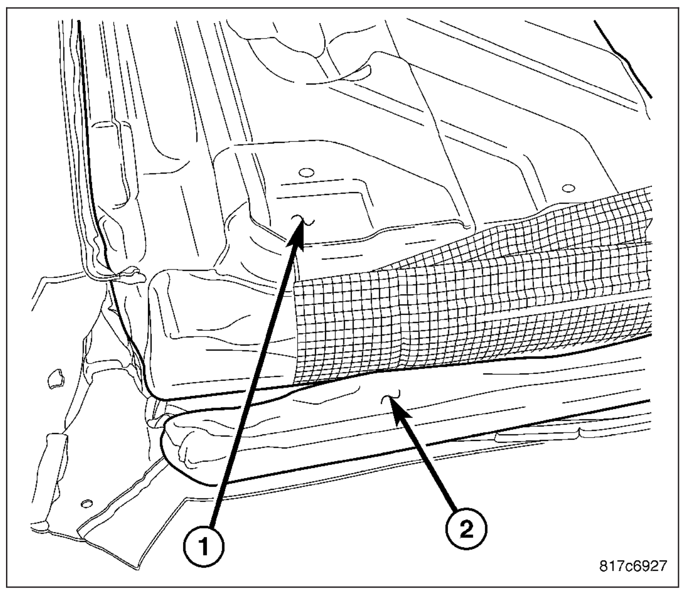


9. Remove the foam insert (2) from the seat back assembly (1).

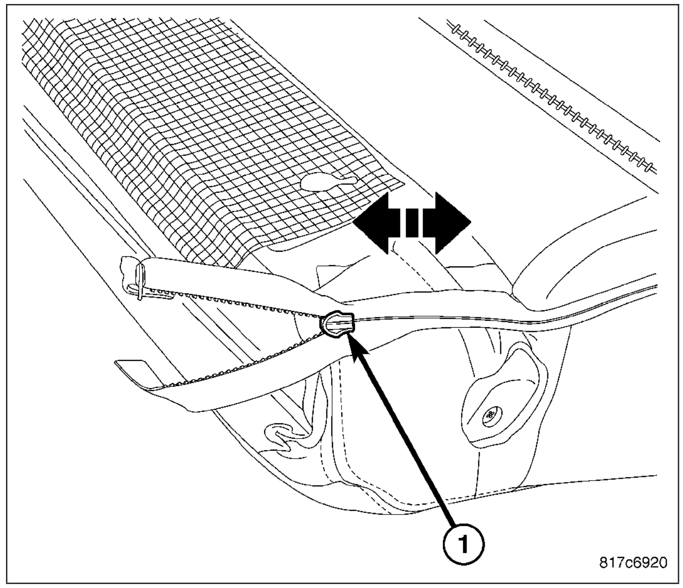
10. Separate the seat cover (3) from the foam cushion (1) and cut off all hog rings (2) attaching the cover to the foam.



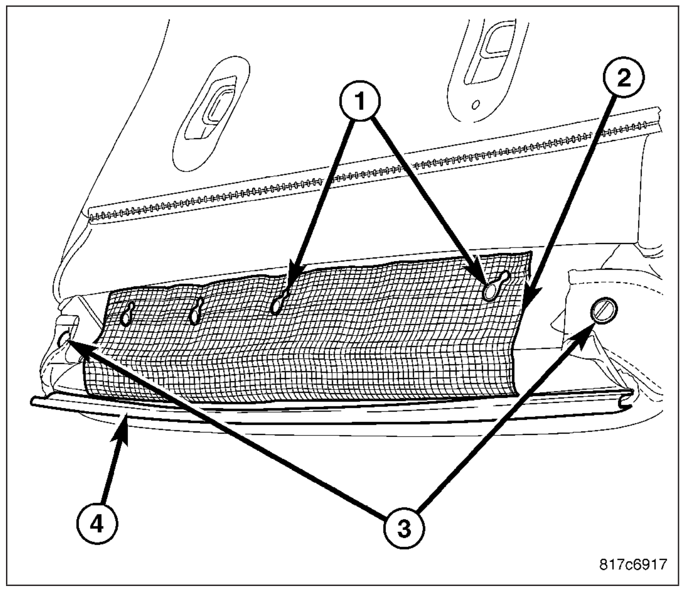
11. Squeeze the locking tab (3) and remove the headrest sleeves (1).
12. Remove the seat back cover and cushion.



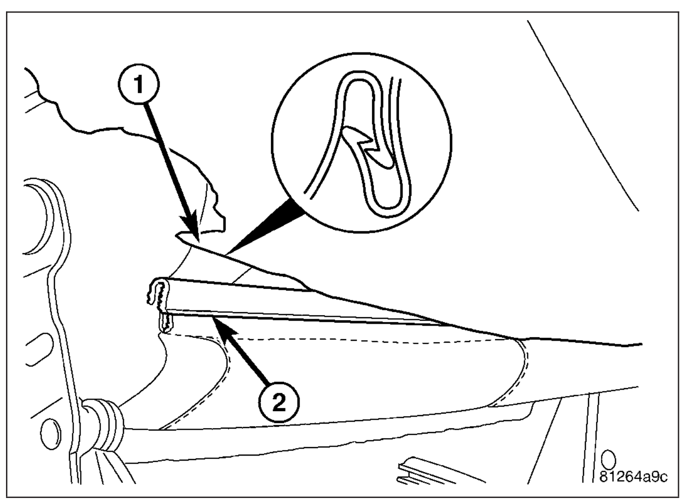
ASSEMBLY



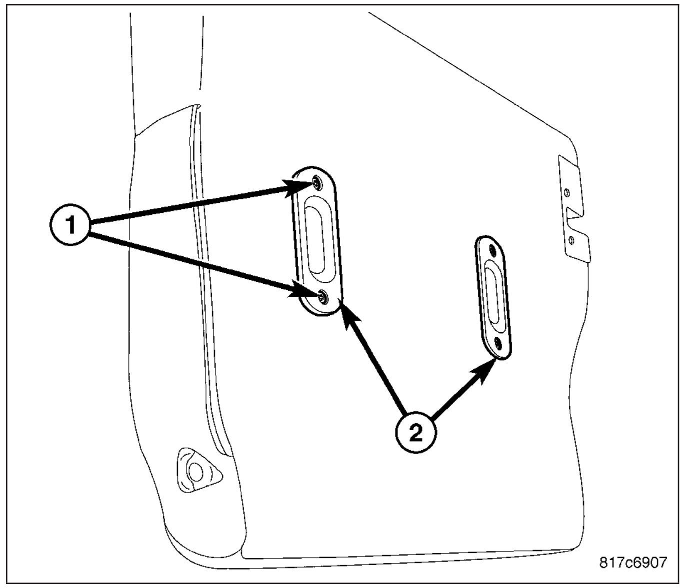
1. Position the seat back cushion on the frame and position the cover over the cushion.
2. Attach the seat cover (3) to the seat back cushion (1) and install new hog rings (2) as required.



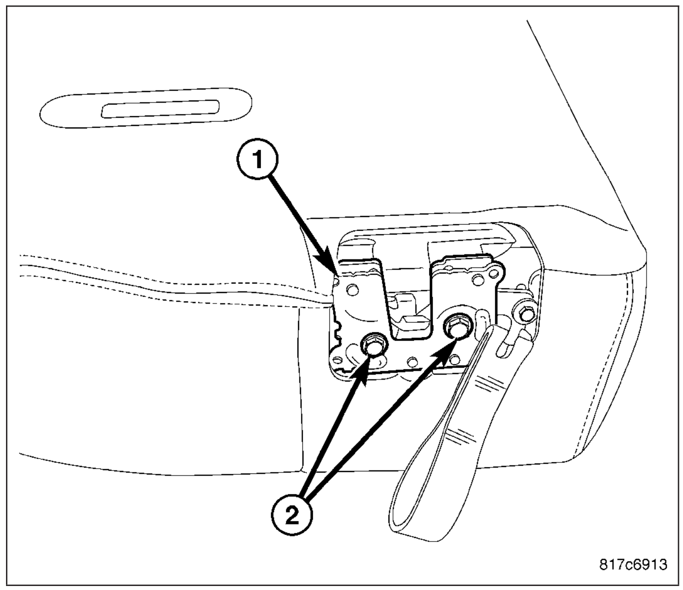
3. Position the foam insert (2) back at the base of the seat back assembly (1).



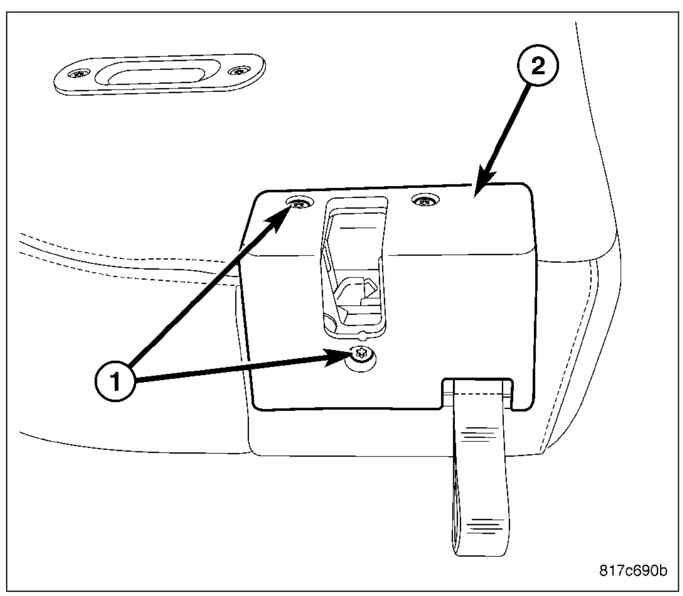
4. Zip the cover back over the frame.



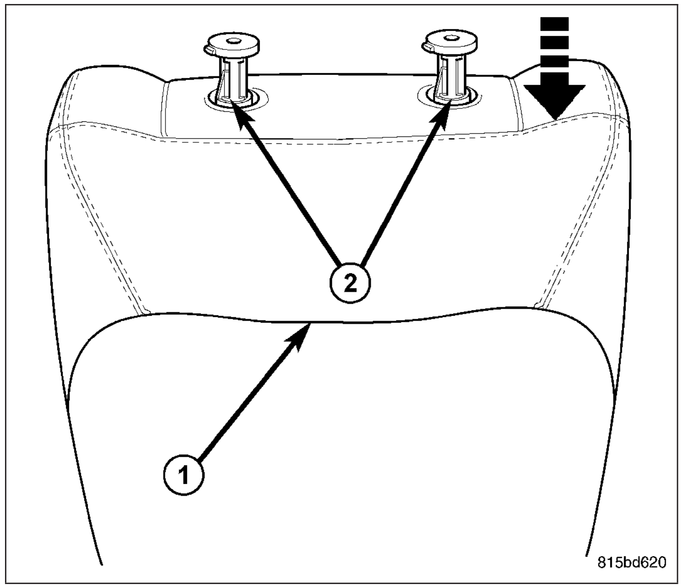
5. Install the push pin fasteners (3).
6. Position the inner cover (2) over the frame hooks (1).



7. Fasten the upper (1) and lower (2) zip strips at the bottom of the seat back.

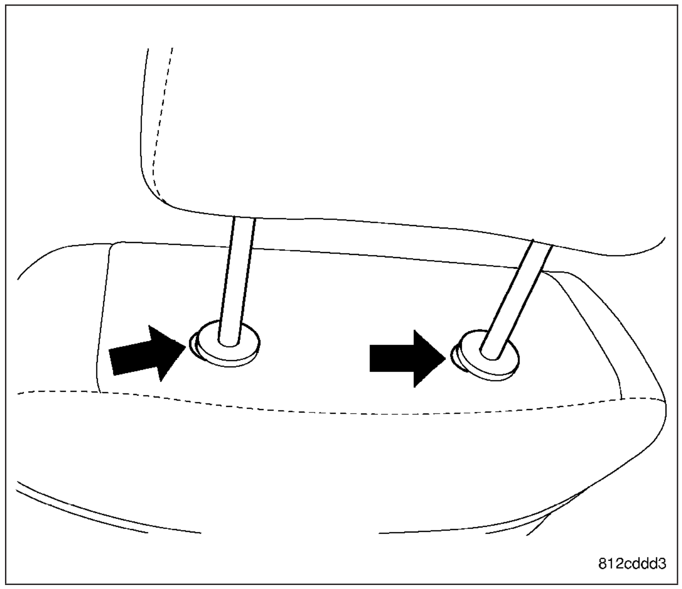


8. Install the child tether bezels (2) and install the screws (1).

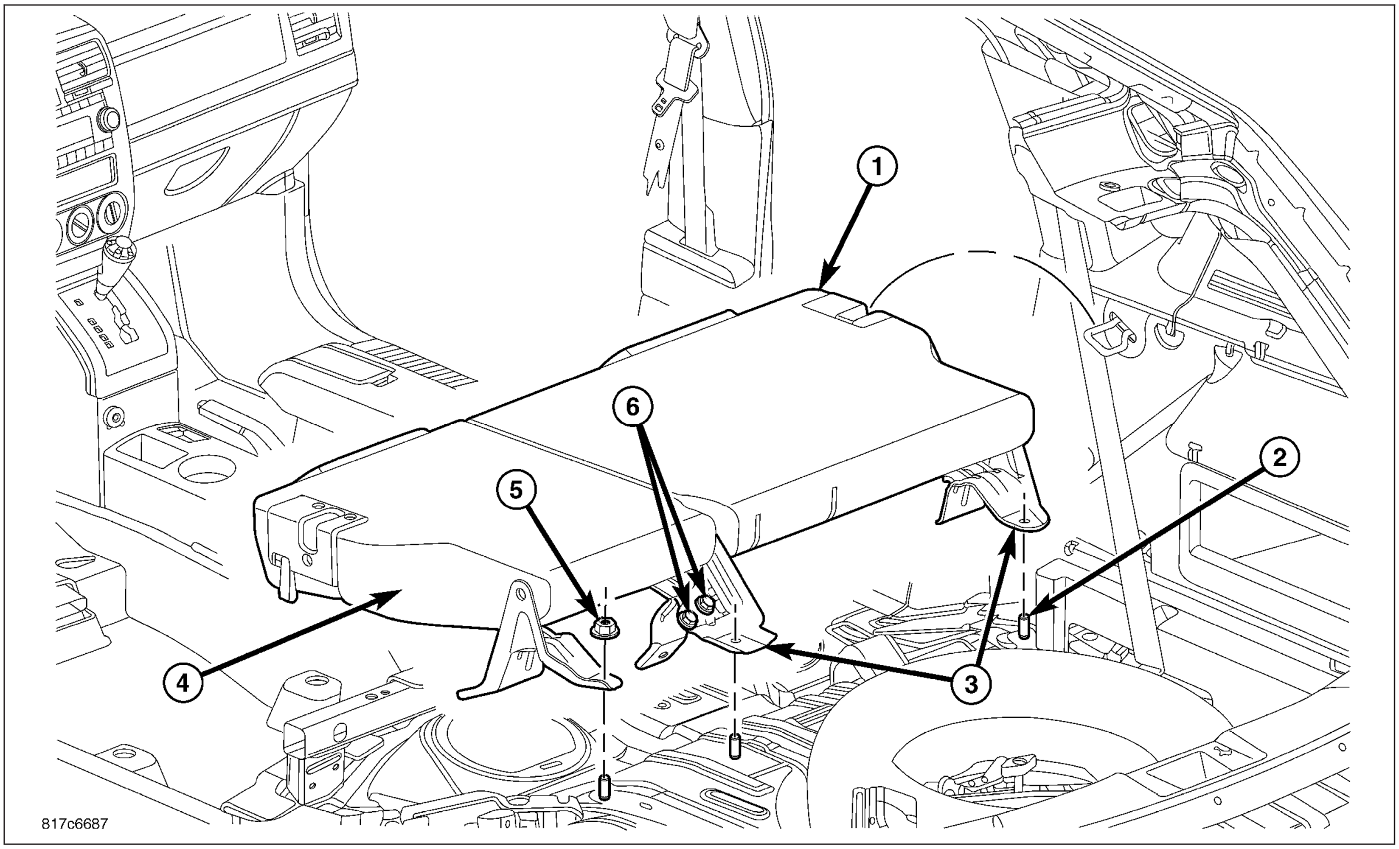


9. Install the latch (1) and install the bolts (2).
10. Tighten the bolts to 28 N·m (21 ft. lbs.).

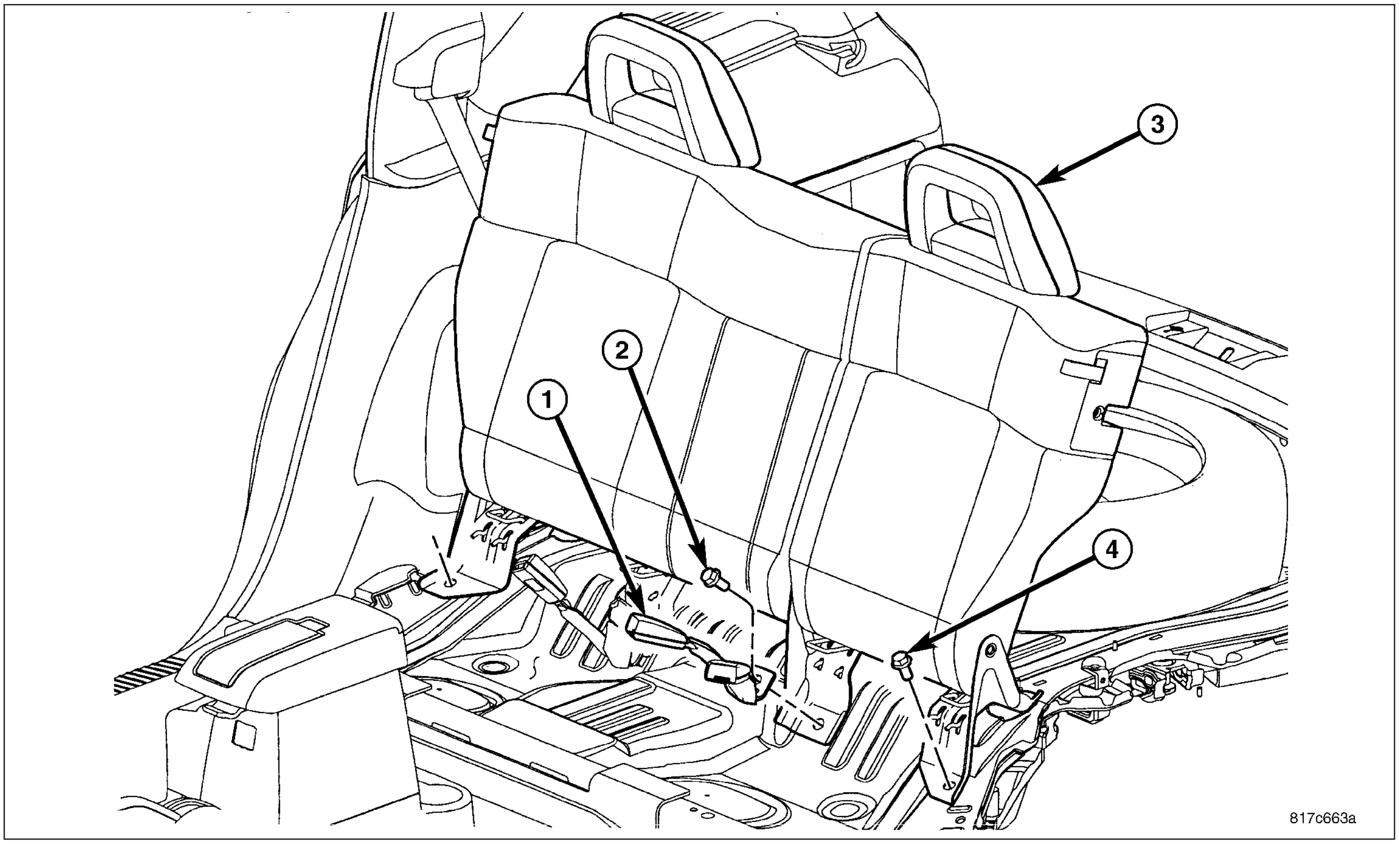
11. Install the latch bezel (2) and install the screws (1).



12. Install the headrest sleeves (2), if equipped.



815bd620

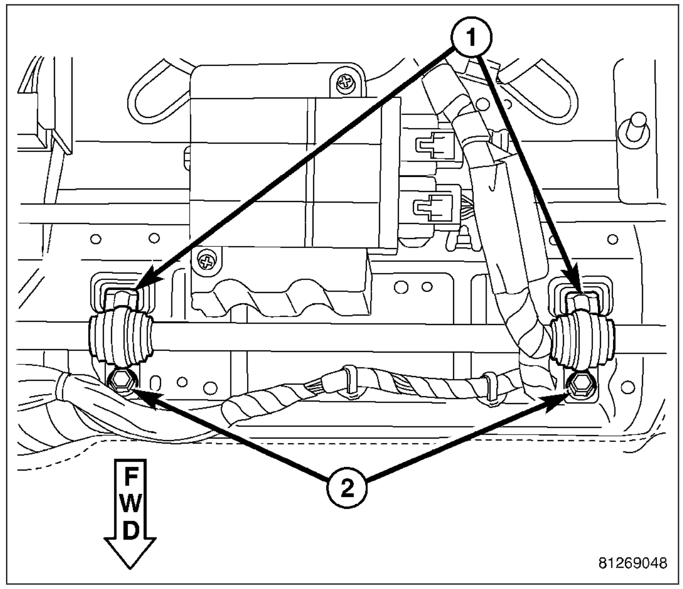


13. Press the headrest sleeve release buttons and install the headrest, if equipped.
14. Install the seat back (Refer to 23 - BODY/SEATS/ SEAT BACK - INSTALLATION).

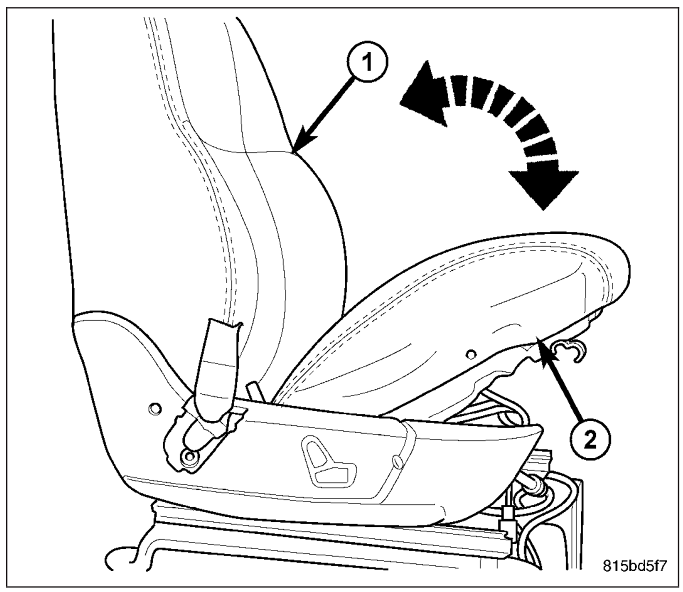
812cddd3

INSTALLATION

1. Install the 60% seat section (1) over the studs (2) and install the nuts (3).
2. Install the 40% seat section (4) over the stud and seat bracket and install the seat bracket bolts (6).
3. Tighten the seat bracket bolts (6) to 46 N·m (34 ft. lbs.).
4. Install the nut (5).
5. Tighten the nuts (5 and 3) to 46 N·m (34 ft. lbs.).



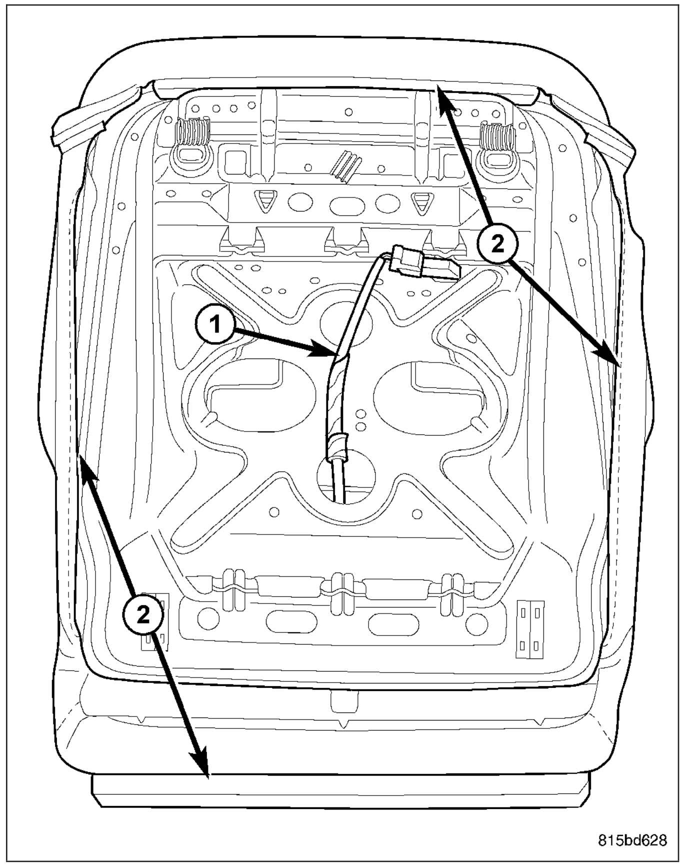
6. Position the seat backs (3) up and latch.
7. Install the belt buckles (1) and install the bolt (2).
8. Tighten the buckle bolt to 45 N·m (33 ft. lbs.)
9. Install the bolts (4) and tighten to 56 N·m (331 ft. lbs.)
10. Install the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - INSTALLATION).



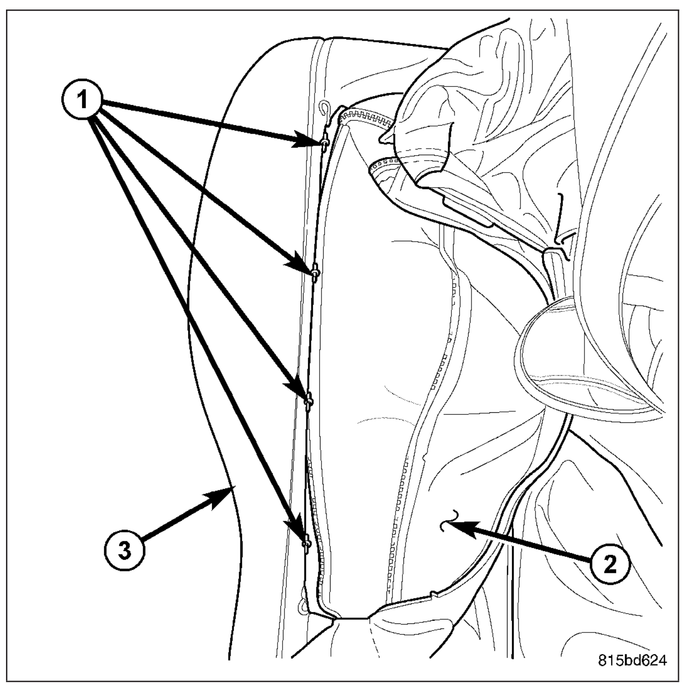
SEAT CUSHION - FRONT

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Move the seat to the forward position and disconnect and isolate the negative battery cable.
3. Remove the bolts (2) and the straps (1).
4. Disconnect the electrical connector, if equipped.

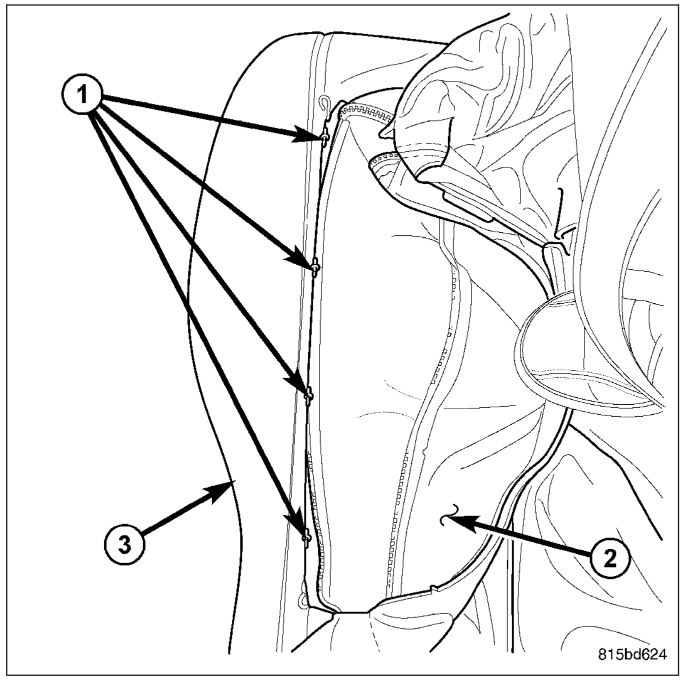


5. Lift the front of the seat cushion (2) up and slide out from under the seat back cushion (1).

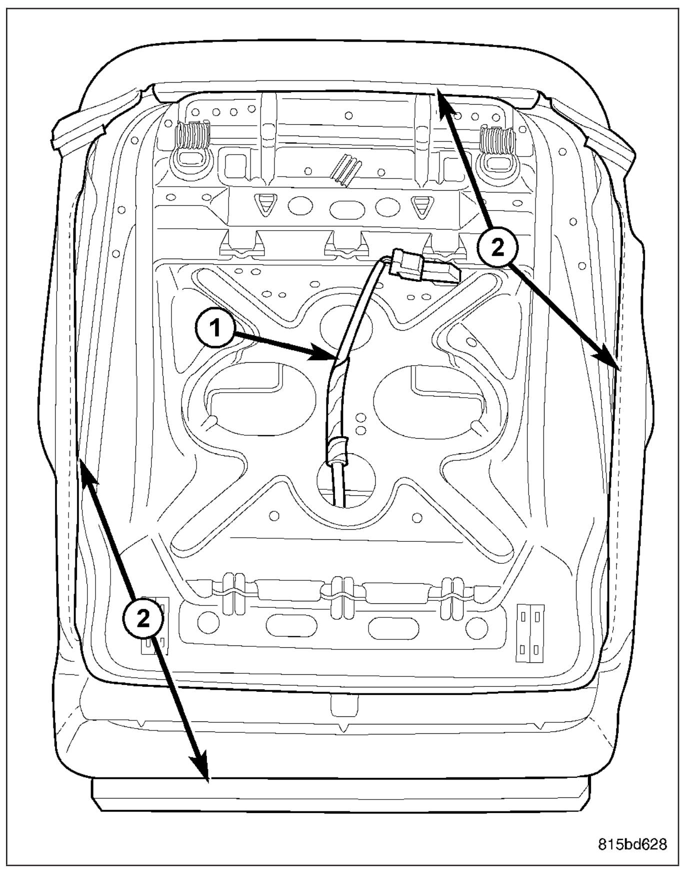


DISASSEMBLY

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION - FRONT - REMOVAL)
3. Release the seat cushion cover J-straps (2) from the seat pan and remove the cushion from the pan.

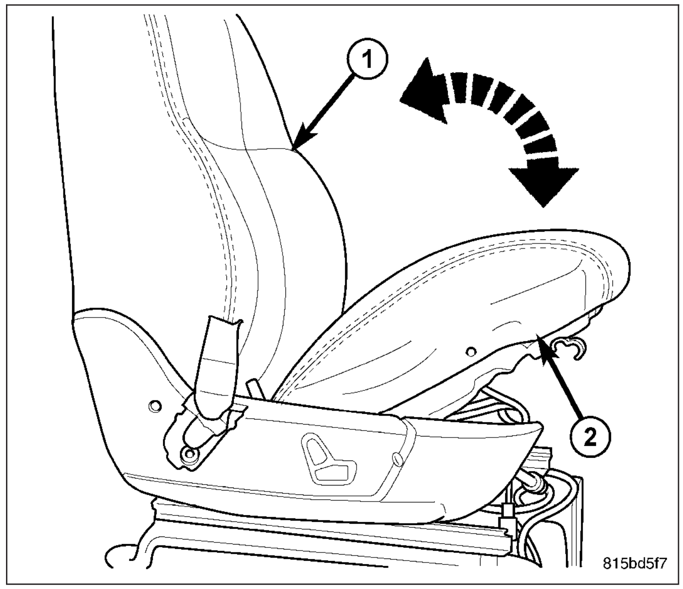


4. Remove the hog rings (1) and separate the seat cushion cover (2) from the seat cushion foam (3).

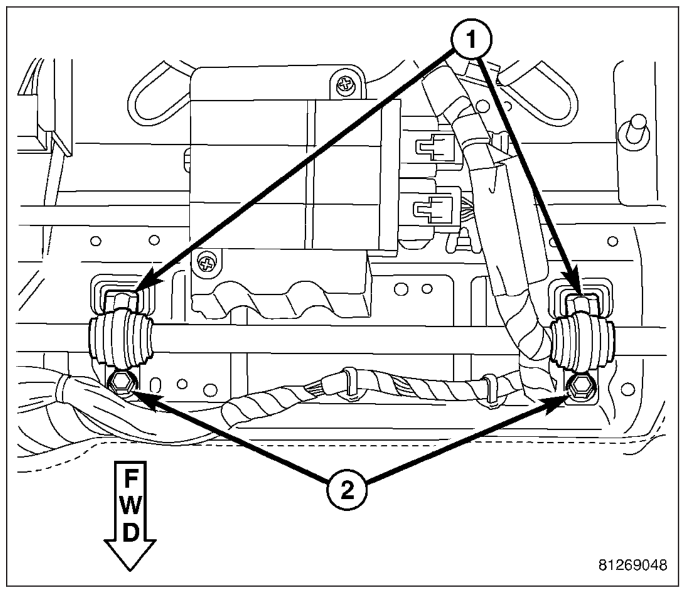


ASSEMBLY

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the seat cushion cover (2) over the seat cushion foam (3) and attach new hog rings (1).

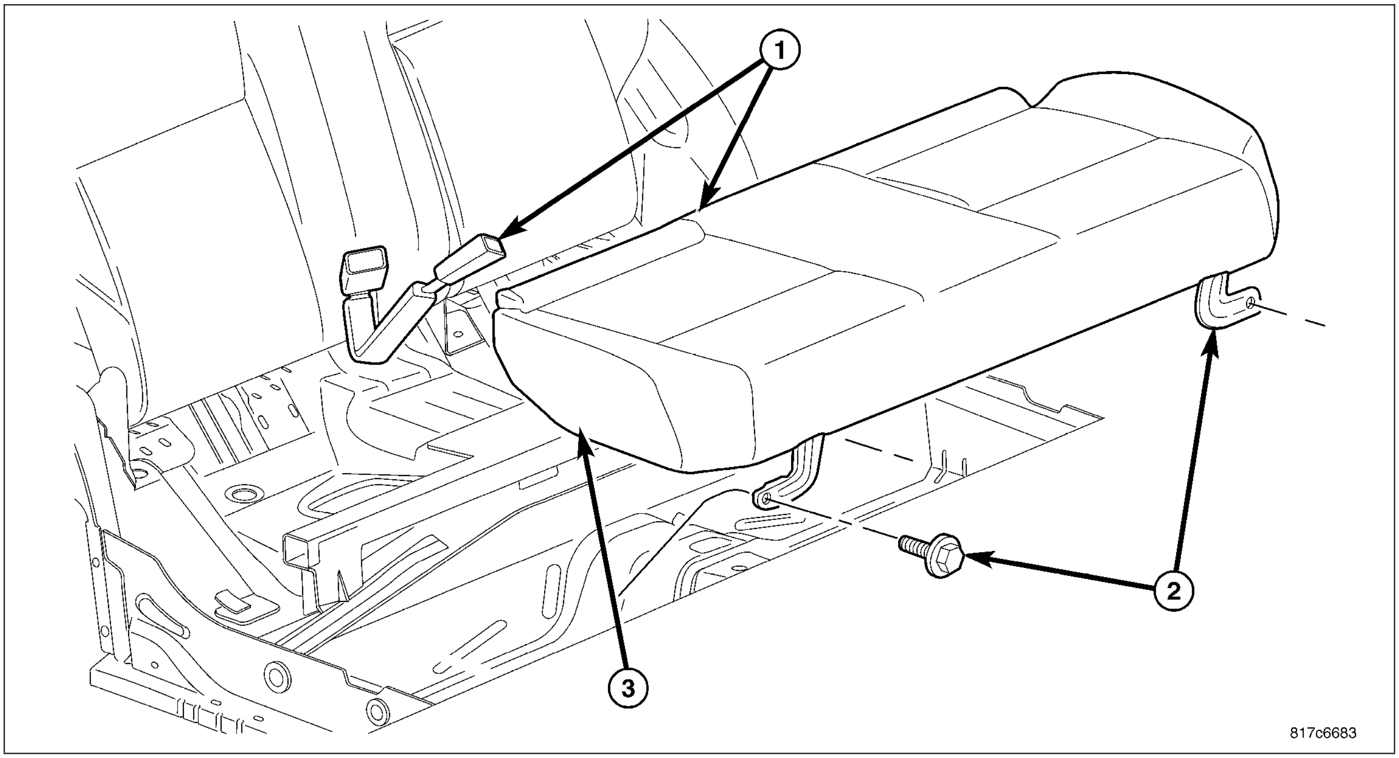


3. Connect the seat cushion cover J-straps (2) to the seat pan.



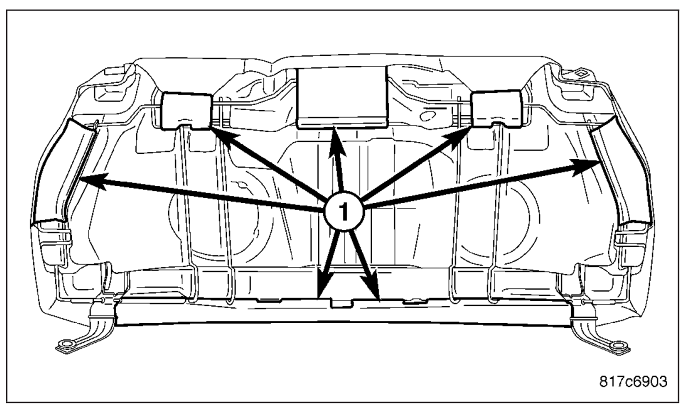
INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the rear of the seat cushion assembly (2) back under the seat back (1) and position the front of the cushion down over the seat adjuster frame.

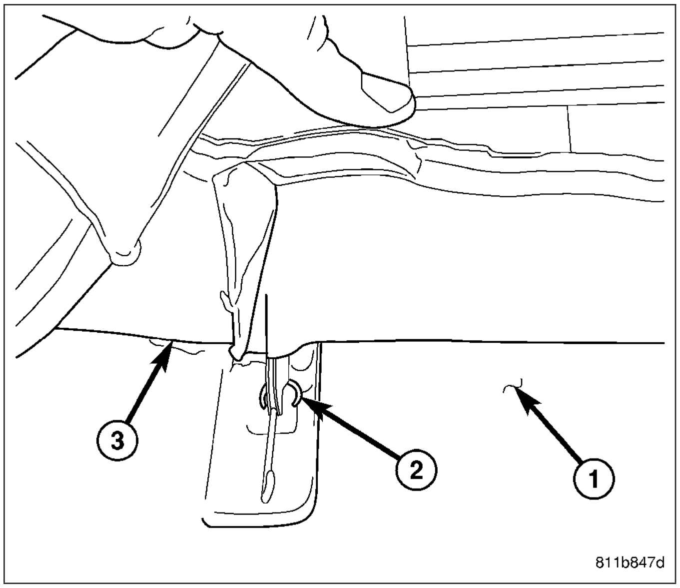


3. Install the seat cushion bushings and straps (1) and install the bolts (2).
4. Tighten the bolts to 11 N·m (8 ft. lbs.).

SEAT CUSHION - REAR



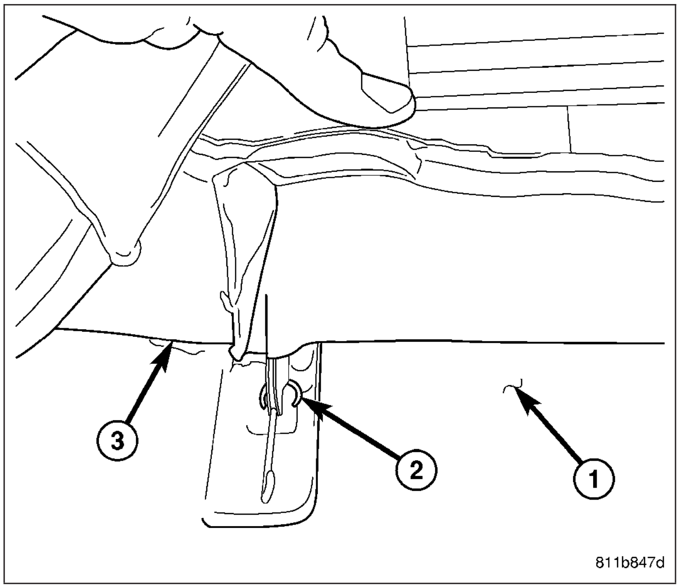
REMOVAL



1. Remove the bolts (2).
2. Lift the front of the cushion (3) up and remove the cushion from under the seat back.

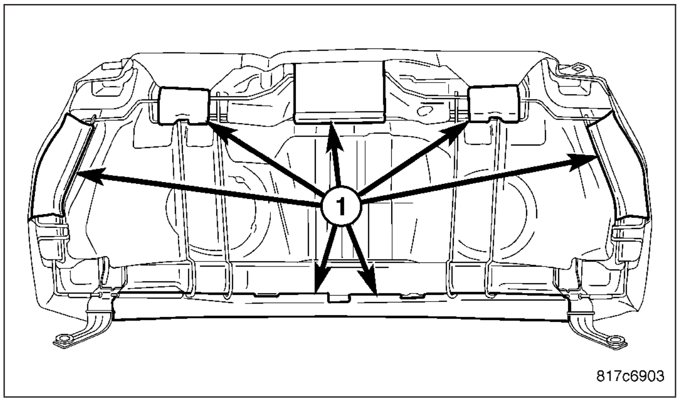
DISASSEMBLY

1. Remove the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REAR - REMOVAL)
2. Separate the J-straps (1) from the seat frame.



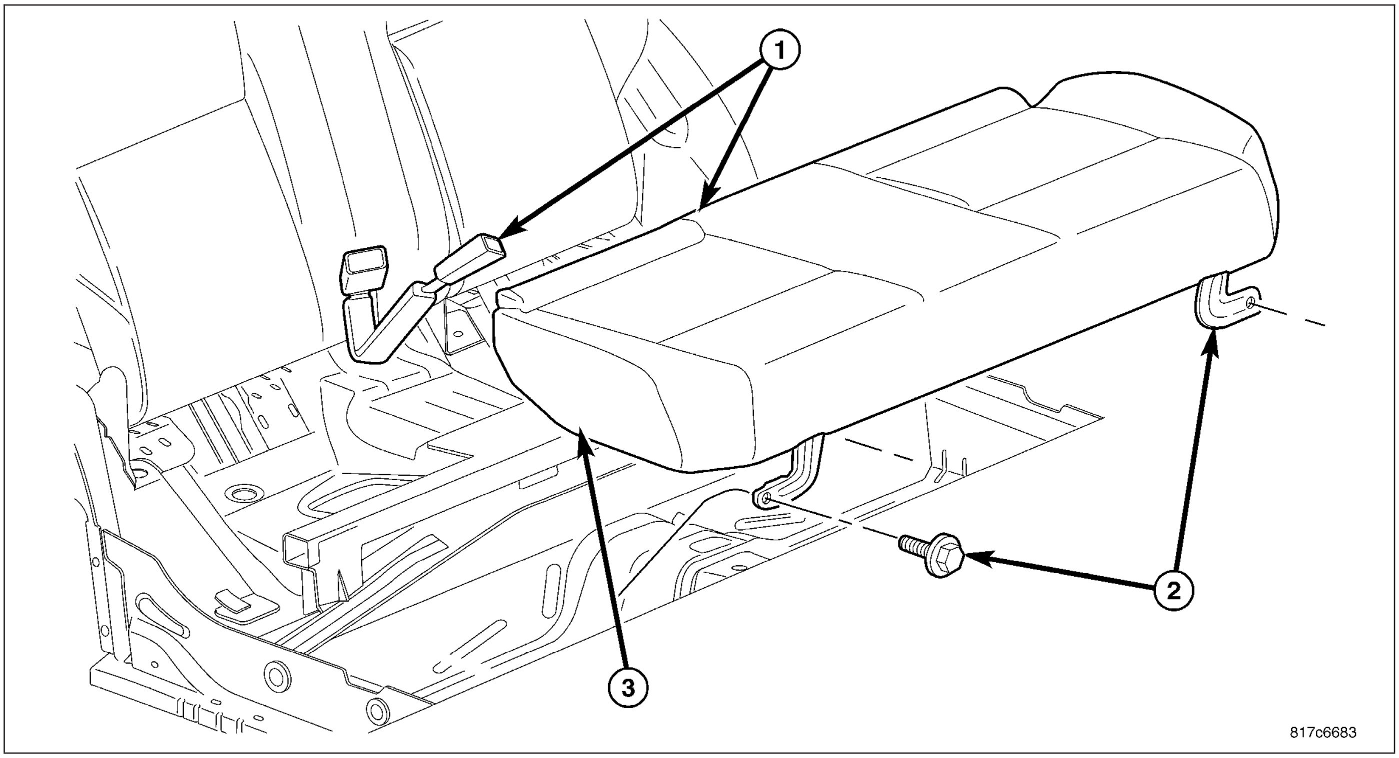
3. Remove the hog rings (2) connecting the seat cover (3) to the seat cushion foam (1) and separate from the seat cushion frame.

811b847d



ASSEMBLY

1. Place the cushion cover (3) onto the cushion foam (1) and install new hog rings (2).



811b847d

2. Connect the J-straps (1) to the seat cushion frame.
3. Install the seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION - REAR - INSTALLATION)

817c6903

INSTALLATION

1. Place the seat cushion into the vehicle and tuck the rear of the cushion (1) up under the seat belt buckles and rear seat back.
2. Lower the front of the cushion (3) down and install the bolts (2).
3. Tighten the bolts to 56 N·m (41.5 ft. lbs.).

STATIONARY GLASS

TABLE OF CONTENTS

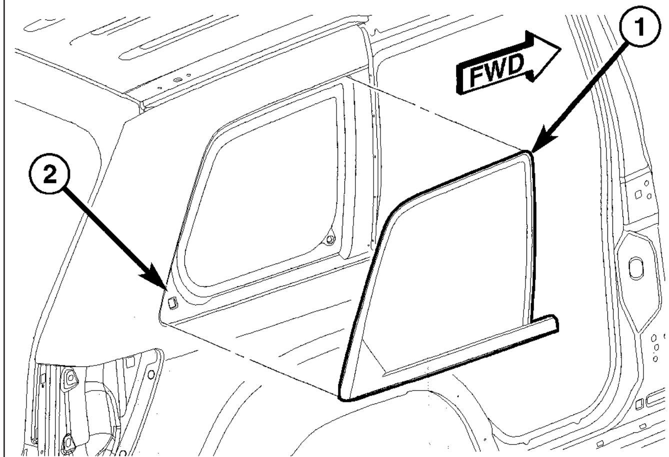
STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **DaimlerChrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **Always wear eye and hand protection when working with glass.**



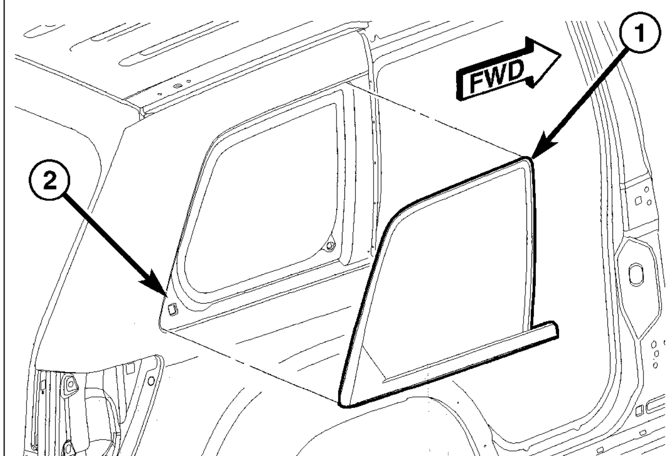
CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

QUARTER GLASS

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the quarter panel trim from the side of the vehicle being serviced (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.



8151d913

3. Using razor knife, cut the urethane adhesive that secures the quarter glass (1) to window fence (2).
4. Carefully push the quarter window glass from the opening.

INSTALLATION

NOTE: Grand Cherokee shown, Caliber similar.

WARNING: Do not operate the vehicle within 24 hours of quarter glass installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the quarter glass may not perform properly if the vehicle is in an accident.

8151d913

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the quarter glass. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

NOTE: To prevent corrosion, do not damage paint on the quarter glass fence when removing original urethane.

NOTE: The quarter glass fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.04 in.) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

1. Using a razor knife, level the original bead of urethane on the fence to a thickness of approximately 1 mm (0.04 in.).
2. If the quarter glass is being reused, remove as much of the original urethane as possible from the glass surface using a razor knife.

WARNING: Do not use solvent based glass cleaners to clean the quarter glass before applying glass prep and primer or poor glass adhesion may result.

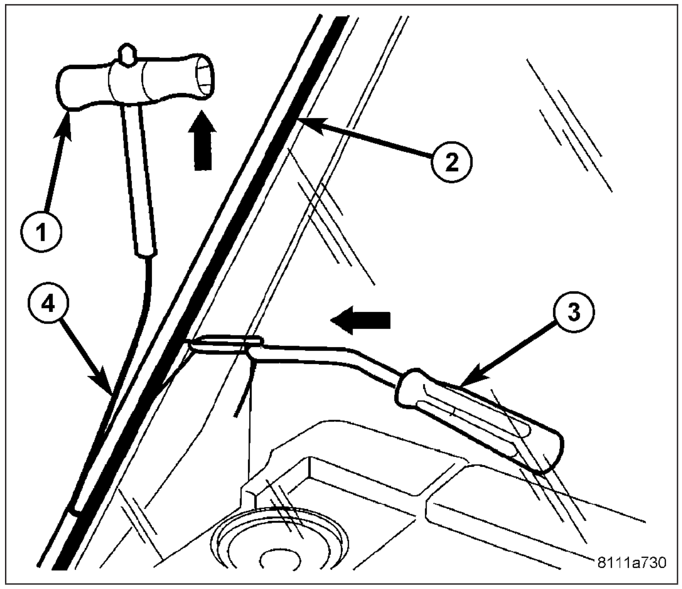
3. Clean the inside of the quarter glass with an ammonia based glass cleaner and a lint-free cloth.
4. Apply glass prep adhesion promoter 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
5. Apply glass primer 25 mm (1 in.) wide around the perimeter of the glass and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
6. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the quarter glass.
7. Re-prime any area that is not fully and evenly primed.
8. Clean the quarter glass fence with an ammonia based glass cleaner and a lint-free cloth.
9. Apply pinch weld primer 15 mm (0.75 in.) wide around the quarter glass fence. Allow at least three minutes drying time.
10. Using a flashlight, verify that the primer is completely and evenly installed along the quarter glass fence.
11. Re-prime any area that is not fully and evenly primed.

CAUTION: Always apply the bead of adhesive to the quarter glass. Always install the quarter glass within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

12. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass starting at the bottom center of the quarter glass.
13. Run the end of the adhesive bead on the quarter glass parallel to the start of the bead and smooth the ends flush.
14. Place the quarter glass (1) into the window opening (2) and insert mounting studs through the holes in the window fence.
15. Install the headliner.
16. Install the quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

WINDSHIELD



DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

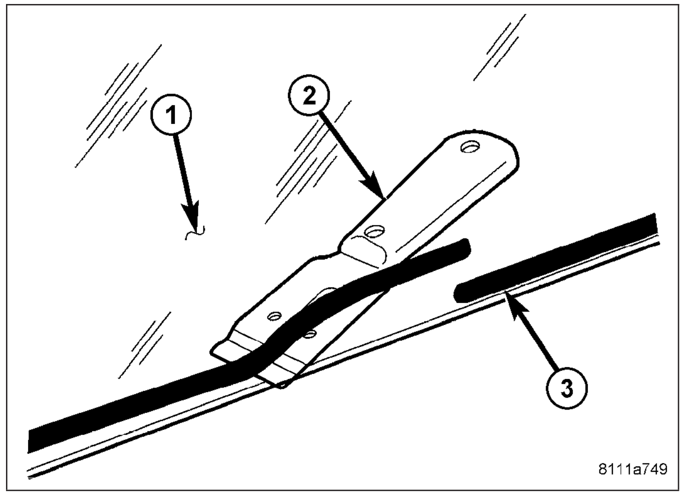
It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).
3. Remove the rain sensor module from the windshield (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/RAIN SENSOR MODULE - REMOVAL).
4. Remove the cowl grille (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL.)

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

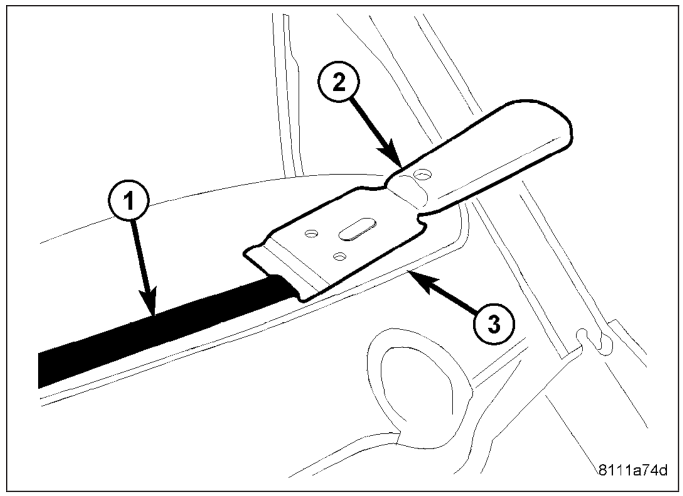
5. Remove molding from the top of the windshield.
6. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
7. Carefully remove the windshield from the vehicle.



INSTALLATION

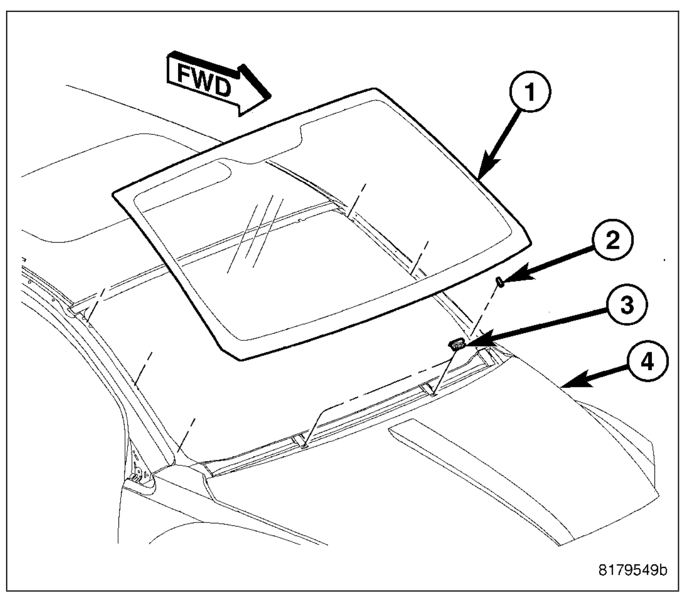
WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

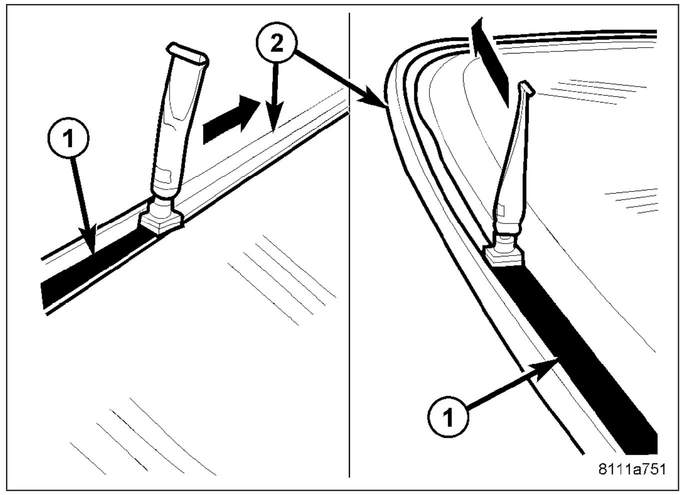


CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

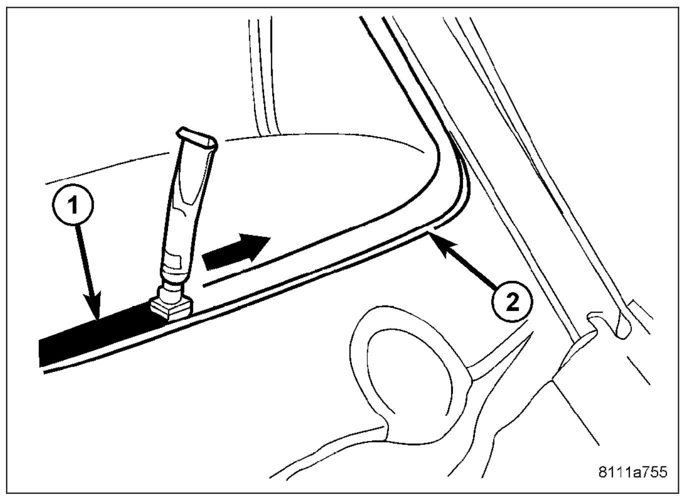
1. If the windshield (1) is being reused, remove as much of the original urethane (3) as possible from the glass surface using a razor knife (2).



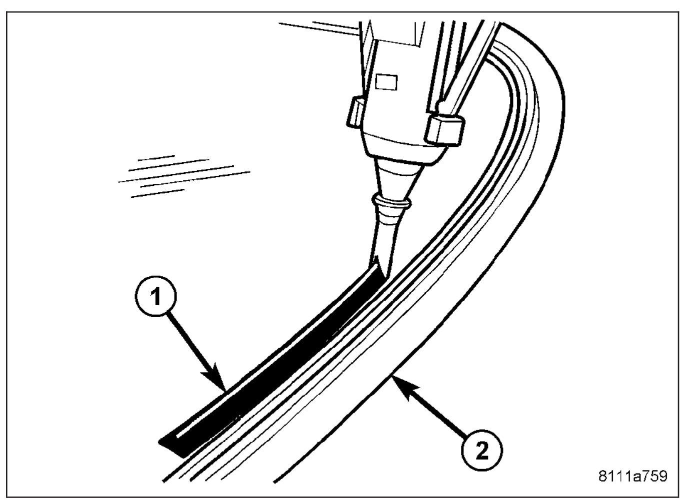
NOTE: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.



NOTE: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.04 in.) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.



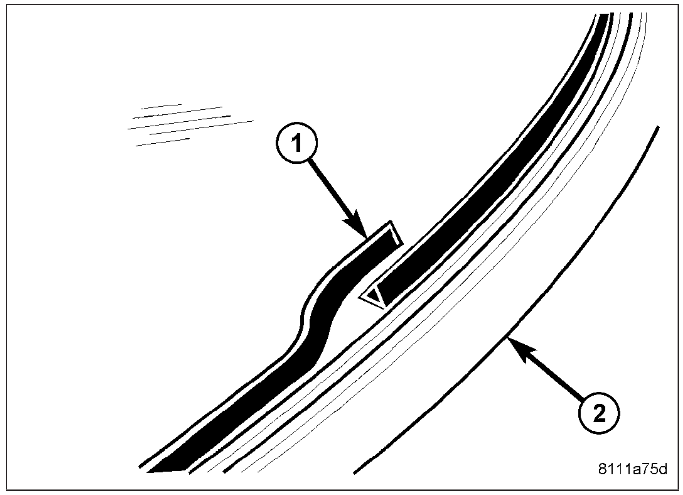
2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove any damaged adhesive backed spacers.
3. Install new adhesive backed spacers along the windshield fence as required.
4. Install a new rubber seal (2) along the top of the windshield (1).
5. Using an assistant, position the windshield into the windshield opening and against the windshield fence (3) and spacers.
6. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
7. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
8. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.



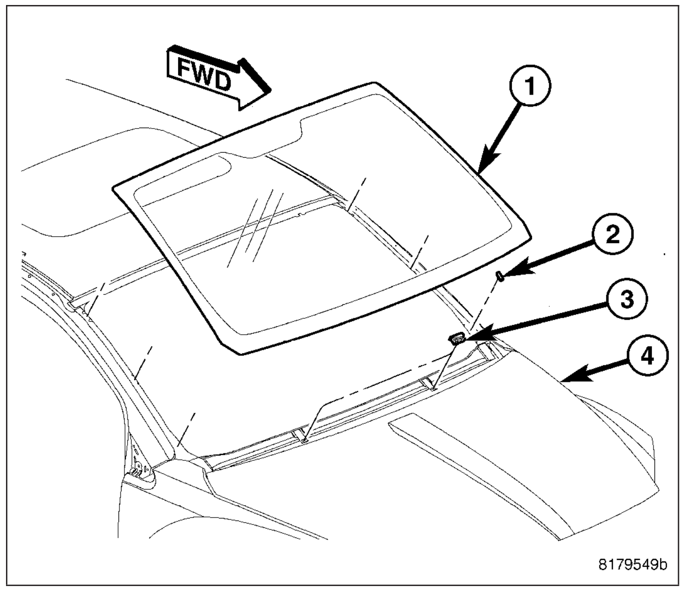
WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
13. Re-prime any area that is not fully and evenly primed.

14. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
17. Re-prime any area that is not fully and evenly primed.



CAUTION: Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.



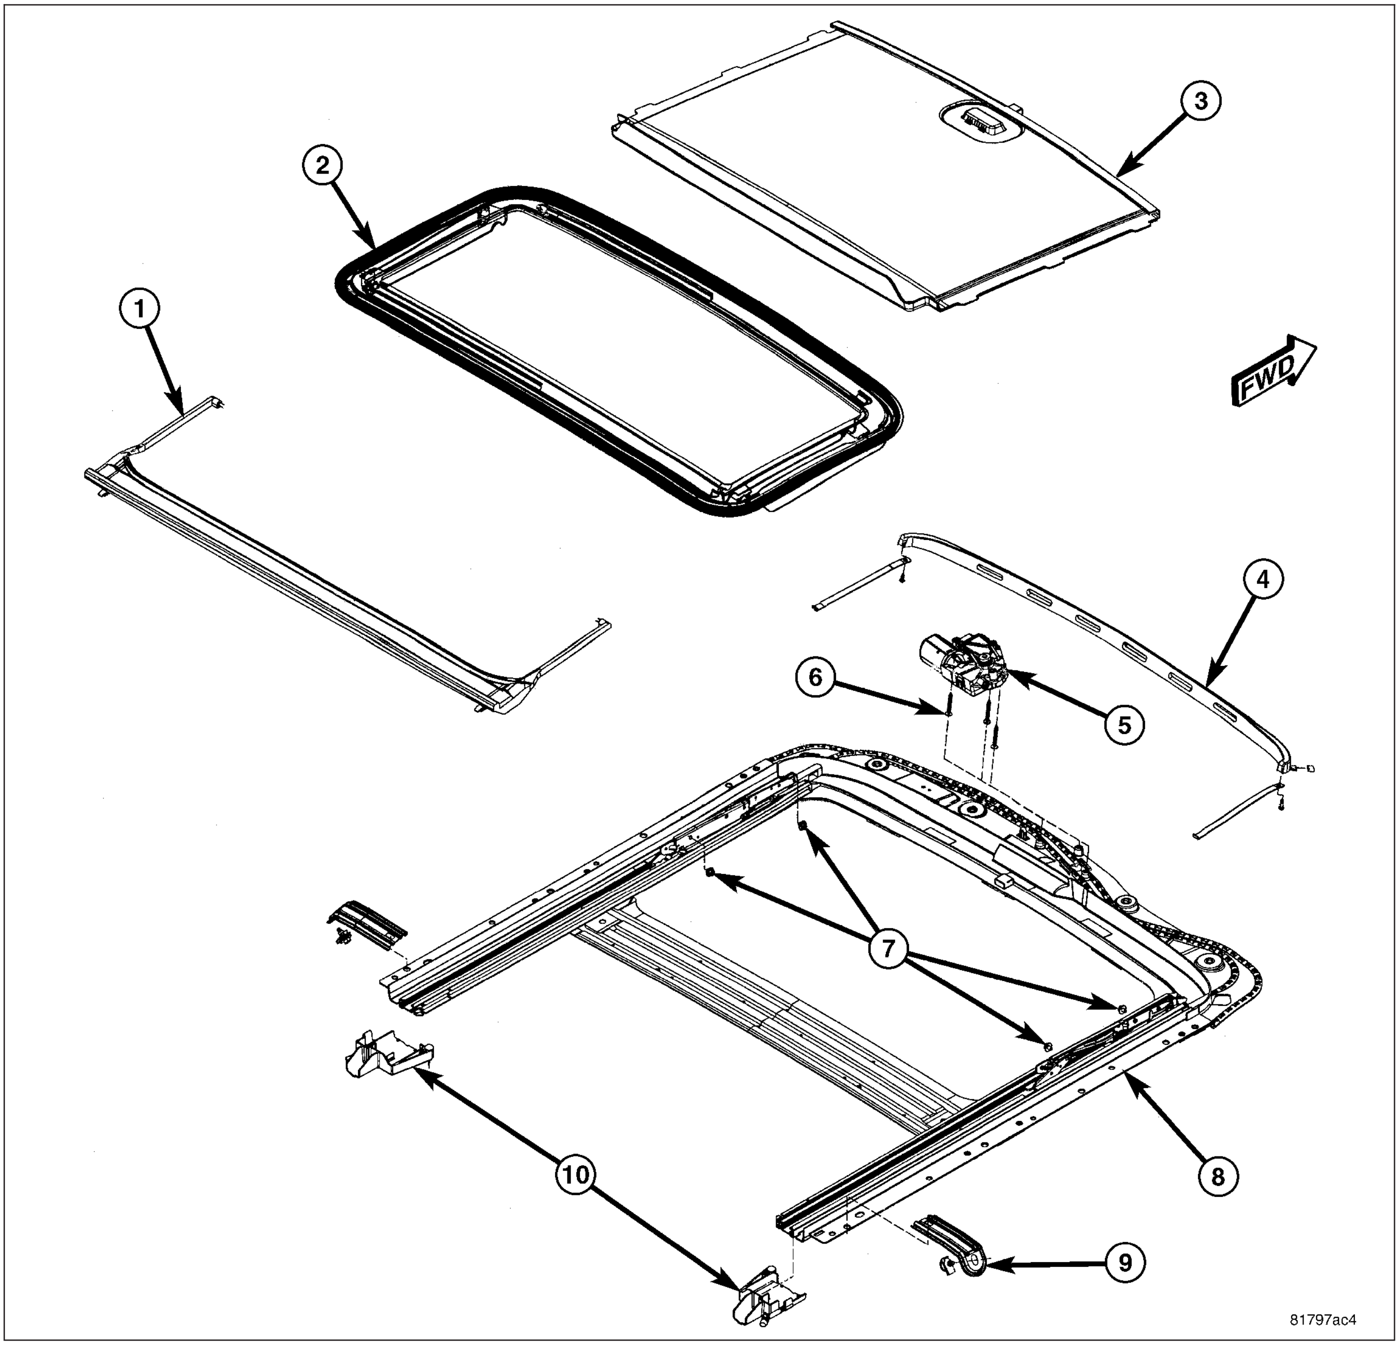
NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

18. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.

19. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.

20. Using an assistant, position the windshield (1) over the windshield opening.
21. Using the grease pencil marks or tape as reference points, align the windshield to the windshield opening.
22. Carefully lower the windshield into the windshield opening. Guide the windshield and the rubber seal (2) at the top the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.



23. Push the windshield inward until the windshield comes into contact with the spacers located on each side and the bottom of the windshield fence.
24. Install the cowl grill (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
25. Install the rear view mirror onto the windshield (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).
26. Install the rain sensor module onto the windshield (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/RAIN SENSOR MODULE - INSTALLATION).

SUNROOF

TABLE OF CONTENTS

SUNROOF

DESCRIPTION

EXPLODED VIEW

8 - FRAME ASSEMBLY
9 - BRACKETS
10 - END CAPS

WARNING: Keep fingers and other body parts out of sunroof opening at all times.

The sunroof features a power sliding glass panel and a sunshade which can be manually positioned anywhere along its travel, rearward of glass panel front edge.

The sunroof is electrically operated from two switches located on the windshield header, between the map lamp. To operate the sunroof the ignition switch must be in either the Accessory or On/Run position. One switch (vent) is a push button type and opens the sunroof to the vent position only. The other switch (open/close) is a rocker type for opening and closing the sunroof. Pressing and releasing the open button once the sunroof will express open and the wind deflector will raise. If the button is pressed a second time the sunroof will stop in that position. Pressing and holding the close button will close the sunroof. If the close button is released the sunroof will stop in that position. Also, by pressing the close button the sunroof will close automatically.

SUNROOF OPERATION INSTRUCTIONS

SWITCH INPUTS			
	OPEN	CLOSE	VENT
FULL VENT	1. Push and hold switch until glass stops in flush closed position glass will then express open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	No action
VENT RANGE	1. Push and hold switch until glass passes through flush closed position. Glass will then open 2. Press switch for less than 0.65 seconds for express to full open.	1. Push and hold switch until glass stops in flush closed position. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Push and hold switch until glass stops in full vent position. 2. Press switch for less than 0.65 seconds for express to full vent.
FLUSH	1. Press switch for less than 0.65 seconds for express to full open. 2. Press switch for more than 0.65 seconds and glass will stop when switch is released	No action	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released or when fully vented. 2. Press switch for less than 0.65 seconds for express to full vent.
FULL OPEN	No action	1. Press and hold switch until glass stops in flush closed position or anywhere in between. 2. Press switch for less than 0.65 seconds for express to flush closed.	1. Press and hold switch. Glass will travel through flush closed to full vent. Glass will stop when switch is released. 2. Press switch for less than 0.65 seconds for express to full vent.

DIAGNOSIS AND TESTING

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a piece of paper between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to Sunroof Glass Panel Adjustment for proper procedures.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

1. Remove A-pillar trim, sun visors, and map lamps/mini console.
2. Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
3. Repair as necessary.
4. Install headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)

DIAGNOSTIC PROCEDURES

Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. Refer to Sunroof Diagnostic Chart for possible causes. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in cavity 19 of the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof drive motor, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 9 volts is detected at the drive motor, proceed with the following tests (the drive motor will not operate at less than 9 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof drive motor, control switch, and body harness. Faulty power circuit between sunroof drive motor, control switch, and body harness. Faulty drive motor. Faulty drive motor electrical connector.
Audible whine when switch is depressed, sunroof does not operate.	Faulty drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.

SYMPTOM	POSSIBLE CAUSE
Sunroof vents and opens, but does not close.	Binding cable. Faulty circuit. Faulty control switch. Faulty drive motor. Broken trough guide
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty drive motor.
Sunroof does not vent.	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty drive motor.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof.	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Front of glass panel too high or rear too low. Wind deflector not deploying. Glass not centered in opening. Faulty glass panel seal.
Rattles from open sunroof while driving.	Loose or broken attaching hardware. Worn or broken mechanism.
Sunroof does not stop in the fully closed position.	Drive motor has lost position of glass, teach procedure required to reprogram drive motor. Refer to sunroof drive motor teach procedure.

CONTROL SWITCH

DESCRIPTION

Vehicles equipped with a power sunroof utilize an sunroof control switch. On this model, the sunroof control switch is located in the overhead console, in between the two reading lamps. The switch is mounted in the overhead console with four plastic retaining tabs, molded into the switch housing.

This switch incorporates six selections of operation open, auto open, close, auto close, auto vent and vent. The individual switches in the sunroof control switch unit cannot be repaired. If one switch is damaged or faulty, the entire sunroof control switch unit must be replaced.

OPERATION

With the operation of the sunroof control switch, voltage is directed to the sunroof motor, through the switch contacts or control module. If the control switch is depressed and held depressed the voltage signal is controlled manually through the switch contacts, so when the switch is released the sunroof stops.

Refer to the Owner's Manual for more information on the operation of the sunroof switch and system.

DIAGNOSIS AND TESTING

CONTROL SWITCH

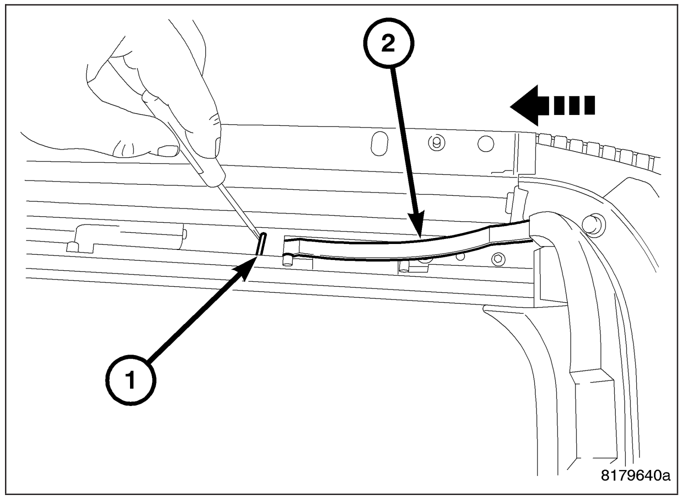
The following test will determine if the sunroof control switch is operating properly.

1. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
2. Remove the sunroof control switch from the overhead console (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL).
3. Using an ohmmeter, test the switch terminals for proper continuity using the table below. If any of the terminals do not show proper continuity, replace the sunroof control switch.

SWITCH POSITION (DEPRESSED)	CONTINUITY BETWEEN TERMINALS
VENT (V)	3, 4
OPEN (AUTO)	1, 4
CLOSE (AUTO)	2, 4

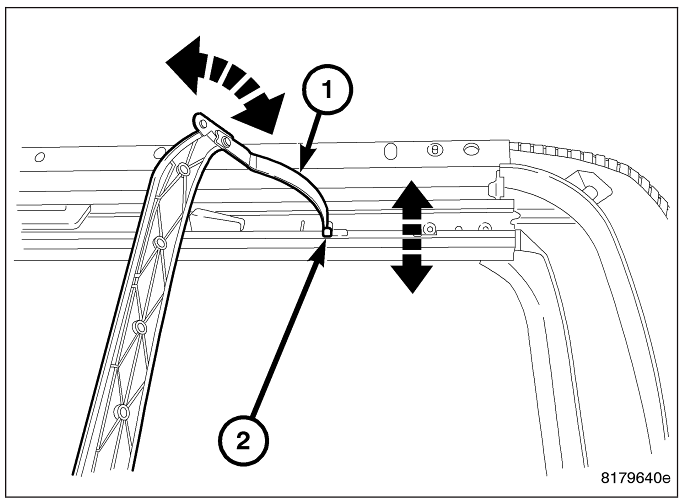
REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the overhead console from the headliner (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Disconnect the sunroof control switch electrical connector. Depress the connector retaining tab and pull the connector straight out.
4. To remove the switch from the overhead console, push on the back of the switch until it comes free from the overhead console.



INSTALLATION

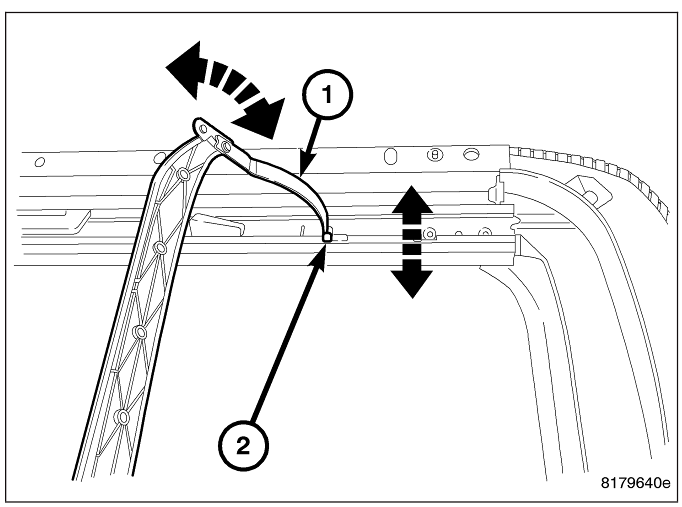
1. Install the switch in the overhead console assembly. Be certain the switch is securely snapped in place.
2. Connect the sunroof control switch electrical connector. Be certain the switch connector is securely snapped in place.
3. Install the overhead console (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
4. Connect the negative battery cable.



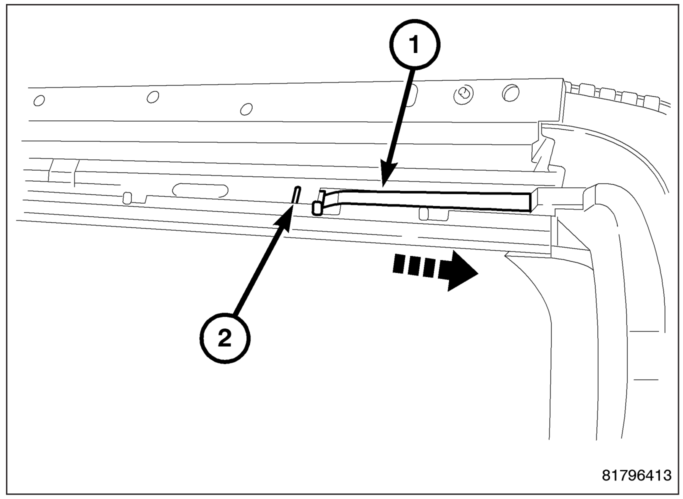
DEFLECTOR-WIND

REMOVAL

1. Open the sunroof glass to the full open position.
2. Press the spring lock (1) with a small flat bladed tool and push the wind deflector (2) reward to release from the car top opening.
3. Repeat the previous step on the opposite side.

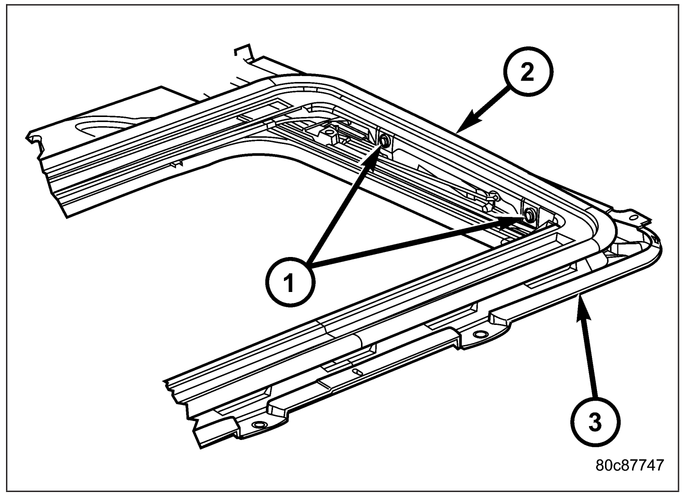


4. Rotate the wind deflector (1) up and release from the mounting hole (2) in the sunroof frame.



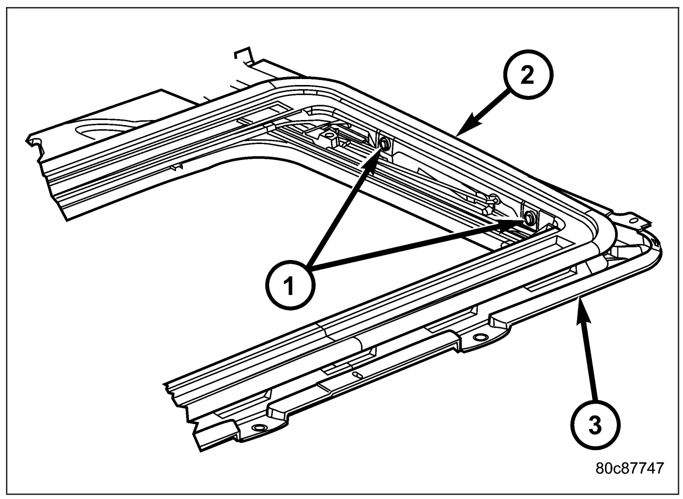
INSTALLATION

1. Position the wind deflector springs (1) into the mounting holes (2) in the sunroof frame.
2. Rotate forward and down into position.



3. Slide the wind deflector and spring (1) forward under the car top lip and make sure the spring lock snaps into place (2) fully.

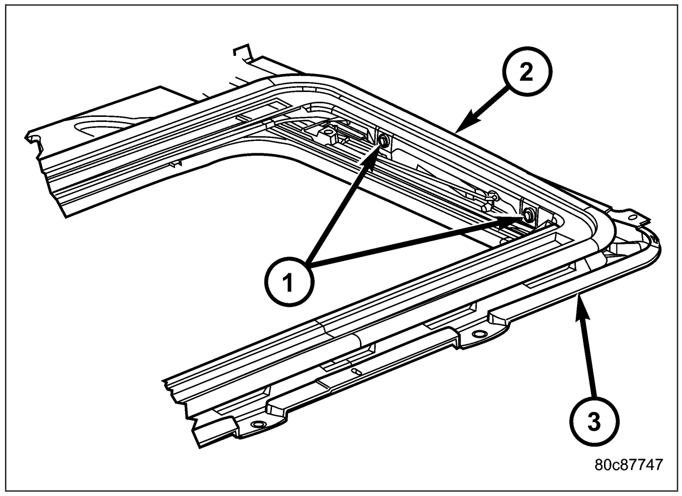
GLASS



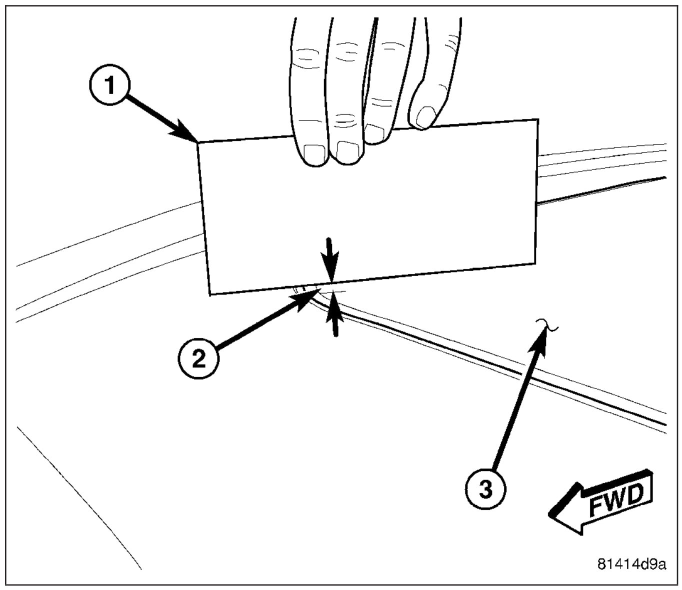
REMOVAL

1. Slide sunshade rearward to the open position.
2. Move the glass panel to the closed position.
3. Remove the four glass panel screws (1).
4. Lift off glass panel and remove from vehicle.

INSTALLATION



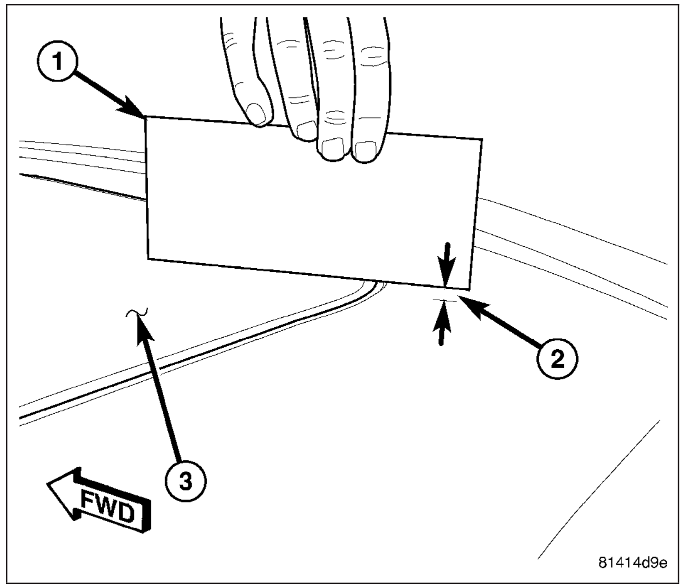
1. Position glass panel (2) on to mechanism lift arm.
2. Start the four attaching screws (1).
3. Center glass in opening by running a business card around the glass.
4. Adjust glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)



ADJUSTMENTS

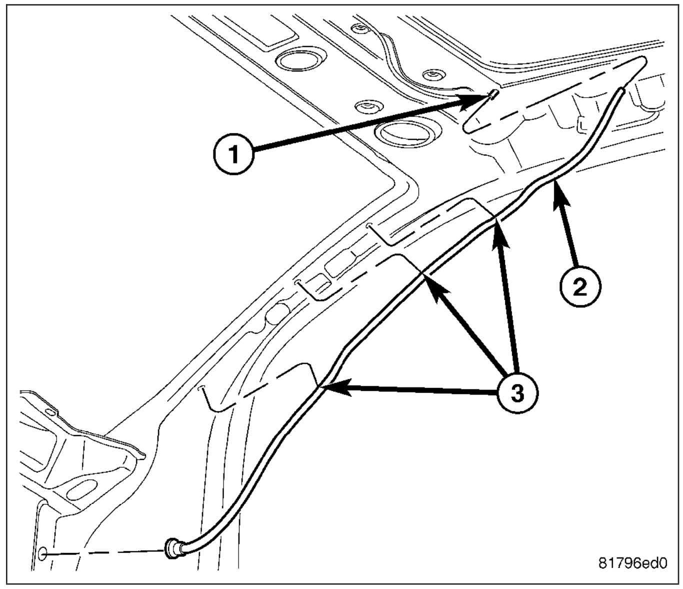
SUNROOF GLASS PANEL ADJUSTMENT

1. Move the sunshade rearward to the open position.
2. Move the sunroof glass panel to the fully closed position.
3. Adjust the glass one corner at a time.
    a. Loosen four glass screws (1).
    b. Lift glass assembly and align the top of the glass panel to the top of the roof panel.
    c. Tighten screw to 3.5 N·m (31 in. lbs.).
    d. Repeat steps a. and b. for each corner of the glass panel.
    e. When properly adjusted, the front of the glass panel is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) lower than the roof surface and the rear edge of the glass panel is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) higher than the roof surface.

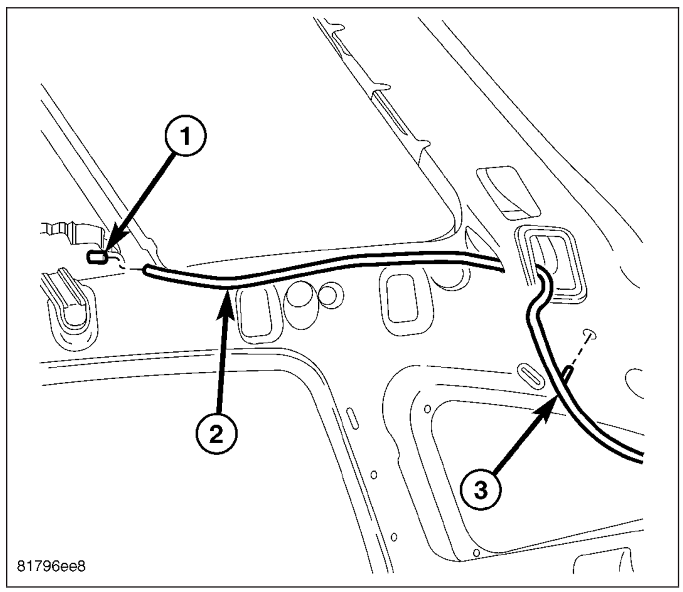


NOTE: When properly adjusted, the front of the glass panel (3) is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) lower than the roof surface (2).

NOTE: When properly adjusted, the rear edge of the glass panel (3) is 1.0 mm (0.04 in.) to 2.0 mm (0.08 in.) higher than the roof surface (2).

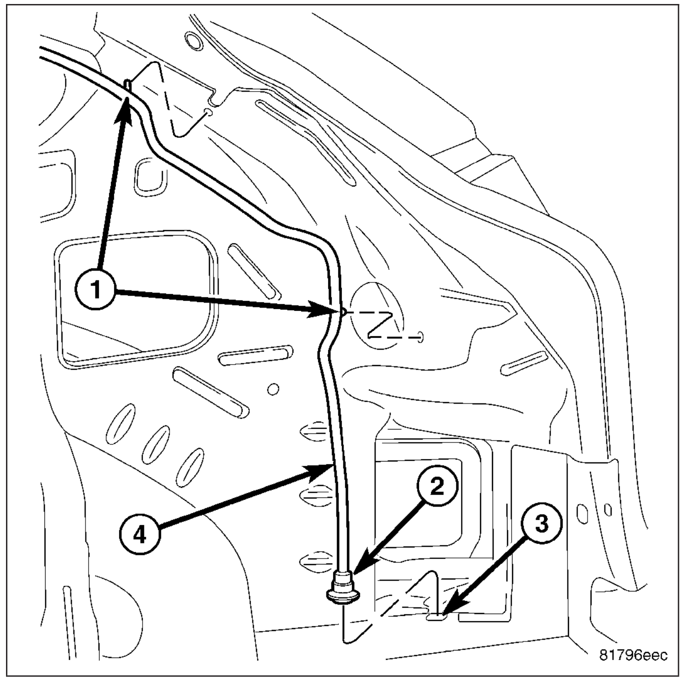


4. Verify sunroof operation and alignment. Check fit and re-adjust as necessary.



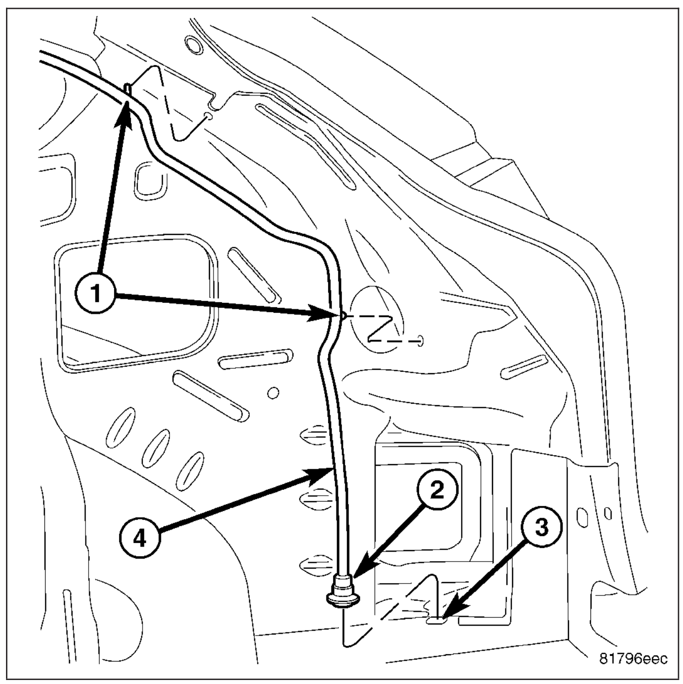
HOSE-DRAIN

REMOVAL

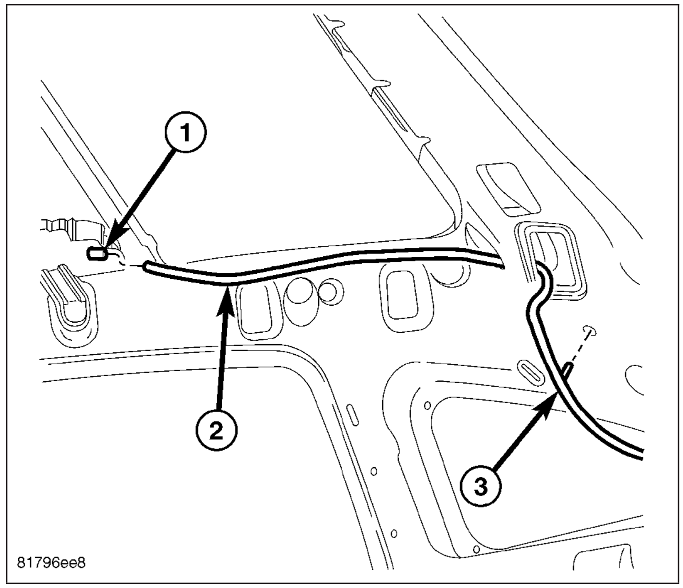


1. Drop down the headliner as necessary to gain access to the drain hoses (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
2. Disconnect the front hoses (2) from the sunroof assembly (1).
3. Release the support clips (3) and disconnect the lower grommet and remove the hose.

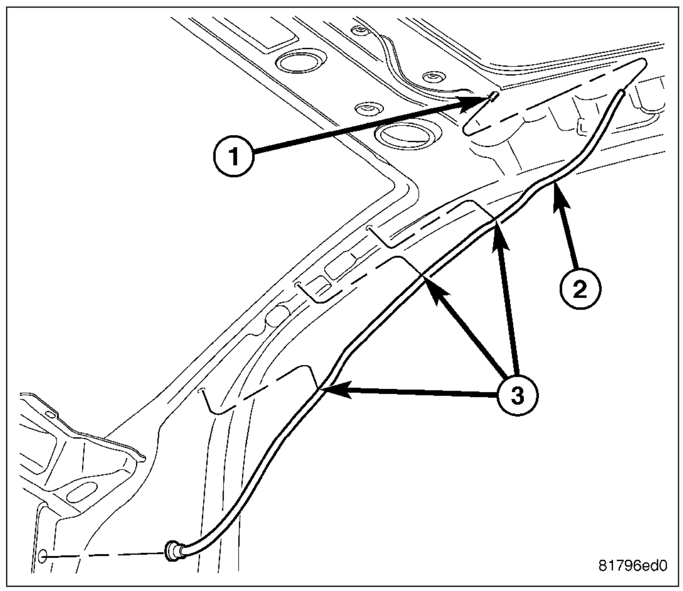
4. Disconnect the rear hoses (2) from the sunroof assembly (1) and release the support clips (3).



5. Separate the remaining support clips (1).
6. Disconnect the grommet (2) from the body (3) and remove the rear hoses as necessary.

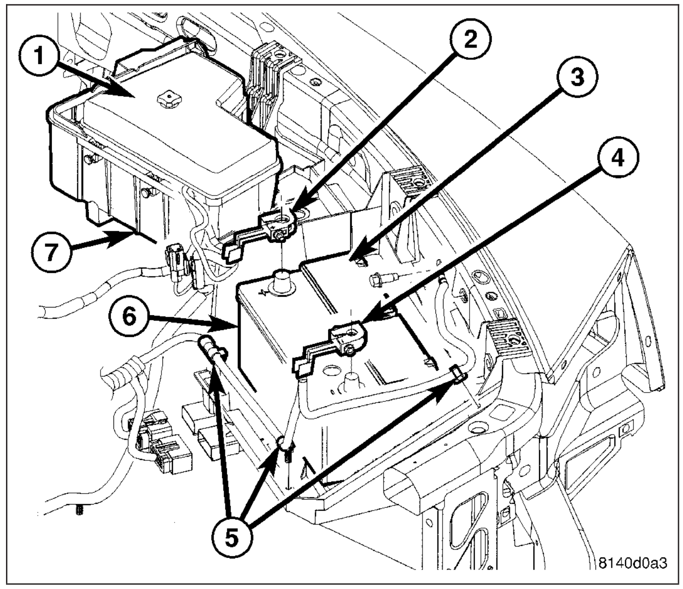


INSTALLATION

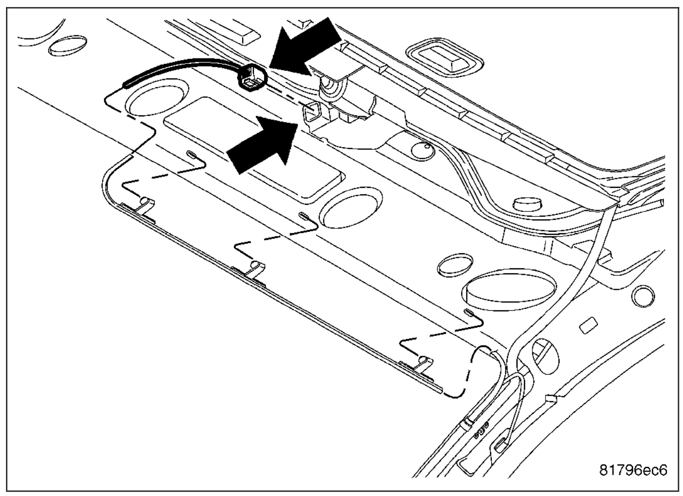


1. Install the rear hoses (4) and connect the grommets (2) to the body (3).
2. Connect the support clips (1).

3. Route the hose as required and connect the remaining support clips (3).
4. Connect the hoses (2) to the sunroof assembly (1).

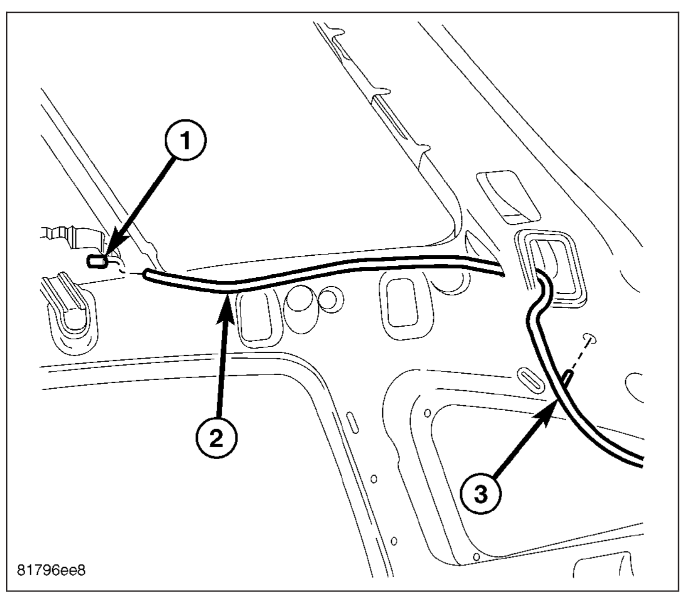


5. Connect the front hose lower grommet to the body.
6. Connect the front hose (2) to the sunroof assembly (1) and connect the support clips (3).

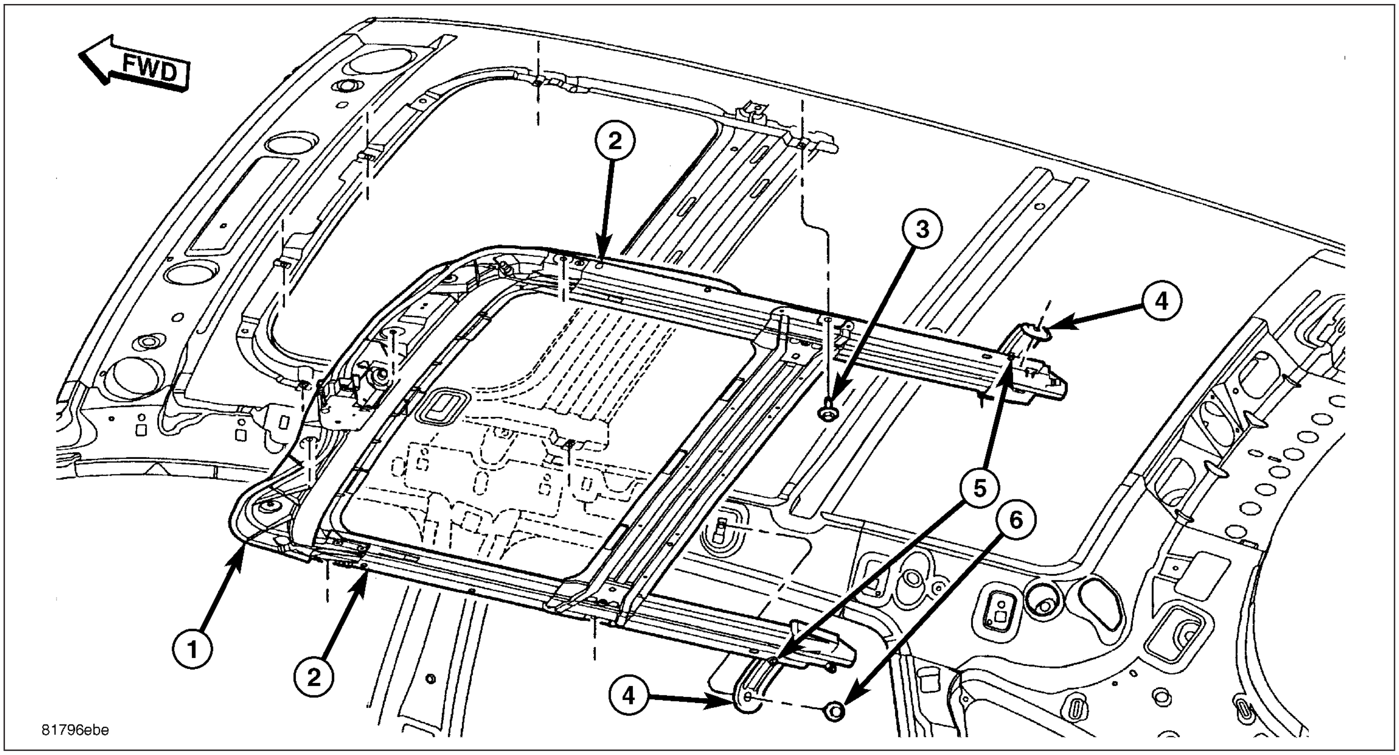


MODULE/FRAME ASSEMBLY

REMOVAL

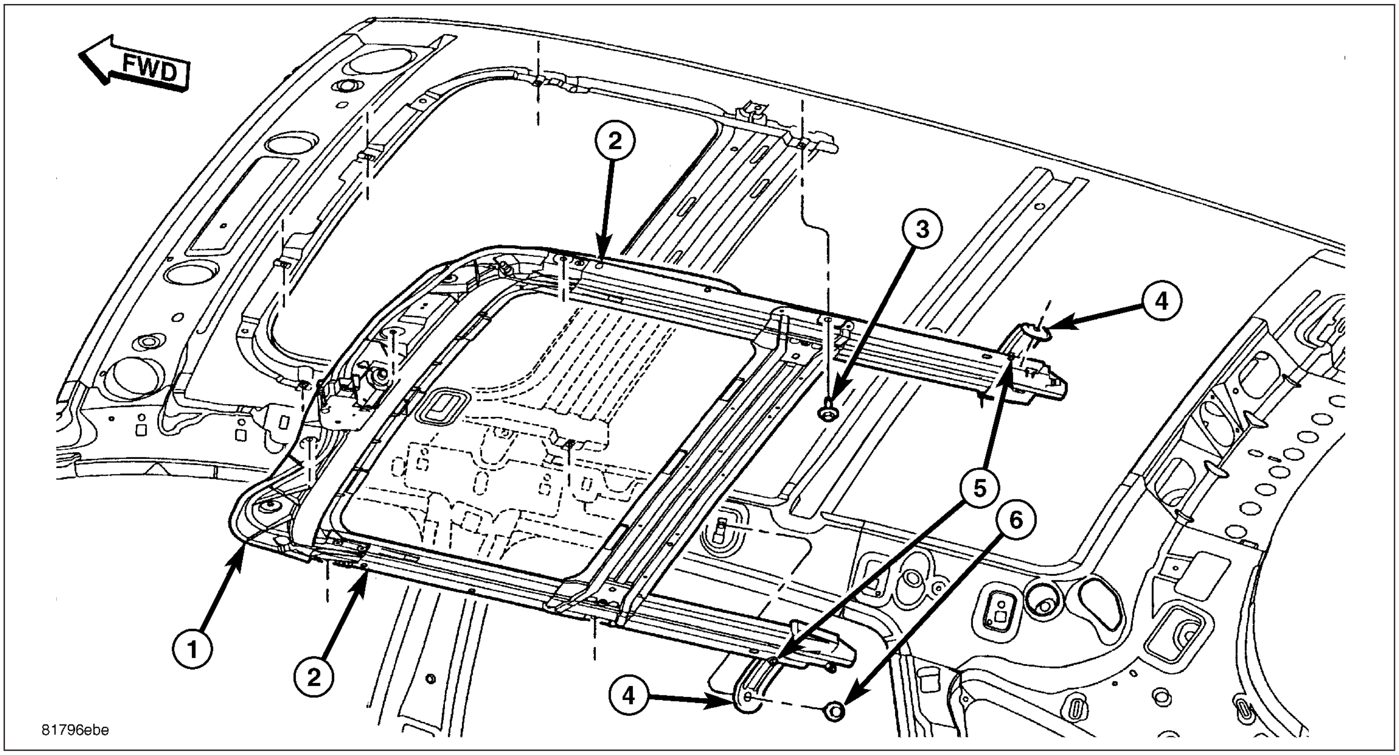


1. Move glass panel to fully closed position.
2. Disconnect and isolate negative battery cable (4).
3. Remove control switch (Refer to 23 - BODY/SUNROOF/CONTROL SWITCH - REMOVAL).
4. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).

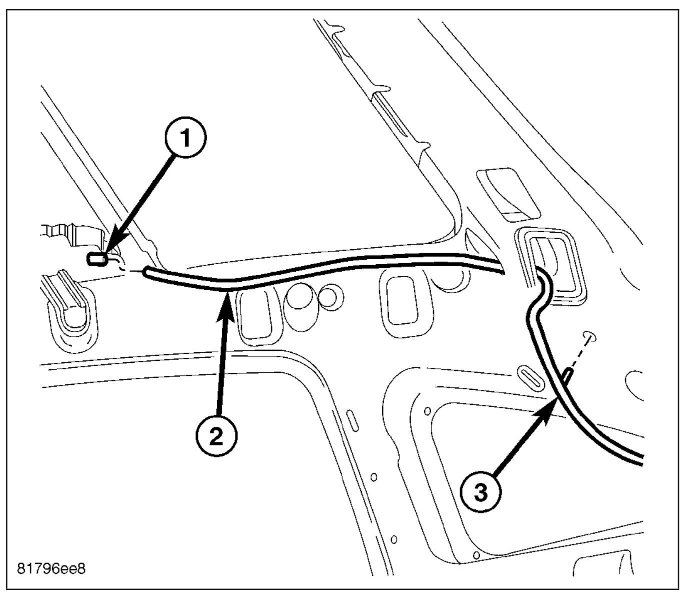


5. Disconnect the electrical connector.

6. Disconnect drain tubes (2) from sunroof housing (1).

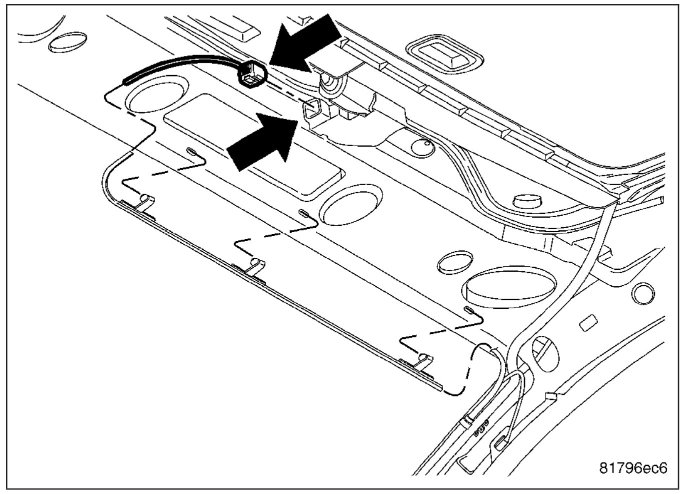


7. Remove two module side bracket (4) bolts (6) and loosen the six remaining fasteners (3).
8. Remove the six (3) fasteners attaching sunroof module assembly (1) to roof panel.
9. Remove the glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).
10. Remove the sunshade (Refer to 23 - BODY/SUNROOF/SUNSHADE - REMOVAL).
11. Remove the drive motor (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - REMOVAL).
12. Remove the wire harness.
13. Remove the trough guides (Refer to 23 - BODY/SUNROOF/GUIDE ASSEMBLY - REMOVAL).

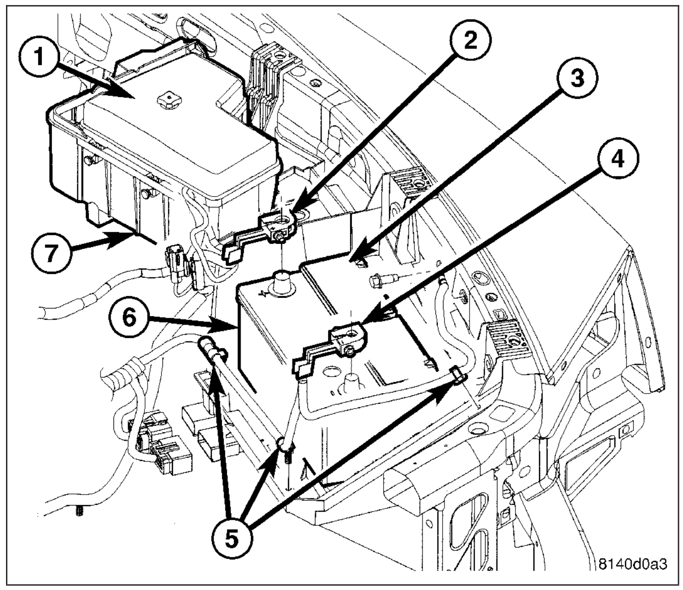


INSTALLATION

NOTE: Mk Sunroof assembly shown, PM similar.



1. Install the trough guides (Refer to 23 - BODY/SUNROOF/TROUGH GUIDE ASSEMBLY - INSTALLATION).
2. Install the drive motor (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - INSTALLATION).
3. Install the sunshade (Refer to 23 - BODY/SUNROOF/SUNSHADE - INSTALLATION).
4. Install the glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).



5. Raise rear end of sunroof module assembly (1) and guide into position and start the six fasteners (3).
6. Visually line up the alignment guide holes (2) with the guide holes in the roof of the vehicle.
7. Tighten the six fasteners (3) to 9 N·m (80 in. lbs.).
8. Tighten the two side bracket fasteners (6) to 9 N·m (80 in. lbs.).
9. Connect the drain tubes (2) to the assembly (1).

10. Connect the electrical connector.

11. Connect battery negative cable (4).

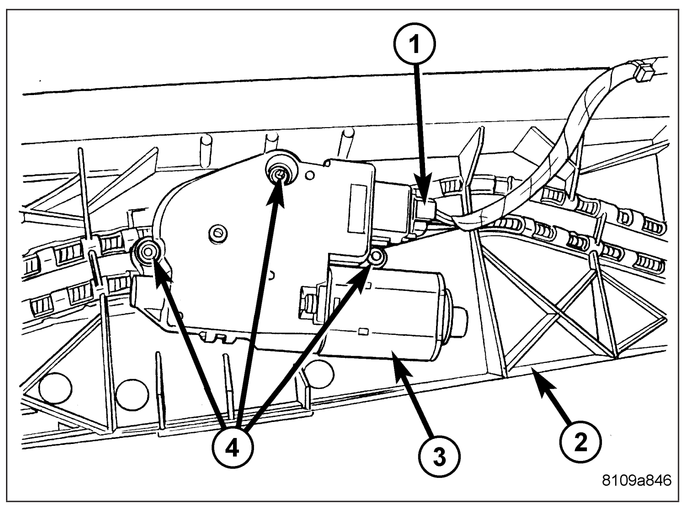
12. Test sunroof operation, adjust glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
13. Partially install the headliner and connect the sunroof wiring electrical connectors. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
14. Temporarily install sunroof switch and perform the sunroof motor teach procedure. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - TEACH PROCEDURE)
15. Complete headliner installation. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
16. Verify correct sunroof operation.

MOTOR-SUNROOF - W/CONTROL UNIT

STANDARD PROCEDURE

DRIVE MOTOR TEACH PROCEDURE

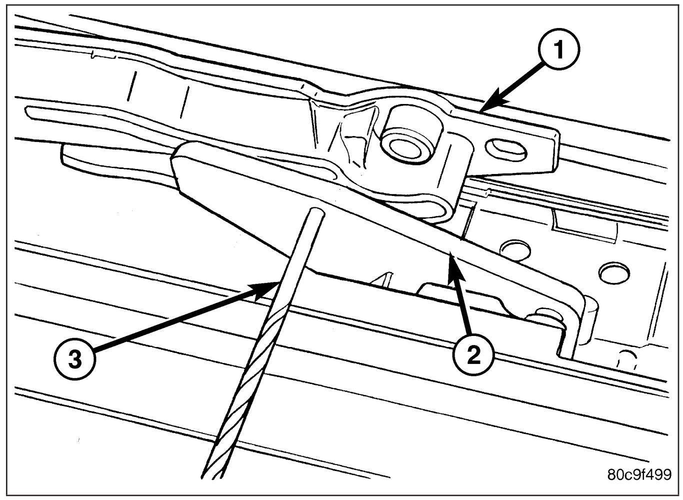
REPLACEMENT DRIVE MOTOR



1. Press and hold the sunroof switch open until the sunroof glass fully opens, automatically reverses direction, and stops at a position just forward of the full open position.
2. Release sunroof switch.
3. Within five seconds of releasing sunroof switch, press and hold the sunroof switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
4. Release sunroof switch. Sunroof will now operate normally.

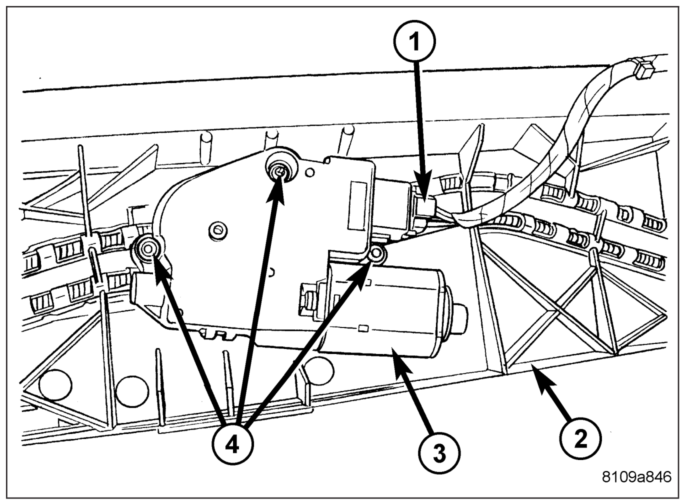
ORIGINAL DRIVE MOTOR

1. Press and hold sunroof switch open until the sunroof glass opens and stops.
2. Release sunroof switch.
3. Press and hold sunroof switch open once again for at least 10 seconds. After 10 seconds of pressing the switch open, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Within five seconds of releasing the sunroof switch, press and hold the switch open again until the sunroof glass closes, goes into vent position, and then finally stops in the closed position.
6. Release sunroof switch. The sunroof will now operate normally.



REMOVAL

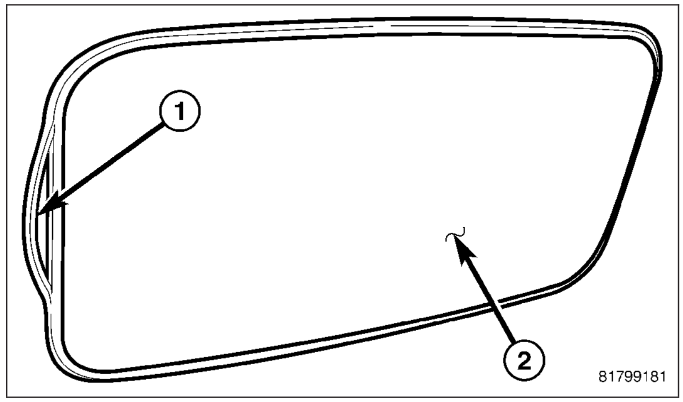
1. Remove headliner. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Disconnect the electrical connector (1).
3. Remove three motor assembly attaching screws (4) from bottom side of motor assembly (3) and remove motor assembly from the motor bracket.



INSTALLATION

1. If sunroof was open when drive motor was removed, carefully move glass panel into closed position and remove glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Set lifter arm timing by manually sliding the mechanisms (1) in the track until timing holes in the trollies are aligned with the timing holes in the lifter arm cams (2) and insert pins (3) into the mechanisms to hold mechanisms in closed position.

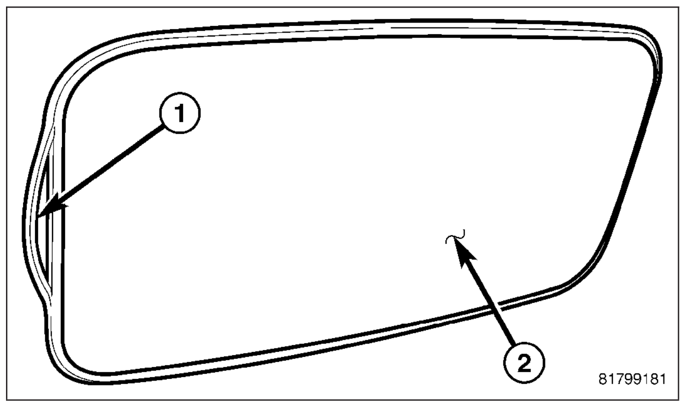
3. Place motor (3) into position and install screws (4) attaching motor to bracket (2).
4. Tighten the screws (4) to 3 N·m (26 in. lbs.).
5. If sunroof glass panel was removed previously, remove the timing pins and install the sunroof glass panel. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)
6. Partially install the headliner and connect the sunroof wiring electrical connectors. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)
7. Temporarily install sunroof switch and perform the sunroof motor teach procedure. (Refer to 23 - BODY/SUNROOF/DRIVE MOTOR - STANDARD PROCEDURE - TEACH PROCEDURE)
8. Test sunroof operation, adjust glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)



9. Complete the headliner installation. (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION)

SEAL-SUNROOF GLASS

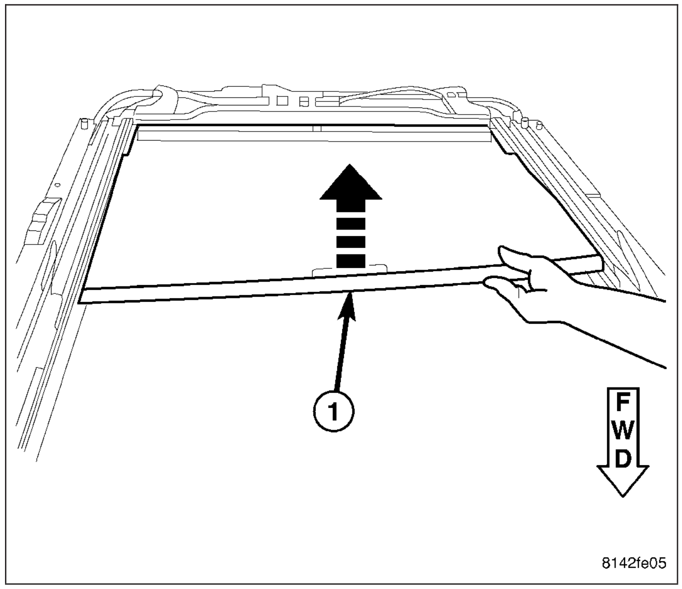
REMOVAL



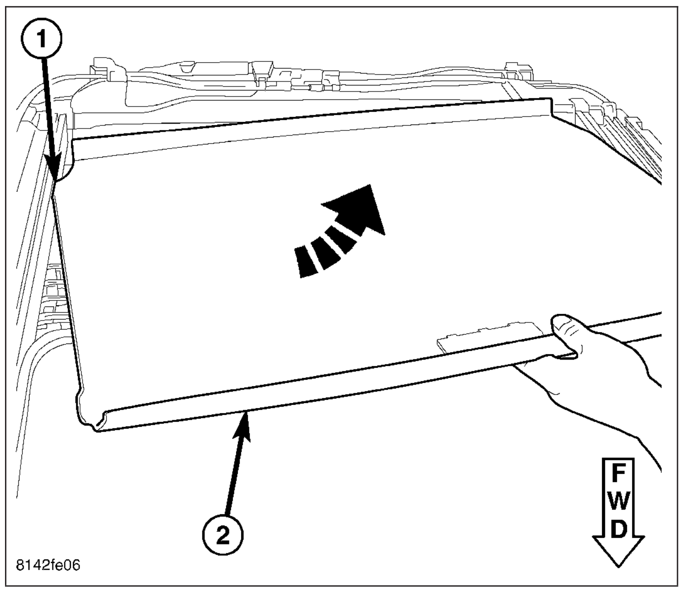
1. Remove sunroof glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL).
2. Place glass panel on clean work area with the top side up. Support the glass assembly from underside to avoid bending or otherwise damaging the mounting tabs.
3. Grasp the seal (1) and pull seal away from the glass panel (2). The seal is a one piece seal.

INSTALLATION

NOTE: Always position seal seam on center of the passenger side of glass panel.



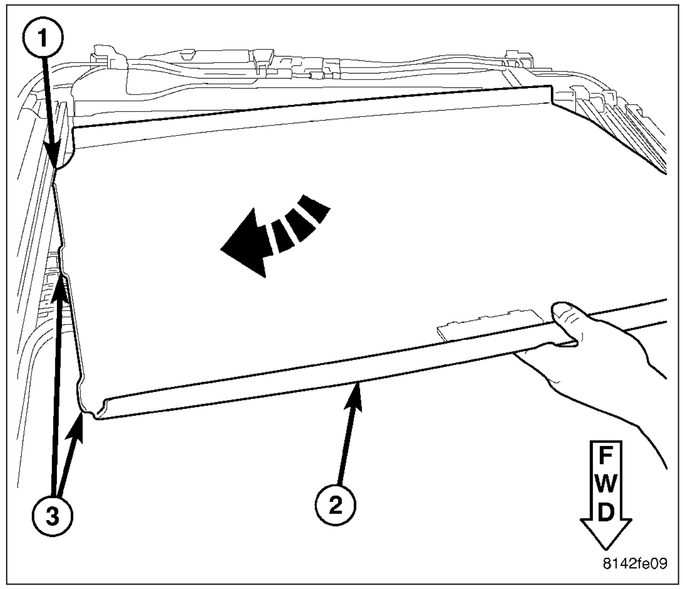
1. Place seal (1) into position.
2. Seat the seal into the glass channel fully. Using care working the seal around the glass (2), being careful not to over stretch the seal while installing.
3. Install the glass panel (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).



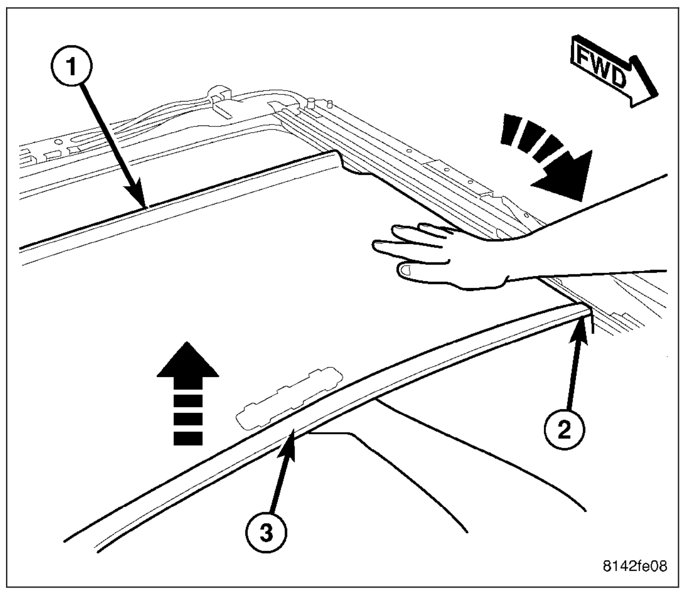
SUNSHADE

REMOVAL

1. Remove the drain trough. (Refer to 23 - BODY/SUNROOF/TROUGH-DRAIN - REMOVAL)
2. Push up the front center of the sunshade (1) to pop out the front two feet.

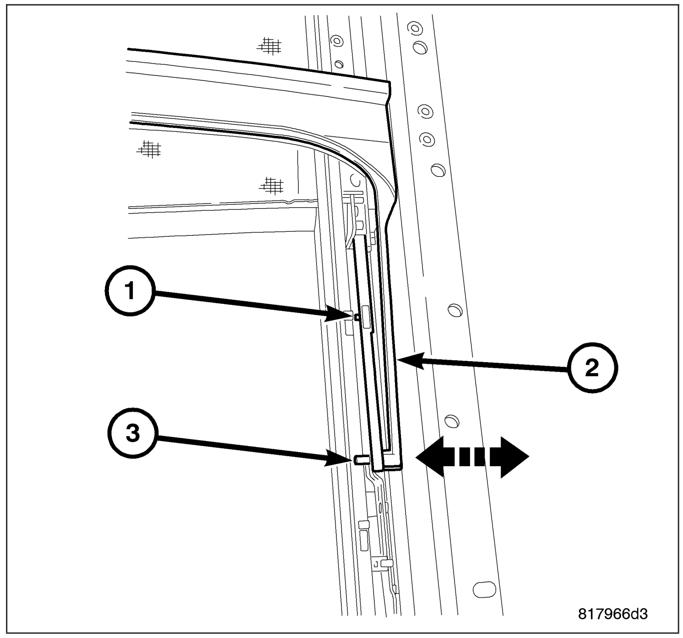


3. Rotate the sunshade (2) so that the other feet (1) are removed from the guide track.

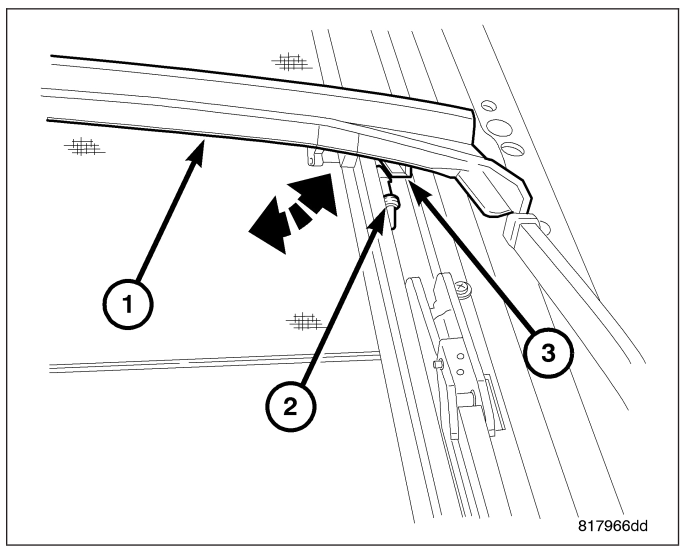


INSTALLATION

1. Verify the sunshade track is free of obstructions like the trim lace/ring.
2. Start with sunshade (2) at an angle with one foot (1) in the track.
3. Rotate the sunshade so the other rear foot is in the track as well as the 2 other feet (3) on the same side as the first foot.



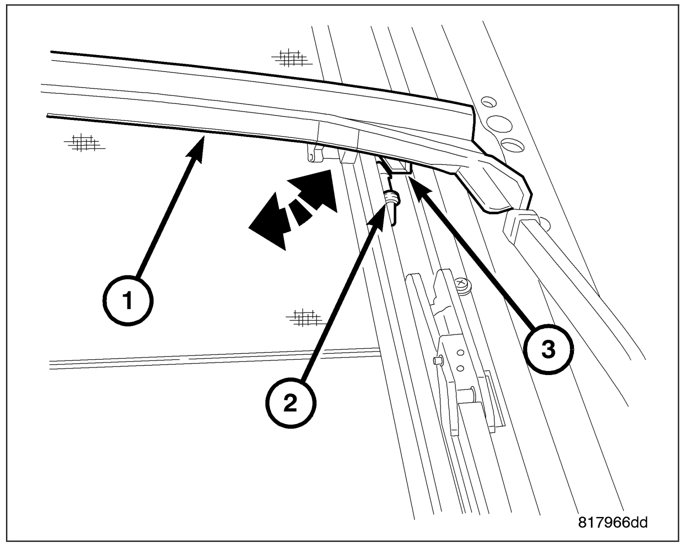
4. To insert the remaining two feet (2) apply force to the middle front of sunshade (3) and guide them into the track.
5. Check that all the feet are in the right track and verify sunshade operation.
6. Install the drain trough. (Refer to 23 - BODY/SUNROOF/TROUGH-DRAIN - INSTALLATION)



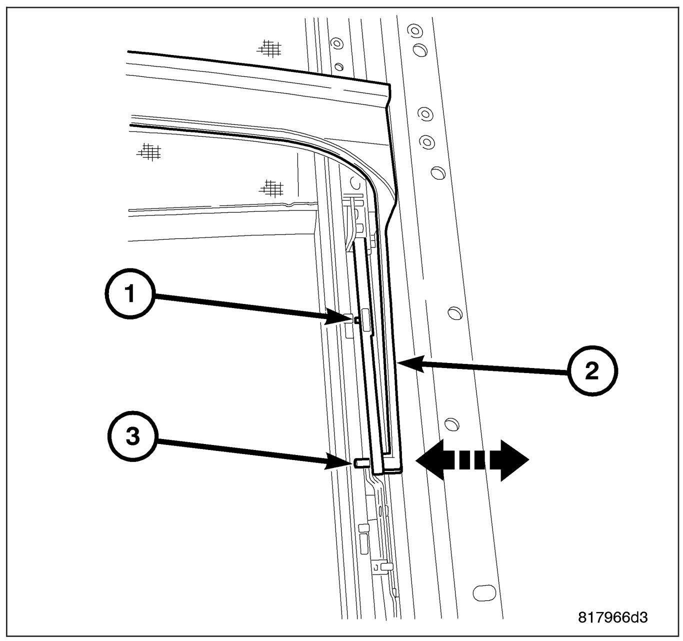
TROUGH

REMOVAL

1. Remove the glass (Refer to 23 - BODY/SUNROOF/GLASS - REMOVAL).
2. Separate the trough pins (3) from the glass lift mechanisms (1).



3. Slide trough (1) to one side and push down on the center of the trough until the guide shoe tab (3) releases from the track (2).
4. Slide the trough in the opposite direction to release the other shoe and lift the trough out of the sunroof opening.



INSTALLATION

1. Insert one of the trough guides (3) and guide shoe (2) into the track.
2. Push down on the center of the trough (1) to flatten it out and install the remaining trough guide (3) and guide shoe (2) into the track.

3. Install the trough guide pins into the glass lift mechanism (3) and seat fully.
4. Install the glass (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION).

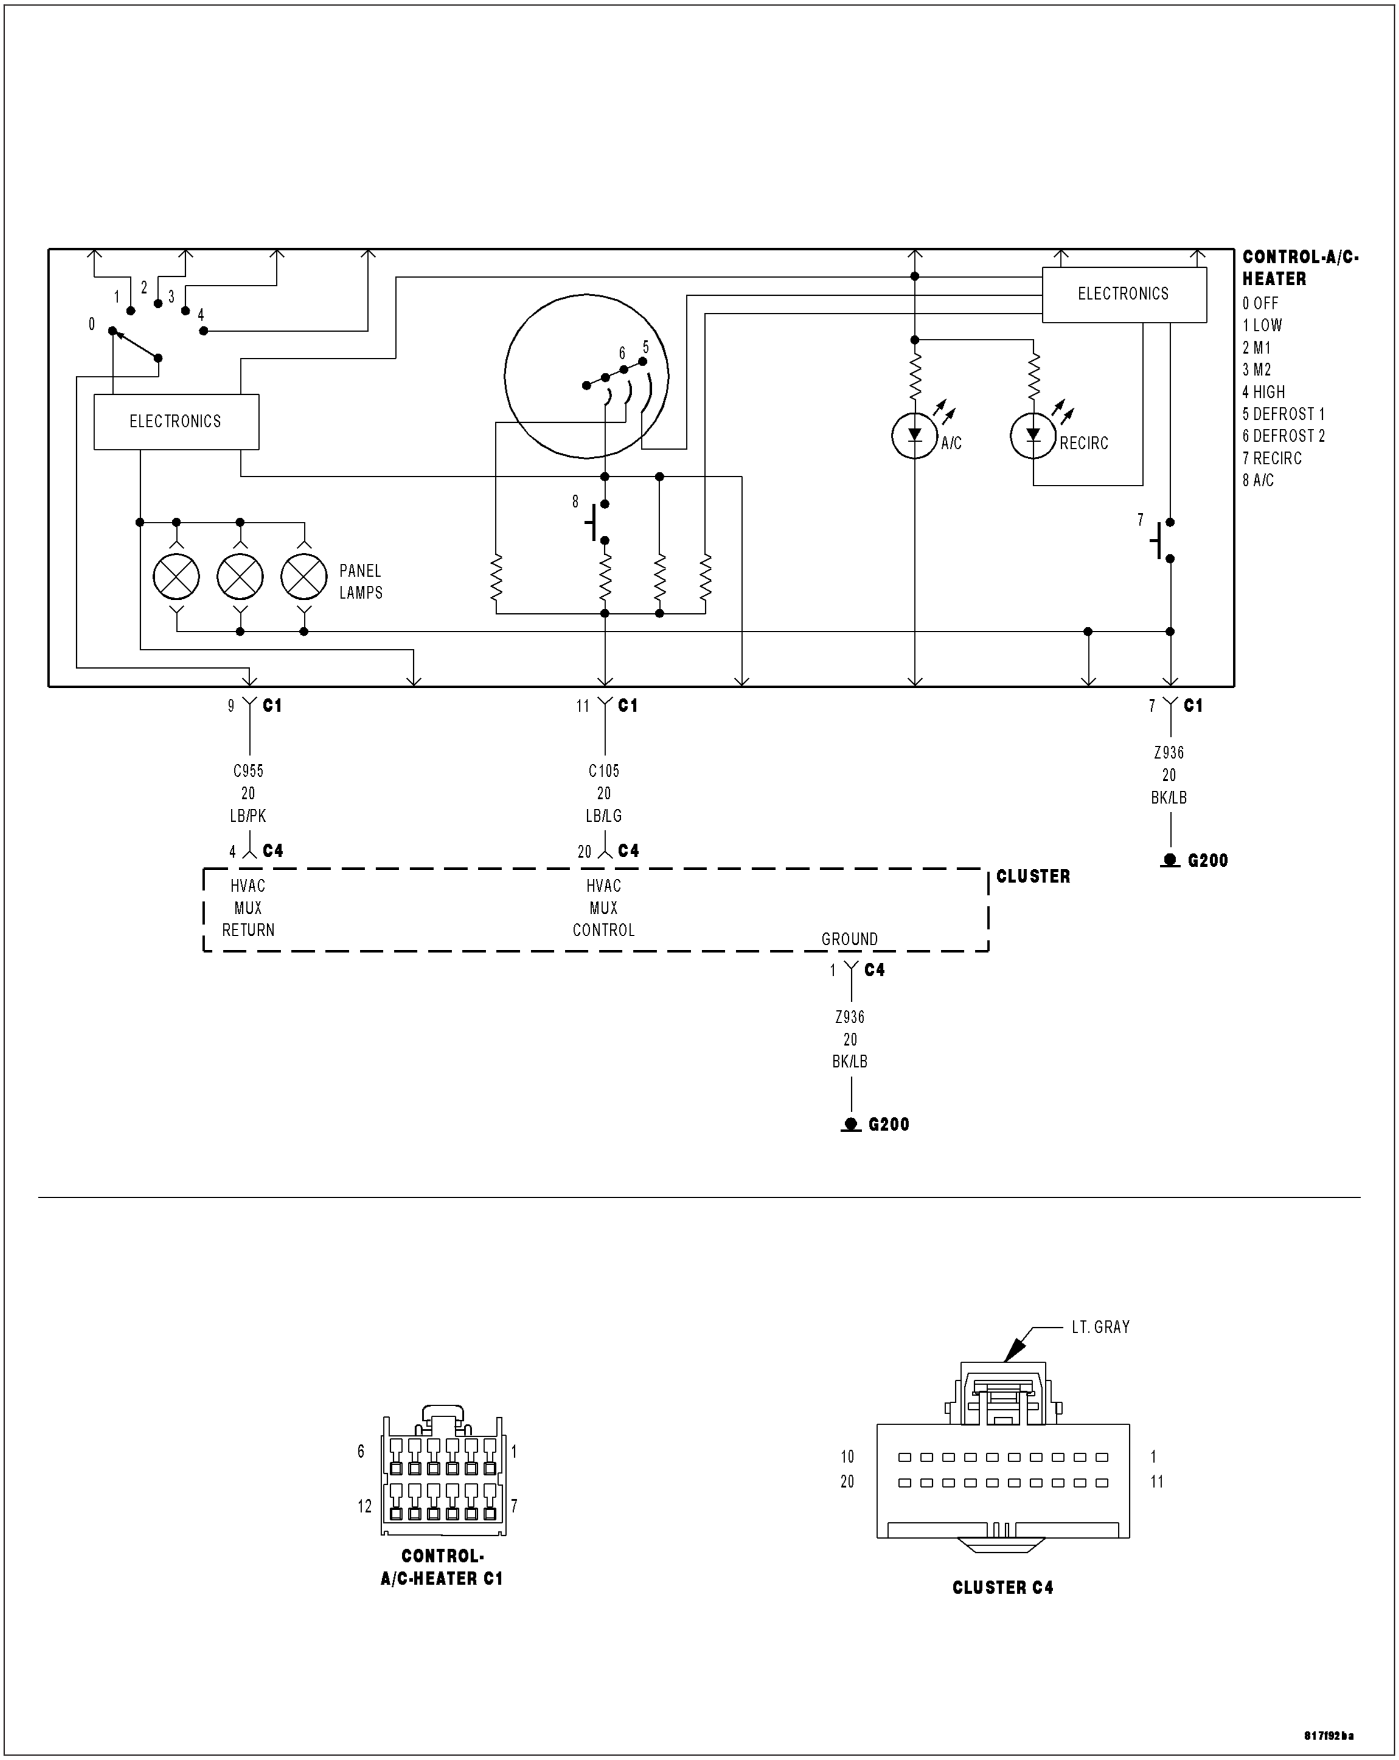
HEATING & AIR CONDITIONING

TABLE OF CONTENTS



HEATING & AIR CONDITIONING ELECTRICAL DIAGNOSTICS

TABLE OF CONTENTS

HEATING & AIR CONDITIONING ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW (CCN)

For a complete wiring diagram **Refer to Section 8W**.

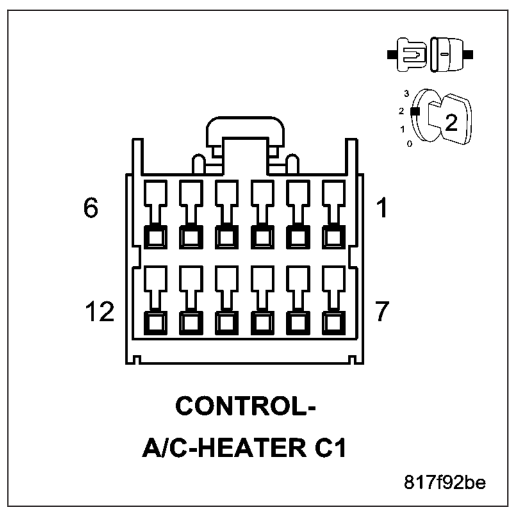
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Instrument Cluster (CCN) detects voltage below 0.55 volts for 10 seconds on the (C105) HVAC MUX Control circuit.

Possible Causes
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO GROUND
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO (Z936) GROUND CIRCUIT
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO (C955) HVAC MUX RETURN CIRCUIT
INSTRUMENT CLUSTER (CCN)
A/C HEATER CONTROL

Diagnostic Test

1. VERIFY DTC B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW IS ACTIVE

Turn the ignition on.
With the scan tool, erase DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read DTCs.



Does the scan tool display active: B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW WITH A/C HEATER CONTROL C1 HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.
Disconnect the A/C Heater Control C1 harness connector.
Turn the ignition on.
With the scan tool, erase DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display: B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW?

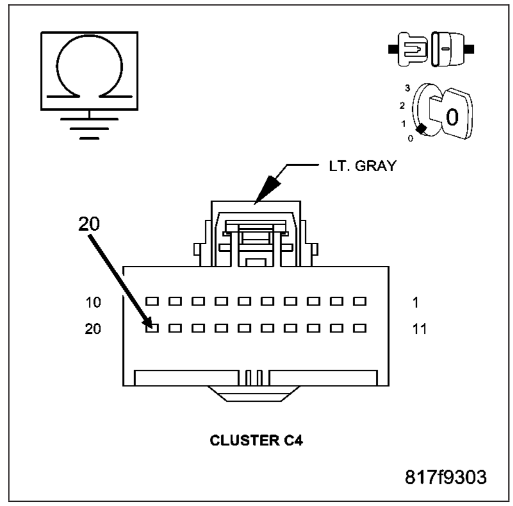
Yes >> Go To 3

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Instrument Cluster C4 harness connector.



Measure the resistance of the (C105) HVAC MUX Control circuit between ground and the A/C Heater Control C4 harness connector.

Does the ohm meter read open circuit?

Yes >> Go To 4

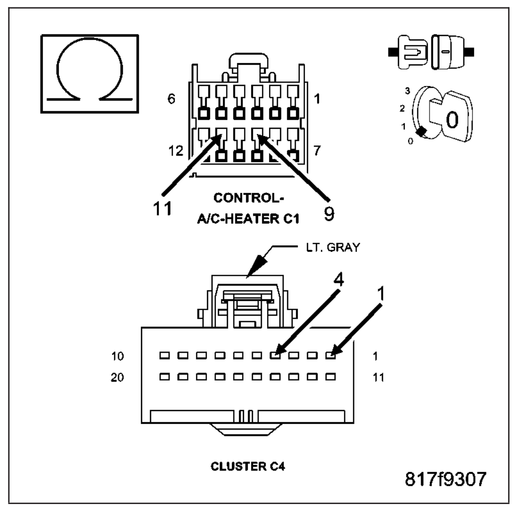
No >> Repair the (C105) HVAC MUX Control circuit for a short to ground.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO THE (Z936) GROUND CIRCUIT & THE (C955) HVAC MUX RETURN CIRCUIT

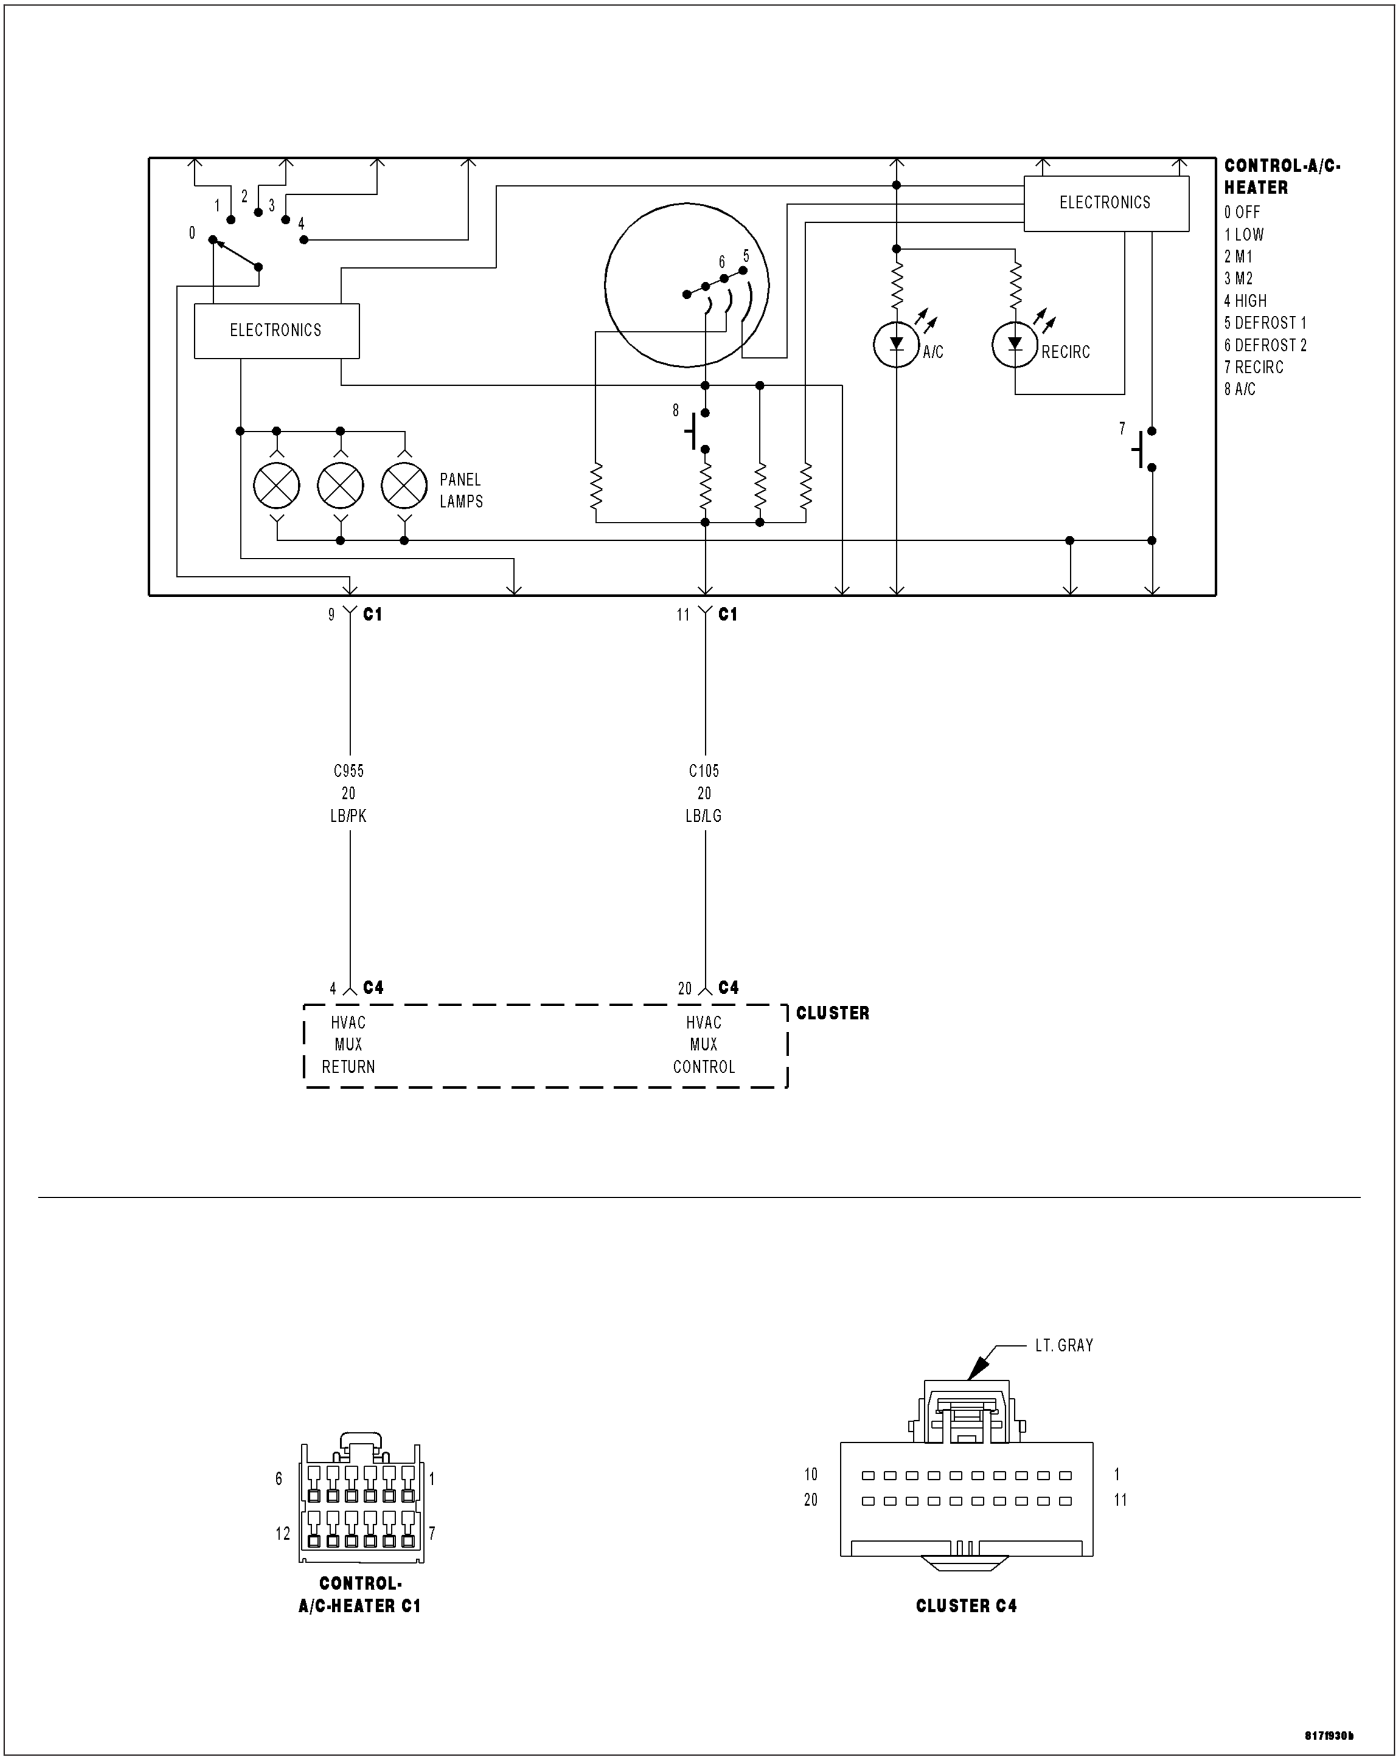
Measure the resistance between the (C105) HVAC MUX Control circuit and the (Z936) Ground circuit in the A/C Heater Control C1 harness connector.

Measure the resistance between the (C105) HVAC MUX Control circuit and the (C955) HVAC MUX Return circuit in the A/C Heater Control C1 and C4 harness connectors.



Does the ohm meter read open circuit?

Yes >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.



Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair any circuits that are shorted to the (C105) HVAC MUX Control circuit.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B1002–A/C SWITCH REQUEST INPUT CIRCUIT HIGH (CCN)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Instrument Cluster (CCN) detects voltage above 4.5 volts for 10 seconds on the (C105) HVAC MUX Control circuit.

Possible Causes
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO VOLTAGE
(C105) HVAC MUX CONTROL CIRCUIT OPEN
(C955) HVAC MUX RETURN CIRCUIT OPEN
A/C HEATER CONTROL
INSTRUMENT CLUSTER (CCN)

Diagnostic Test

1. VERIFY DTC B1002–A/C SWITCH REQUEST INPUT CIRCUIT HIGH IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

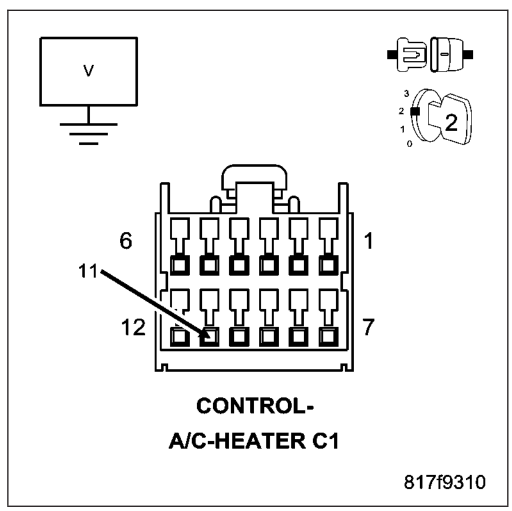
With the scan tool, read DTCs.

Does the scan tool display active: B1002–A/C SWITCH REQUEST INPUT CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



2. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT VOLTAGE AT A/C HEATER CONTROL C1 HARNESS CONNECTOR

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

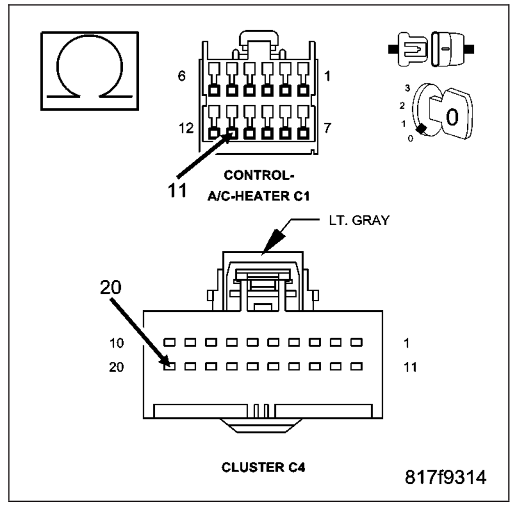
Turn the ignition on.

Measure the voltage of the (C105) HVAC MUX Control circuit.

What is the voltage?

Below 4.8 Volts
Go To 3

4.8 to 5.2 Volts
Go To 4



Above 5.2 Volts
Go To 6

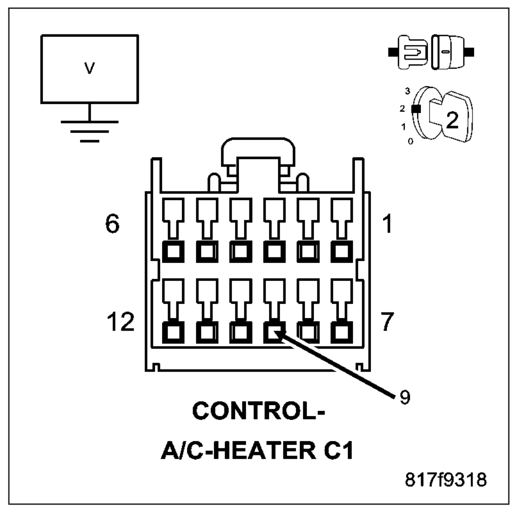
3. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the Instrument Cluster (CCN) C4 harness connector.

Measure the resistance of the (C105) HVAC MUX Control circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C4 harness connector.

Does the ohm meter read open circuit?



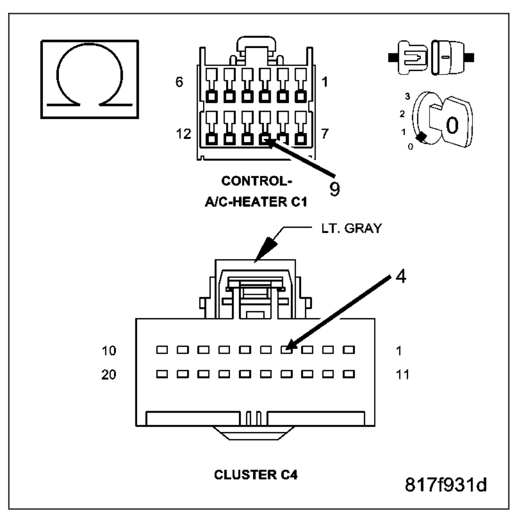
Yes >> Repair the (C105) HVAC MUX Control circuit for an open.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK THE (C955) HVAC MUX RETURN CIRCUIT OPERATION

Turn the ignition on.

Using a volt meter, measure the voltage of the (C955) HVAC MUX Return circuit in the A/C Heater Control C1 harness connector.



Does the volt meter read above 4.5 volts?

Yes >> Replace the A/C-Heater Control in accordance with the Service Information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 5

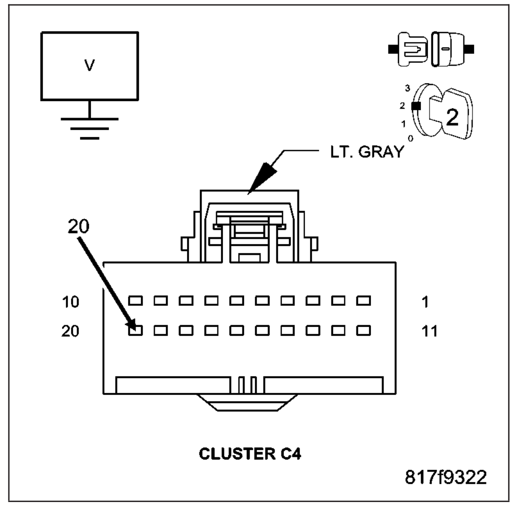
5. CHECK THE (C955) HVAC MUX RETURN CIRCUIT FOR AN OPEN

Measure the resistance of the (C955) HVAC MUX Return circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C4 harness connector.

Does the ohm meter read open circuit?

Yes >> Repair the (C955) HVAC MUX Return circuit for an open.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Instrument Cluster in accordance with the Service Information.
Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



6. CHECK THE (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Instrument Cluster C4 harness connector.

Turn the ignition on.

Measure the voltage of the (C105) HVAC MUX Control circuit.

Is the voltage above 1.0 volts?

Yes >> Repair the (C105) HVAC MUX Control circuit for a short to voltage.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10C1–A/C SELECT SWITCH STUCK (CCN)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Instrument Cluster (CCN) detects that the A/C mode switch stays in a pushed position for more than 5 seconds.

Possible Causes
DTC B1001 OR B1002 ACTIVE IN THE CCN
OBJECT HOLDING A/C MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING A/C MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. CHECK FOR ACTIVE DTC B1001 OR B1002 IN THE CCN

Turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B1001 or B1002?

Yes >> Diagnose and repair the DTC. Refer to the Table of Contents in this Section.

No >> Go To 2

2. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Turn the ignition off.

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Go To 3

3. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE A/C MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the A/C mode switch to stay or stick in a pushed position.

Is anything present that would cause the A/C mode switch to stay or stick in a pushed position?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Go To 4

4. CHECK THE A/C MODE SWITCH AND STATUS INDICATOR FUNCTION

Start the engine.
Turn the blower control on.
Press the A/C mode switch on and off several times while observing the A/C status indicator.

Does the A/C status indicator turn on and off?

Yes >> Go To 5

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

5. VERIFY THAT DTC B10C1–A/C SELECT SWITCH STUCK IS STILL ACTIVE

Turn the ignition on.
With the scan tool, erase DTCs.
Turn the ignition off, wait 10 seconds, and turn the ignition on.
With the scan tool, read DTCs.

Does the scan tool display active: B10C1–A/C SELECT SWITCH STUCK?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

No >> Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (CCN)

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The switch input changes when the switch is pushed down. A stored DTC B1016 indicates that the Electronic Back Light (EBL) mode switch was stuck in a pushed position for more than 10 minutes, but has since returned to its normal state. An active DTC B1016 indicates that the EBL mode switch is stuck in a pushed position. An active DTC B1016 will prevent proper EBL mode switch and status indicator function.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the EBL mode switch stays in a pushed position for more than 10 minutes.

Possible Causes
OBJECT HOLDING ELECTRONIC BACK LIGHT (EBL) MODE SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING EBL MODE SWITCH TO GET STUCK IN A PUSHED POSITION
A/C HEATER CONTROL

Diagnostic Test

1. INSPECT THE A/C HEATER CONTROL FOR DAMAGE

Inspect the A/C Heater Control for damage.

Is the A/C Heater Control damaged?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 2

2. INSPECT FOR OBJECT OR SUBSTANCE CAUSING THE EBL MODE SWITCH TO STAY OR STICK IN A PUSHED POSITION

Inspect the A/C Heater Control for anything that would cause the EBL mode switch to stay or stick in a pushed position.

Is anything present that would cause the EBL mode switch to stay or stick in a pushed position?

Yes >> Repair as necessary.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECK FOR NORMAL EBL MODE SWITCH AND STATUS INDICATOR FUNCTION

Turn the ignition on.

Press the EBL mode switch on and off several times while observing the EBL status indicator.

Does the EBL status indicator turn on and off?

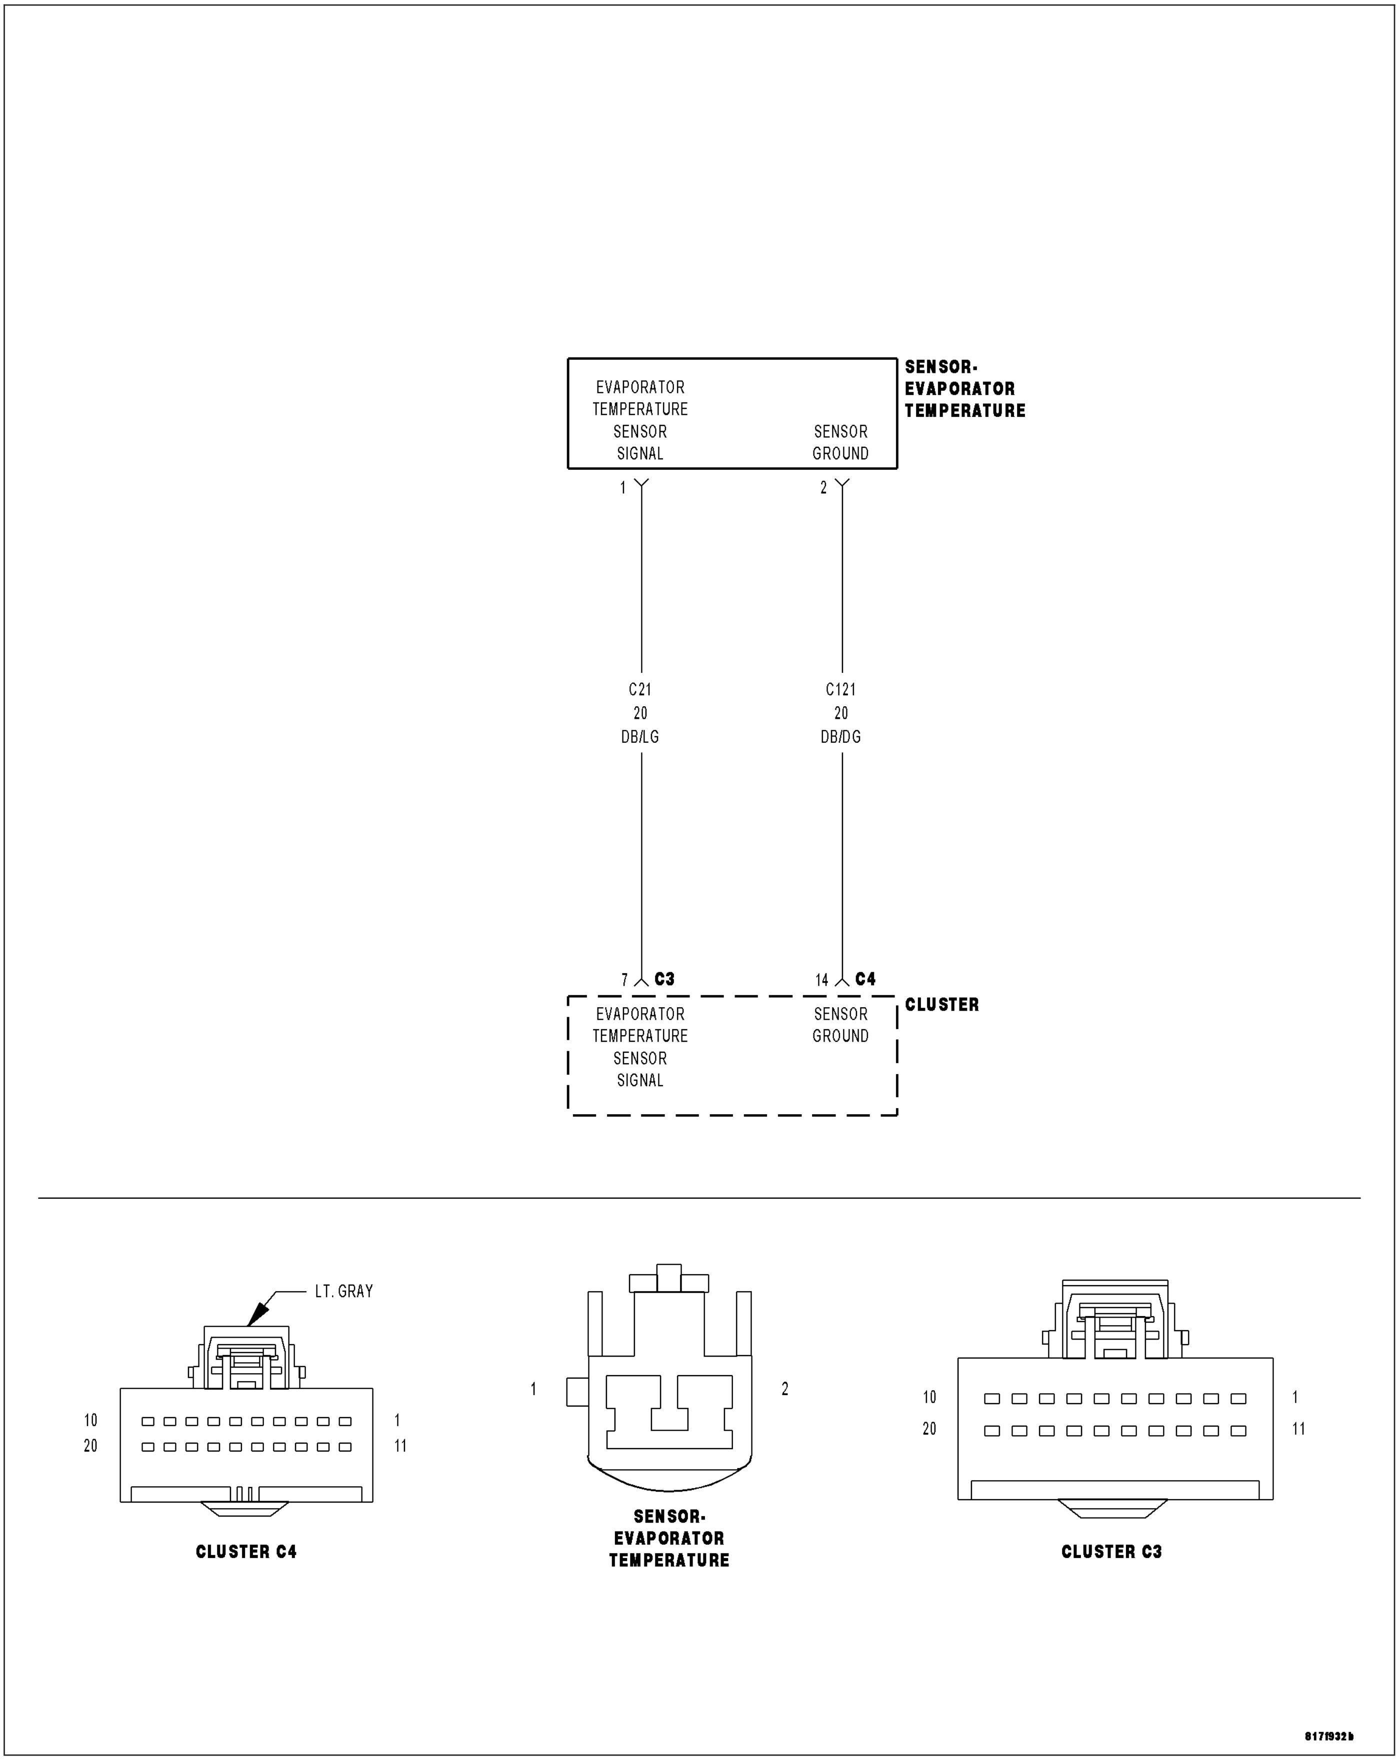
Yes >> Go To 4

No >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

4. VERIFY THAT DTC B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW IS STILL ACTIVE

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on. Wait 10 minutes before proceeding.



With the scan tool, read DTCs.

Does the scan tool display active: B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW?

Yes >> Replace the A/C Heater Control in accordance with the Service Information.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (CCN)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT
EVAPORATOR TEMPERATURE SENSOR
INSTRUMENT CLUSTER (CCN)

NOTE: This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW WITH EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.

Disconnect the Evaporator Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display: B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW?

Yes >> Go To 2

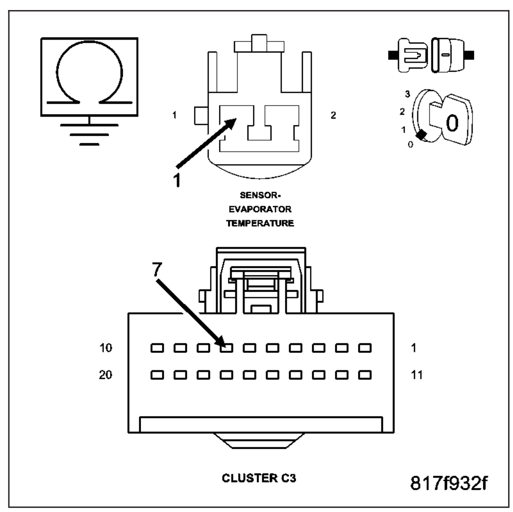
No >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND

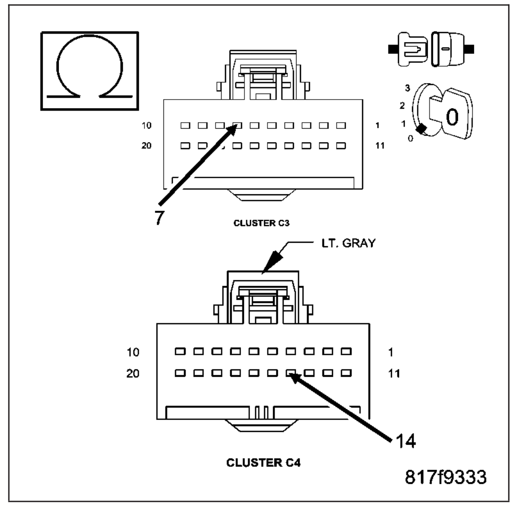
Turn the ignition off.

Disconnect the Cluster (CCN) C3 harness connector.



Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the Cluster (CCN) C3 harness connector.

Does the ohm meter read open circuit?



Yes >> Go To 3

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

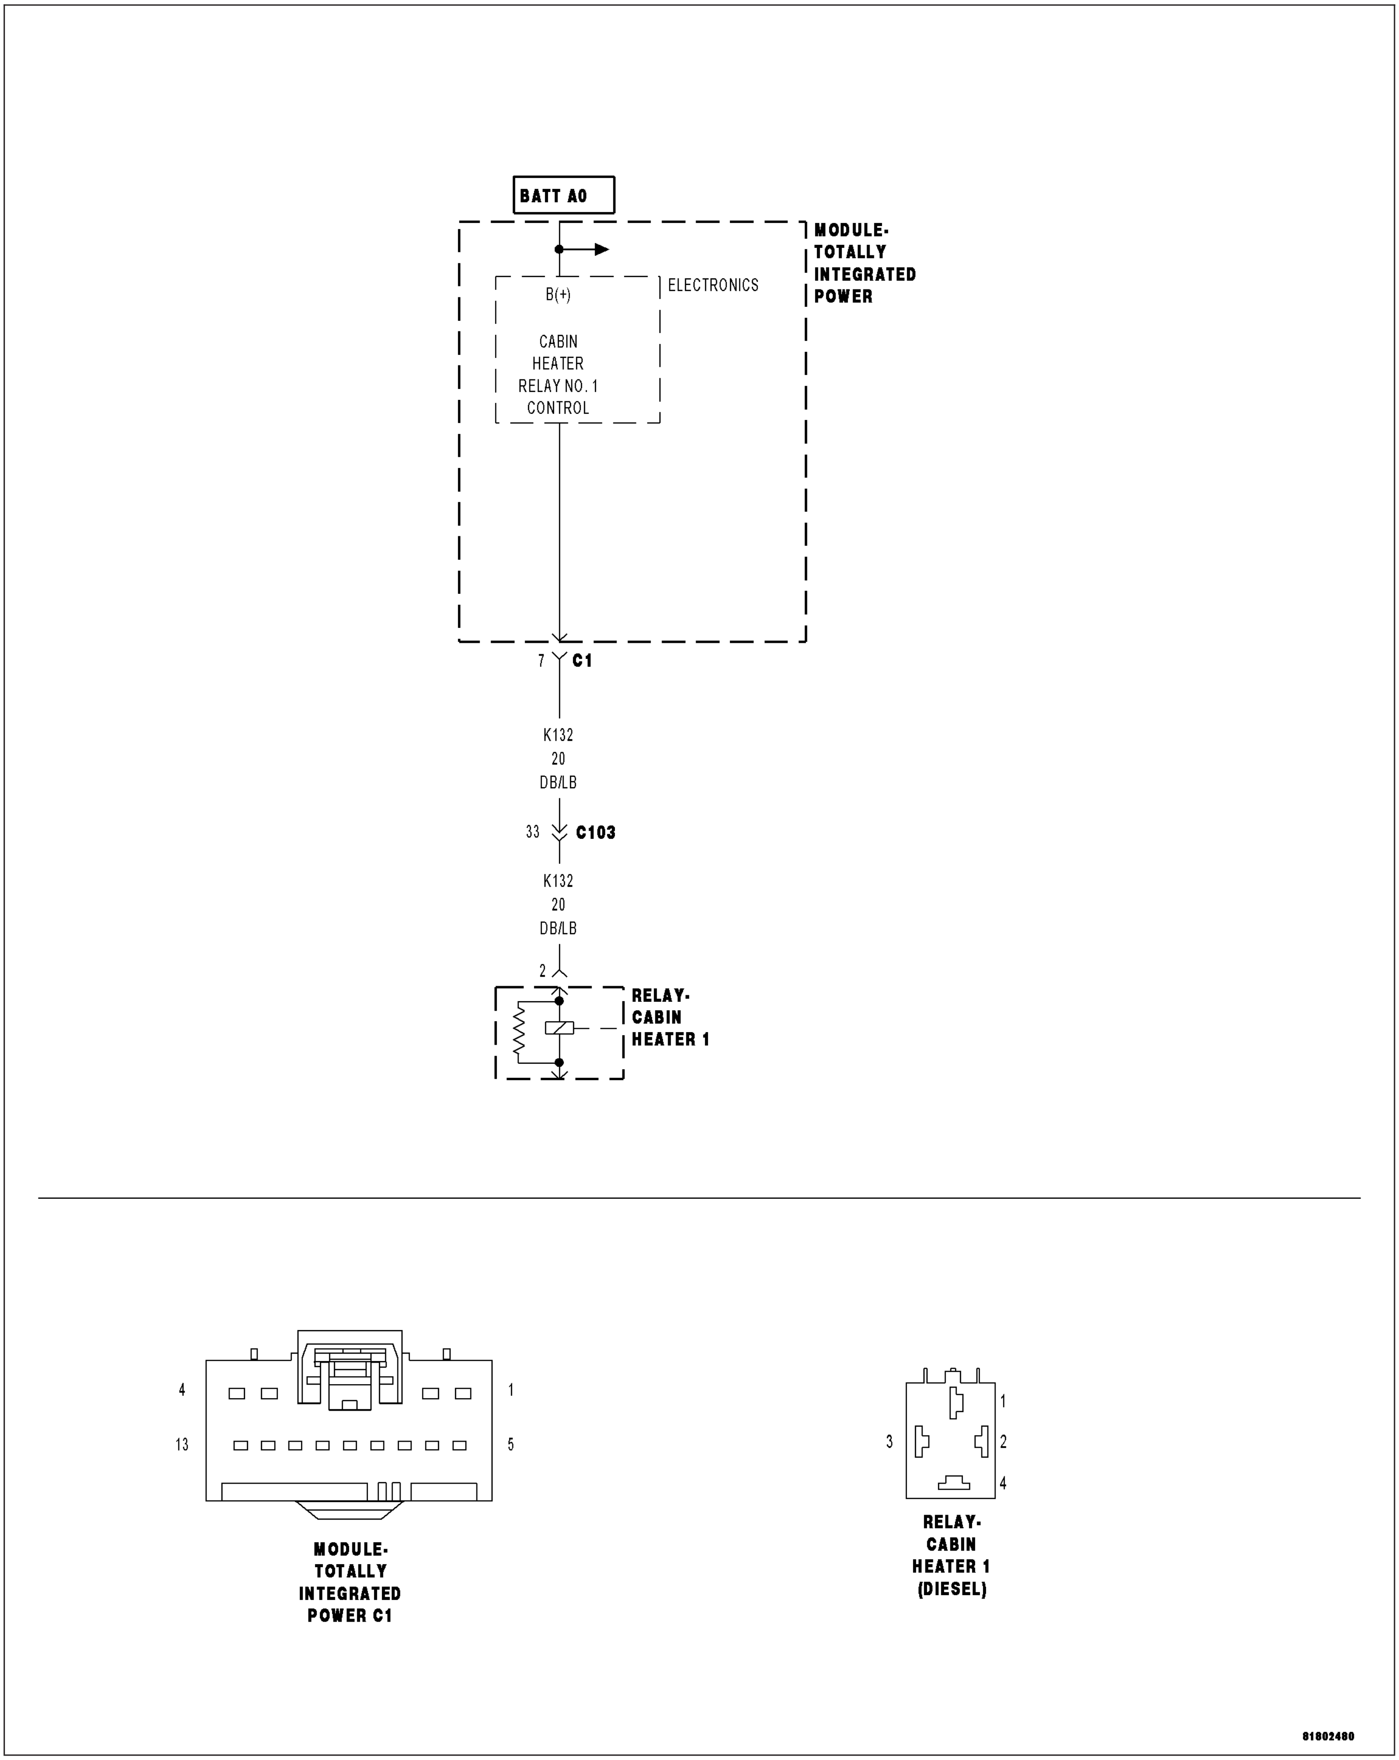
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND CIRCUIT

Disconnect the Cluster (CCN) C4 harness connector.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit in the Cluster (CCN) C4 harness connector and the (C121) Sensor Ground circuit in the Cluster (CCN) C3 harness connector.

Does the ohm meter read open circuit?



Yes >> Replace the Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10B4–CABIN HEATER 1 CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, the Cabin Heater Relay 1 commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module detects the (K132) Cabin Heater Relay 1 Control circuit is shorted to ground.

Possible Causes
(K132) CABIN HEATER RELAY 1 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 1 RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 1 Relay.

Monitor the scan tool for at least two minutes.

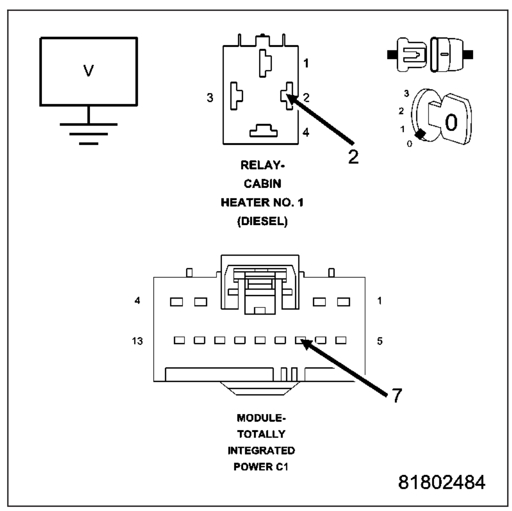
With the scan tool, read DTCs.

Does the scan tool display active: B10B4–CABIN HEATER 1 CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).



2. CHECK (K132) CABIN HEATER RELAY 1 OUTPUT CIRCUIT FOR SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 1.

Using an ohm meter measure the resistance between the (K132) Cabin Heater Relay 1 Output circuit and ground.

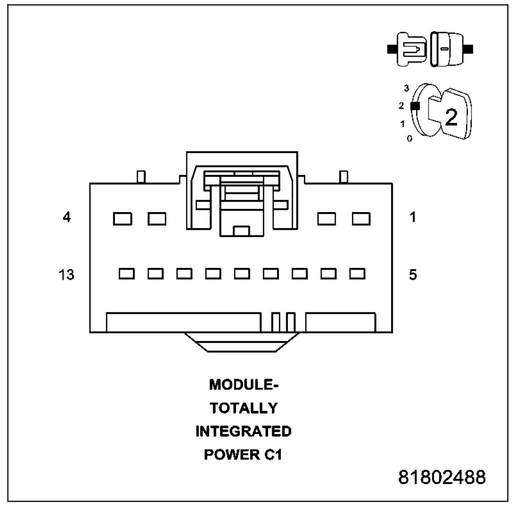
Does the ohm meter read open circuit?

Yes >> Go To 3

No >> Repair the (K132) Cabin Heater Relay 1 Output circuit for a short to ground.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

3. TOTALLY INTEGRATED POWER MODULE (TIPM)



Turn the ignition on.

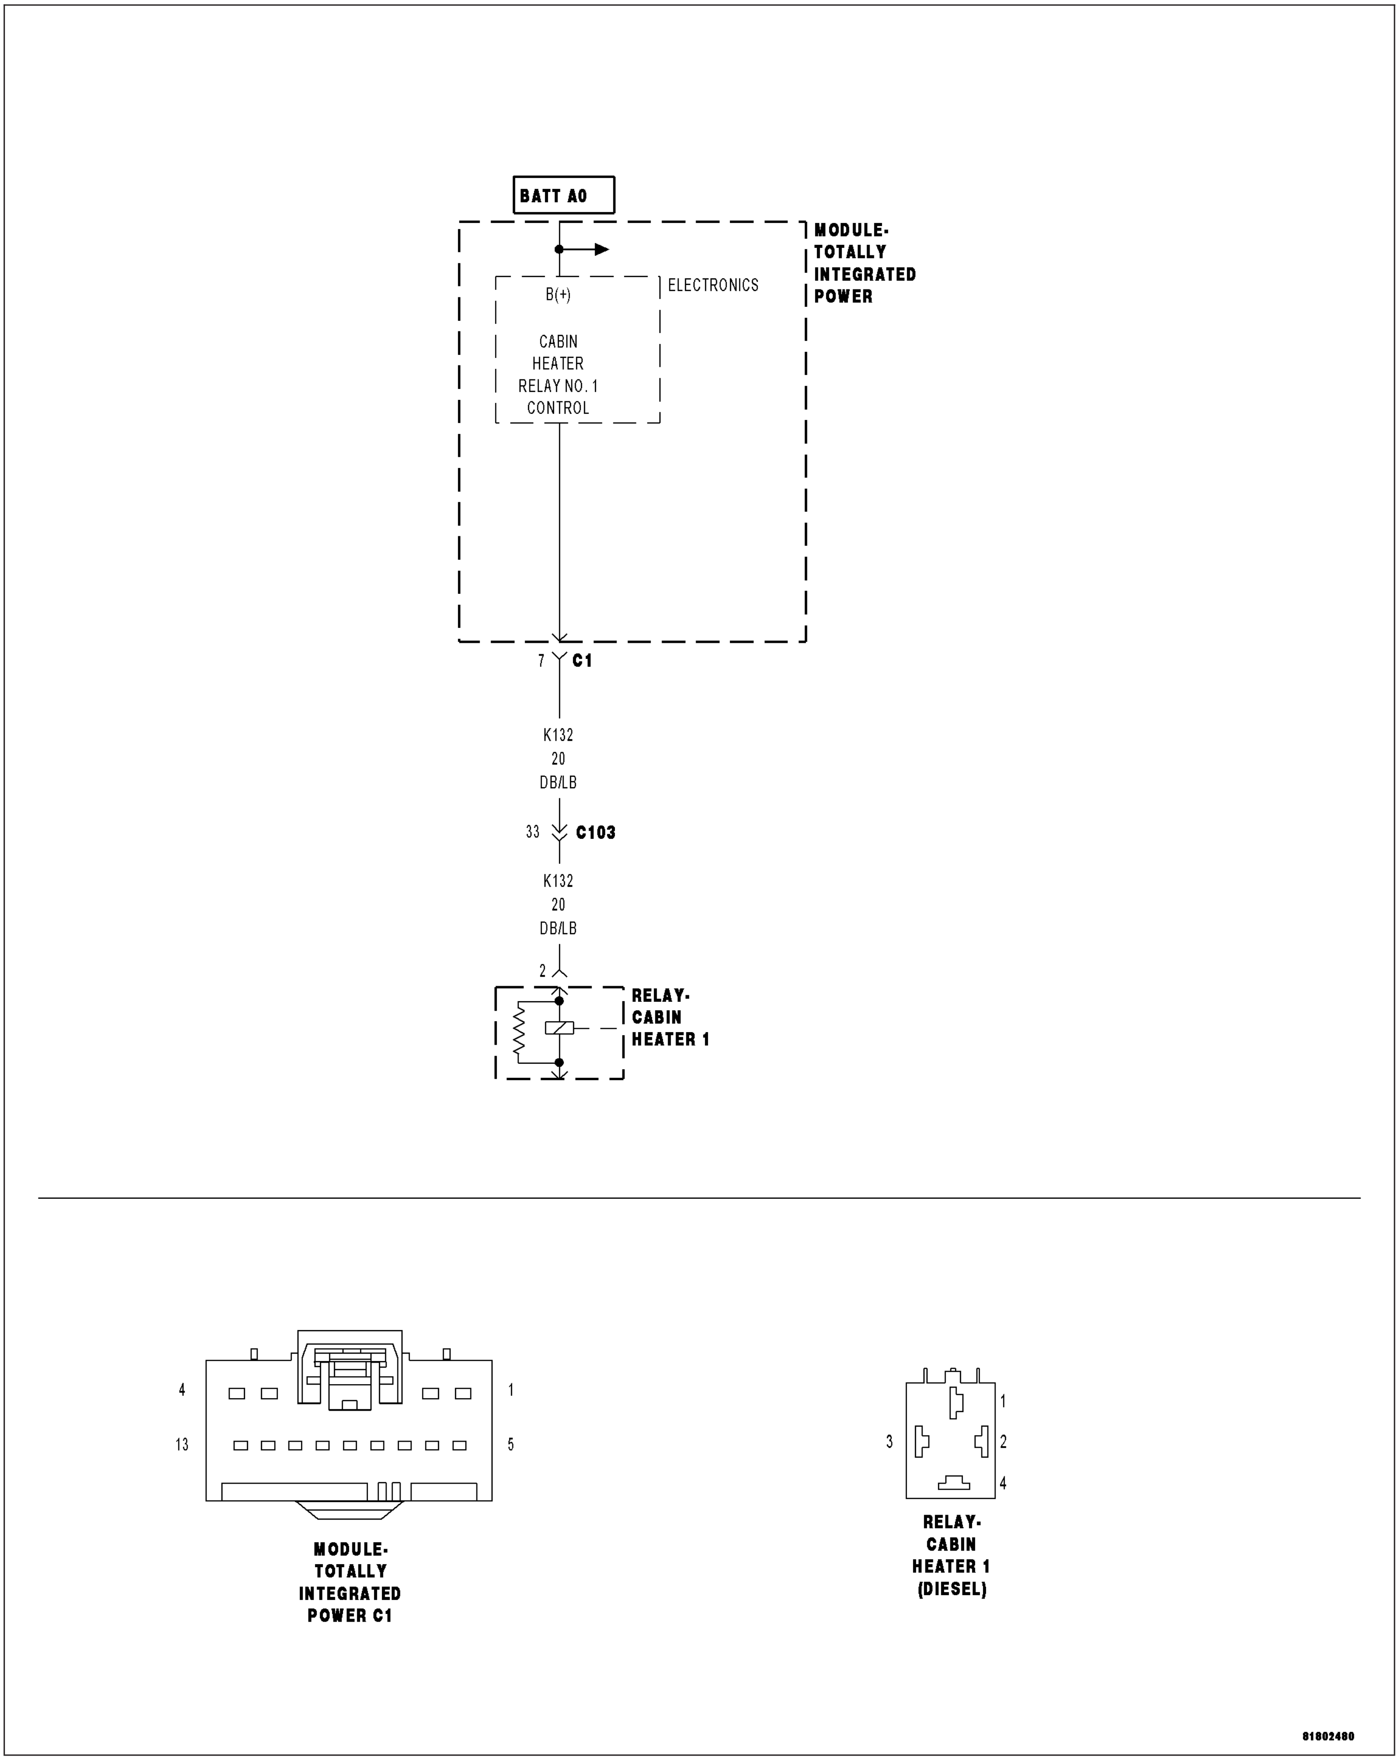
With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 1 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B4–CABIN HEATER 1 CONTROL CIRCUIT LOW?



Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 1 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10B5–CABIN HEATER 1 CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, the Cabin Heater Relay 1 is commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module detects a short to voltage on the (K132) Cabin Heater Relay 1 Control circuit.

Possible Causes
(K132) CABIN HEATER RELAY 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
CABIN HEATER RELAY 1
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 1 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

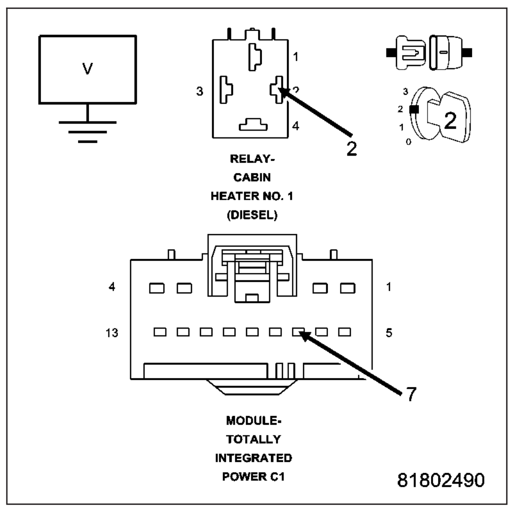
Does the scan tool display active: B10B5–CABIN HEATER 1 CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

2. CHECK THE (K132) CABIN HEATER RELAY 1 CONTROL CIRCUIT FOR SHORT TO VOLTAGE



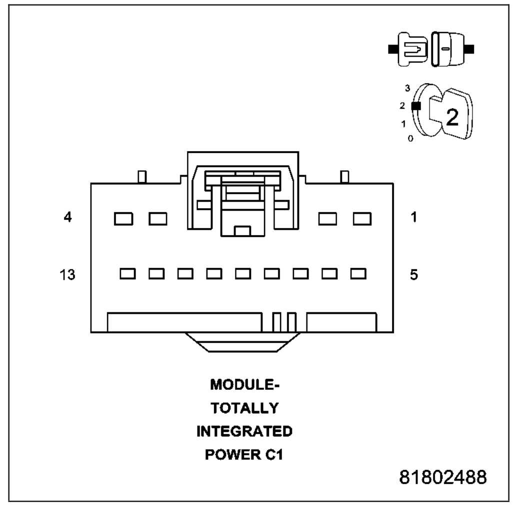
Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 1.

Turn the ignition on.

With a volt meter, measure the voltage on the (K132) Cabin Heater Relay 1 Control circuit.



Does the volt meter read 1.0 volt or above?

Yes >> Repair short to voltage on the (K132) Cabin Heater Relay 1 Control circuit.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. TOTALLY INTEGRATED POWER MODULE

Turn the ignition on.

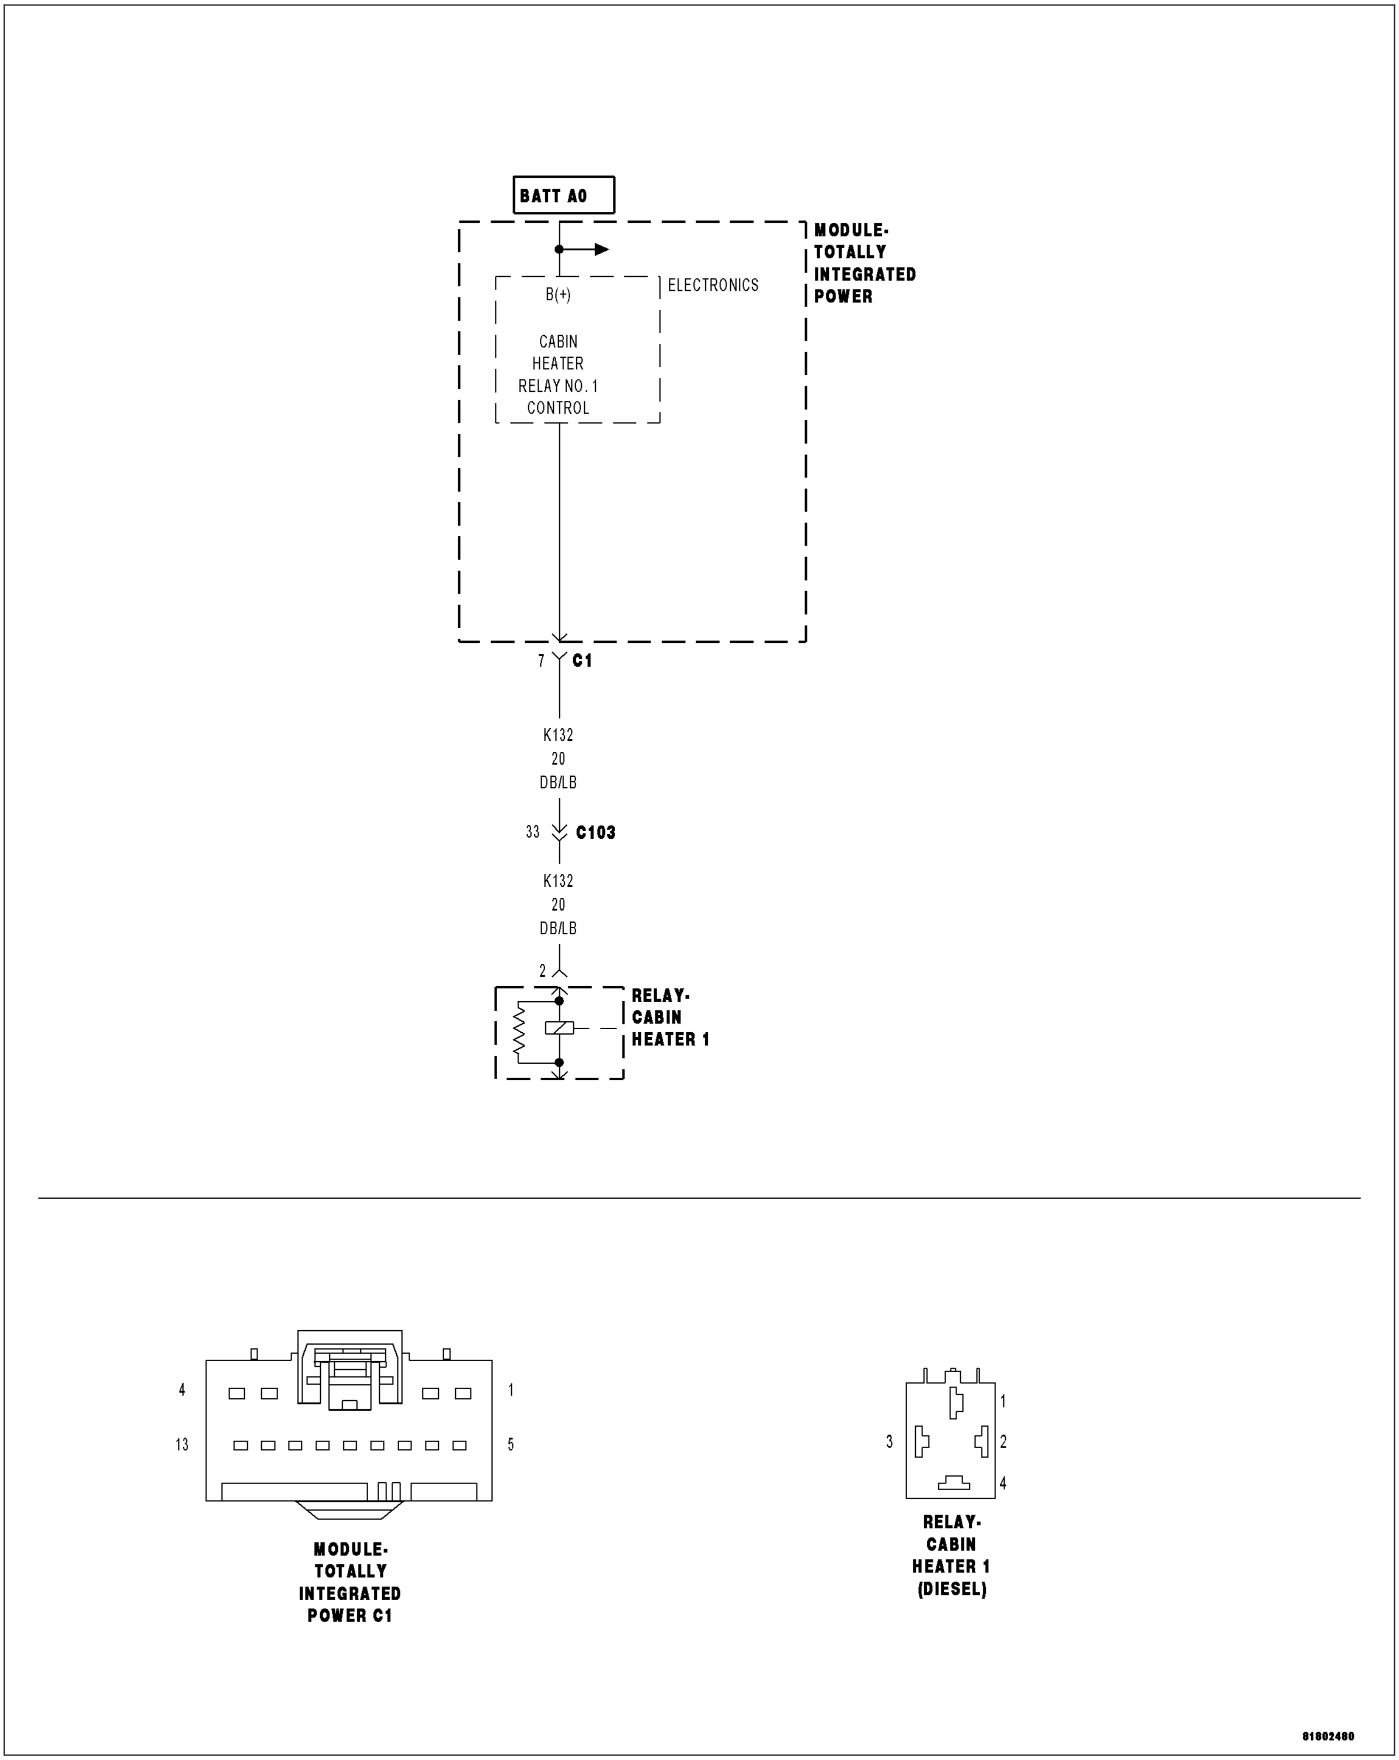
With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 1 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B5–CABIN HEATER 1 CONTROL CIRCUIT HIGH?



Yes >> Replace the Totally Integrated Power Module (TIPM in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 1 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10B6–CABIN HEATER 1 CONTROL CIRCUIT OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, and the Cabin Heater Relay 1 commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects that the (K132) Cabin Heater Relay 1 Control circuit is open.

Possible Causes
(K132) CABIN HEATER RELAY 1 OUTPUT CIRCUIT OPEN
CABIN HEATER RELAY 1
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater Relay 1.

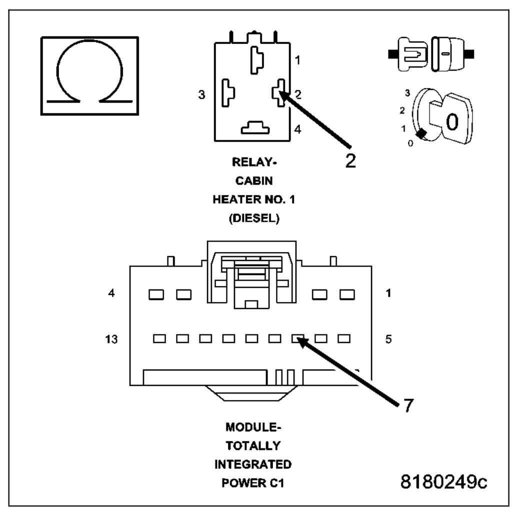
Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B6–CABIN HEATER 1 CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.



2. CHECK (K132) CABIN HEATER RELAY 1 CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 1.

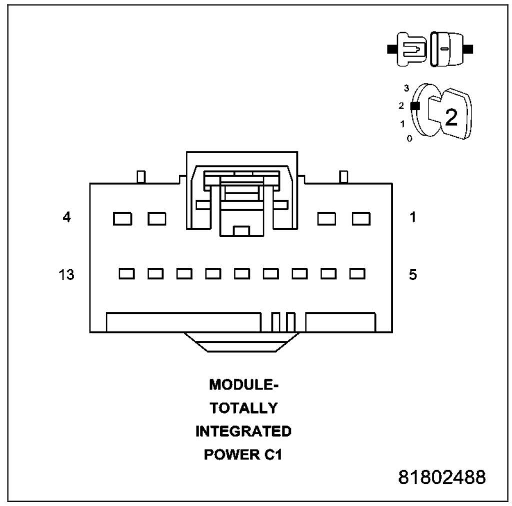
Using an ohm meter, measure the resistance of the (K132) Cabin Heater Relay 1 Control circuit between the TIPM C1 harness connector, and the Cabin Heater Relay 1 harness connector.

Does the ohm meter read open circuit?

Yes >> Repair the (K132) Cabin Heater Relay 1 Control circuit for an open.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3



3. TOTALLY INTEGRATED POWER MODULE

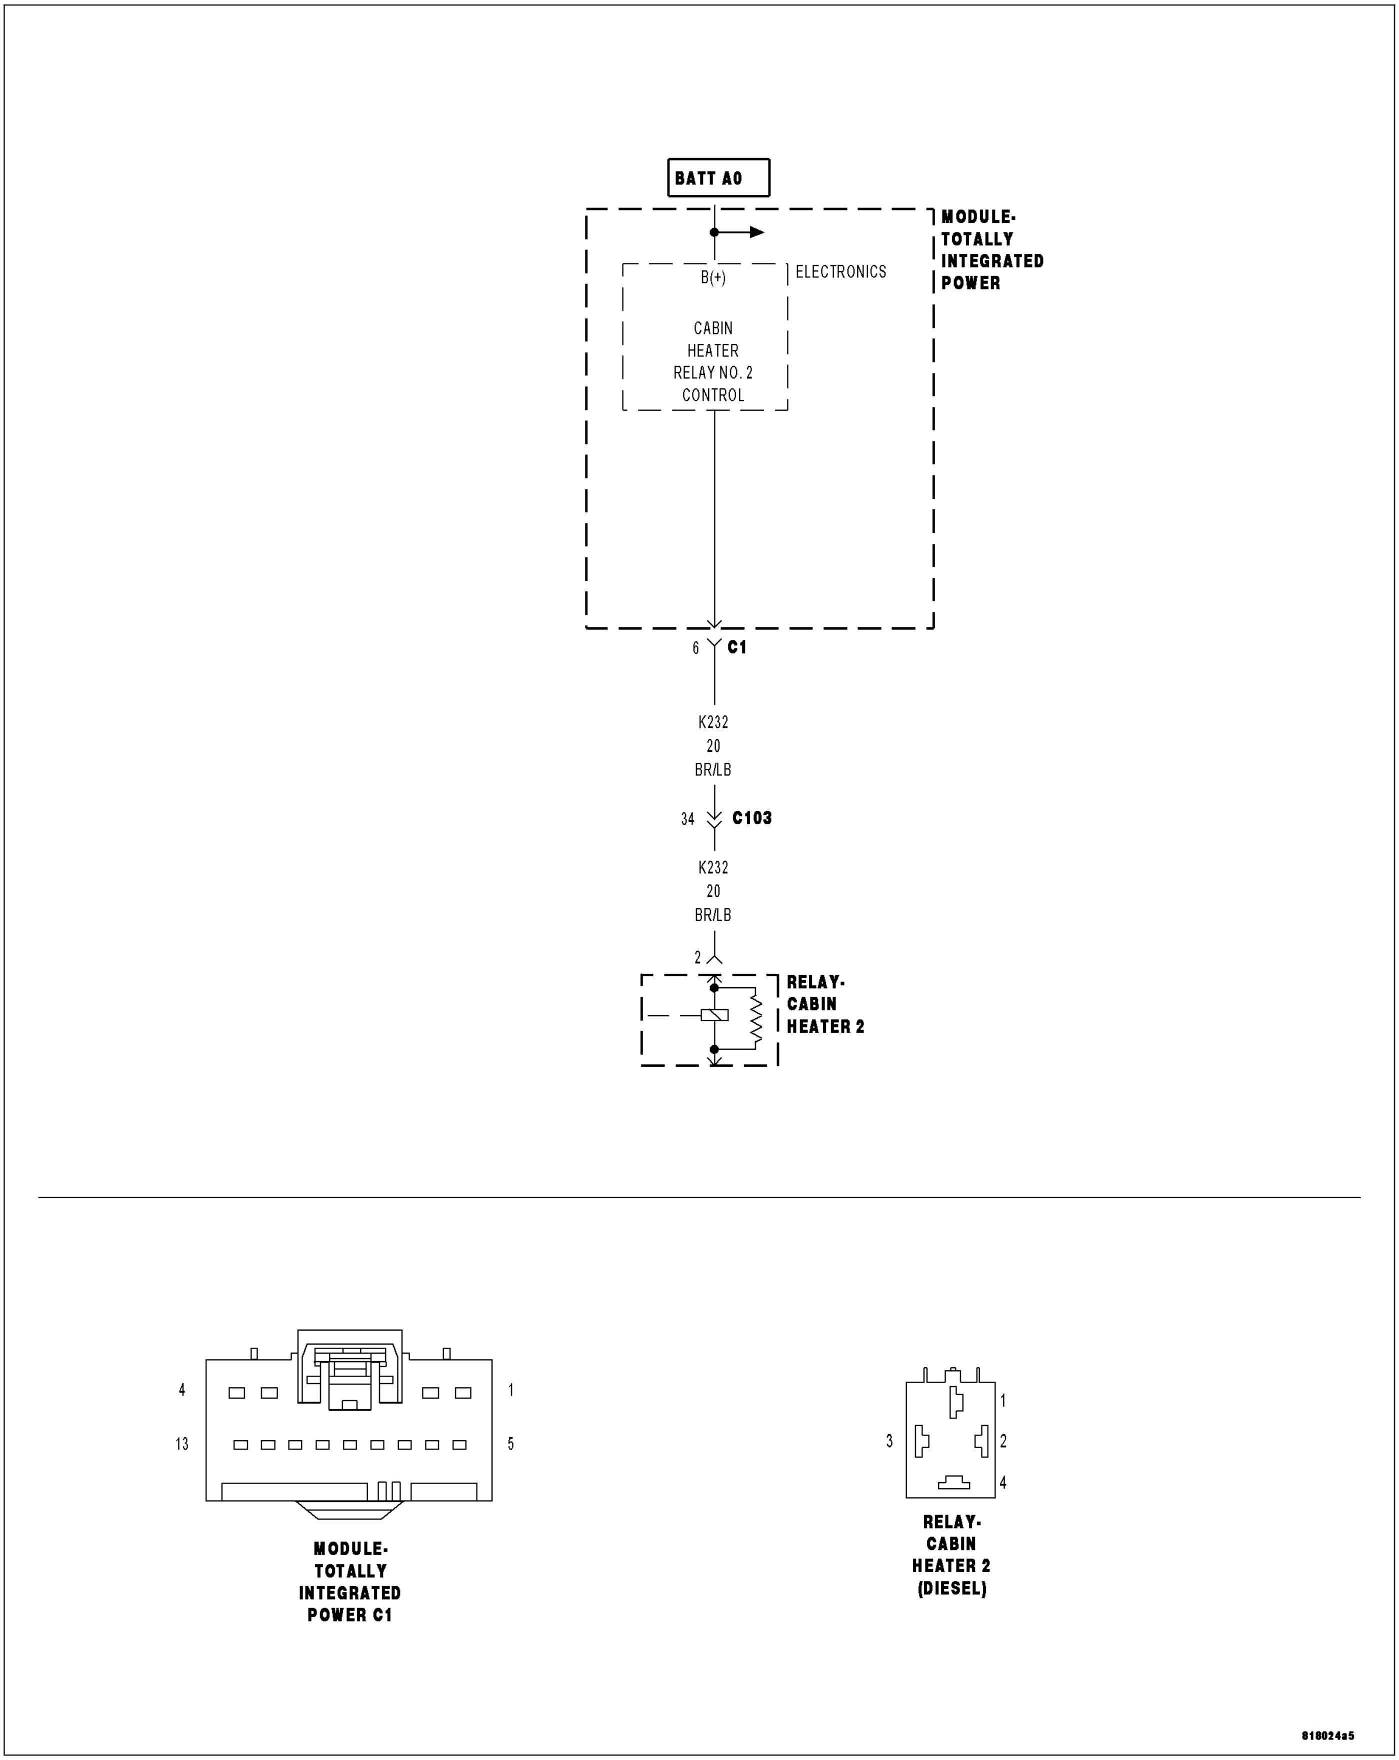
Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater Relay 1.

With the scan tool, read DTCs.

Does the scan tool display active: B10B6–CABIN HEATER 1 CONTROL CIRCUIT OPEN?



Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 1 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10B8–CABIN HEATER 2 CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, the Cabin Heater Relay 2 commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module detects the (K232) Cabin Heater Relay 2 Control circuit is shorted to ground.

Possible Causes
(K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 2 RELAY
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool, for at least two minutes.

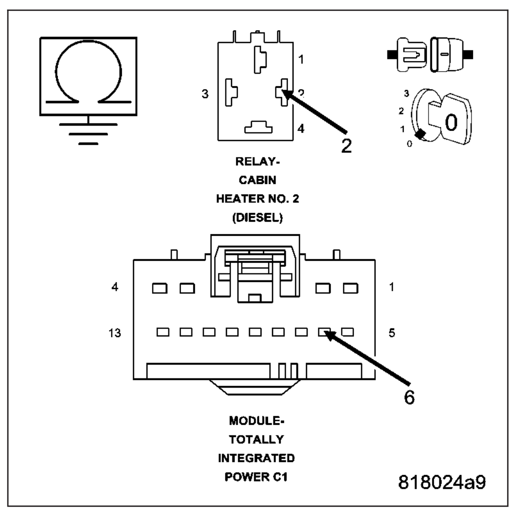
With the scan tool, read DTCs.

Does the scan tool, display active: B10B8–CABIN HEATER 2 CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).



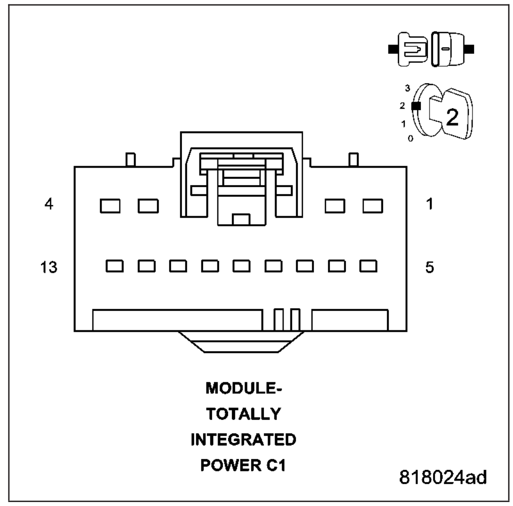
2. CHECK (K232) CABIN HEATER RELAY 2 OUTPUT CIRCUIT FOR SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 2.

Using an ohm meter measure the resistance between the (K232) Cabin Heater Relay 2 Output circuit and ground.



Does the ohm meter read open circuit?

Yes >> Go To 3

No >> Repair the (K232) Cabin Heater Relay 2 Output circuit for a short to ground.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

3. TOTALLY INTEGRATED POWER MODULE (TIPM)

Turn the ignition on.

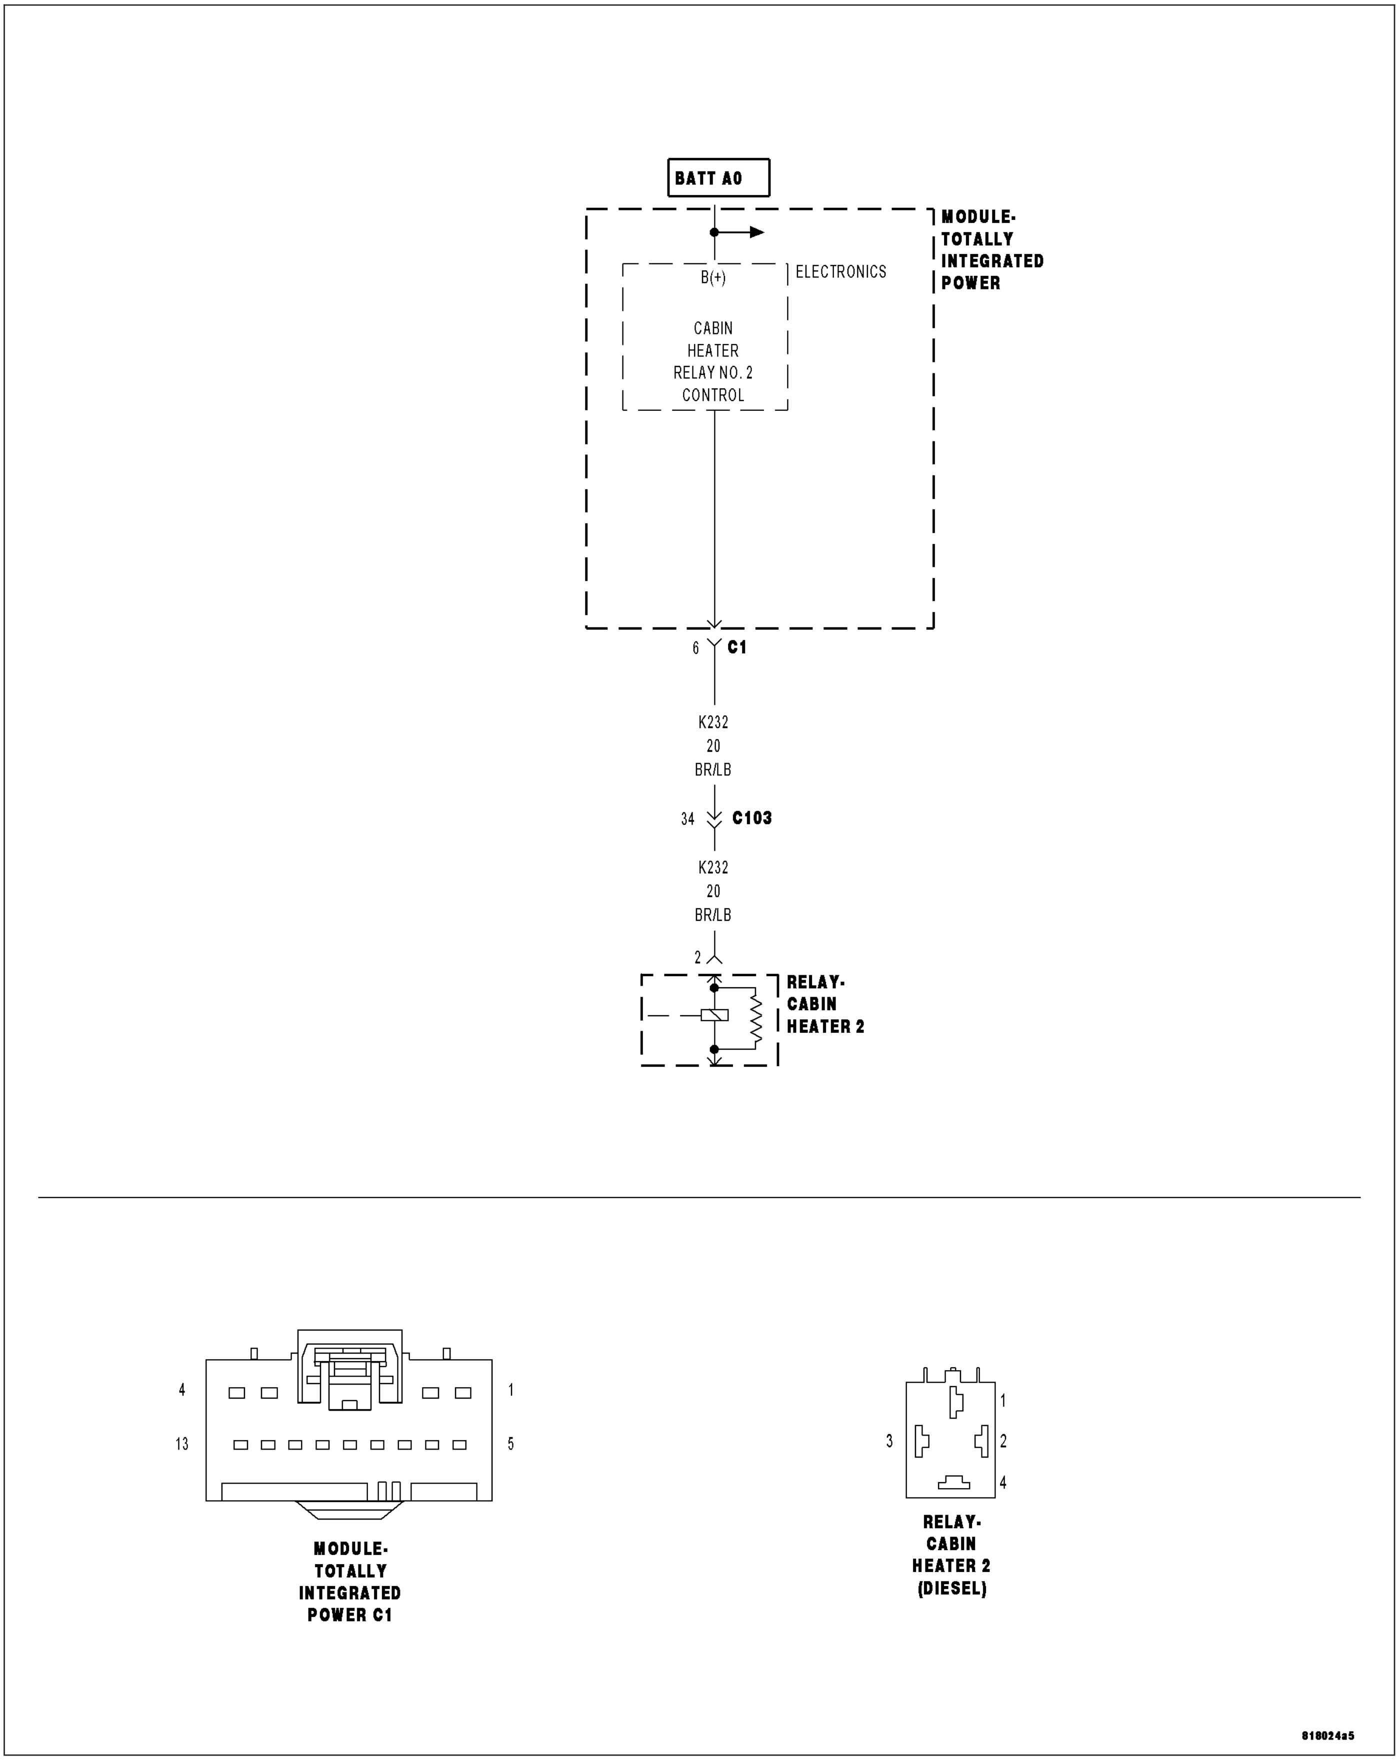
With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B8–CABIN HEATER 2 CONTROL CIRCUIT LOW?



Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 2 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10B9–CABIN HEATER 2 CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, the Cabin Heater Relay 2 is commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module detects a short to voltage on the (K232) Cabin Heater Relay 2 Control circuit.

Possible Causes
(K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
CABIN HEATER RELAY 2
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

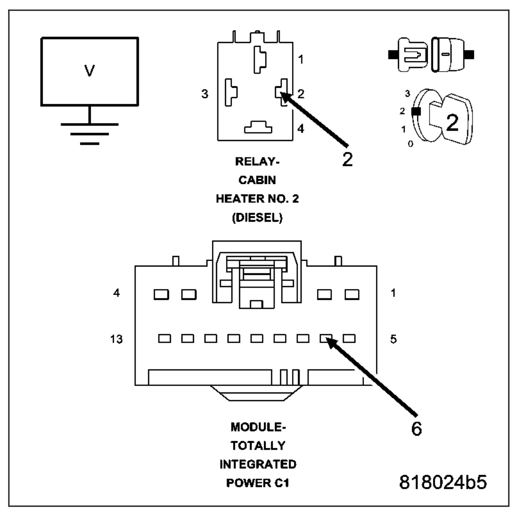
Does the scan tool, display active: B10B9–CABIN HEATER 2 CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

2. CHECK THE (K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT FOR SHORT TO VOLTAGE



Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 2.

Turn the ignition on.

With a volt meter, measure the voltage on the (K232) Cabin Heater Relay 2 Control circuit.

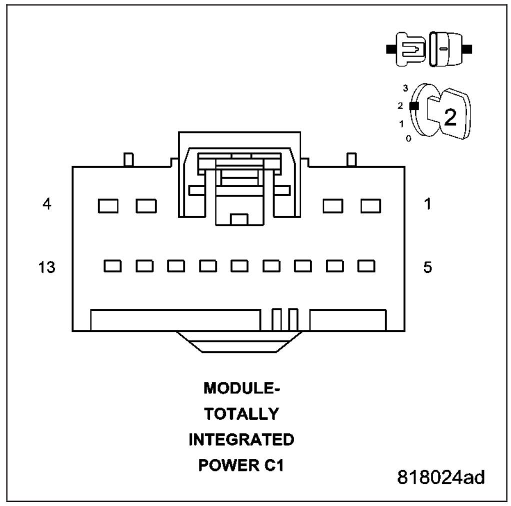
Does the volt meter read 1.0 volt or above?

Yes >> Repair short to voltage on the (K232) Cabin Heater Relay 2 Control circuit.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. TOTALLY INTEGRATED POWER MODULE



Turn the ignition on.

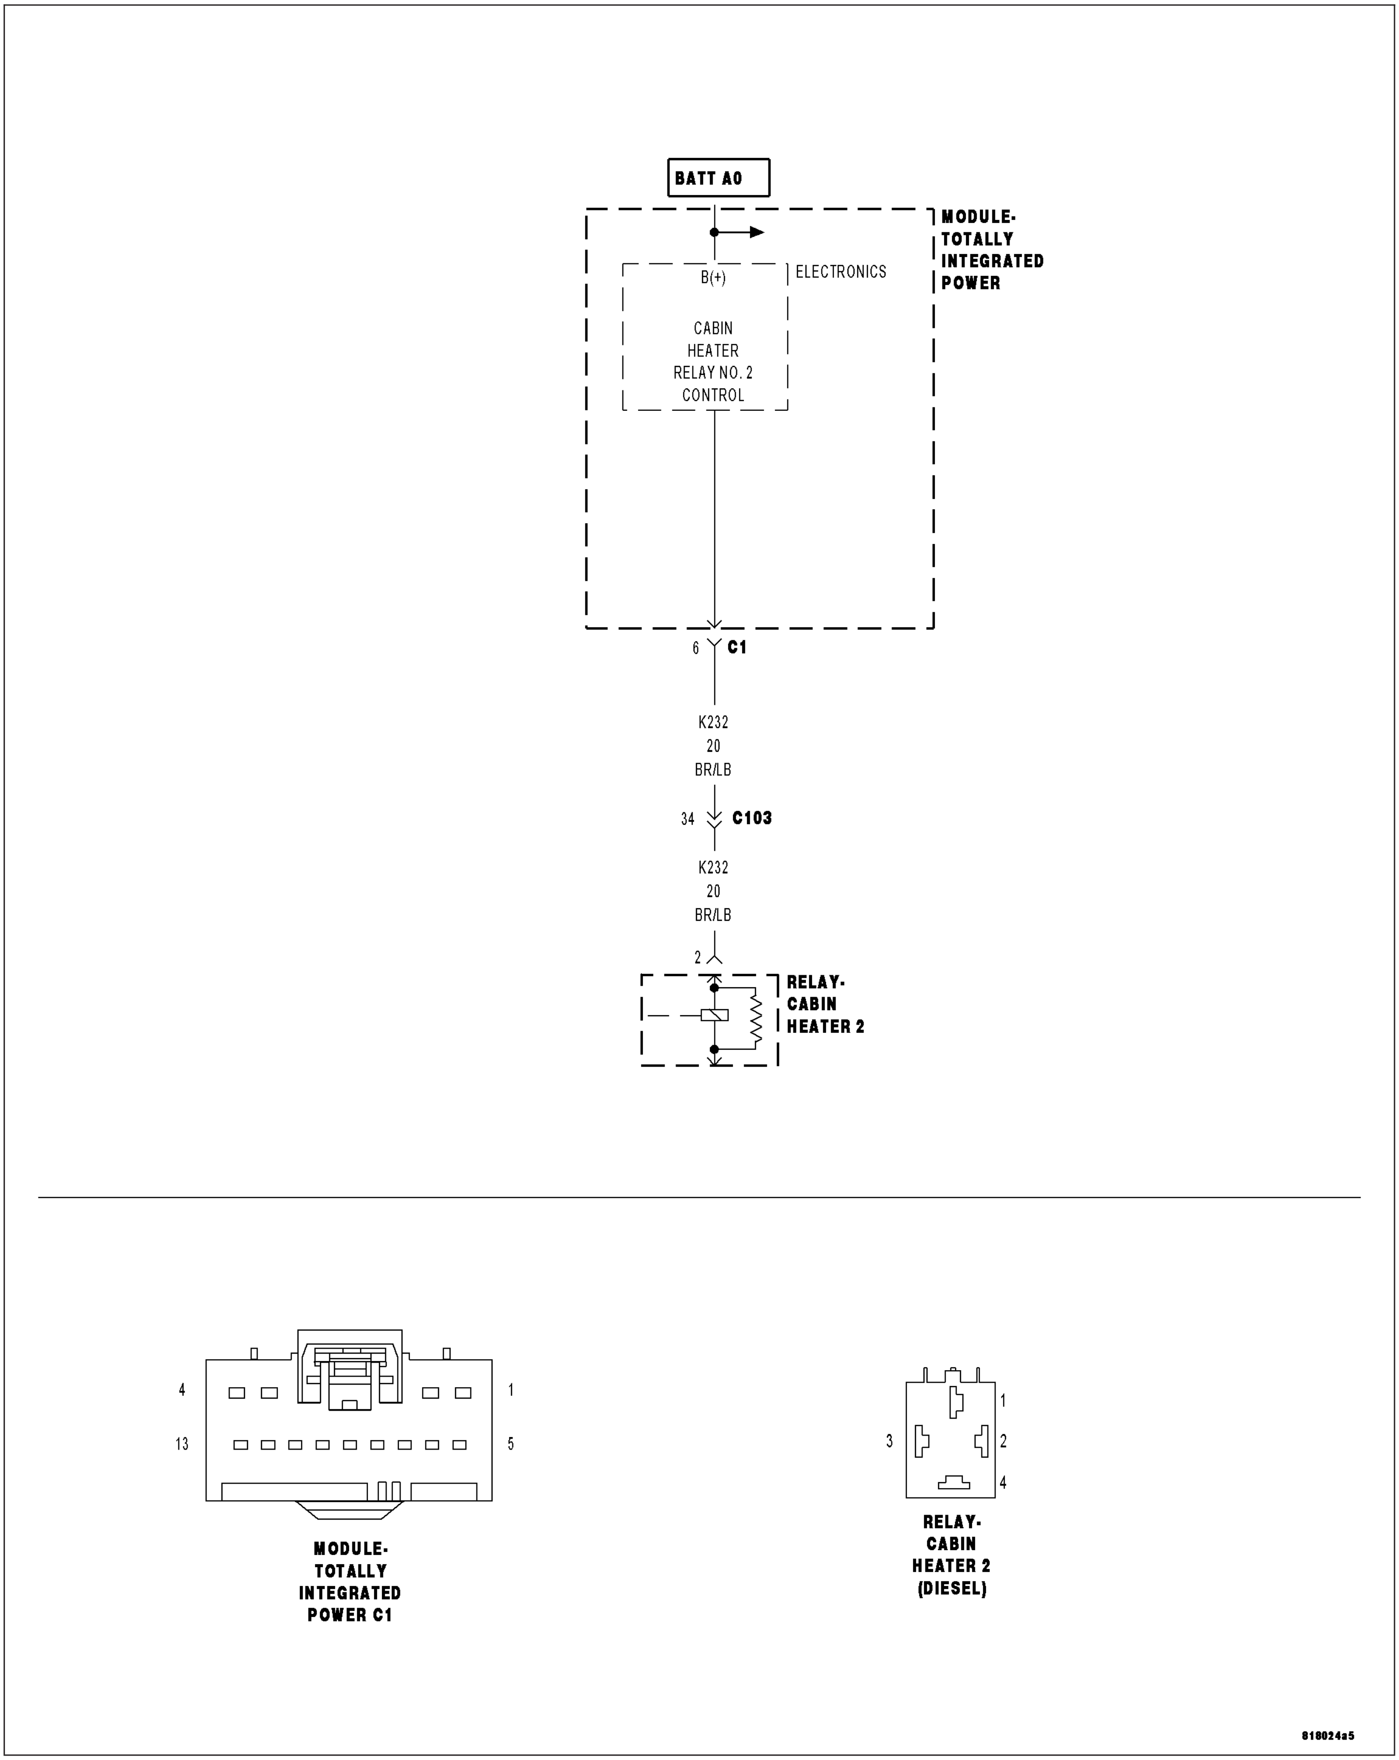
With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater 2 Relay.

Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10B9–CABIN HEATER 2 CONTROL CIRCUIT HIGH?



Yes >> Replace the Totally Integrated Power Module (TIPM in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 2 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10BA–CABIN HEATER 2 CONTROL CIRCUIT OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, and the Cabin Heater Relay 2 commanded on.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects that the (K232) Cabin Heater Relay 2 Control circuit is open.

Possible Causes
(K232) CABIN HEATER RELAY 2 OUTPUT CIRCUIT OPEN
CABIN HEATER RELAY 2
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY THAT THE DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater Relay 2.

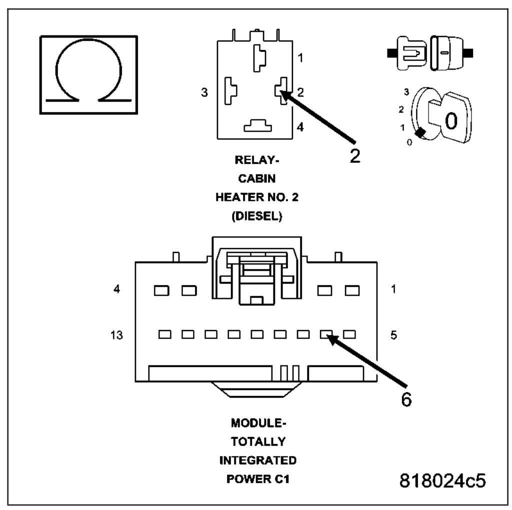
Monitor the scan tool for at least two minutes.

With the scan tool, read DTCs.

Does the scan tool display active: B10BA–CABIN HEATER 2 CONTROL CIRCUIT OPEN?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.



2. CHECK (K232) CABIN HEATER RELAY 2 CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

Disconnect the TIPM C1 harness connector.

Remove the Cabin Heater Relay 2.

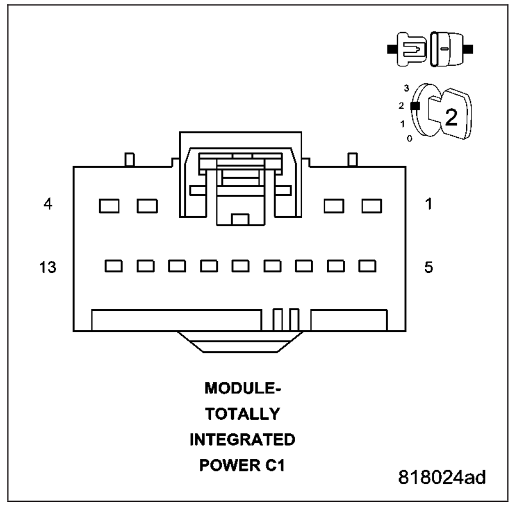
Using an ohm meter, measure the resistance of the (K232) Cabin Heater Relay 2 Control circuit between the TIPM C1 harness connector, and the Cabin Heater Relay 2 harness connector.

Does the ohm meter read open circuit?

Yes >> Repair the (K232) Cabin Heater Relay 2 Control circuit for an open.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Go To 3



3. TOTALLY INTEGRATED POWER MODULE

Turn the ignition on.

With the scan tool, erase DTCs.

With the scan tool, actuate the Cabin Heater Relay 2.

With the scan tool, read DTCs.

Does the scan tool display active: B10BA–CABIN HEATER 2 CONTROL CIRCUIT OPEN?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

No >> Replace the Cabin Heater Relay 2 in accordance with the service information.

Perform the BODY VERIFICATION TEST VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ FRONT CONTROL MODULE - DIAGNOSIS AND TESTING).

B10C0–CONDENSER FAN CONTROL CIRCUIT OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting Condenser Fan operation.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects an open condition in the (C123) Condenser Fan Control circuit.

Possible Causes
(C123) CONDENSER FAN CONTROL OUTPUT CIRCUIT OPEN
CONDENSER FAN MOTOR
TIPM

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, actuate the Condenser Fan.

With the scan tool, read TIPM DTCs.

Does this DTC reset?

Yes >> With the scan tool, de-actuate the Condenser Fan. Then, Go To 2

No >> With the scan tool, de-actuate the Condenser Fan. Then, check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, corroded, and contaminated terminals.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK (C123) CONDENSER FAN CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Disconnect the Condenser Fan harness connector.

Measure the resistance of the (C123) Condenser Fan Control Output circuit between the TIPM C8 harness connector and the Condenser Fan harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 3

No >> Repair the (C123) Condenser Fan Control Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

3. CHECK CONDENSER FAN MOTOR

Reconnect the TIPM C8 harness connector.

Ignition on, engine not running.

With the scan tool, actuate the Condenser Fan.

Using a 12-volt test light connected to ground, probe the (C123) Condenser Fan Control Output circuit at the Condenser Fan harness connector.

Does the test light illuminate brightly and flash on and off?

Yes >> With the scan tool, de-actuate the Condenser Fan. Then, replace the Condenser Fan Motor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> With the scan tool, de-actuate the Condenser Fan. Then, Go To 4

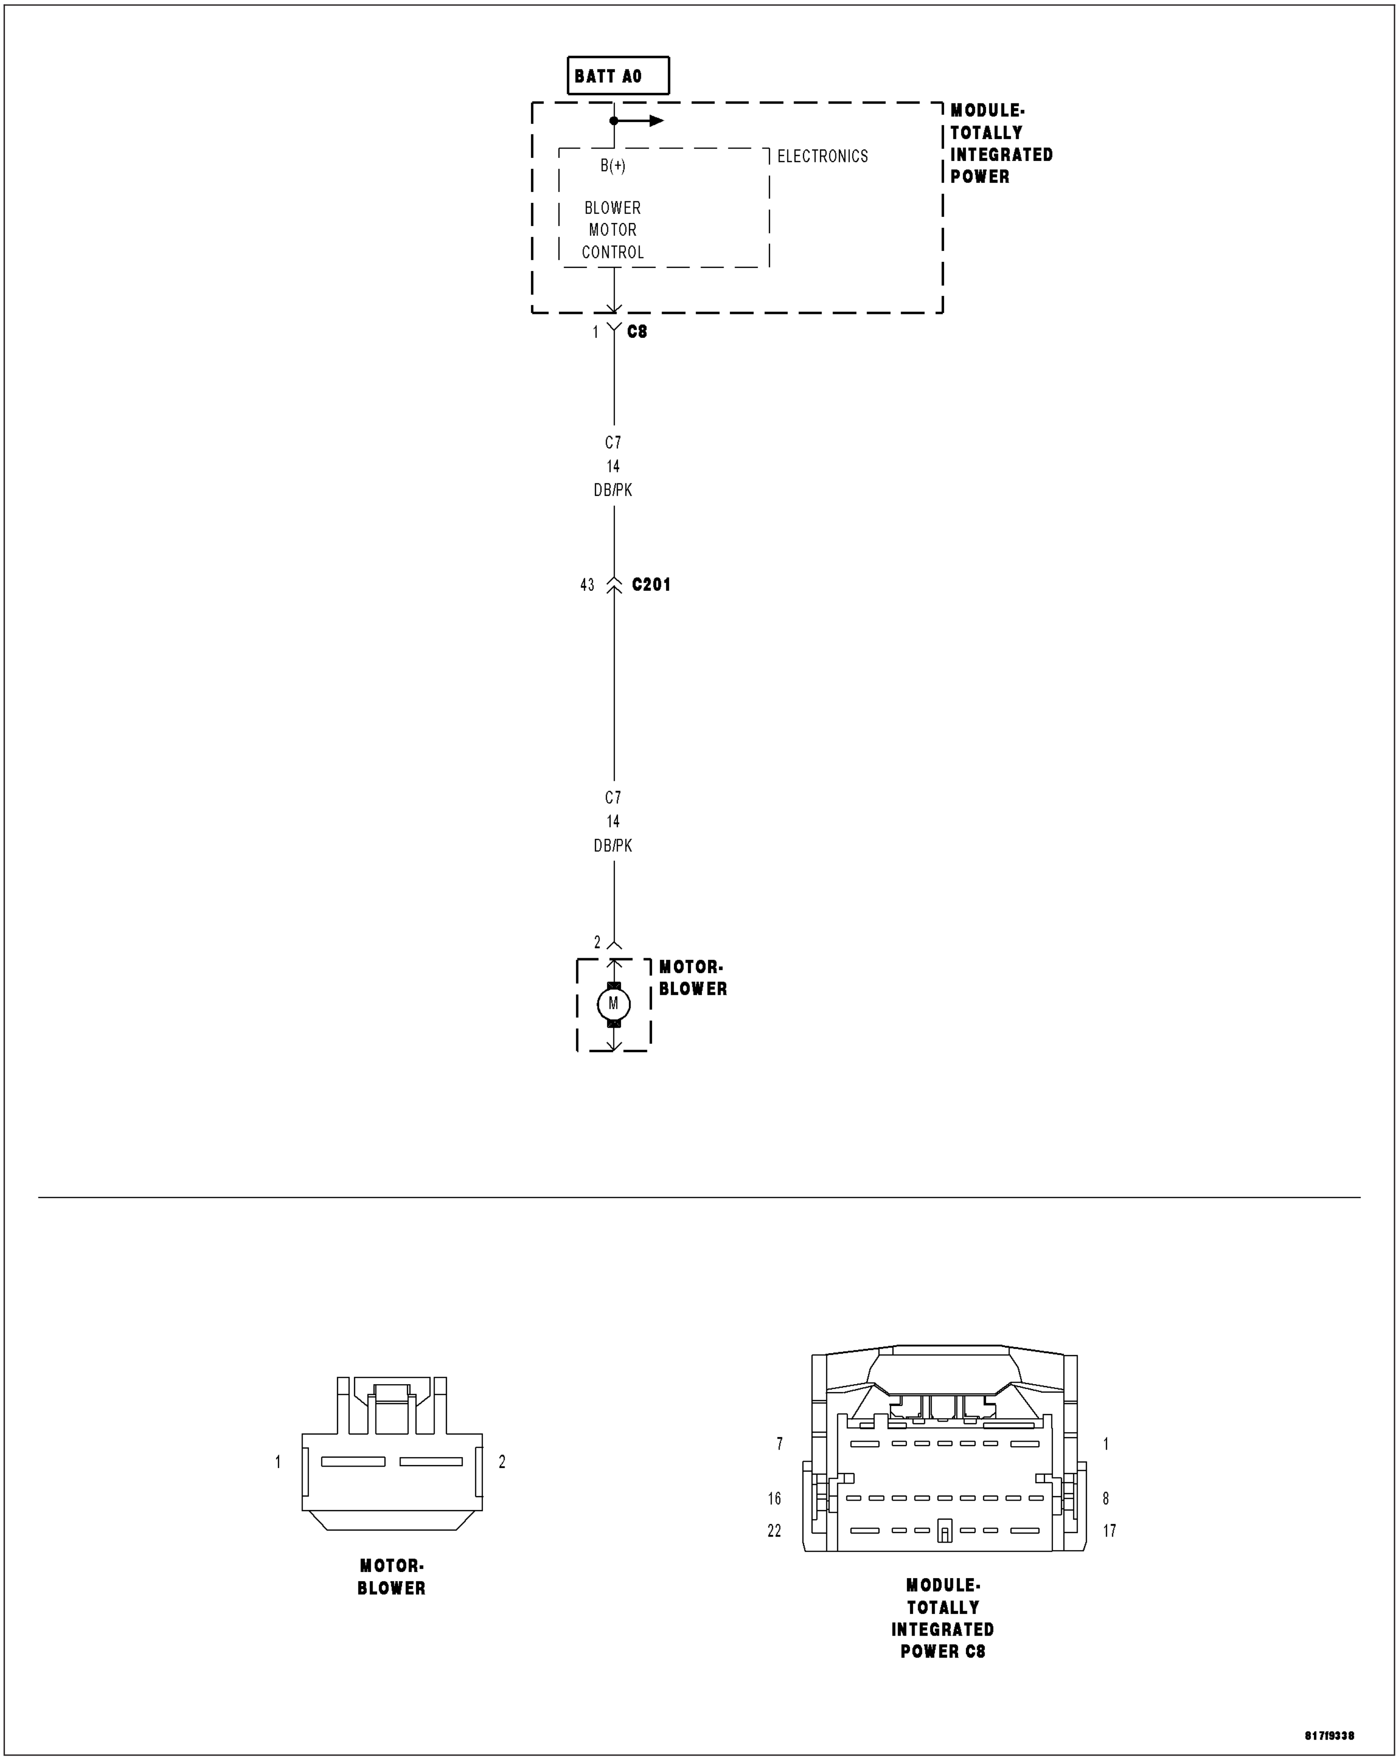
4. INSPECT RELATED WIRING

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects a short to ground on the (C7) Blower Motor Control circuit, when blower motor operation is requested.

Possible Causes
(C7) BLOWER MOTOR CONTROL CIRCUIT SHORTED TO GROUND
BLOWER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the blower control switch to off.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Turn the blower control switch to on.

With the scan tool, read DTCs.

Does the scan tool display active: B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR ACTIVE DTC B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW WITH BLOWER MOTOR HARNESS CONNECTOR DISCONNECTED

Turn the blower control switch to off.

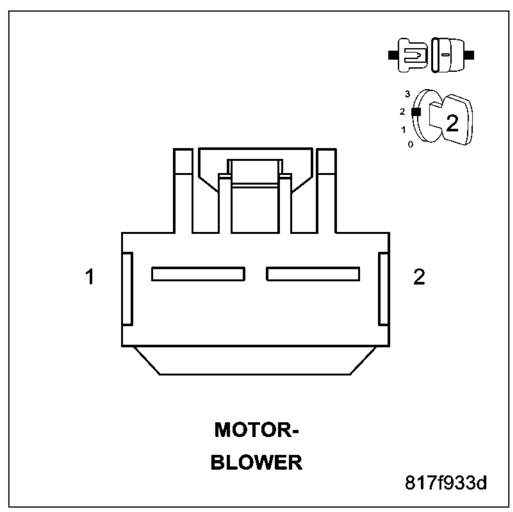
Disconnect the Blower Motor harness connector.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Turn the blower control switch to on.



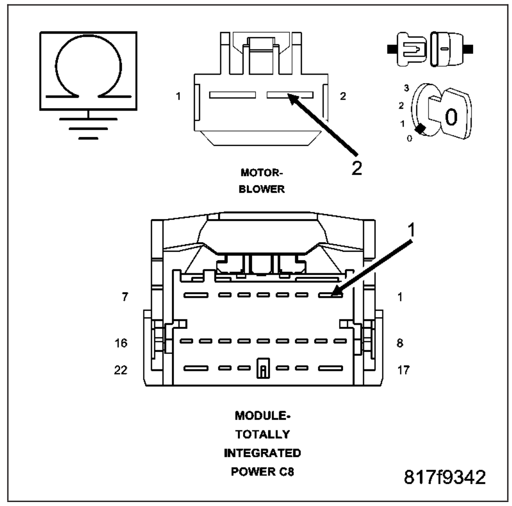
With the scan tool, read DTCs.

Does the scan tool display active: B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW?

Yes >> Go To 3

No >> Replace the Blower Motor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



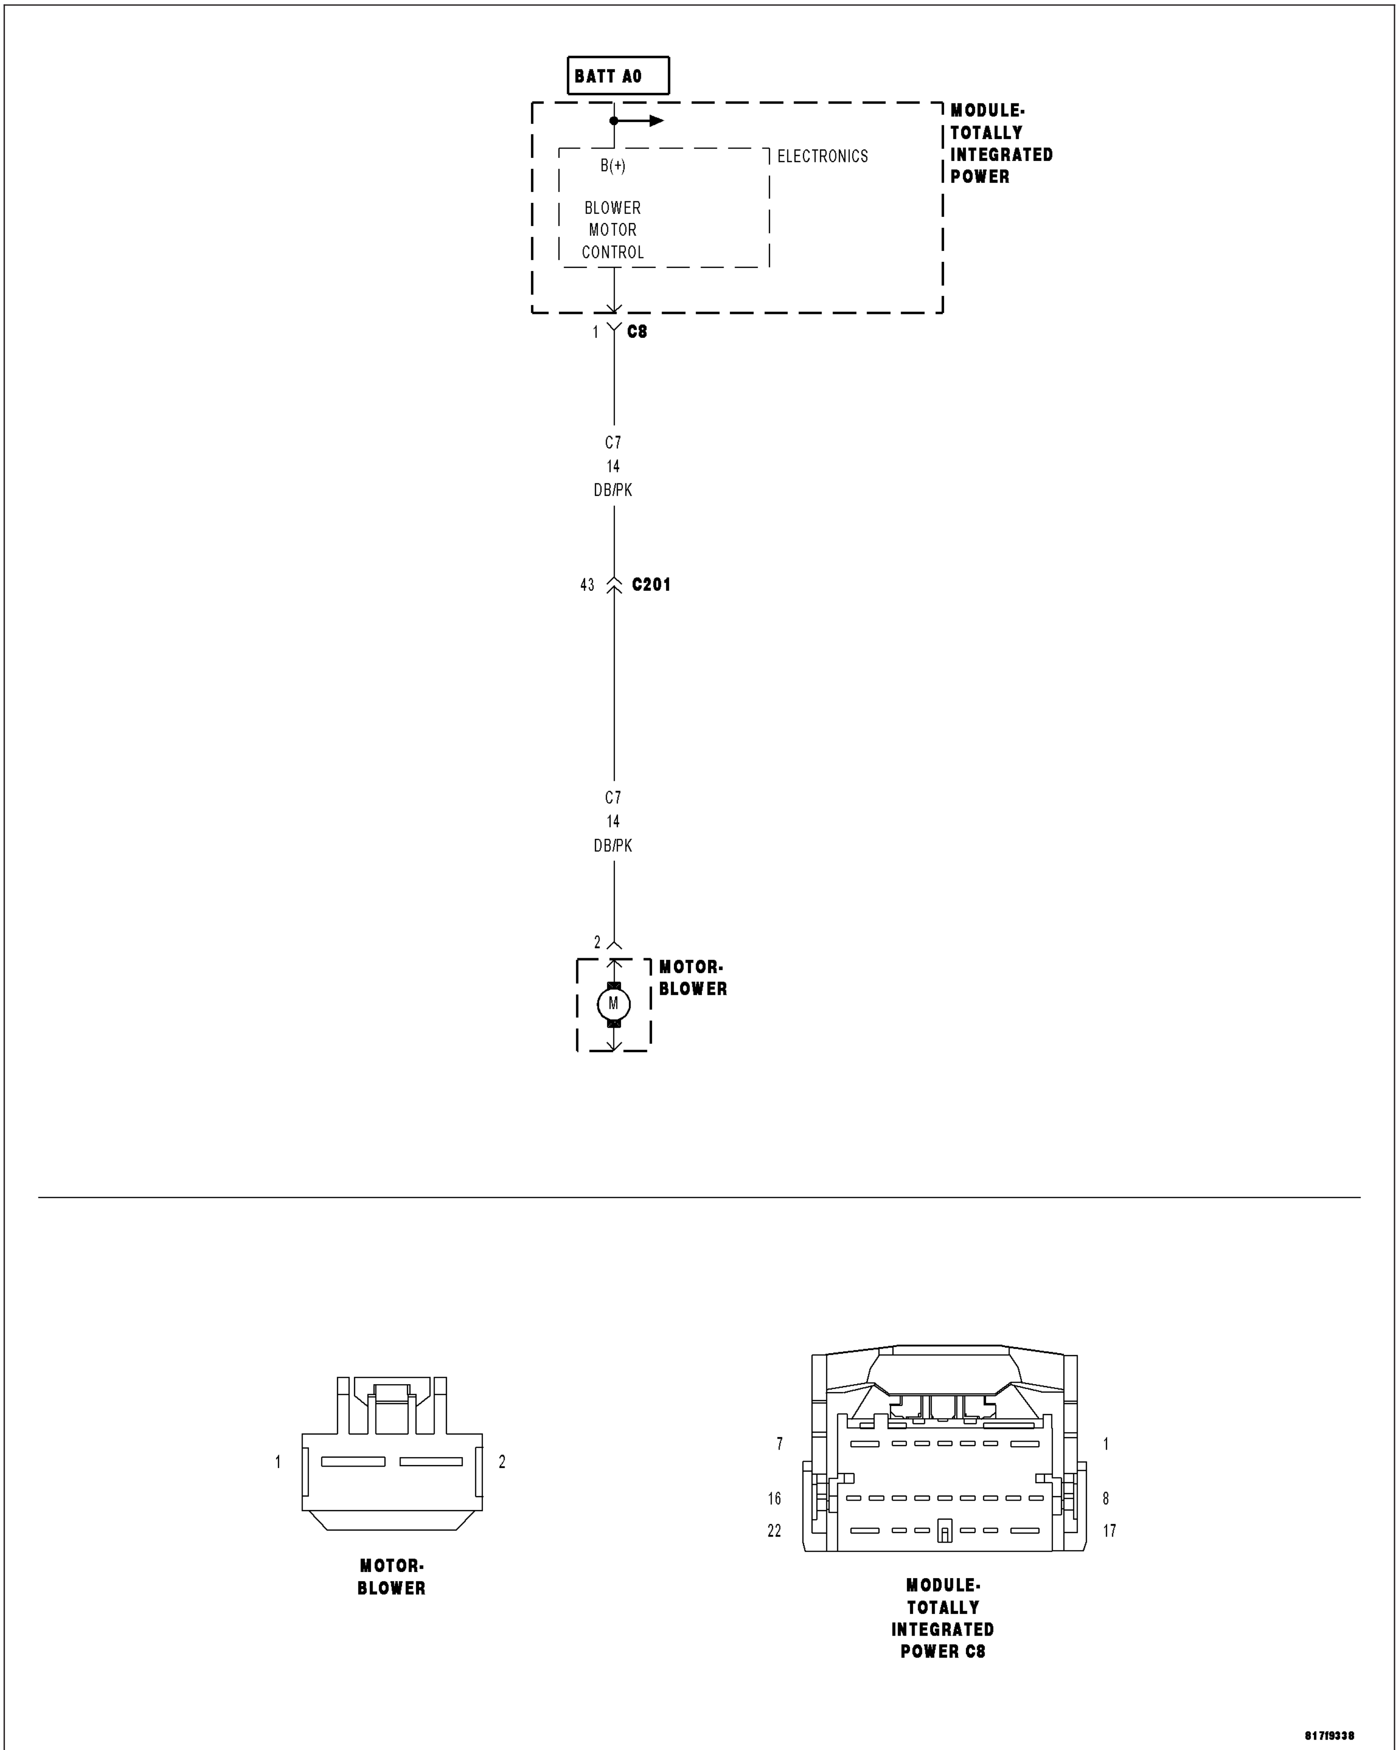
3. CHECK THE (C7) BLOWER MOTOR CONTROL CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Measure the resistance of the (C7) Blower Motor Control circuit between ground and the Blower Motor harness connector.

Does the ohm meter read open circuit?



Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Repair the (C7) Blower Motor Control circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting Blower Motor operation.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects a short to voltage condition on the (C7) Blower Motor Control circuit.

Possible Causes
(C7) BLOWER MOTOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(C7) BLOWER MOTOR CONTROL CIRCUIT OPEN
BLOWER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the a/c control, turn on the Blower Motor.

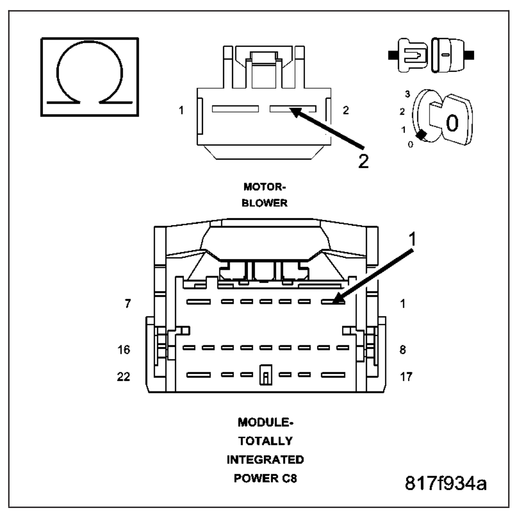
With the scan tool, read DTCs.

Does the scan tool display active: B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).



2. CHECK (C7) BLOWER MOTOR CONTROL CIRCUIT FOR AN OPEN

Turn the ignition off.

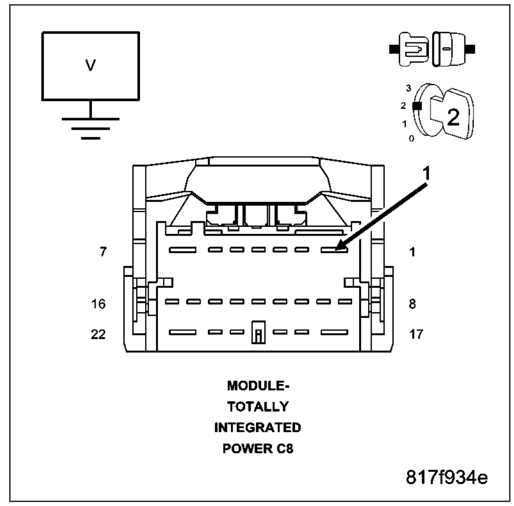
Disconnect the TIPM C8 harness connector.

Disconnect the Blower Motor harness connector.

Measure the resistance of the (C7) Blower Motor Control circuit between the TIPM C8 harness connector and the Blower Motor harness connector.

Does the ohm meter read open circuit?

Yes >> Repair the (C7) Blower Motor Control circuit for an open.



Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (C7) BLOWER MOTOR CONTROL CIRCUIT FOR SHORT TO VOLTAGE

Turn the ignition on.

With a volt meter measure the voltage on the (C7) Blower Motor Control circuit.

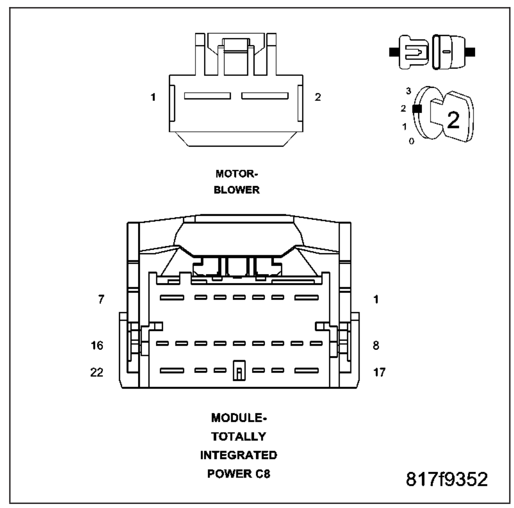
Does the volt meter read above 10.0 volts?

Yes >> Repair the (C7) Blower Motor Control circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. TOTALLY INTEGRATED POWER MODULE



Turn the ignition on.

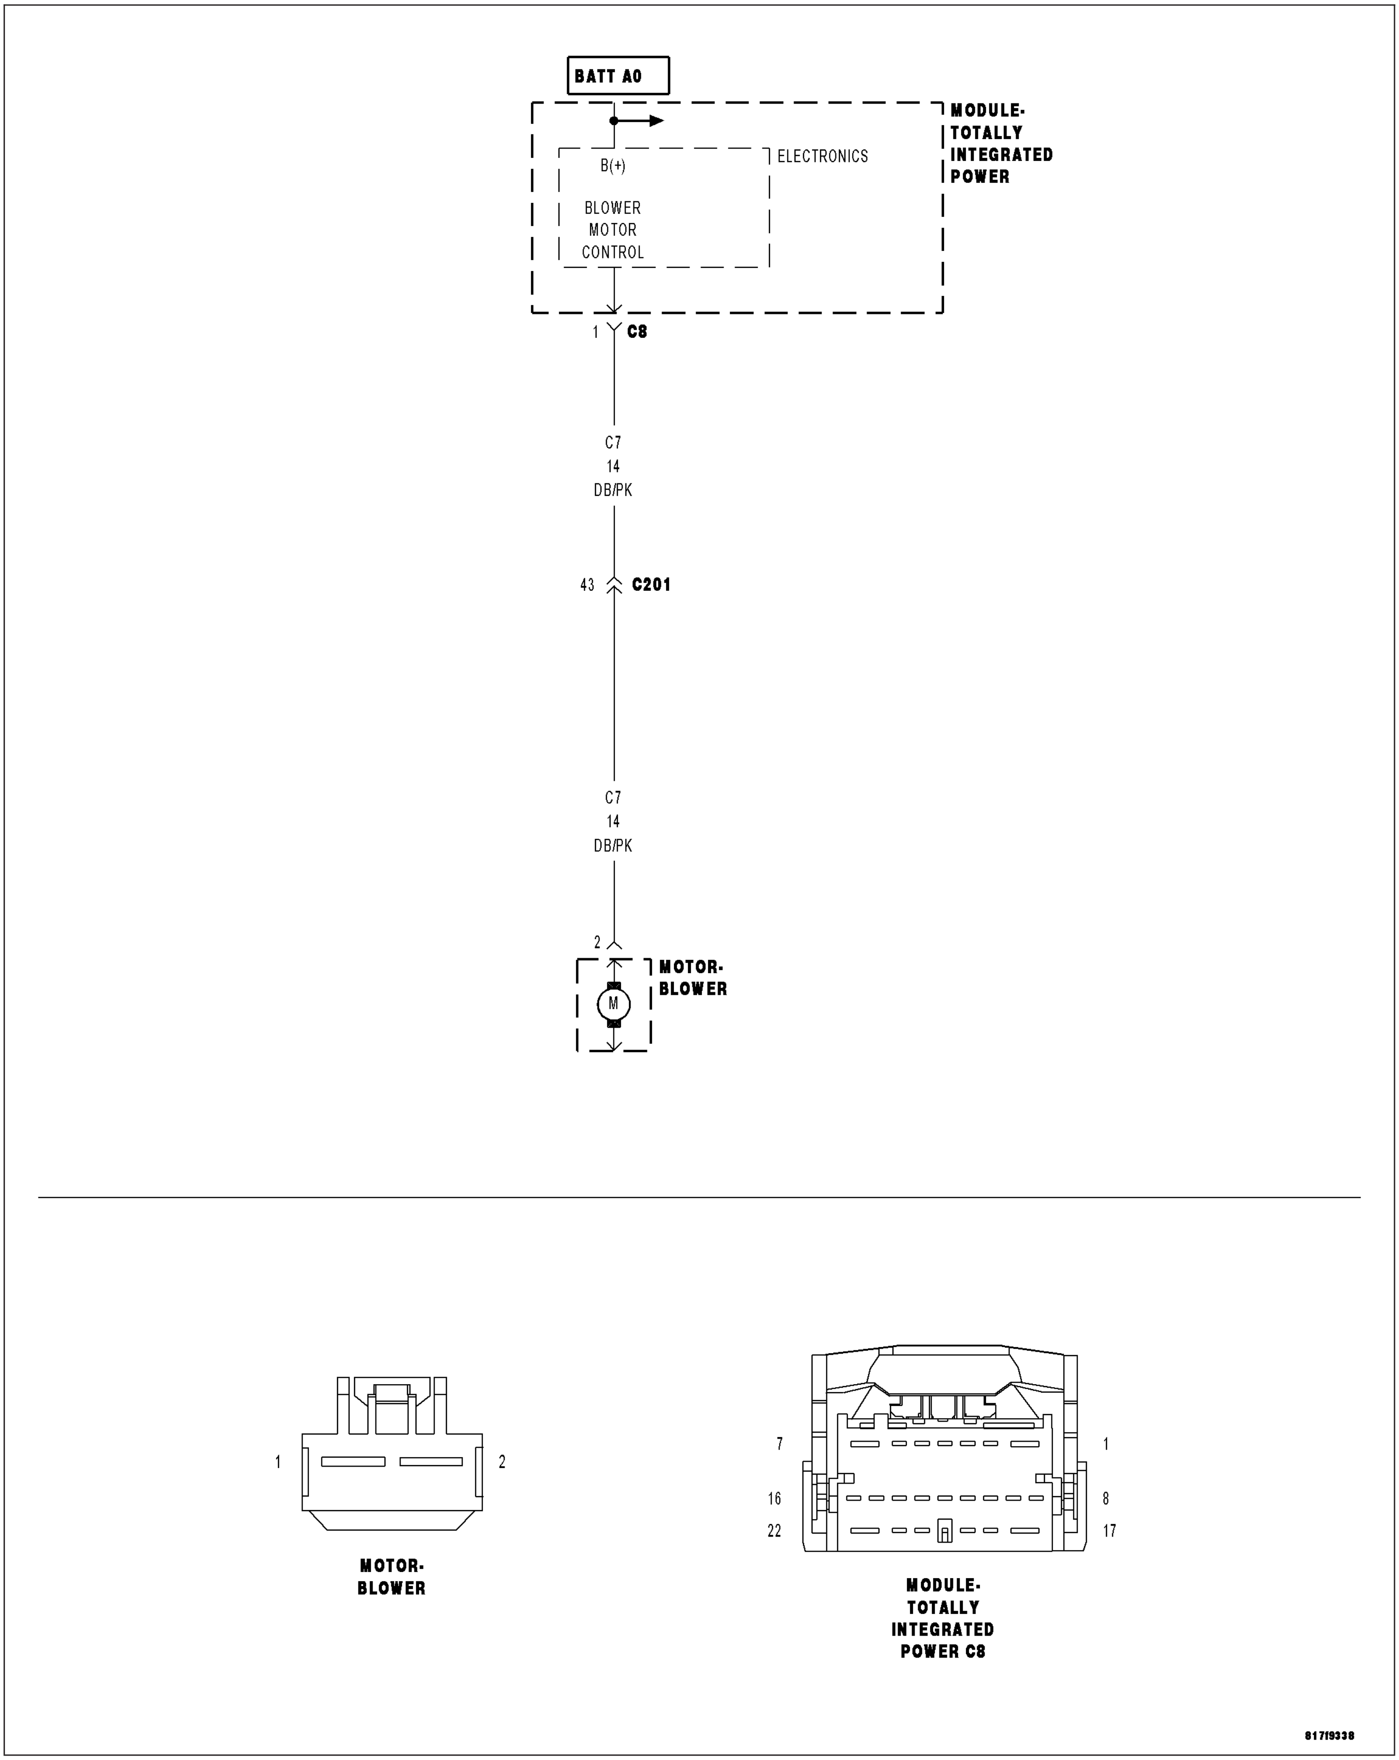
With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the a/c control, turn on the Blower Motor.

With the scan tool, read DTCs.

Does the scan tool display active: B10EA-BLOWER MOTOR CONTROL CIRCUIT HIGH?



Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Blower Motor in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10EC–BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Totally Integrated Power Module (TIPM) will set this DTC if it detects an overcurrent condition on the (C7) Blower Motor Control circuit for more than 500 ms when blower motor operation is requested.

Possible Causes
BLOCKAGE STALLING BLOWER MOTOR
BLOWER MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY DTC B10EC-BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B10EC-BLOWER MOTOR CONTROL CIRCUIT OVERCURRENT?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR PROPER BLOWER MOTOR OPERATION

Turn the ignition on.

Turn the Blower Motor on.

Does the Blower Motor operate normally?

Yes >> Go To 4

No >> Go To 3

3. CHECK FOR ACTIVE: B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Turn on the Blower Motor.

With the scan tool, read DTCs.

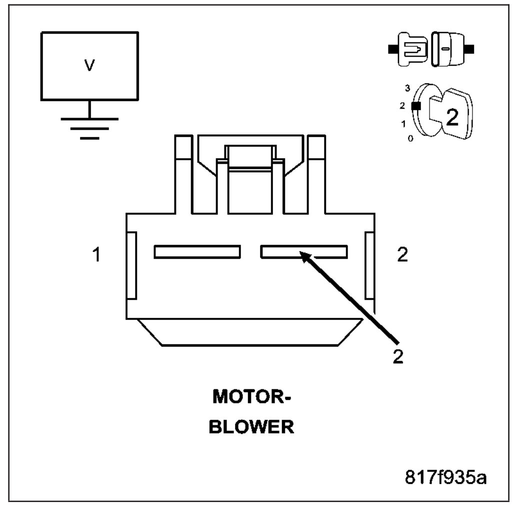
Does the scan tool display active: B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW?

Yes >> Follow the diagnostics for Code B10E9–BLOWER MOTOR CONTROL CIRCUIT LOW.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK FOR 12 VOLTS TO THE BLOWER MOTOR



Turn the ignition off.

Disconnect the Blower Motor harness connector.

Turn the ignition on.

Turn the Blower Motor control on.

Using a volt meter measure the voltage on the (C7) Blower Motor Control circuit in the Blower Motor harness connector.

Does the volt meter read 12 volts?

Yes >> Go To 5

No >> Go To 6

5. CHECK FOR A BLOCKAGE STALLING THE BLOWER MOTOR

Turn the ignition off.

Remove the Blower Motor from the HVAC housing assembly.

Look for anything on the Blower Motor and in the HVAC housing that is physically preventing Blower Motor operation.

Is anything physically preventing Blower Motor operation?

Yes >> Repair as necessary. Also, check Blower Motor for proper operation. Reinstall, or replace the Blower Motor as necessary in accordance with the service information.

No >> Replace the Blower Motor in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. CHECK FOR CHAFING IN THE (C7) BLOWER MOTOR CONTROL CIRCUIT

Turn the ignition off.

Check the (C7) Blower Motor Control circuit for wire chaffing.

Is any wire chaffing present?

Yes >> Repair the wire chafing on the (C7) Blower Motor Control circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

B10BF–CONDENSER FAN CONTROL CIRCUIT HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects a shorted high condition in the (N112) High Speed Radiator Fan Control circuit.

Possible Causes
(N112) HIGH SPEED RADIATOR FAN CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
RADIATOR FAN MOTOR
TOTALLY INTEGRATED POWER MODULE (TIPM)

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, actuate the Radiator Fan.

With the scan tool, read DTCs.

Does the scan tool display active: B10BF-CONDENSER FAN CONTROL CIRCUIT HIGH?

Yes >> With the scan tool, de-actuate the Radiator Fan. Then, Go To 2

No >> With the scan tool, de-actuate the Radiator Fan. The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK (N112) HIGH SPEED RADIATOR FAN CONTROL CIRCUIT FOR A SHORT TO BATTERY VOLTAGE

Turn the ignition off

Disconnect the TIPM C11 harness connector.

Disconnect the Radiator Fan Motor harness connector.

Turn the ignition on.

Using a volt meter, measure the voltage on the (N112) High Speed Radiator Fan Control circuit at the Radiator Fan Motor harness connector.

Does the volt meter read 10 volts, or above?

Yes >> Repair the (N112) High Speed Radiator Fan Control circuit for a short to battery voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK (Z823) GROUND CIRCUIT FOR AN OPEN

Turn the ignition off.

Reconnect the TIPM C8 harness connector.

NOTE: The test light should illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Using a 12-volt test light connected to 12 volts, probe the (Z823) Ground circuit at the Condenser Fan Motor harness connector.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the excessive resistance in the (Z823) Ground circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

4. CHECK RADIATOR FAN MOTOR

Ignition on, engine not running.

With the scan tool, actuate the Radiator Fan.

Using a 12-volt test light connected to ground, probe the (C123) Condenser Fan Control Output circuit at the Condenser Fan Motor harness connector.

Does the test light illuminate brightly and flash on and off?

Yes >> With the scan tool, de-actuate the Condenser Fan. Then, replace the Condenser Fan Motor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> With the scan tool, de-actuate the Condenser Fan. Then, Go To 5

5. INSPECT RELATED WIRING

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the related wiring harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the TIPM in accordance with the Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

B10BE–CONDENSER FAN CONTROL CIRCUIT LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts.
- **Set Condition:**
  If the Totally Integrated Power Module (TIPM) detects a shorted low condition in the (C123) Condenser Fan Control circuit.

Possible Causes
(C123) CONDENSER FAN CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
CONDENSER FAN MOTOR
TIPM

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, actuate the Condenser Fan.

With the scan tool, read TIPM DTCs.

Does this DTC reset?

Yes >> With the scan tool, de-actuate the Condenser Fan. Then, Go To 2

No >> With the scan tool, de-actuate the Condenser Fan. Then, check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, corroded, and contaminated terminals.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK (C123) CONDENSER FAN CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Disconnect the Condenser Fan Motor harness connector.

Measure the resistance of the (C123) Condenser Fan Control Output circuit between ground and the Condenser Fan Motor harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (C123) Condenser Fan Control Output circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 3

3. CHECK FOR A SHORTED CONDENSER FAN MOTOR

Reconnect the TIPM C8 harness connector.

Ignition on, engine not running.

With the scan tool, actuate the Condenser Fan.

Using a 12-volt test light connected to ground, probe the (C123) Condenser Fan Control Output circuit at the Condenser Fan Motor harness connector.

Does the test light illuminate brightly and flash on and off?

Yes >> With the scan tool, de-actuate the Condenser Fan. Then, replace the Condenser Fan Motor in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> With the scan tool, de-actuate the Condenser Fan. Then, Go To 4

4. INSPECT RELATED WIRING

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Turn the ignition off.

Using the schematics as a guide, inspect the related wiring harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the TIPM in accordance with the Service Information.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

B10EE-CONDENSOR FAN CONTROL CIRCUIT OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Totally Integrated Power Module (TIPM) will set this DTC if it detects an overcurrent condition on the (N112) High Speed Radiator Fan Control circuit for more than 500 ms when Radiator Fan operation is requested.

Possible Causes
BLOCKAGE STALLING RADIATOR FAN
RADIATOR FAN
TIPM

Diagnostic Test

1. VERIFY DTC B10EE-CONDENSER FAN CONTROL CIRCUIT OVERCURRENT IS ACTIVE

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read DTCs.

Does the scan tool display active: B10EE-CONDENSER FAN CONTROL CIRCUIT OVERCURRENT?

Yes >> Go To 2

No >> The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.

Perform the BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

2. CHECK FOR PROPER RADIATOR FAN OPERATION

Turn the ignition on.

With the scan tool, activate the Radiator Fan.

Does the Radiator Fan operate normally?

Yes >> Go To 4

No >> Go To 3

3. CHECK FOR ACTIVE: B10BE–CONDENSER FAN CONTROL CIRCUIT LOW

Turn the ignition on.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Use the scan tool, to activate the Condenser Fan.

With the scan tool, read DTCs.

Does the scan tool display active: B10BE–CONDENSER FAN CONTROL CIRCUIT LOW?

Yes >> Follow the diagnostics for Code B10BE–CONDENSER FAN CONTROL CIRCUIT LOW.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Go To 4

4. CHECK FOR 12 VOLTS TO THE RADIATOR FAN

Turn the ignition off.

Disconnect the Radiator Fan harness connector.

Turn the ignition on.

With the scan tool, activate the Radiator Fan.

Using a volt meter measure the voltage on the (N112) High Speed Radiator Fan Control circuit in the Radiator Fan harness connector.

Does the volt meter read 12 volts?

Yes >> Go To 5

No >> Go To 6

5. CHECK FOR A BLOCKAGE STALLING THE RADIATOR FAN

Turn the ignition off.

Look for anything that may be physically preventing the Radiator Fan from operating normally.

Is anything physically preventing Blower Motor operation?

Yes >> Repair as necessary. Also, check the Radiator Fan for proper operation. Reinstall or replace the Radiator Fan as necessary in accordance with the service information.

No >> Replace the Radiator Fan in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

6. CHECK FOR CHAFFING IN THE (N112) HIGH SPEED RADIATOR FAN CONTROL CIRCUIT

Turn the ignition off.

Check the (N112) High Speed Radiator Fan Control circuit for wire chaffing.

Is any wire chaffing present?

Yes >> Repair the wire chaffing on the (N112) High Speed Radiator Fan Control circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

No >> Replace the Totally Integrated Power Module (TIPM) in accordance with the service information.

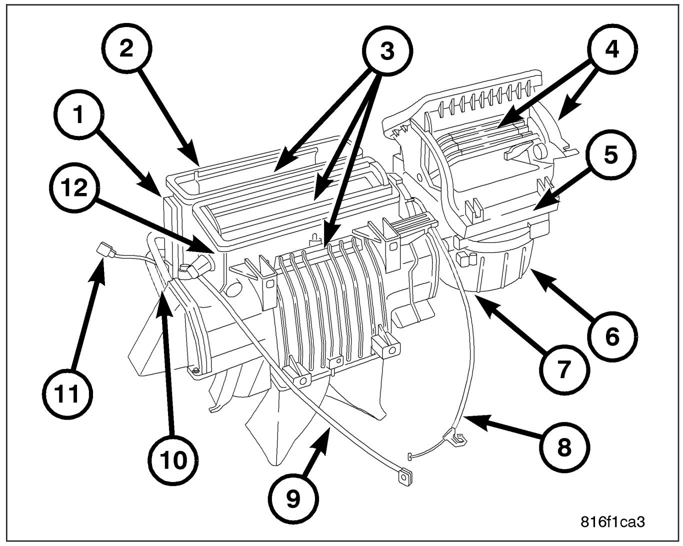
Perform BODY VERIFICATION TEST - VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE).

HVAC - SERVICE INFORMATION

TABLE OF CONTENTS

HVAC - SERVICE INFORMATION

DESCRIPTION



A manual temperature control (MTC) single zone type heating-A/C system or a manually controlled heater-only system is standard equipment on this model, depending on market.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

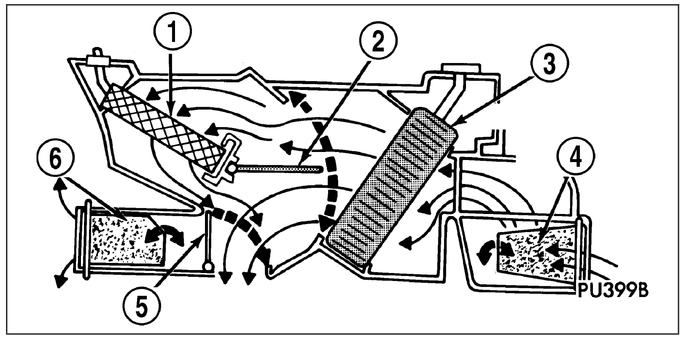
The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment beneath the instrument panel. The HVAC housing includes:

- A/C evaporator (A/C system only) (2)
- Mode-air doors (3)
- Recirculation-air door and actuator (4)
- Particulate air filter (when equipped) (5)
- Blower motor (6)
- Blower motor resistor (7)
- Mode control cable (8)
- Temperature control cable (9)
- Heater core (10)
- Evaporator temperature sensor (A/C system only) (11)
- Blend-air door (12)

On heater-only systems, the A/C evaporator is omitted from the HVAC housing and is replaced with an air restrictor plate.

NOTE: An electric positive temperature coefficient (PTC) heater is used on vehicles when equipped with the 2.0L diesel engine. The PTC heater unit compensates for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core. For more information, (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/ HEATER UNIT - DESCRIPTION).



Based upon the system mode selected, conditioned air can exit the standard heater-only or optional heater-A/C housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC air distribution housing and the floor outlets are located on each side of the distribution housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the various outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlet** - A single large defroster outlet is located in the center of the instrument panel, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and two located near the top of the instrument panel center bezel.
- **Front Floor Outlets** - There are two front floor outlets, one located on each side the floor panel center tunnel behind the instrument panel.
- **Rear Seat Floor Outlets** - There are two rear seat floor outlets, one located on each side of the floor panel near the front of each rear seat foot well.

OPERATION

Both the manual temperature control (MTC) heating-A/C system and the heater-only system are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. The temperature control determines the discharge air temperature by operating the blend door cable, which moves the blend-air door. This design allows almost immediate control of output air temperature.

NOTE: Typical blend-air type HVAC system shown.

The heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing. On models equipped with A/C, the air passes through the A/C evaporator (3). Air flow can be directed either through or around the heater core (1). This is done by adjusting the blend-air door (2) with the temperature control located on the A/C-heater control in the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed control located on the A/C-heater control.

The outside (fresh) air intake can be shut off by pressing the Recirculation button on the A/C-heater control. This will operate an electrically actuated recirculation-air door (4) that closes off the fresh air intake and recirculates the air that is already inside the vehicle.

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control. It will automatically engage when the mode control is set in any Mix to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to direct the conditioned air to the selected system outlets. The mode control uses a control cable to operated the mode-air doors (5 and 6).

The defroster outlet receives airflow from the HVAC housing through the molded plastic defroster duct, which is secured to the top of the instrument panel. The airflow from the defroster outlet is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are integral to the instrument panel cover and direct air from the HVAC housing through the outlets on the top corners of the instrument panel. The demisters operate when the mode control is set in any Floor to Defrost position.

The panel outlets receive airflow from the HVAC housing through the center air distribution duct and molded plastic panel outlet ducts. The airflow from each of the panel outlets is adjustable. A thumbwheel located at the bottom of each panel outlet grille is used to adjust a center diffuser that changes the airflow direction, and a knob on the outer edge of each panel outlet grille opens or closes a shutter to turn airflow on or off through that outlet.

The front and rear floor outlets receive airflow from the HVAC housing through the front and rear floor ducts. The front floor outlets are integral to the molded plastic front floor ducts, which are secured to each side of the HVAC housing. Two molded plastic rear seat ducts are attached to the two molded plastic rear floor ducts, which are secured to the rear of the HVAC housing. The rear seat ducts direct airflow beneath the carpet to the outlets located near the front of each rear seat foot well. None of the floor outlets can be adjusted.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the

passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Check for diagnostic trouble codes using a scan tool. If no DTCs are found in the powertrain control module (PCM) or engine control module (ECM) (depending on engine application), gateway module or the totally integrated power module (TIPM), go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Connect a tachometer and a manifold gauge set or an A/C recycling/charging station.
3. Operate the heating-A/C system under the following conditions.
   - Engine at idle and operating temperature
   - Doors or windows open
   - Transaxle in Park or Neutral with parking brake set (depending on application)
   - A/C-heater controls set to Recirculation mode (max-A/C), full cool, panel mode, high blower and A/C on.
4. Insert a thermometer in the driver side center panel air outlet and operate the vehicle a minimum of ten minutes to allow the thermometer temperature stabilizes.
5. Compare the air temperature at the center panel outlet and the A/C system pressures to the A/C Performance Temperature and Pressure chart.

A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	6 -15° C (42 - 59° F)	7 -18° C (45 - 64° F)	9 - 21° C (48 - 69° F)	11 - 22° C (52 - 72° F)	13 - 24° C (56 - 75° F)
A/C High Side Pressure	1034 - 1896 kPa (150 - 275 psi)	1207 - 2068 kPa (175 - 300 psi)	1379 - 2241 kPa (200 - 325 psi)	1551 - 2413 kPa (225 - 350 psi)	1724 - 2241 kPa (250 - 375 psi)
A/C Low Side Pressure	214 - 365 kPa (31 - 53 psi)	248 - 407 kPa (36 - 59 psi)	283 - 476 kPa (41 - 69 psi)	317 - 483 kPa (46 - 70 psi)	359 - 496 kPa (52 - 72 psi)

6. If the air outlet temperature or the A/C system pressures are not within specifications, refer to the A/C System Diagnosis chart.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Equal refrigerant pressures	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Faulty A/C compressor.	2. See A/C Compressor in this group. Test the compressor and replace, if required.
	3. Improperly installed or faulty A/C pressure transducer.	4. See A/C High Pressure Transducer in this group. Test the transducer and replace, if required.
	4. Faulty A/C-heater control, cabin compartment node (CCN), totally integrated power module (TIPM), gateway module or PCM/ECM (depending on engine application).	4. Refer to the appropriate Electrical Diagnostic Procedures for testing of the A/C-heater control, CCN, TIPM, gateway module or PCM/ECM. Test the module and replace, if required.
Normal refrigerant pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Temperature control cable improperly installed or faulty.	2. See Temperature Control Cable this group. Inspect the cable for proper operation. Replace the cable as required.
	3. Blend door inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend door for proper operation and sealing. Repair if required.
	4. Blend door not in full cold position.	4. See Temperature Control Cable this group. Inspect the cable for proper operation. Replace the cable as required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.

Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the accumulator is restricted.	2. See Accumulator in this group. Replace the restricted accumulator, if required.
	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace, if required. Refer to Group 7.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. Test the engine cooling system and repair, if required. Refer to Group 7.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Replace the accessory drive belt or tensioner, if required. Refer to Group 7.
	2. Faulty A/C orifice tube.	2. See A/C Orifice Tube in this group. Replace A/C liquid line if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C orifice tube.	2. See A/C Orifice Tube in this group. Replace A/C liquid line if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: Do not remove radiator cap when engine is hot, personal injury can result.

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to and from the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature		Minimum Floor Outlet Temperature	
Celsius	Fahrenheit	Celsius	Fahrenheit
16°	60°	54°	130°
21°	70°	56°	132°
26°	80°	57°	134°
32°	90°	58°	136°

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Faulty water pump
- Faulty thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake
- Obstructed heater system outlets
- Faulty engine thermostat
- Faulty blower motor system
- Faulty A/C-heater control
- Faulty temperature control cable
- Faulty, obstructed or improperly installed blend-air door

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Faulty A/C-heater control
- Faulty temperature control cable
- Faulty, obstructed or improperly installed blend-air door
- Improper engine coolant temperature

SPECIFICATIONS

A/C SYSTEM

Item	Description	Notes
A/C Compressor	Denso 5SE12C	ND-8 PAG oil
Freeze-up Control	Evaporator temperature sensor	Input to A/C-heater control, HVAC housing mounted, sets compressor to destroke 2° C below evaporator target temperature (minimum 5° C (41° F)) and activates compressor when within 1° C of evaporator target temperature
Low psi Control	A/C pressure transducer	Input to PCM/ECM, discharge line mounted, sets compressor to destroke below 200 kPa (29 psi), activates compressor above 234 -262 kPa (34 - 38 psi)
High psi Control	A/C pressure transducer	Input to PCM/ECM, discharge line mounted - compressor to destroke above 3130 kPa (454 psi) and below 200 kPa (29 psi)
Refrigerant Charge Capacity	Refer to the A/C Underhood Specification Label located in the engine compartment.	R-134a refrigerant

CONTROLS

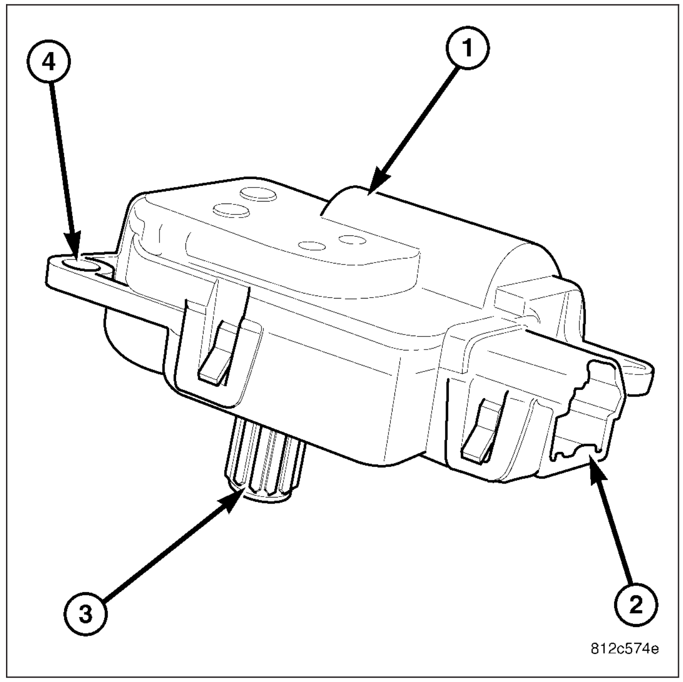

TABLE OF CONTENTS

ACTUATOR-RECIRCULATION DOOR

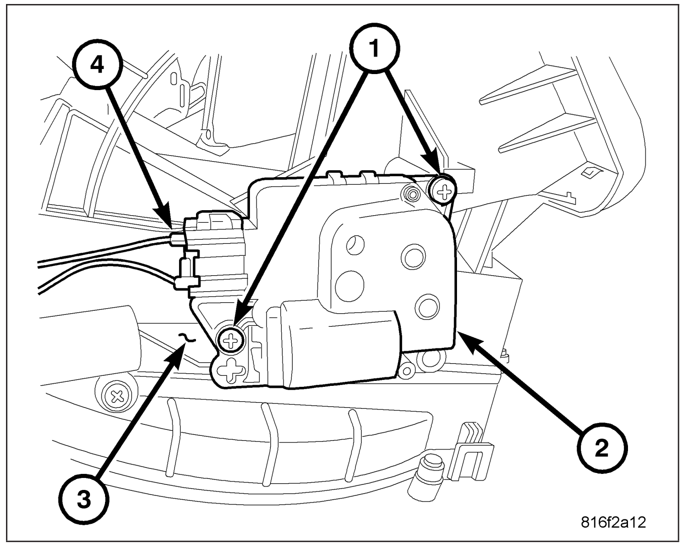
DESCRIPTION

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The recirculation door actuator is located on the right side of the HVAC air inlet housing and is directly connected to the pivot shaft lever of the recirculation-air door.

The recirculation door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (2), an output shaft with splines (3) that connect it to the recirculation door and three integral mounting tabs (4) that allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

OPERATION

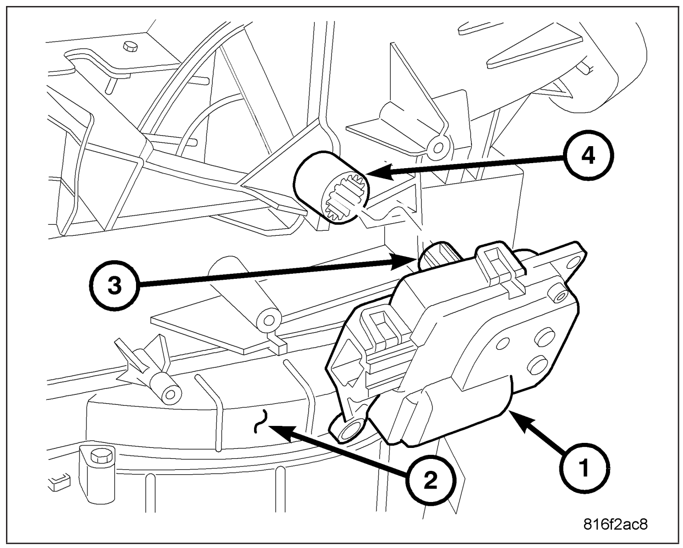
The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the instrument panel wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. Once the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.



The recirculation door actuator cannot be adjusted or repaired and, if faulty or damaged it must be replaced.

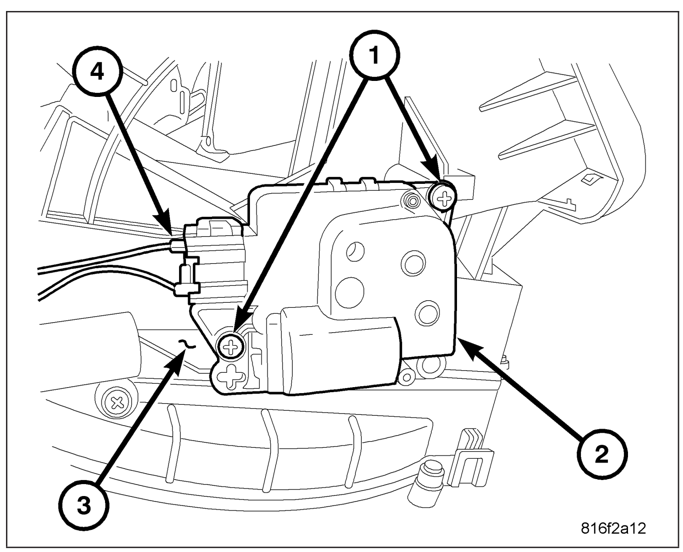
REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.



NOTE: Illustration shown with instrument panel removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - REMOVAL).
3. Reach through glove box opening in the instrument panel and remove the screws (1) that secure the recirculation door actuator (2) to the right side of the HVAC air inlet housing (3).
4. Remove the recirculation door actuator from the air inlet housing and disconnect the wire harness connector (4) from the actuator.
5. Remove the recirculation door actuator from the vehicle.



INSTALLATION

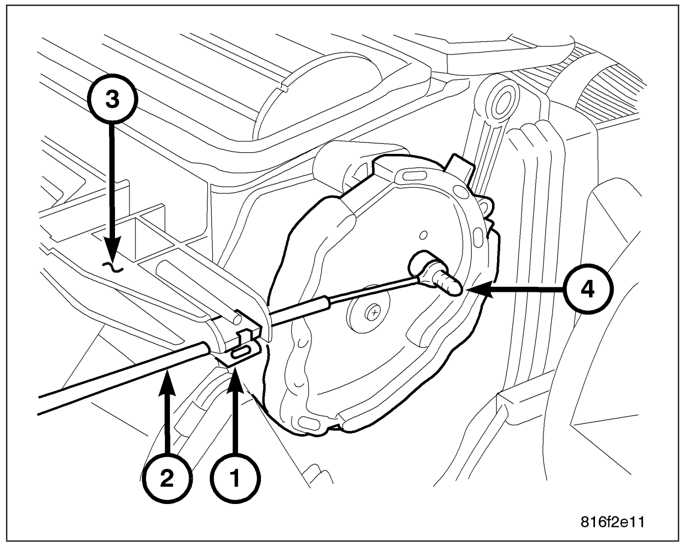
1. Position the recirculation door actuator (1) to the right side of the HVAC air inlet housing (2).
2. Install the recirculation door actuator onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the recirculation door pivot shaft adapter (4).

3. Install the screws (1) that secure the recirculation door actuator (2) to the air inlet housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the instrument panel wire harness connector (4) to the recirculation door actuator.
5. Install the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - INSTALLATION).
6. Reconnect the negative battery cable.

CABLE-MODE DOOR

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.



NOTE: Illustration shown with instrument panel removed for clarity.

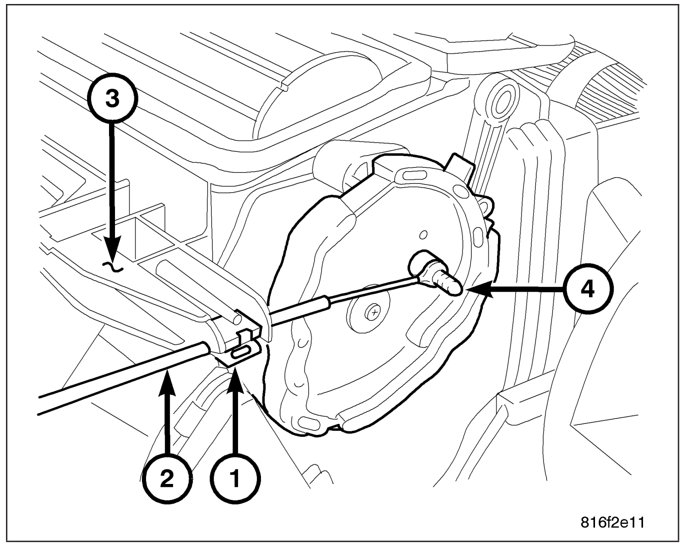
NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.

NOTE: To aid in reinstallation, note the installed position of the mode control cable to the A/C-heater control prior to removal of the cable.

2. Remove the instrument panel center bezel and disconnect the mode control cable from the A/C-heater control (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).
3. On LHD models, remove the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - REMOVAL).
4. Disengage the metal retaining clip (1) that secures the mode control cable (2) from the right side of the HVAC air distribution housing (3).

NOTE: To aid in reinstallation, note the position of the mode control cable as it passes through the instrument panel support prior to removal of the cable.



5. Disconnect the mode control cable from the mode door cam (4) and remove the cable from the vehicle.

INSTALLATION

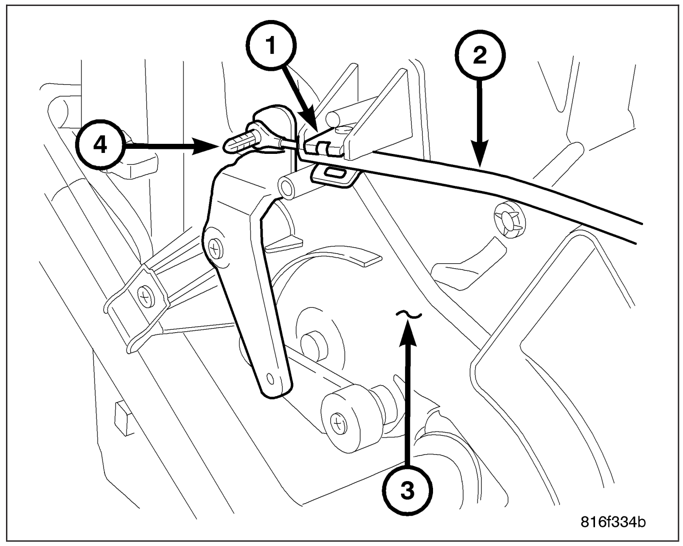
NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Position the mode control cable (2) to the right side of the HVAC air distribution housing (3) through the opening in the instrument panel support.
2. Connect the mode control cable to the mode door cam (4).
3. Engage the metal retaining clip (1) to the right side of the HVAC air distribution housing. Make sure the retaining clip is fully engaged to the housing.
4. Connect the mode door control cable to the A/C-heater control and install the instrument panel center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
5. Visually verify the mode door cam moves from the full defrost position to the full panel position and then back to the full defrost position using the mode control knob on the A/C-heater control. If OK, go to step 10. If not OK, proceed to step 6.

CAUTION: Failure to adjust the mode control cable when required can result in operating modes not being properly obtained.

6. Disengage the mode control cable from the metal retaining clip located on the right side of the HVAC housing.
7. Turn the mode control knob on the A/C-heater control to the full defrost position.
8. Reach behind the instrument panel and turn the mode door cam clockwise until it stops in the full defrost position and engage the mode control cable to the metal retaining clip. Make sure the cam is in the full defrost position and that the cable is fully engaged to the retaining clip.
9. Verify the mode door cam moves from the full defrost position to the full panel position and then back to the full defrost position as selected with the mode control knob on the A/C-heater control. If not, repeat steps 6 thru 9.
10. On LHD models, install the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - INSTALLATION).
11. Reconnect the negative battery cable.



CABLE-TEMPERATURE CONTROL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Illustration shown with instrument panel removed for clarity.

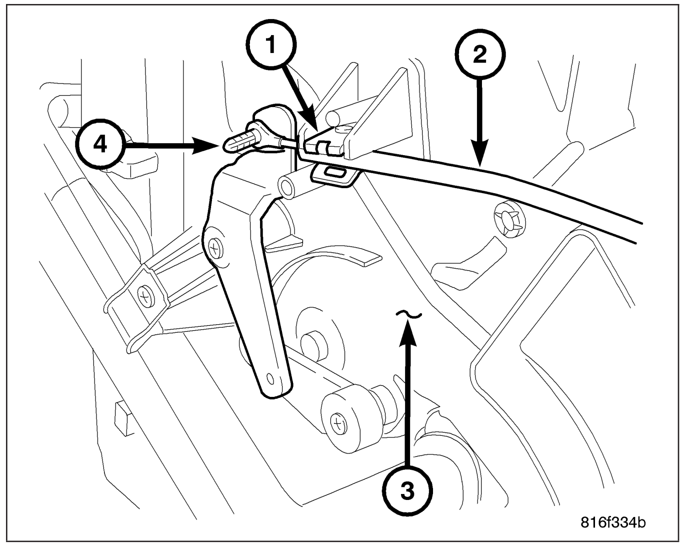
NOTE: LHD model shown. RHD model similar.

1. Disconnect and isolate the negative battery cable.

NOTE: To aid in reinstallation, note the installed position of the temperature control cable to the A/C-heater control prior to removal of the cable.

2. Remove the instrument panel center bezel and disconnect the temperature control cable from the A/C-heater control (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).
3. On RHD models, remove the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - REMOVAL).
4. Disengage the metal retaining clip (1) that secures the temperature control cable (2) from the left side of the HVAC air distribution housing (3).

NOTE: To aid in reinstallation, note the position of the temperature control cable as it passes through the instrument panel support prior to removal of the cable.



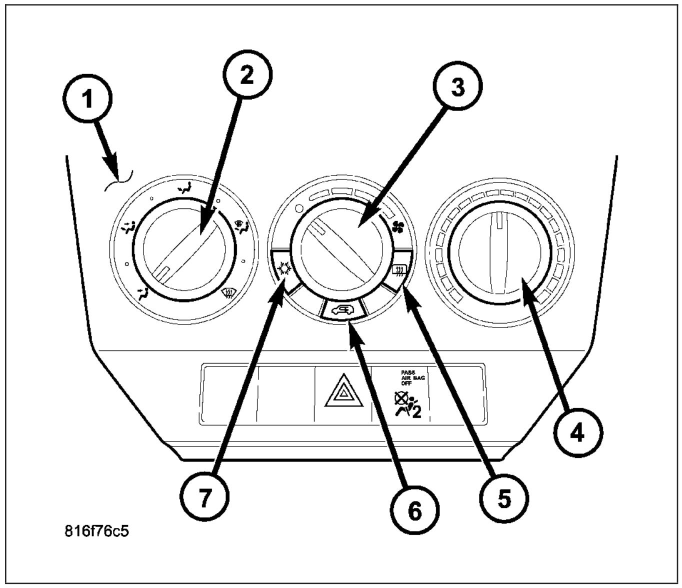
5. Disconnect the temperature control cable from the blend door pivot lever (4) and remove the cable from the vehicle.

INSTALLATION

NOTE: Illustration shown with instrument panel removed for clarity.

NOTE: LHD model shown. RHD model similar.

1. Position the temperature control cable (2) to the left side of the HVAC air distribution housing (3) through the opening in the instrument panel support.
2. Connect the temperature control cable to the blend door pivot lever (4).
3. Engage the metal retaining clip (1) to the left side of the HVAC air distribution housing. Make sure the retaining clip is fully engaged to the housing.
4. Connect the temperature door control cable to the A/C-heater control and install the instrument panel center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
5. Visually verify that the blend door pivot lever moves from the full hot position to the full cold position and then back to the full hot position using the temperature control knob on the A/C-heater control. If OK, go to step 10. If not OK, proceed to step 6.



CAUTION: Failure to adjust the temperature control cable can result in full heating or cooling capabilities not being obtained.

6. Disengage the temperature control cable from the metal retaining clip located on the left side of the HVAC housing.
7. Turn the temperature control knob on the A/C-heater control to the full hot position.
8. Reach behind the instrument panel and move the blend door pivot lever forward until it stops in the full hot position and engage the temperature control cable to the metal retaining clip. Make sure the lever is in the full hot position and that the cable is fully engaged to the retaining clip.
9. Verify that the blend door pivot lever moves from the full hot position to the full cold position and then back to the full hot position, as selected with the temperature control knob on the A/C-heater control. If not, repeat steps 6 thru 9.
10. On RHD models, install the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - INSTALLATION).
11. Reconnect the negative battery cable.

CONTROL-A/C HEATER

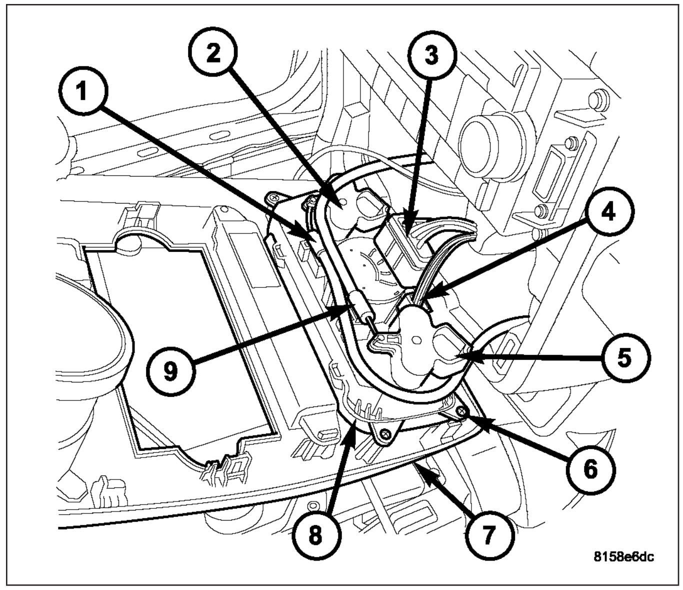
DESCRIPTION

NOTE: Typical A/C-heater control shown.

The A/C-heater control (1) for the manual temperature control (MTC) single zone system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The heating-A/C system uses a combination of electrical and cable operated controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

The A/C-heater control is located in the instrument panel and contains:



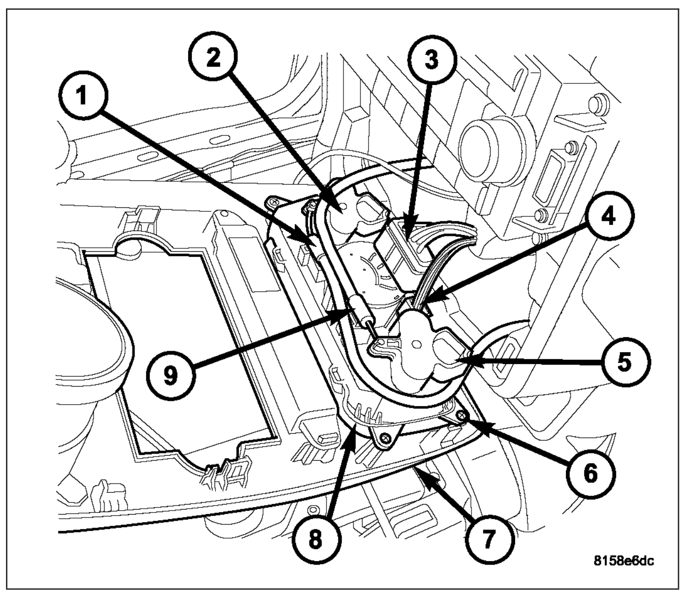
- a rotary control for mode control of the discharged air (2).
- a rotary control for blower motor speed selection and to turn the blower motor off (3).
- a rotary control for temperature control of the discharged air (4).
- a push-button control to turn the rear window defogger system on and off (5).
- a push-button control for recirculation control of the discharged air (6).
- a push-button control to turn the A/C system on and off (7).

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced. The control knobs for the A/C-heater control are available for service replacement.

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: Typical A/C-heater control and center bezel shown.



1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (7) from the instrument panel and disconnect the wiring connector for the clock, power window switches and the accessory switches, as equipped (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).

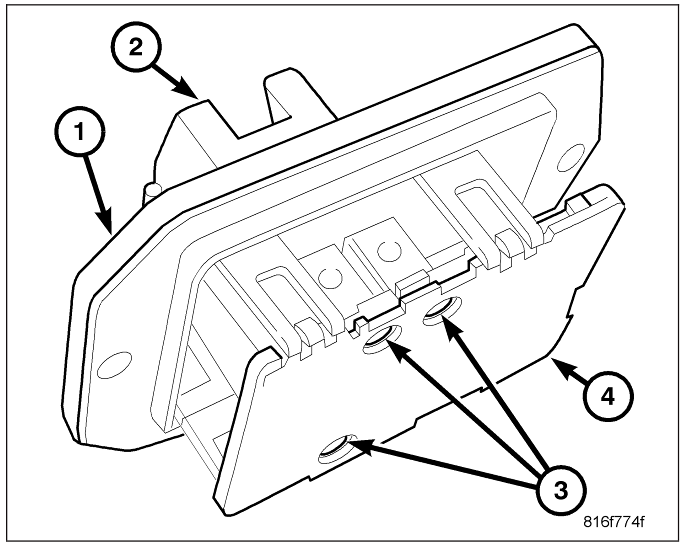
NOTE: To aid in reinstallation, note the installed positions of the control cables prior to removal.

3. Using a small screwdriver or similar tool, disengage the retaining clips that secure the control cables (1 and 9) to the back of the A/C-heater control (8).
4. Using a small screwdriver or similar tool, disengage the retaining clips that secure the control cables to the mode control sector gear (2) and the temperature control sector gear (5).
5. Disconnect the wire harness connectors (3 and 4) from the rear of the A/C-heater control and place the center bezel on a work bench.
6. Remove the four screws (6) that secure the A/C-heater control to the back of the center bezel and remove the control.

INSTALLATION

NOTE: Typical A/C-heater control and center bezel shown.

1. Install the A/C-heater control (8) into the instrument panel center bezel (7).
2. Install the four screws (6) that secure the A/C-heater control to the center bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Position the center bezel to the instrument panel and connect the wire harness connectors (3 and 4) to the back of the A/C-heater control.



NOTE: Install the mode control cable onto the A/C heater control first. Then install the temperature control cable.

4. Connect the control cables (1 and 9) to the mode door control sector gear (2) and the temperature control sector gear (5) and fully engage the retaining clips. Make sure the retaining clips are fully engage to the sector gears.
5. Connect the control cables to the back of the A/C-heater control and fully engage the retaining clips. Make sure the retaining clips are fully engage to the back of the A/C-heater control.
6. Connect the wire harness connectors to the accessory switches, power window switches and clock, as equipped and install the center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - INSTALLATION).
7. Reconnect the negative battery cable.

RESISTOR-BLOWER MOTOR

DESCRIPTION

The blower motor resistor is mounted to the bottom of the HVAC housing on the passenger side of the vehicle. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are resistors (3) located between a two-piece stamped steel base (4).

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The blower motor resistor has three resistors, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control for the heating-A/C system directs the ground path for the blower motor through the correct resistor to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistors. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistors, increasing the blower motor speed. When the blower motor control is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

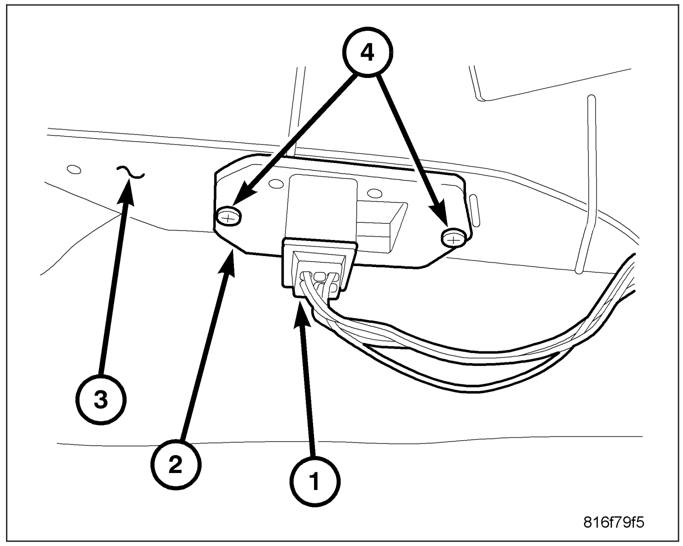
DIAGNOSIS AND TESTING

BLOWER MOTOR RESISTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL).
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

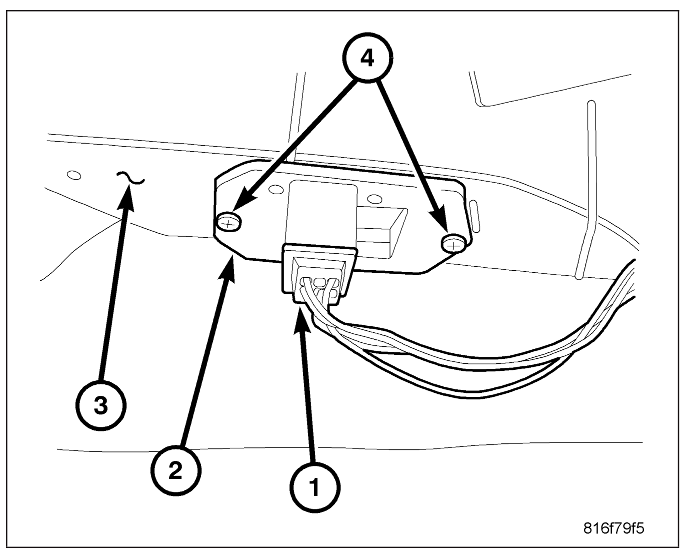


REMOVAL

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

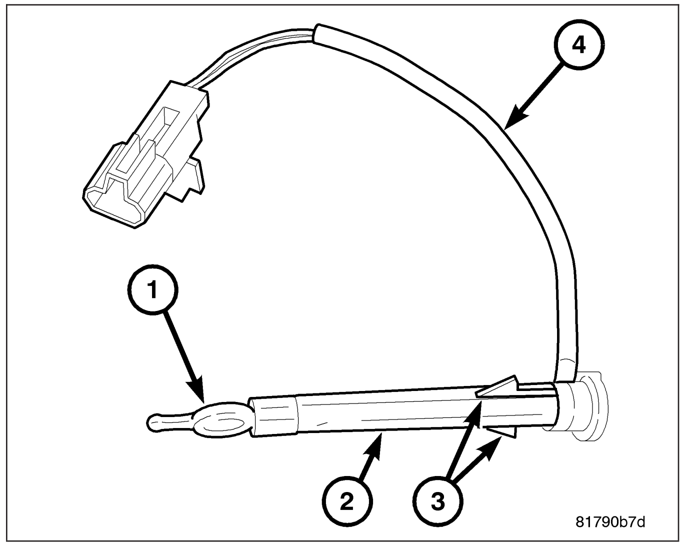
NOTE: LHD model shown. RHD model similar.



1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the blower motor resistor (2) located on the bottom of the passenger side of the HVAC housing (3).
3. Remove the two screws (4) that secure the blower motor resistor to the HVAC housing and remove the resistor.

INSTALLATION

NOTE: LHD model shown. RHD model similar.



1. Position the blower motor resistor (2) onto the bottom of the passenger side of the HVAC housing (3).
2. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor resistor.
4. Reconnect the negative battery cable.

SENSOR-EVAPORATOR TEMPERATURE

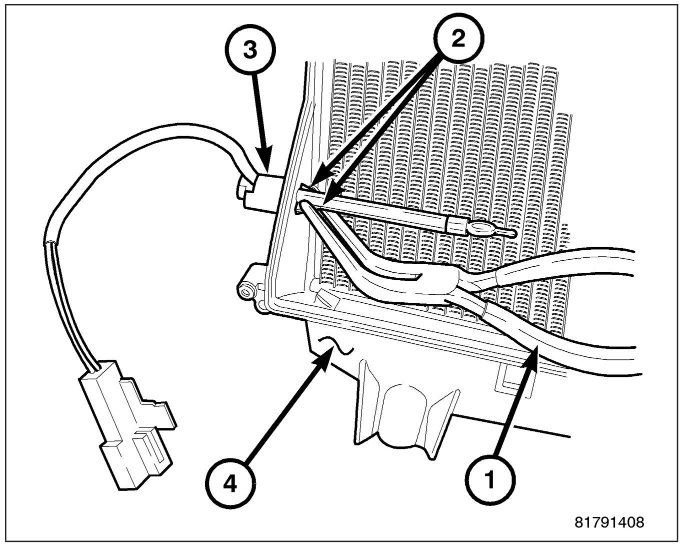
DESCRIPTION

The evaporator temperature sensor measures the temperature of the conditioned air downstream of the A/C evaporator. The evaporator temperature sensor is an electrical thermistor (1) mounted on the end of a molded plastic housing (2) that is inserted into the driver side of the HVAC housing near the coldest point of the A/C evaporator. The evaporator temperature sensor is retained in the HVAC housing by two integral retaining tabs (3) and is connected to the vehicle electrical system by use of a wire lead and connector (4) with two terminals.

OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the monitored voltage reading as an indication of evaporator temperature. The A/C-heater control is programmed to respond to this input by requesting the powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) to adjust the compressor swash plate angle as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - OPERATION for more information).

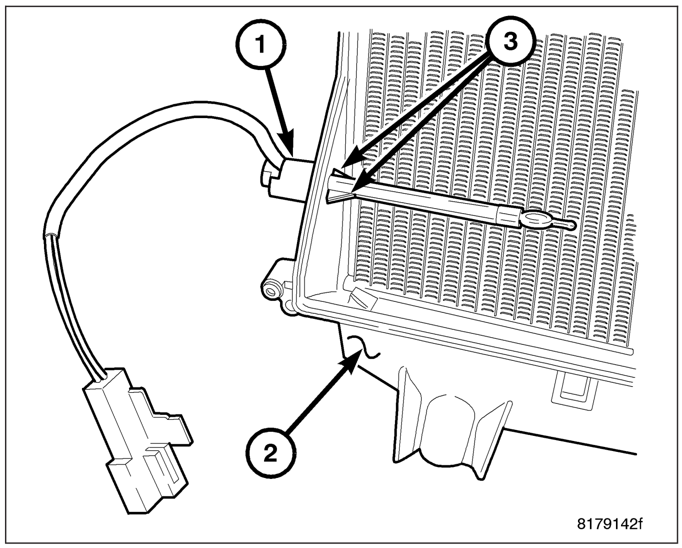


The evaporator temperature sensor is diagnosed using a scan tool (refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REMOVAL

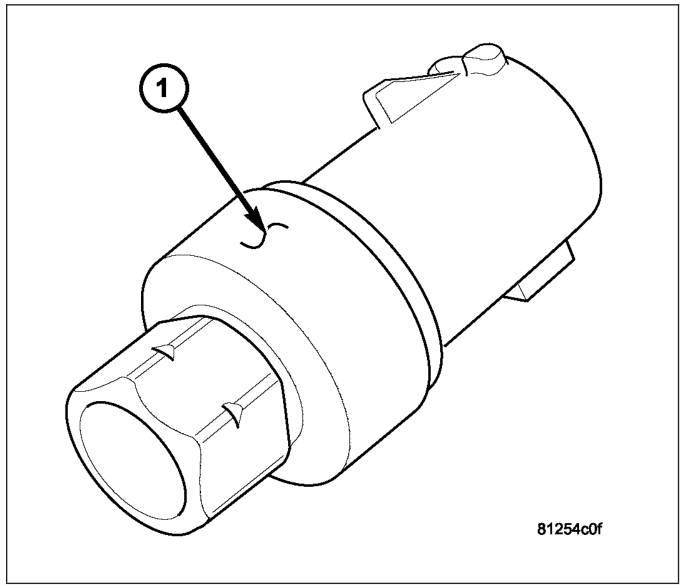
NOTE: LHD model shown. RHD model similar.



1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air distribution housing from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).
3. Using needle nose pliers (1) , disengage the two retaining tabs (2) that secure the evaporator temperature sensor (3) to the driver side of the HVAC housing (4) and remove the sensor.

INSTALLATION

NOTE: LHD model shown. RHD model similar.



1. Install the evaporator temperature sensor (1) into the driver side of the HVAC housing (2). Make sure the retaining tabs (3) are fully engaged to the housing.
2. Install the air distribution housing onto the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).
3. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

TRANSDUCER-A/C PRESSURE

DESCRIPTION

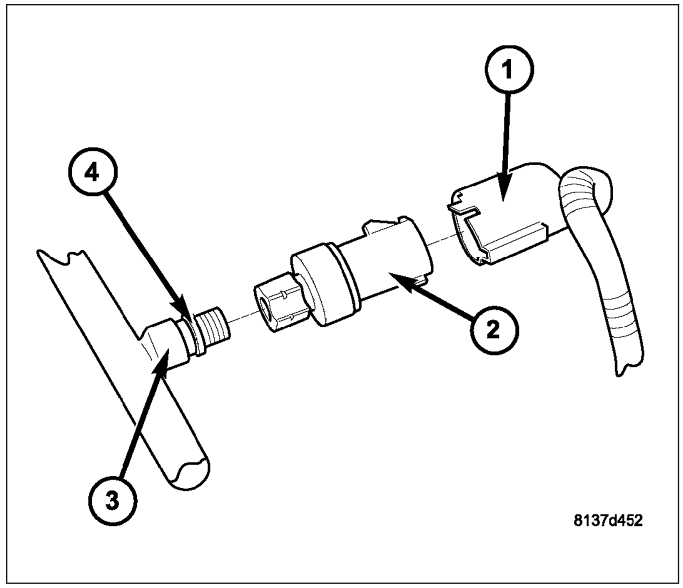
The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C discharge line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C discharge line. A rubber O-ring seals the connection between the A/C pressure transducer and the discharge line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C discharge line and its internal resistance changes in response to the pressures it monitors. The powertrain control module (PCM) or the engine control module (ECM) (depending on engine application) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the transducer on a sensor return circuit to determine refrigerant pressure. The PCM/ECM is programmed to respond to this and other sensor inputs by controlling the operation of the swashplate within the A/C compressor and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM adjusts the swashplate to nearly a zero degree angle (low compressor displacement) when high side pressure rises above 3130 kPa (454 psi) and re-adjusts the swashplate to a greater angle (higher compressor displacement) when high side pressure drops below 1999 kPa (290 psi). The A/C pressure transducer also reduces the swashplate angle if the high side pressure drops below 200 kPa (29 psi) and will increase the swashplate angle when the high side pressure rises above 234 -262 kPa (34 - 38 psi). When the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan.

A Schrader-type valve in the A/C discharge line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The A/C pressure transducer is diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.



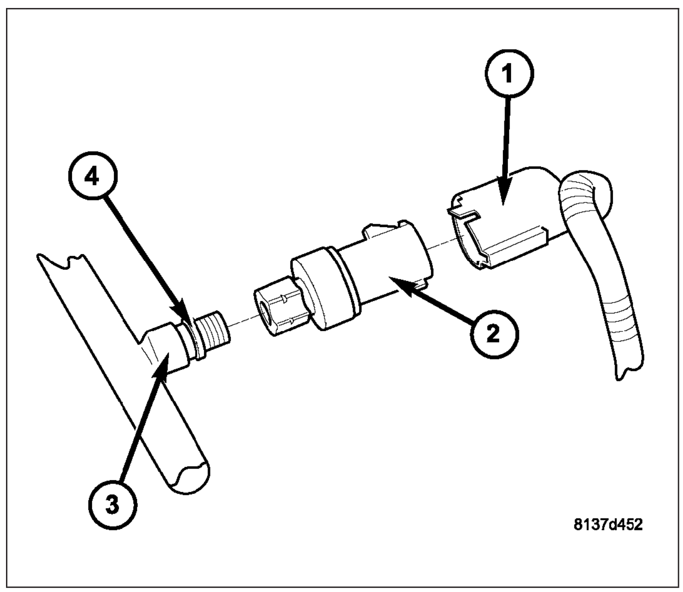
The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged it must be replaced.

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

NOTE: Typical A/C pressure transducer shown.

1. Disconnect and isolate the negative battery cable.
2. Remove the upper radiator closure panel and carefully pull the top of the fascia forward to gain access to the A/C pressure transducer (2) (refer to 23 - BODY/EXTERIOR/CLOSURE PANEL-UPPER RADIATOR - REMOVAL).
3. Reach down through the opening between the A/C condenser and the front fascia and disconnect the wire harness connector (1) from the A/C pressure transducer located on the A/C discharge line (3).
4. Remove the A/C pressure transducer from the fitting on the A/C discharge line and remove and discard the O-ring seal.



INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

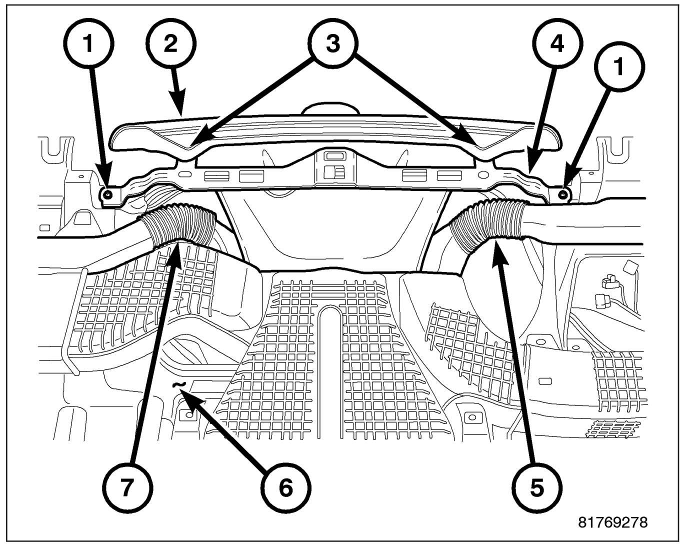
NOTE: Typical A/C pressure transducer shown.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the discharge line fitting (3).
2. Install the A/C pressure transducer (2) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Install the upper radiator closure panel (refer to 23 - BODY/EXTERIOR/CLOSURE PANEL-UPPER RADIATOR - INSTALLATION).
5. Reconnect the negative battery cable.

DISTRIBUTION

TABLE OF CONTENTS

DUCT-DEFROSTER



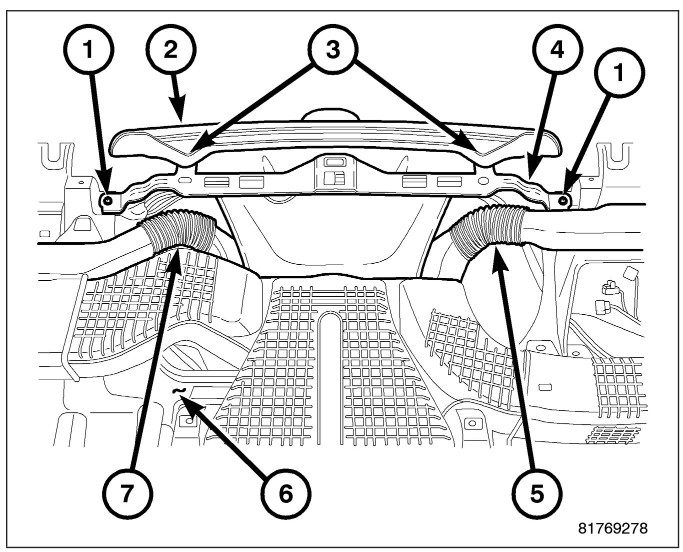
REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: LHD model shown. RHD model similar.

NOTE: Illustration shown with instrument panel removed from vehicle for clarity.

1. Remove the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
2. Disconnect the left demister duct (7) and the right demister duct (5) from the defroster duct (2).
3. Remove the two screws (3) that secure the defroster duct to the defroster duct support (4).
4. Remove the two screws (1) that secure the defroster duct support to the instrument panel (6) and position the support out of the way.
5. Remove the defroster duct from the instrument panel.



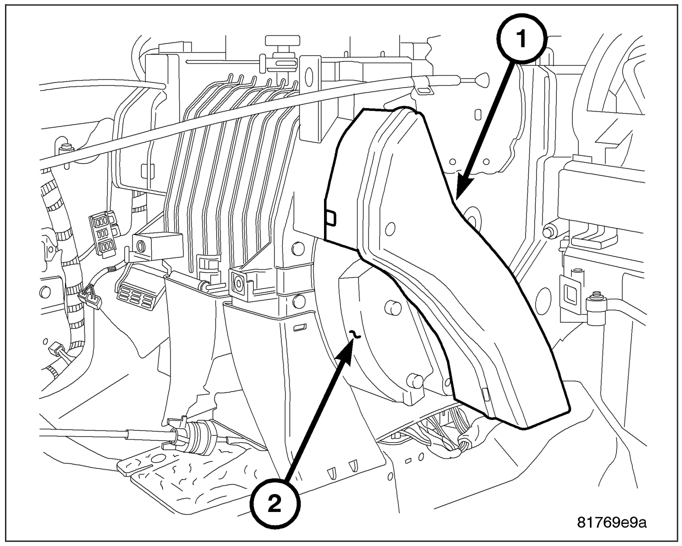
INSTALLATION

NOTE: LHD model shown. RHD model similar.

NOTE: Illustration shown with instrument panel removed from vehicle for clarity.

1. Position the defroster duct (2) to the front of the instrument panel (6).
2. Reposition the defroster duct support (4) to the instrument panel and install the two retaining screws (1). Tighten the screws to 3 N·m (27 in. lbs.).
3. Install the two screws (3) that secure the defroster duct to the defroster duct support. Tighten the screws to 2.2 N·m (20 in. lbs.).
4. Connect the left demister duct (7) and the right demister duct (5) to the defroster duct.
5. Install the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

DUCTS-FLOOR DISTRIBUTION



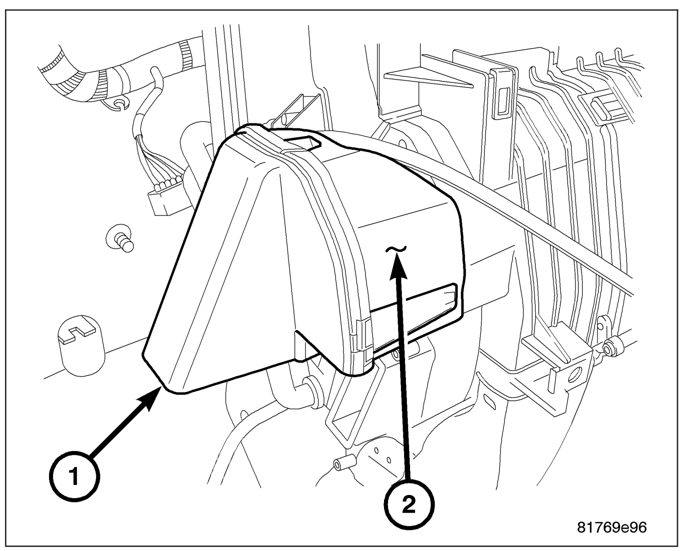
REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

RIGHT FRONT FLOOR DUCT

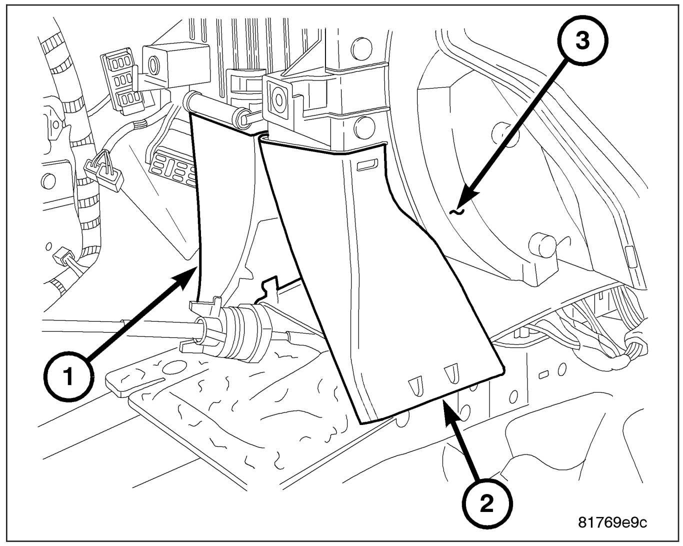
NOTE: LHD model shown. RHD model similar.

1. Remove the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - REMOVAL).
2. Disconnect the right floor duct (1) from the right side of the HVAC housing (2) and remove the duct.



LEFT FRONT FLOOR DUCT

NOTE: Illustration shown with instrument panel removed for clarity.

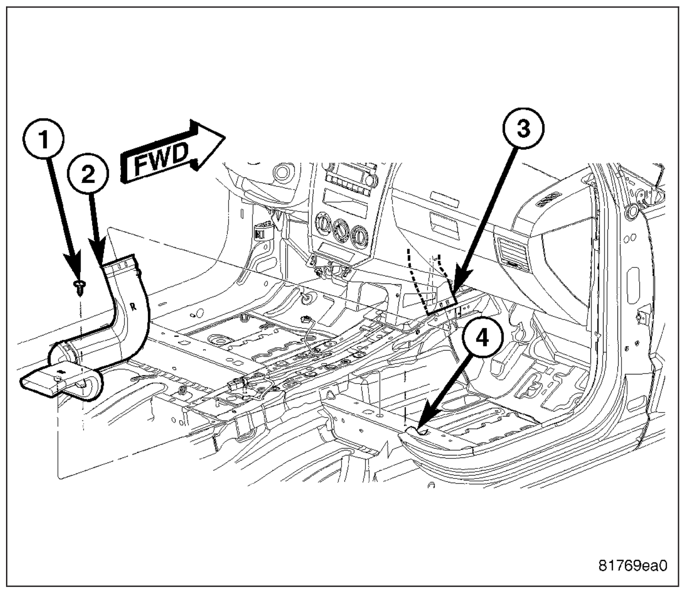


NOTE: LHD model shown. RHD model similar.

1. On LHD models, remove the steering column opening cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-STEERING COLUMN OPENING - REMOVAL).
2. On RHD models, remove the instrument panel cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-INSTRUMENT PANEL - REMOVAL).
3. Remove the screw that secures the left floor distribution duct (1) to the left side of the HVAC housing (2) and disconnect the duct from the housing outlet.

REAR FLOOR DISTRIBUTION DUCTS

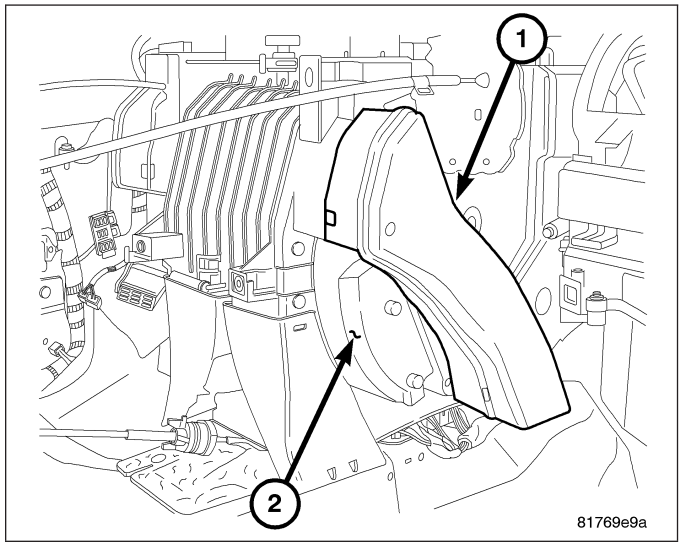
1. Remove the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - REMOVAL).
2. Remove the rear seat floor ducts (refer to REAR SEAT FLOOR DUCTS in this group).
3. Disconnect the left rear floor distribution duct (1) and the right rear floor distribution duct (2) as required from the HVAC housing (3) and remove the duct(s).



REAR SEAT FLOOR DUCTS

NOTE: Right side rear floor duct shown. Left side duct similar.

NOTE: LHD model shown. RHD model similar.

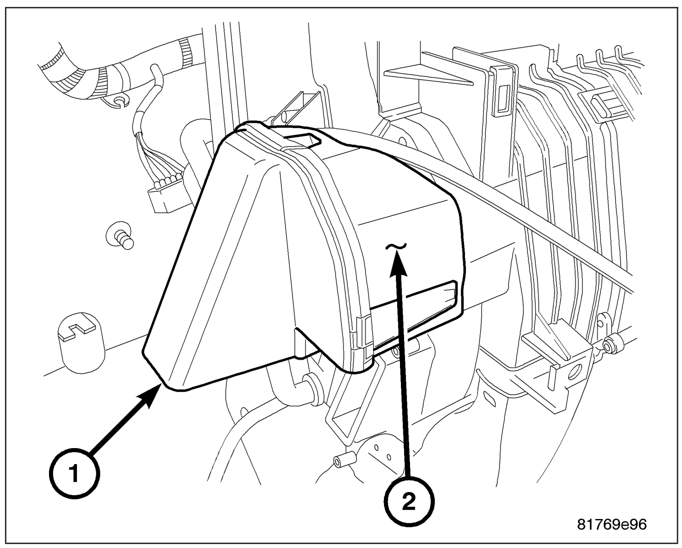


1. Remove the center floor console (refer to 23 - BODY/INTERIOR/CONSOLE-CENTER - REMOVAL).
2. Remove the front seat from the side of the vehicle being serviced (refer to 23 - BODY/SEATS/SEAT-FRONT - REMOVAL).
3. Pull the carpet back to gain access to the rear seat floor duct (2) (refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL).
4. Remove the screw (1) and disengage the retainer that secures the rear seat floor duct to the floor support (4).
5. Disconnect the rear seat floor duct from the rear floor distribution duct (3) and remove the rear seat duct(s).

INSTALLATION

RIGHT FRONT FLOOR DUCT

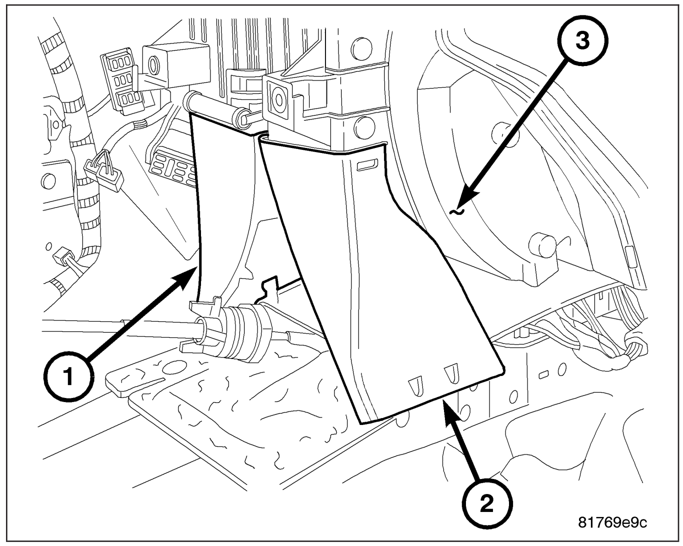
NOTE: LHD model shown. RHD model similar.



1. Connect the right front floor duct (1) to the right side of the HVAC housing (2). Make sure the duct is fully engaged to the housing.
2. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - INSTALLATION).

LEFT FRONT FLOOR DUCT

NOTE: Illustration shown with instrument panel removed for clarity.

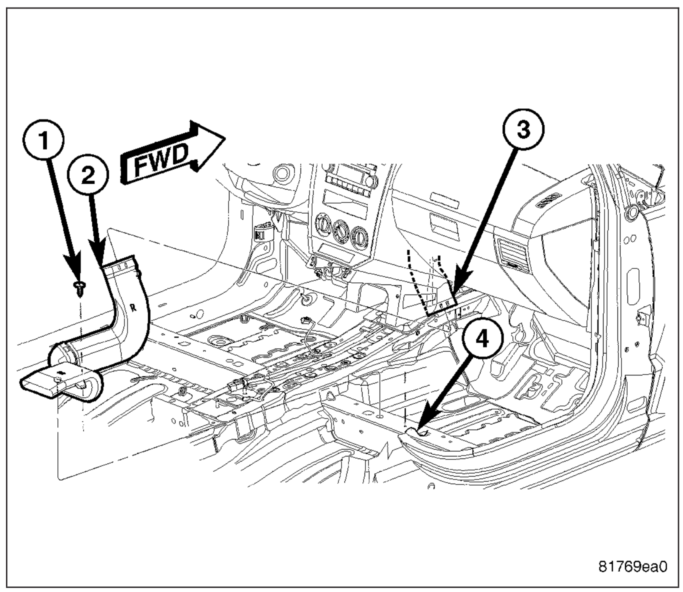


NOTE: LHD model shown. RHD model similar.

1. Connect the left front floor duct (1) to the left side of the HVAC housing (2). Make sure the duct is fully engaged to the housing.
2. Install the screw that secures the left front floor duct to the left side of the HVAC housing. Tighten the screw to 2 N·m (17 in. lbs.).
3. On LHD models, install the steering column opening cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-STEERING COLUMN OPENING - INSTALLATION).
4. On RHD models, install the instrument panel cover (Refer to 23 - BODY/INSTRUMENT PANEL/COVER-INSTRUMENT PANEL - INSTALLATION).

REAR FLOOR DISTRIBUTION DUCTS

1. Connect the left rear floor distribution duct (1) and the right rear floor distribution duct (2) as required to the HVAC housing (3). Make sure the ducts are fully engaged to the housing.
2. Install the rear seat floor ducts (refer to REAR SEAT FLOOR DUCTS in this group).
3. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - INSTALLATION).



REAR SEAT FLOOR DUCTS

NOTE: Right side rear floor duct shown. Left side duct similar.

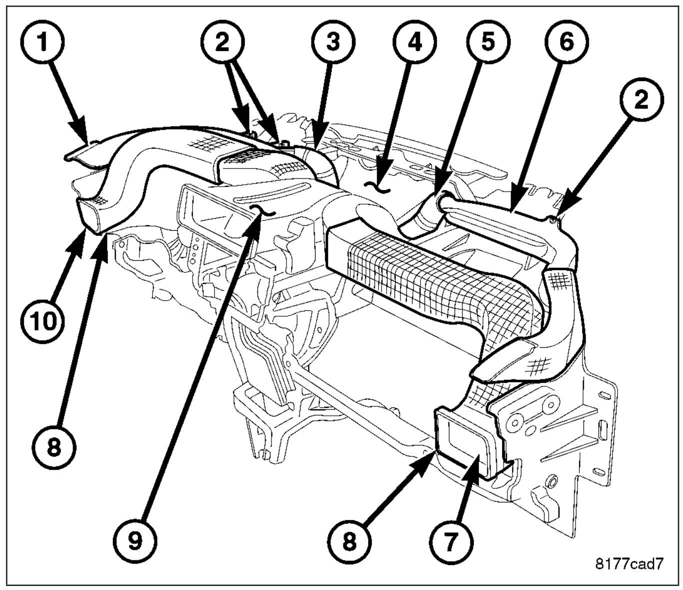
NOTE: LHD model shown. RHD model similar.

1. Connect the rear seat floor duct (2) to the rear floor distribution duct (3). Make sure the ducts are fully engaged to each other.
2. Engage the retainer that secures the rear seat floor duct to the floor support (4) and install the retaining screw (1). Tighten the screw to 2.2 N·m (20 in. lbs.).
3. Reinstall the carpet (refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).
4. Install the front seat to the side of the vehicle being serviced (refer to 23 - BODY/SEATS/SEAT-FRONT - INSTALLATION).
5. Install the center floor console (refer to 23 - BODY/INTERIOR/CONSOLE-CENTER - INSTALLATION).

DUCT-INSTRUMENT PANEL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

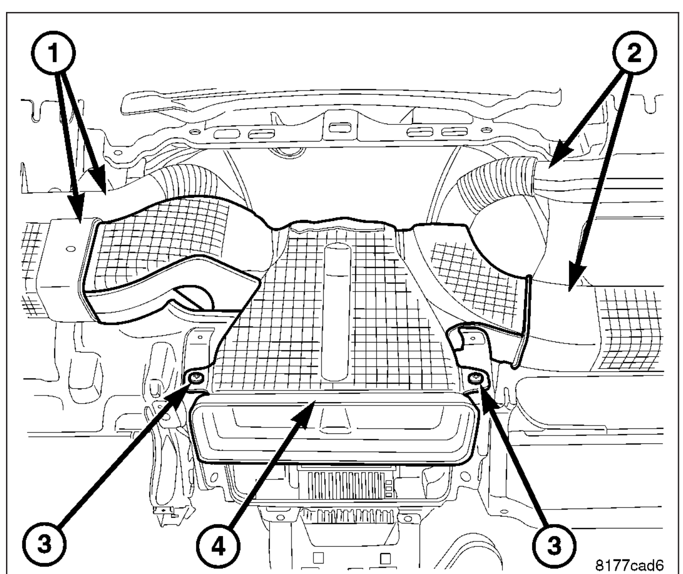


NOTE: Illustrations shown with instrument panel removed from vehicle for clarity.

LEFT AND RIGHT SIDE DUCT

NOTE: The left and right side instrument panel ducts are serviced only as an assembly with the left or right side demister duct.

NOTE: LHD model shown. RHD model similar.

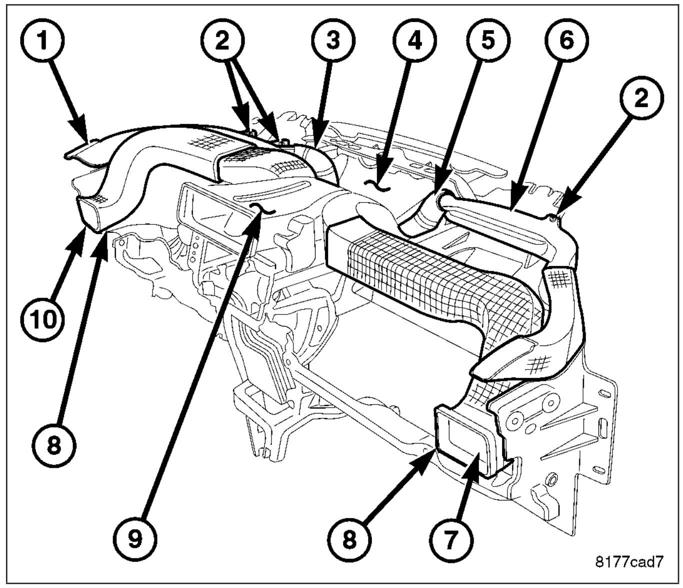


1. Remove the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
2. Disconnect the left side demister hose (3) and right side demister hose (5) from the defroster duct (4).
3. Remove the screws (2) that secure each demister duct (1 and 6) to the instrument panel support.
4. Remove the push-pin fastener (8) that secures each instrument panel duct (7 and 10) to the instrument panel support.
5. Disconnect the left and right side instrument panel ducts from the center duct (9).
6. Remove the each instrument panel duct and demister duct as an assembly from the instrument panel.

CENTER DUCT

NOTE: LHD model shown. RHD model similar.

1. Remove the left and right side instrument panel and demister ducts (1 and 2) (refer to LEFT AND RIGHT SIDE DUCT).
2. Remove the two screws (3) that secure the center instrument panel duct (4) to the instrument panel support.
3. Rotate and tilt the center duct as necessary to remove it from the instrument panel.

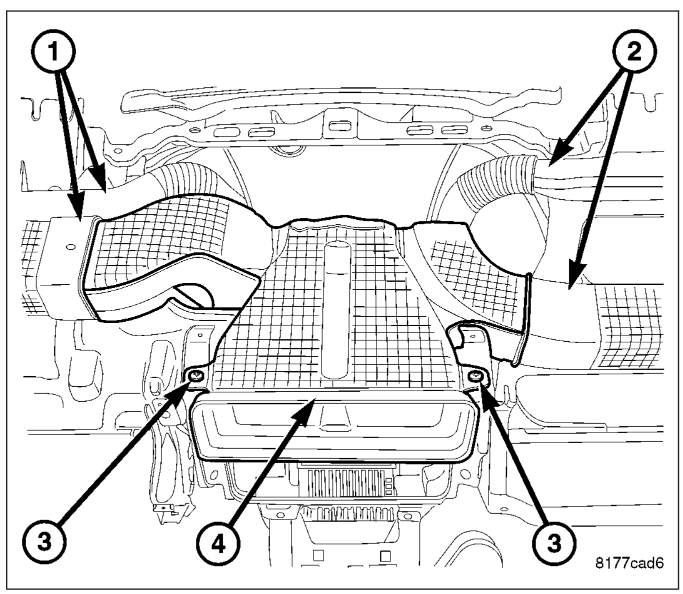


INSTALLATION

NOTE: Illustrations shown with instrument panel removed from vehicle for clarity.

LEFT AND RIGHT SIDE DUCT

NOTE: The left and right side instrument panel ducts are serviced only as an assembly with the left or right side demister duct.



NOTE: LHD model shown. RHD model similar.

1. Position the left and right side instrument panel ducts (7 and 10) and the left and right side demister ducts (1 and 6) onto the top of the instrument panel as assemblies.
2. Connect the left and right side instrument panel ducts to the center duct (9). Make sure the ducts are fully engaged to each other.
3. Install the push-pin fastener (8) that secures each instrument panel duct to the instrument panel support.
4. Install the screws (2) that secure each demister duct to the instrument panel support. Tighten the screws to 2.2 N·m (20 in. lbs.).
5. Connect the left and right side demister hoses (3 and 5) to the defroster duct (4). Make sure the hoses are fully engaged to the defroster and demister ducts.
6. Install the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

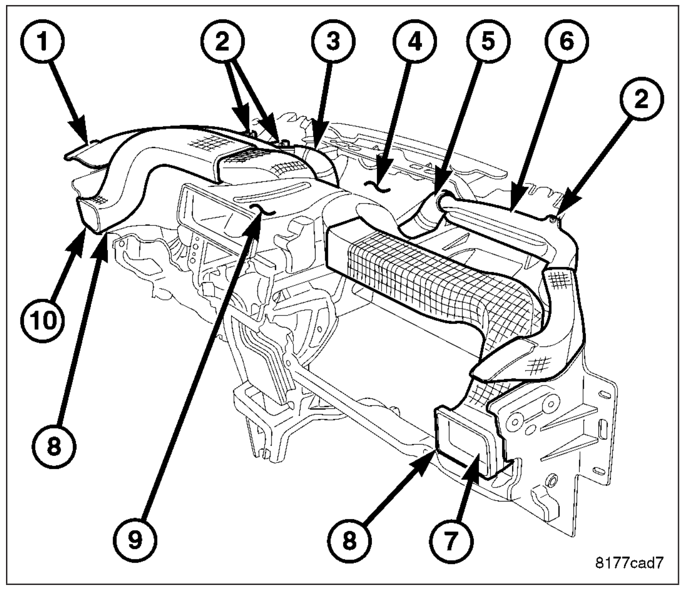
CENTER DUCT

NOTE: LHD model shown. RHD model similar.

1. Position the center instrument panel duct (2) onto the top of instrument panel. Rotate and tilt the duct as necessary.
2. Install the two screws (3) that secure the center duct to the instrument panel support. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Install the left and right side instrument panel and demister ducts (1 and 2) (refer to LEFT AND RIGHT SIDE DUCT).

DUCT-INSTRUMENT PANEL DEMISTER

REMOVAL



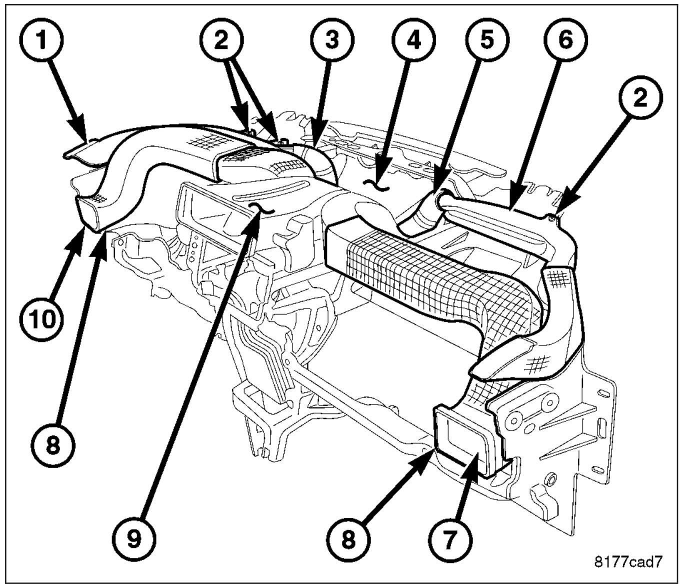
WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The left and right side demister ducts are serviced only as an assembly with the left or right side instrument panel duct.

NOTE: Illustration shown with instrument panel removed from vehicle for clarity.

NOTE: LHD model shown. RHD model similar.

1. Remove the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
2. Disconnect the left side demister hose (3) and right side demister hose (5) from the defroster duct (4).
3. Remove the screws (2) that secure each demister duct (1 and 6) to the instrument panel support.
4. Remove the push-pin fastener (8) that secures each instrument panel duct (7 and 10) to the instrument panel support.
5. Disconnect the left and right side instrument panel ducts from the center duct (9).
6. Remove the each demister duct and instrument panel duct as an assembly from the instrument panel.

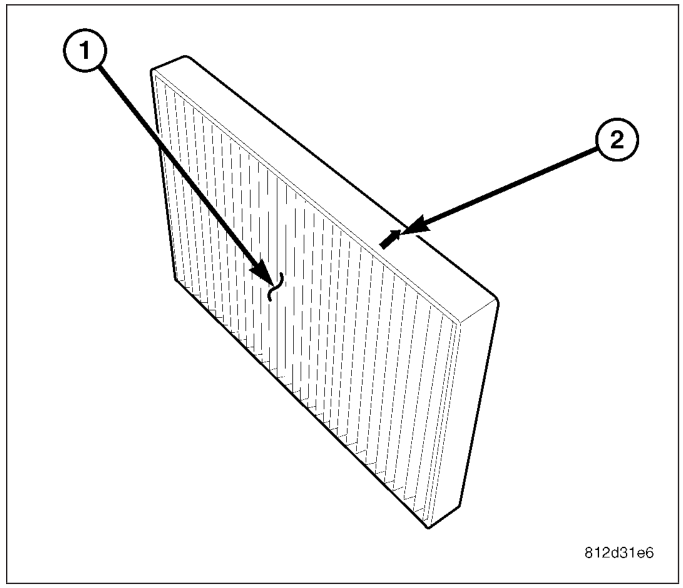


INSTALLATION

NOTE: The left and right side demister ducts are serviced only as an assembly with the left or right side instrument panel duct.

NOTE: Illustration shown with instrument panel removed from vehicle for clarity.

NOTE: LHD model shown. RHD model similar.

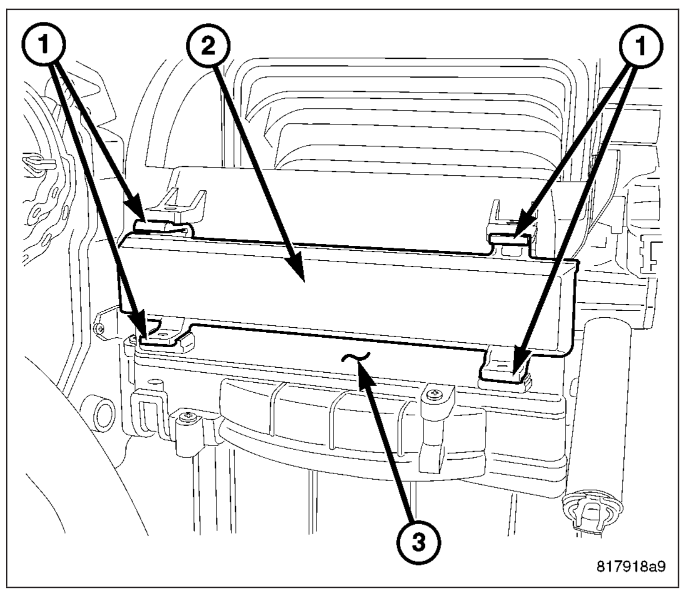


1. Position the left and right side demister ducts (1 and 6) and the left and right side instrument panel ducts (7 and 10) onto the top of the instrument panel as assemblies.
2. Connect the left and right side instrument panel ducts to the center duct (9). Make sure the ducts are fully engaged to each other.
3. Install the push-pin fastener (8) that secures each instrument panel duct to the instrument panel support.
4. Install the screws (2) that secure each demister duct to the instrument panel support. Tighten the screws to 2.2 N·m (20 in. lbs.).
5. Connect the left and right side demister hoses (3 and 5) to the defroster duct (4). Make sure the hoses are fully engaged to the defroster and demister ducts.
6. Install the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

FILTER-PARTICULATE AIR

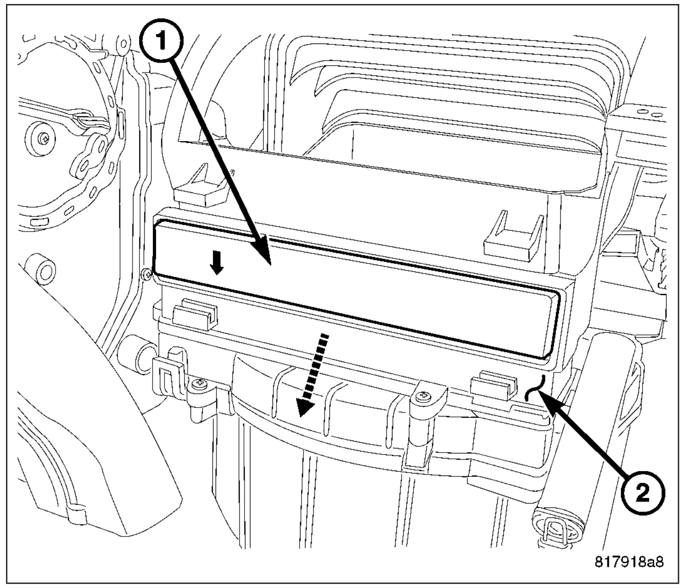
DESCRIPTION

Some models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the passenger compartment, behind the glove box bin.



The filter should be replaced at least once a year or every 24,000 km (15,000 miles) and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with an arrow (2) to indicate the direction of air flow through the filter.

REMOVAL

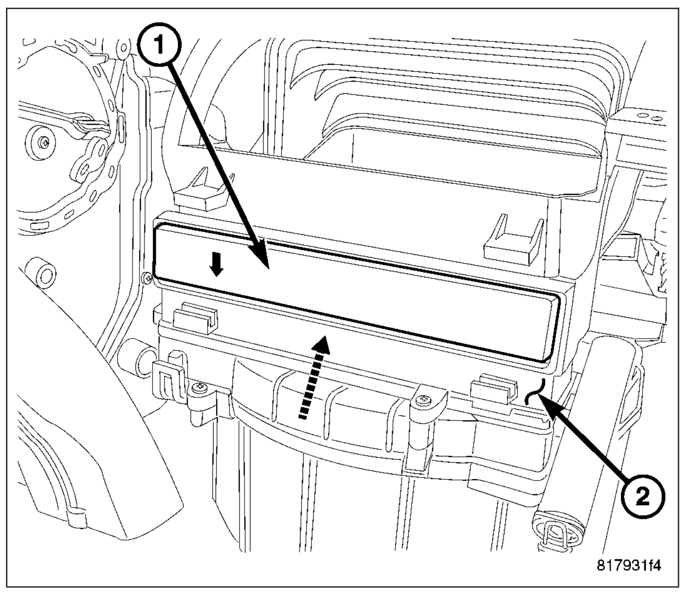


NOTE: LHD model shown in illustrations. RHD model similar.

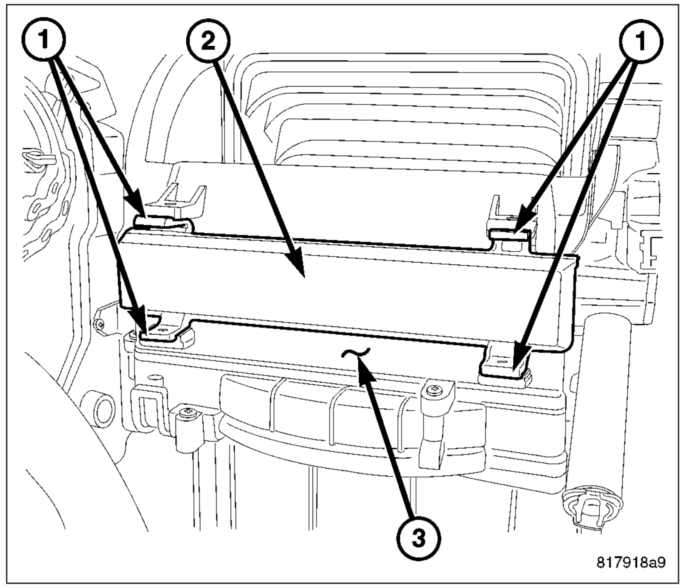
NOTE: Illustration shown with instrument panel removed for clarity.

1. Remove the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - REMOVAL).
2. Disengage the four retaining tabs (1) that secure the particulate air filter cover (2) to the passenger side of the HVAC housing (3) and remove the cover.

3. Remove the particulate air filter (1) from the HVAC housing (2) by pulling the filter element straight out of the housing.



INSTALLATION

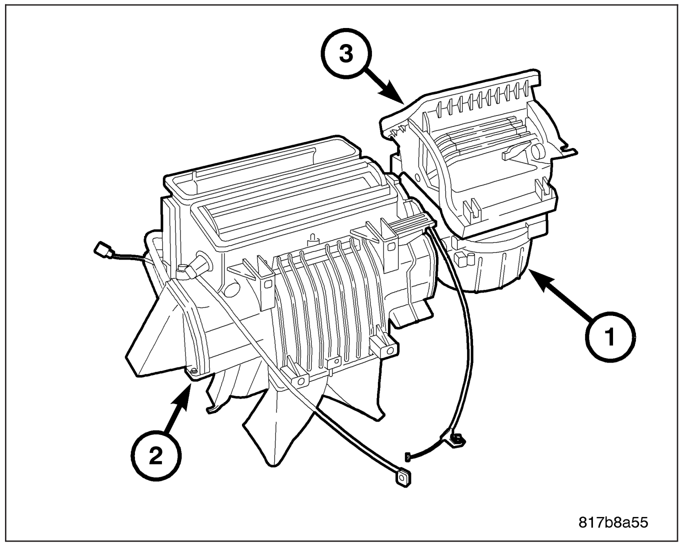


NOTE: The particulate air filter is labeled with an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.

1. Install the particulate air filter (1) into the filter opening in the HVAC housing (2). Insert the particulate air filter directly into the housing with the arrow on the filter pointing to the floor.

2. Position the particulate air filter cover (2) to the HVAC housing (3) and engage the four retaining tabs (1) that secure the cover to the housing. Make sure the retaining tabs are fully engaged.
3. Install the glove box bin (refer to 23 - BODY/INSTRUMENT PANEL/BIN-GLOVE BOX - INSTALLATION).



HOUSING-HVAC

DESCRIPTION

NOTE: LHD model shown RHD model similar.

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

- **HVAC housing** — The HVAC housing (1) is mounted to the dash panel behind the instrument panel and contains the A/C evaporator. The HVAC housing consists of a upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, blower motor and the air distribution housing.
- **Air distribution housing** — The air distribution housing (2) is mounted to the rear of the HVAC housing and contains the heater core, blend-air and mode-air doors and door linkage.
- **Air inlet housing** — The air inlet housing (3) is mounted to the passenger side end of the HVAC housing. The air inlet housing contains the recirculation-air door and actuator when equipped with A/C.

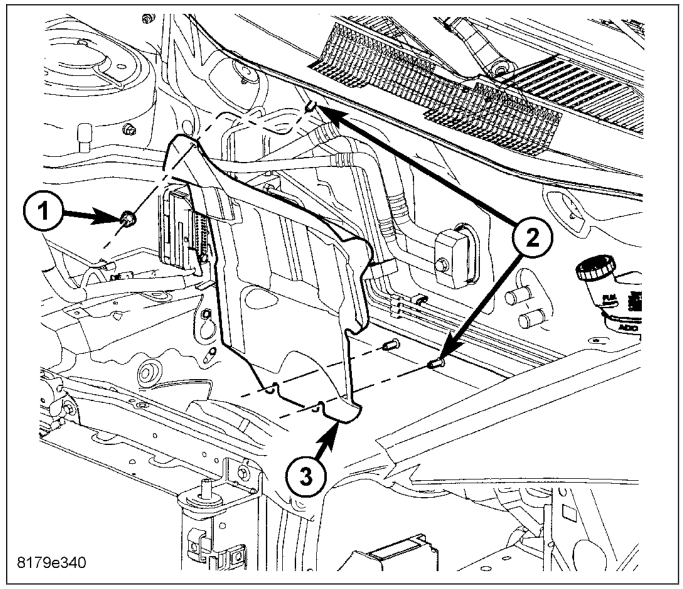
The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the temperature control cable, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door cable operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. When equipped with A/C, the recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric recirculation door actuator and the blower motor are connected to the vehicle electrical system by the instrument panel wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor, which is located in the dash panel in the engine compartment.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

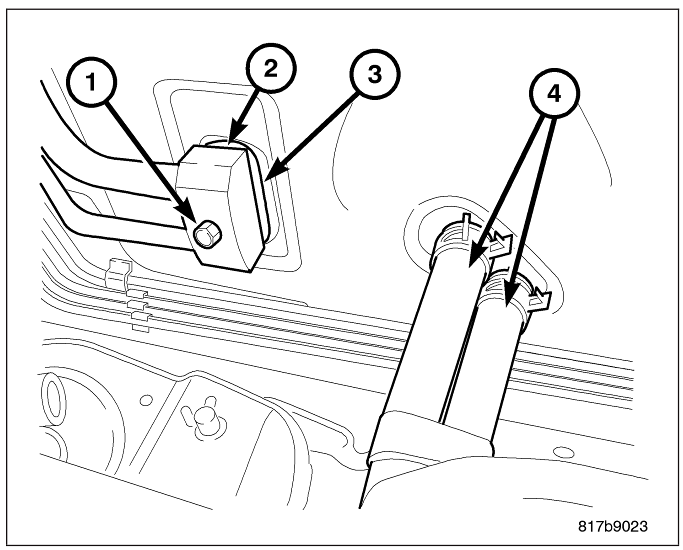
REMOVAL

HOUSING-HVAC



WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

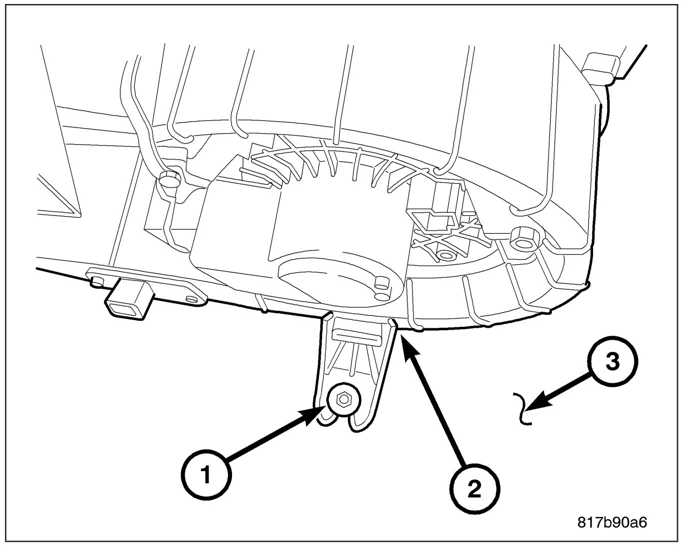
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.



NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the heater core, A/C evaporator, air intake housing and the mode-air and blend-air doors.

NOTE: LHD model shown in illustrations. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Partially drain the engine cooling system (refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE - DRAINING COOLING SYSTEM).
4. Remove the three nuts (1) that secure the heat shield (3) to the studs (2) located on the dash panel in the engine compartment and remove the heat shield.



5. Remove the bolt (1) that secures the A/C liquid and suction line assembly (2) to the A/C evaporator (3).
6. Disconnect the A/C liquid and suction line assembly from the A/C evaporator and remove and discard the dual-plane seals.
7. Install plugs in, or tape over the opened refrigerant line fittings and the evaporator ports.
8. Disconnect the heater hoses (4) from the heater core tubes. Install plugs in, or tape over the opened heater core tubes to prevent coolant spillage during housing removal.

NOTE: Make sure to remove the five bolts that secure the HVAC housing to the instrument panel support prior to removing the instrument panel from the vehicle.

9. Remove the instrument panel (refer to 23 - BODY/ INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - REMOVAL).
10. Remove the rear floor ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ DUCTS-FLOOR DISTRIBUTION - REMOVAL).
11. Remove the condensation drain tube (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ TUBE-CONDENSATION DRAIN - REMOVAL).
12. Remove the nut (1) that secures the passenger side of the HVAC housing (2) to the dash panel (3).

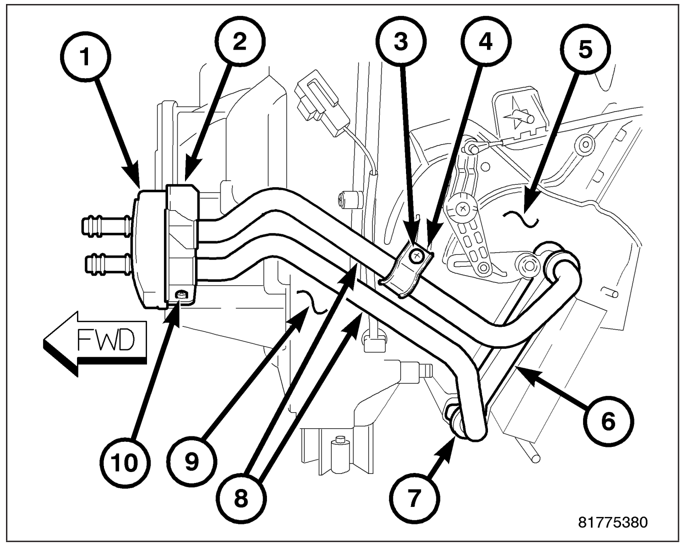
NOTE: Use care to ensure that the interior is covered in case of loss of residual fluids from the heater and evaporator cores.

13. Pull the HVAC housing rearward and remove the HVAC housing assembly from the passenger compartment.

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

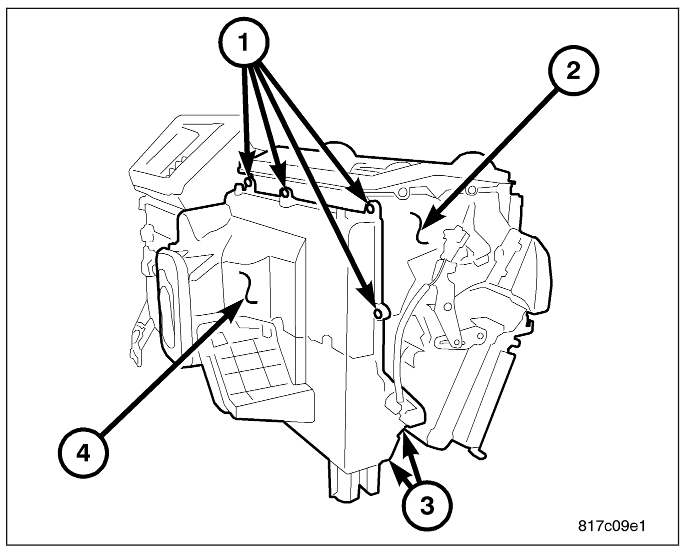


NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove all of the floor distribution ducts from the air distribution housing (5) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.



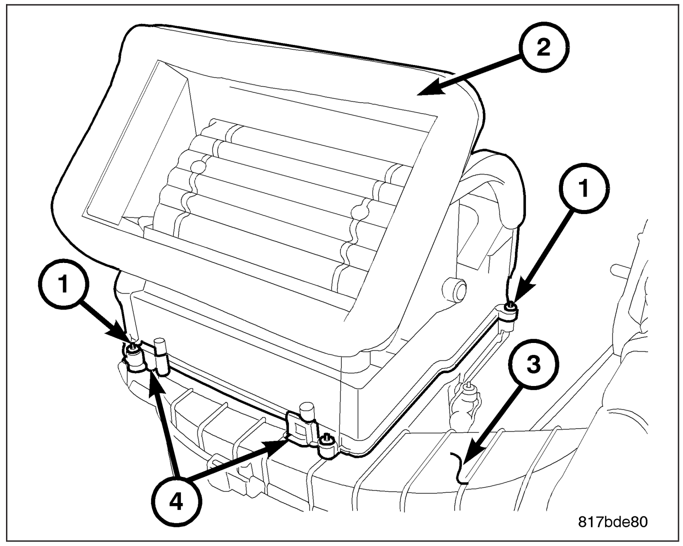
3. Remove the foam seal (1) from the flange (2) located on the front of the HVAC housing (9).
4. Remove the screw (10) that secures the flange to the front of the HVAC housing and remove the flange.

5. Remove the screw (3) that secures the retaining bracket (4) for the heater core tubes (8) to the left side of the air distribution housing.
6. On RHD models, remove the air distribution housing from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL)
7. Carefully pull the heater core (6) out of the driver side of the air distribution housing.

NOTE: Illustration shown with heater core and tubes removed from view for clarity.

8. Remove the two metal retaining clips (3) that secure the bottom of air distribution housing (2) to the HVAC housing (4).
9. Remove the seven screws (1) that secure the air distribution housing to the rear of the HVAC housing.
10. Remove the air distribution housing from the rear of the HVAC housing.
11. If required, disassemble the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - DISASSEMBLY).

HOUSING-AIR INLET

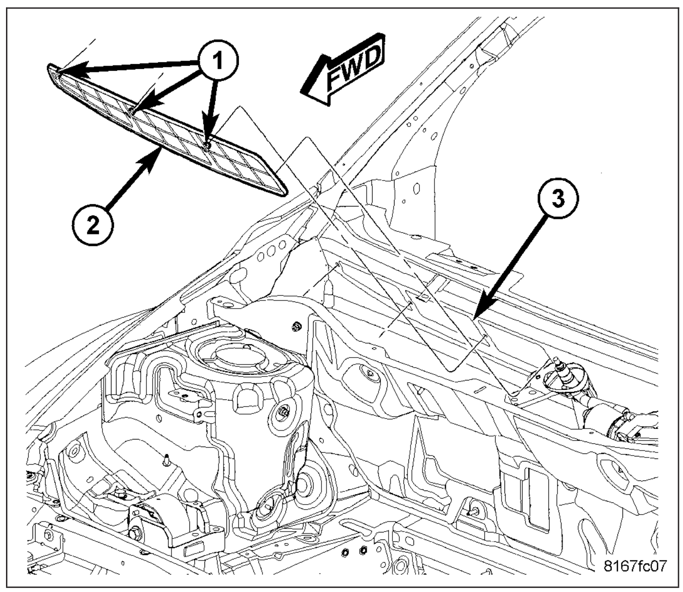


WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

NOTE: LHD model with A/C shown. RHD and heater-only models similar.

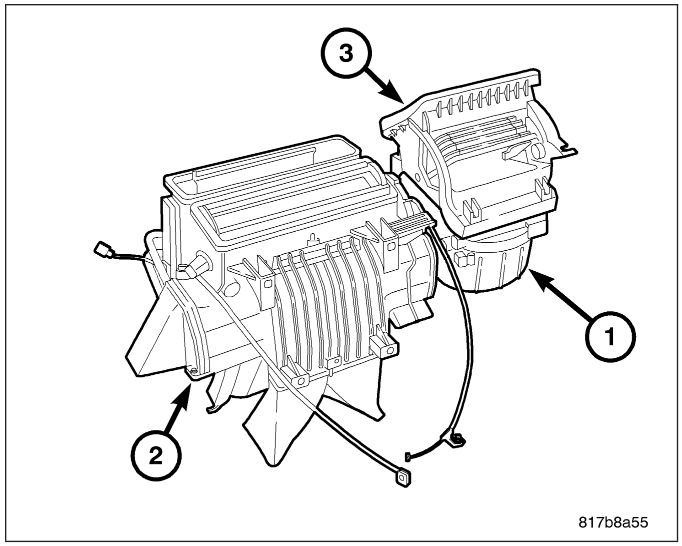


1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. If equipped, remove the particulate air filter (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FILTER-PARTICULATE AIR - REMOVAL).
3. Remove the four screws (1) that secure the air inlet housing (2) to the top of the HVAC housing (3).
4. Disengage the two plastic retaining tabs (4) that secure the air inlet housing to the HVAC housing and remove the inlet housing from the HVAC housing.
5. If required, disassemble the air inlet housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - DISASSEMBLY).

SCREEN-AIR INLET

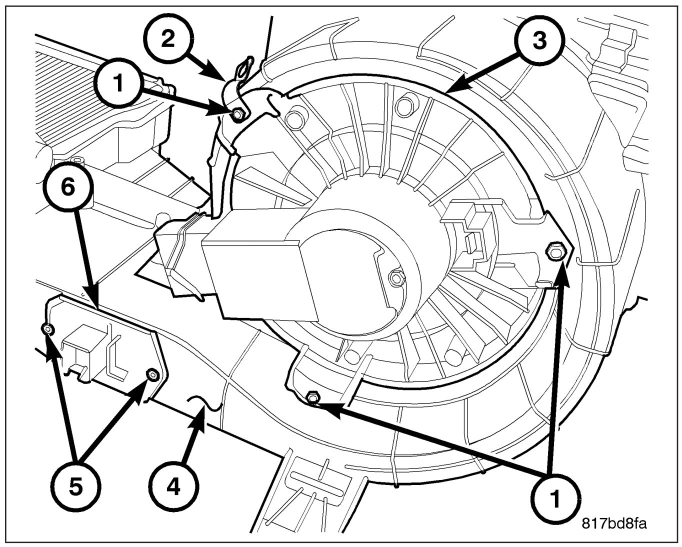
NOTE: LHD model shown. RHD model similar.

1. Remove the cowl grille screen (refer to 23 - BODY/EXTERIOR/SCREEN-COWL GRILLE - REMOVAL).
2. Disengage the three push-in retainers (1) that secure the HVAC housing air inlet screen (2) to the cowl panel (3) and remove the screen.



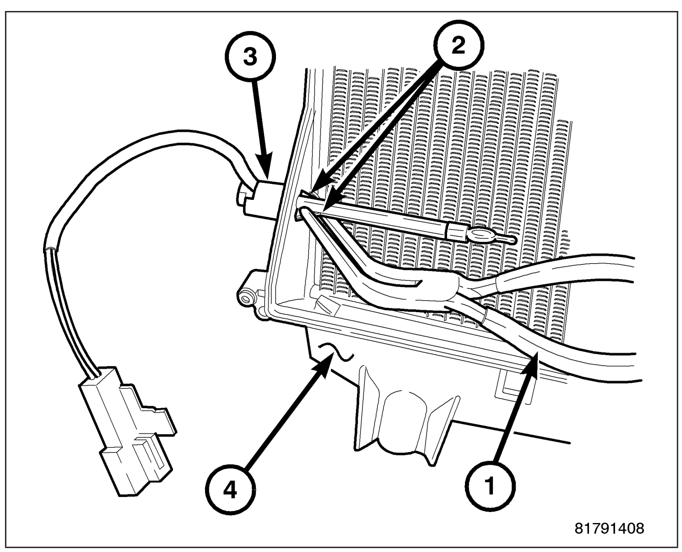
DISASSEMBLY

HOUSING-HVAC



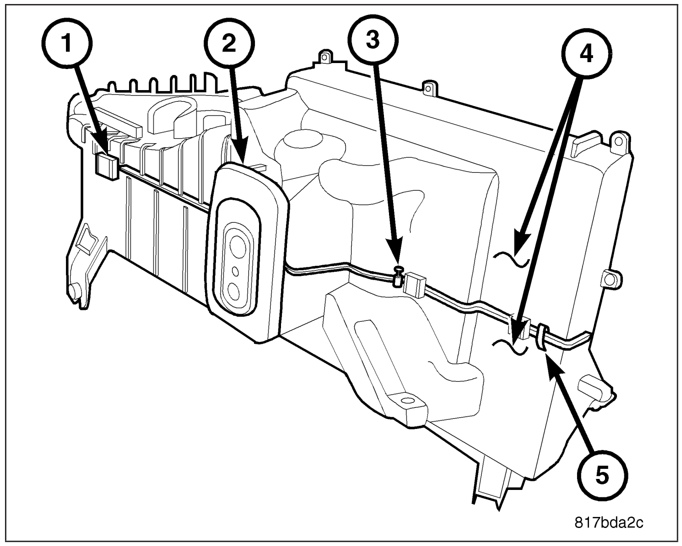
NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.



1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air distribution housing (2) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).
3. Remove the air inlet housing (3) from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - REMOVAL).

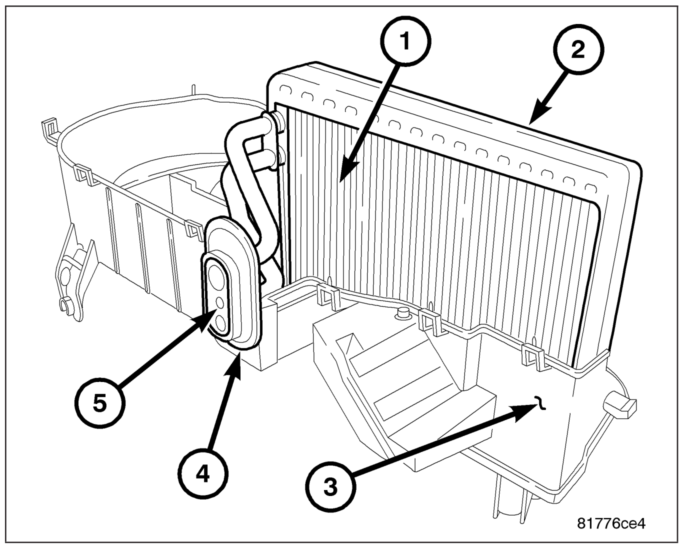
4. Remove the three screws (1) that secure the wire lead bracket (2) and the blower motor (3) to the bottom of the HVAC housing (4) and remove the blower motor and wire lead bracket.
5. Remove the two screws (5) that secure the blower motor resistor (6) to the bottom of the HVAC housing and remove the resistor.



6. Using needle nose pliers (1), disengage the two retaining tabs (2) that secure the evaporator temperature sensor (3) to the driver side of the HVAC housing (4) and remove the sensor.

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

7. Carefully remove the foam seal (2) from the front of the two halves of the HVAC housing (4). If the seal is deformed or damaged, it must be replaced.
8. Remove the nine screws (3) and three metal clips (5) that secure the two halves of the HVAC housing together.
9. Disengage the nine plastic retaining tabs (1) that secure the two halves of the HVAC housing together and separate the housing.

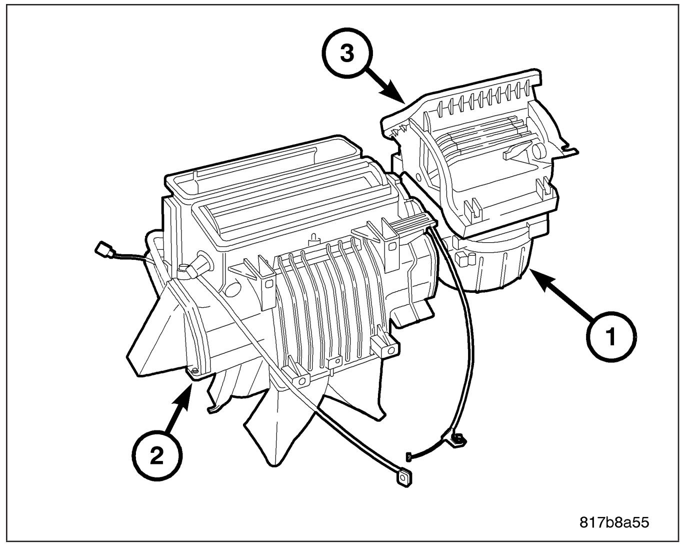


NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

10. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

NOTE: If the seal around the evaporator tube tapping block is deformed or damaged, the seal must be replaced.

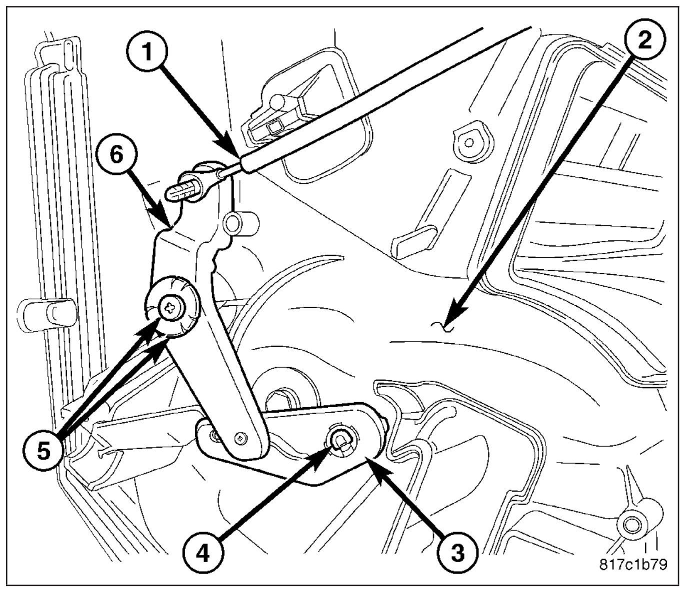
11. If required, remove the seal (4) from around the evaporator tube tapping block (5).



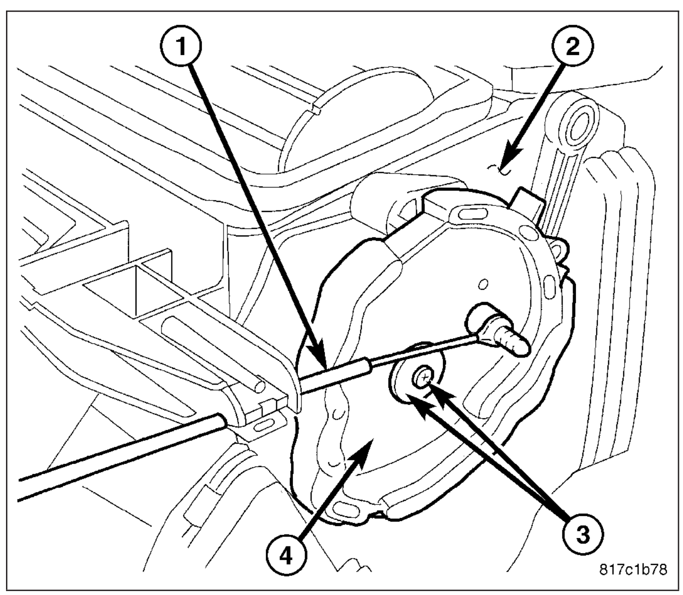
HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.



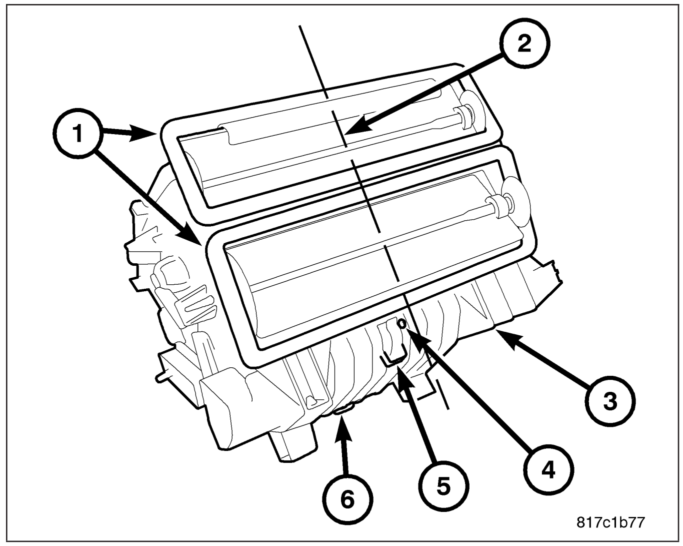
1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air distribution housing (2) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL).
3. If equipped with the 2.0L diesel engine, remove the electric positive temperature coefficient (PTC) heater unit from the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).



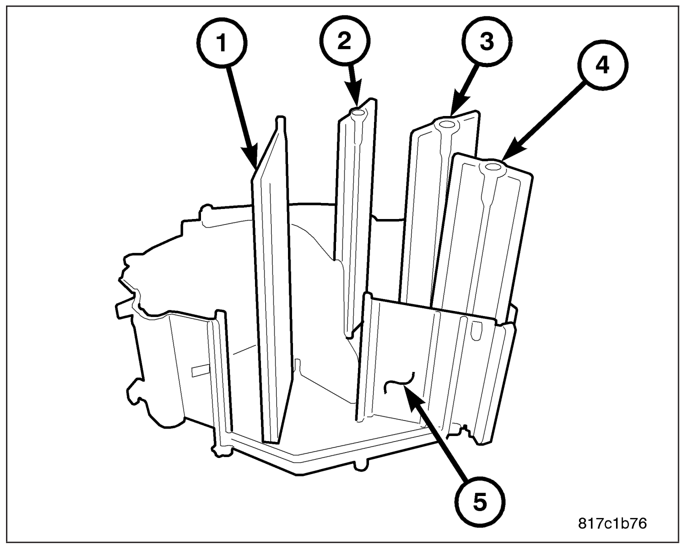
4. Remove the heater core from the air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CORE HEATER - REMOVAL).
5. Remove the temperature control cable (1) from the left side of the air distribution housing (2) (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-TEMPERATURE CONTROL - REMOVAL).
6. Remove the screw and washer (5) that secures the blend door cable lever (6) to the air distribution housing and remove the cable lever.

NOTE: To remove the blend door pivot lever, disengage the retaining tab and pull the lever straight out of the air distribution housing.

7. Remove the blend door pivot lever (3) from the end of the blend door pivot shaft (4) and remove the pivot lever.

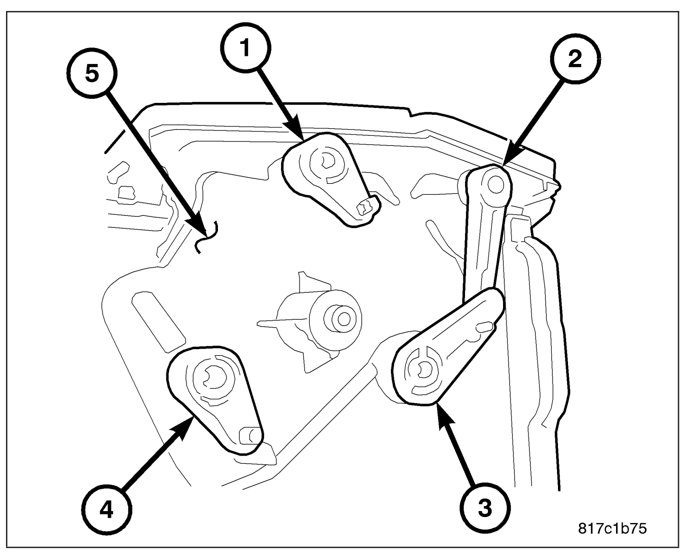


8. Remove the mode door cable (1) from the right side of the air distribution housing (2) (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-MODE DOOR - REMOVAL).
9. Remove the screw and washer (3) that secure the mode door cam (4) to the air distribution housing and remove the cam.



NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

10. Carefully cut the two foam seals (1) along the parting line (2) of the two halves of the air distribution housing (3). If either seal is deformed or damaged, it must be replaced.
11. Remove the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together.
12. Disengage the three plastic retaining tabs (6) that secure the two halves of the air distribution housing together and carefully separate the housing.

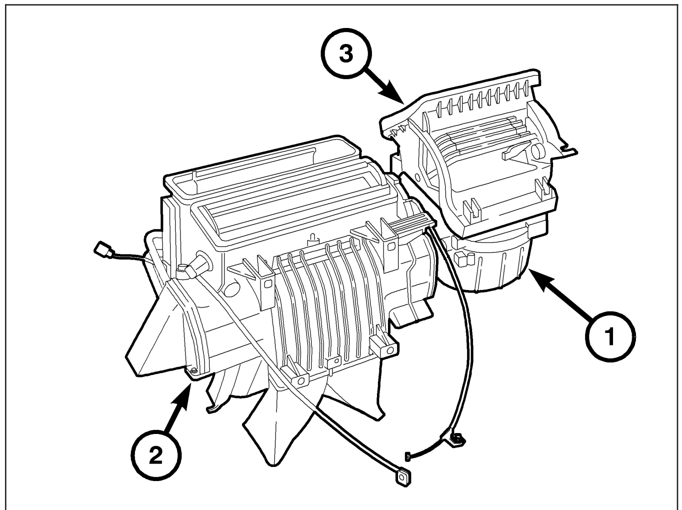


NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

13. Disengage the air door(s) (1, 2, 3 and 4) from the mode door levers and remove the air doors from the air distribution housing (5).

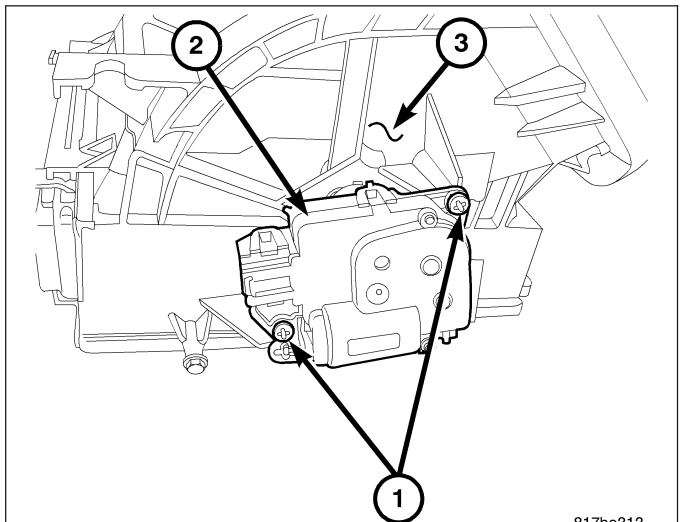
NOTE: To remove the mode door levers, disengage the retaining tabs on the inside of the air distribution housing and pull the levers straight out of the housing.

14. Remove the four mode door levers (1, 2, 3 and 4) from the right side of the air distribution housing (5).



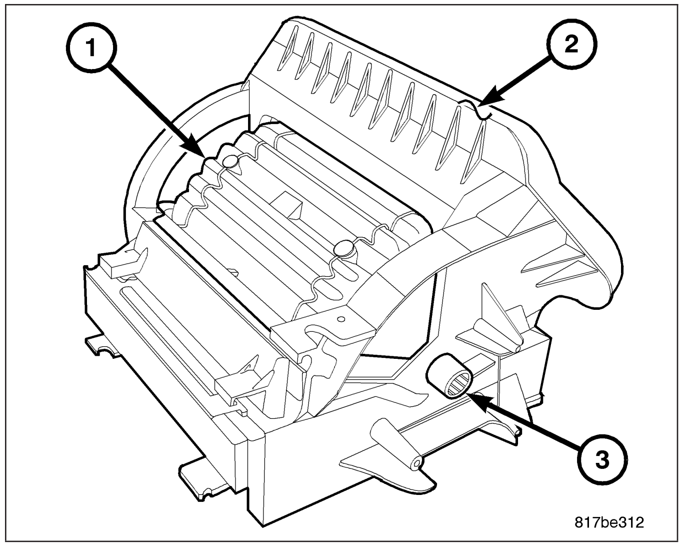
HOUSING-AIR INLET

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.



NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the air inlet housing (3) from the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - REMOVAL).



817b8a55

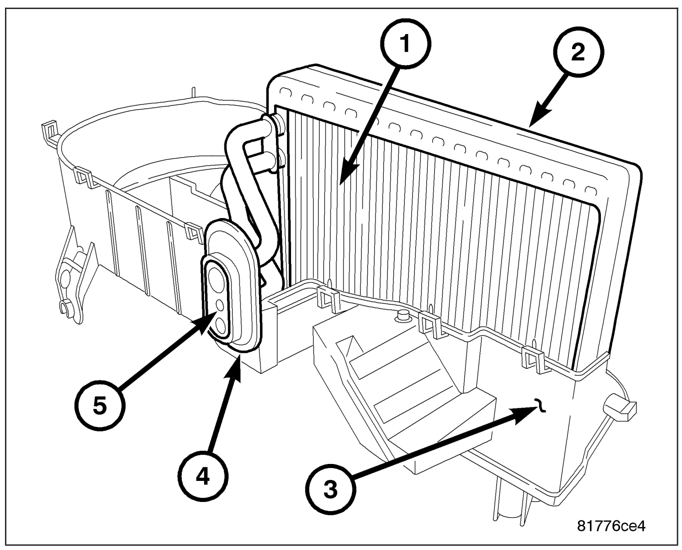
3. Remove the two screws (1) that secure the recirculation door actuator (2) to the right side of the air inlet housing (3) and remove the actuator.

817be313

4. To remove the recirculation door pivot shaft adapter from the right end of the recirculation-air door, first carefully push down on the tab of the door lever pivot shaft adapter located inside of the air inlet housing, then pull the pivot shaft adapter straight out of the end of the recirculation-air door pivot shaft.

NOTE: If the foam seal on the air inlet housing is deformed or damaged, the seal must be replaced.

NOTE: If a rubber seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

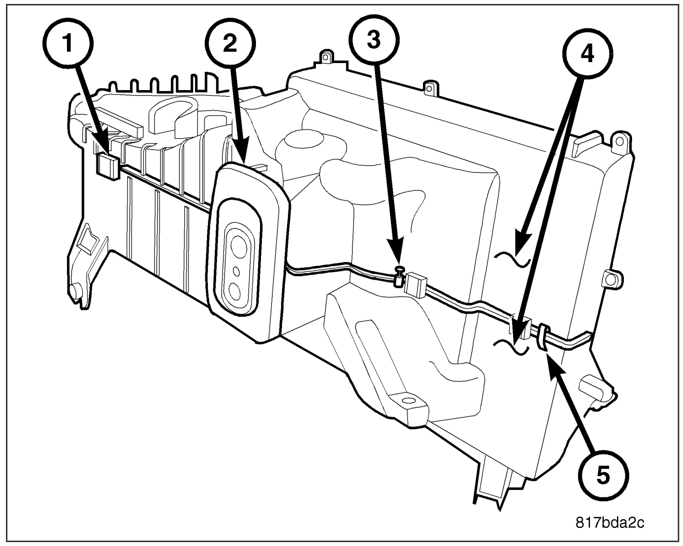


5. Carefully pinch the two ends of the recirculation air-door together and remove the air-door from the air inlet housing. If the seal on the recirculation air-door is deformed or damaged, the air-door must be replaced.

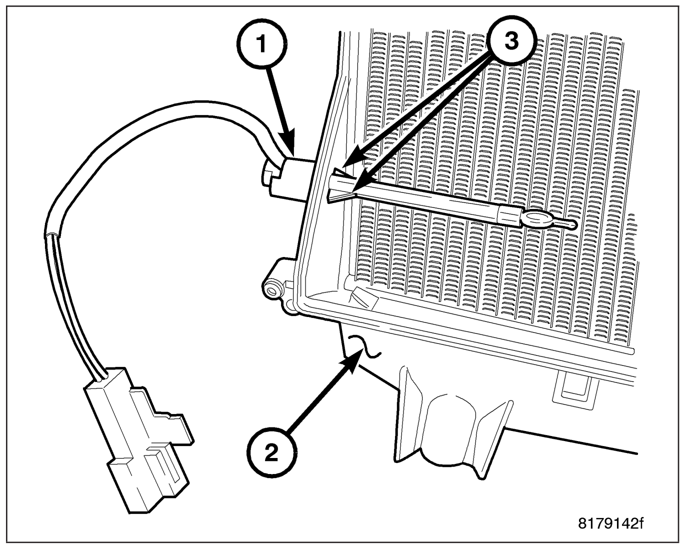
ASSEMBLY

HOUSING-HVAC

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

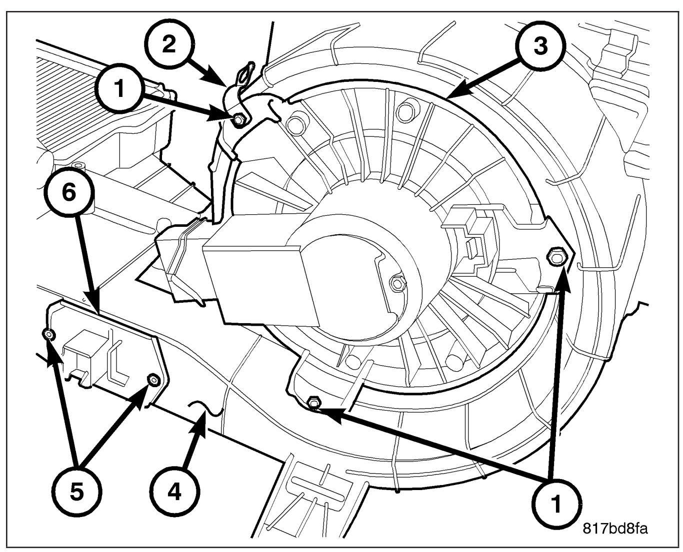


1. If removed, install the seal (4) onto the evaporator tube tapping block (5).

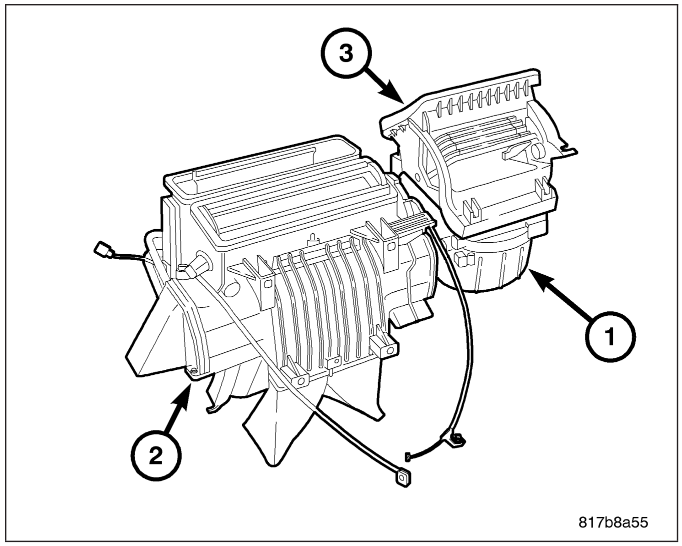


NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.

2. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).



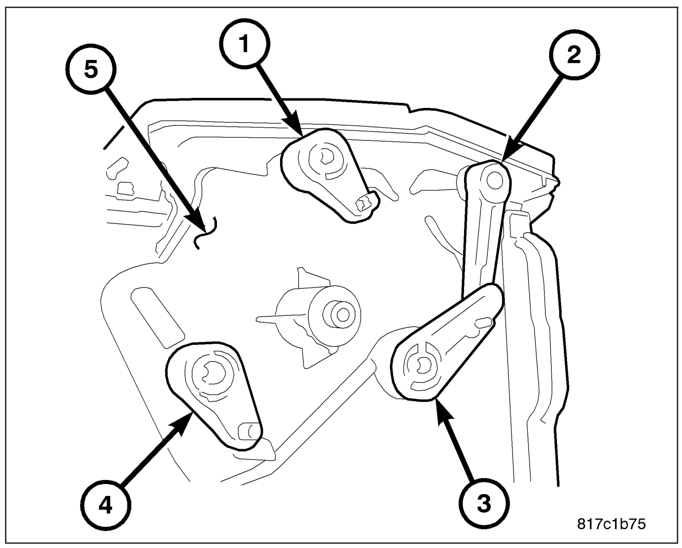
3. Install the two halves of the HVAC housing (4) together and engage the nine plastic retaining tabs (1). Make sure the retaining tabs are fully engaged.
4. Install the nine screws (3) and three metal clips (5) that secure the two halves of the HVAC housing together. Tighten the screws to 1.2 N·m (10 in lbs.). Make sure the metal clips are fully engaged to the housing halves.
5. Install the foam seal (2) onto the front of the two HVAC housing halves.



6. Install the evaporator temperature sensor (1) into the driver side of the HVAC housing (2). Make sure the retaining tabs (3) are fully engaged to the housing.

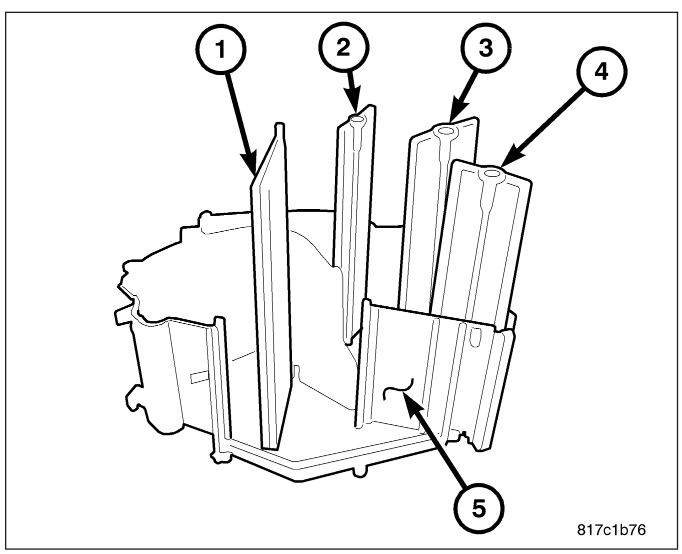
7. Position the blower motor (3) into the bottom of the HVAC housing (4).
8. Install the wire lead bracket (2) and the three screws (1) that secure the blower motor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
9. Position the blower motor resistor (6) into the HVAC housing.
10. Install the two screws (5) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

11. Install the air inlet housing (3) onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING- AIR INLET - INSTALLATION).
12. Install the air distribution housing (2) onto the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).



NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

13. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

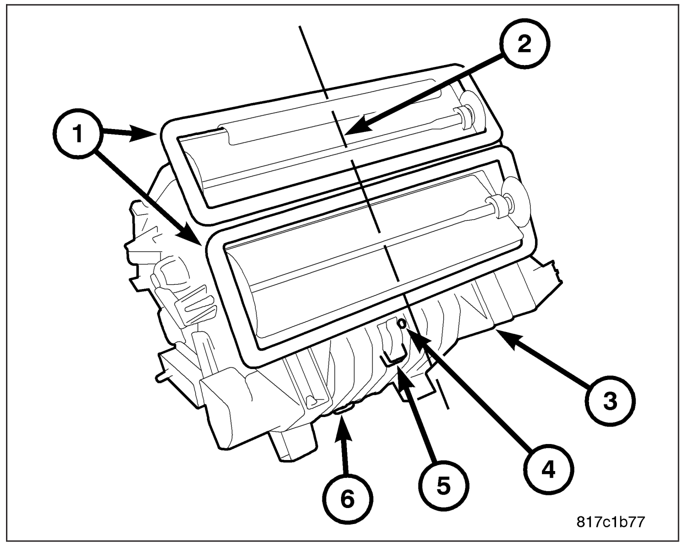


HOUSING-AIR DISTRIBUTION

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

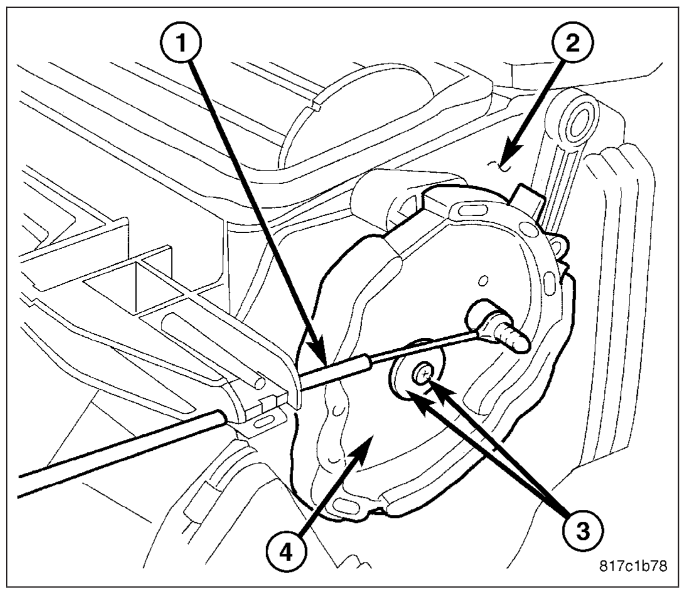
1. Install the four mode door levers (1, 2, 3 and 4) onto the right side of the air distribution housing (5) Make sure the lever retaining tabs are fully engaged to the housing.

NOTE: Properly position the air doors within the air distribution housing by first aligning the four mode door levers to the scribe lines located on the right outer side of the air distribution housing. Then, install the air doors onto the mode door levers with the UP mark on each air door facing toward the top of the housing.



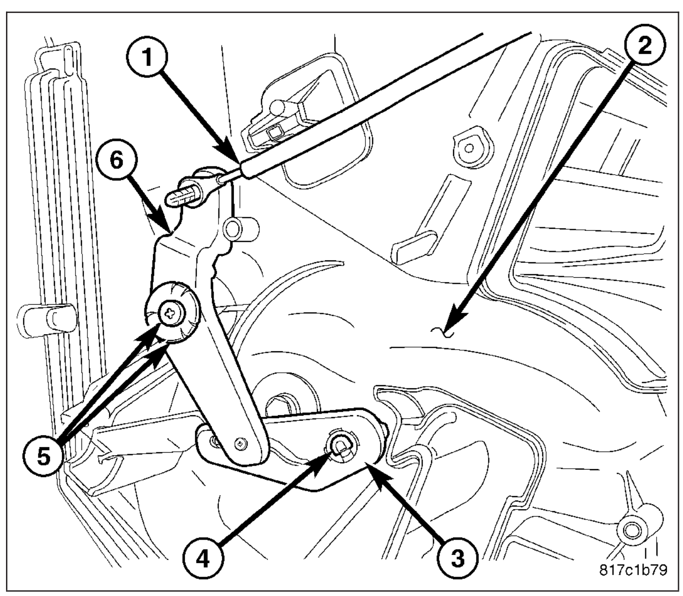
NOTE: If a seal on an air door is deformed or damaged, the air door must be replaced.

2. Align the four mode door levers to the scribe lines on the right outer side of the air distribution housing (5) and install the air door(s) (1, 2, 3 and 4)



onto the mode door levers with the UP mark on each air door facing toward the top of the housing.

3. Align the air door(s) with the pivot shaft hole(s) in the air distribution housing (3) and install the two halves of the housing together. Make sure the three plastic retaining tabs (6) are fully engaged.
4. Install the five screws (4) and one metal clip (5) that secure the two halves of the air distribution housing together. Tighten the screws to 2.2 N·m (20 in lbs.). Make sure the metal clip is fully engaged to the housing halves.

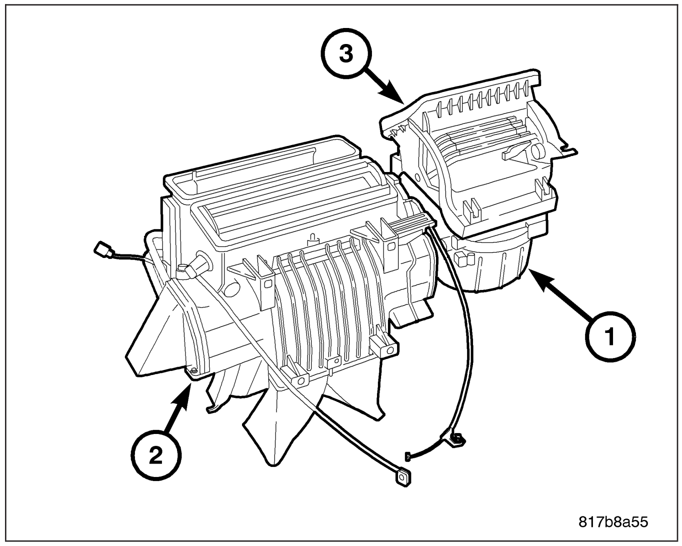


NOTE: If any foam seal on the air distribution housing outlets is deformed or damaged, the seal must be replaced.

5. Inspect the foam seals (1), especially at the parting line (2). If a foam seal is deformed or damaged, it must be replaced.

NOTE: Align the pins on the mode door levers with the grooves in the back of the mode door cam prior to installation of the cam.

6. Align the mode door levers on the right side of the air distribution housing (2) to the mode door cam (4) and install the cam onto the housing. Make sure the levers are correctly engaged to the cam.
7. Install the screw and washer (3) that secure the mode door cam to the air distribution housing. Tighten the screw to 0.6 N·m (5 in. lbs.).
8. Install the mode door cable (1) (refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CABLE-MODE DOOR - INSTALLATION).



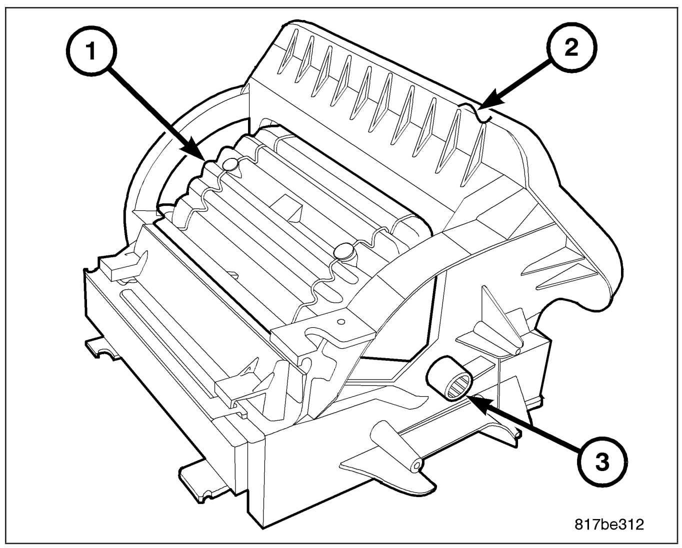
9. Install the blend door pivot lever (3) onto the end of the blend door pivot shaft (4) located on the left side of the air distribution housing (2). Make sure the lever retaining tab is fully engaged to the pivot shaft.

NOTE: Align the pin on the blend door lever with the groove in the pivot lever prior to installation of the blend door lever.

10. Install the blend door lever (6) onto the air distribution housing. Make sure the levers are correctly aligned to each other.
11. Install the screw and washer (5) that secure the blend door lever to the air distribution housing. Tighten the screw to 0.6 N·m (5 in. lbs.).
12. Install the temperature control cable (1) (refer to 24 - HEATING & AIR CONDITIONING/CON-

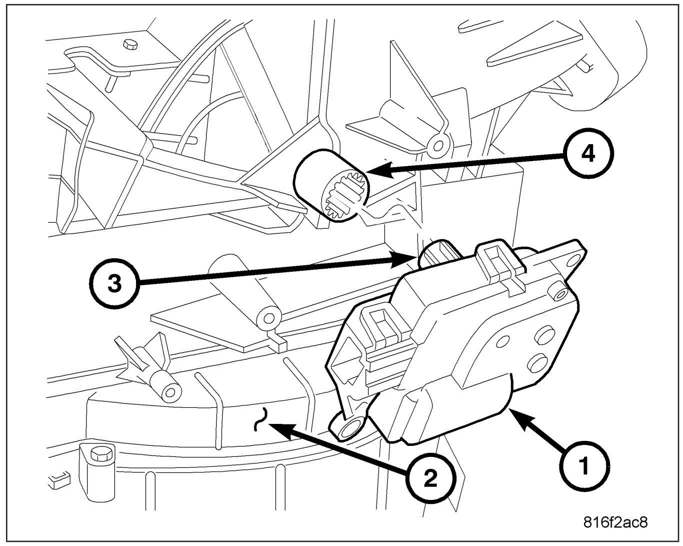
TROLS/CABLE-TEMPERATURE CONTROL - INSTALLATION).

13. If equipped with the 2.0L diesel engine, install the electric positive temperature coefficient (PTC) heater unit into the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - INSTALLATION).
14. Install the heater core into the air distribution housing (2) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/CORE HEATER - INSTALLATION).
15. Install the air distribution housing onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).
16. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).



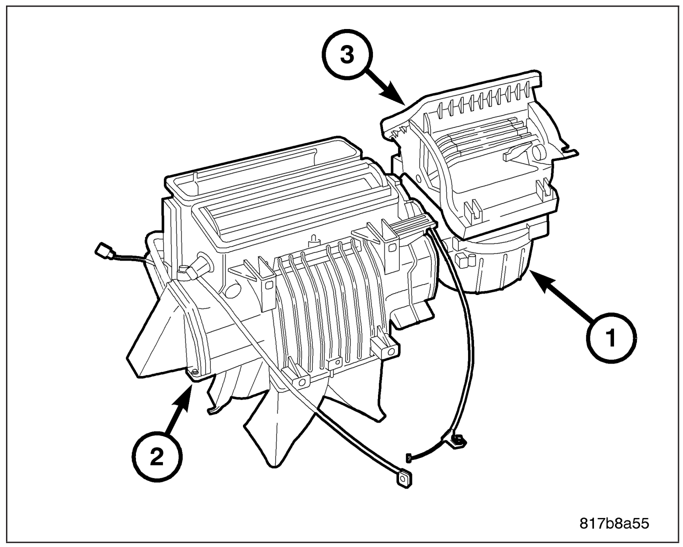
HOUSING-AIR INLET

NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.



1. Carefully install the recirculation-air door (1) into the air inlet housing (2) by pinching the two ends of the air-door together and aligning the pivot shafts of the air-door to the pivot shaft holes in the air inlet housing.

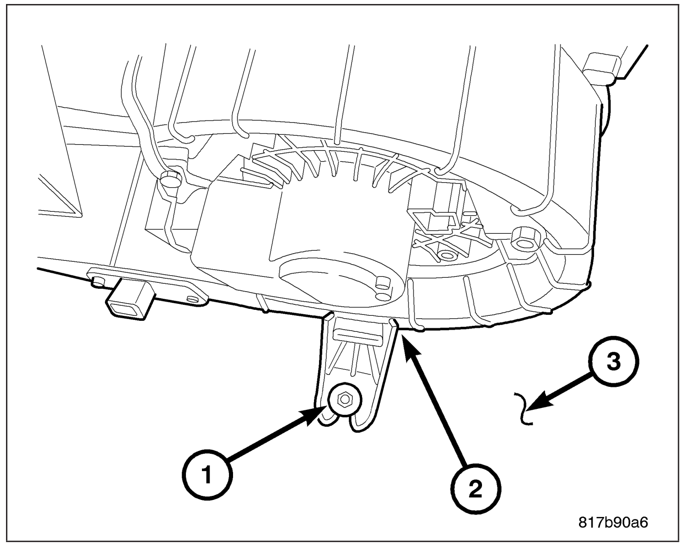
NOTE: Install the recirculation door pivot shaft adapter by carefully pushing it straight into the end of the recirculation door pivot shaft.



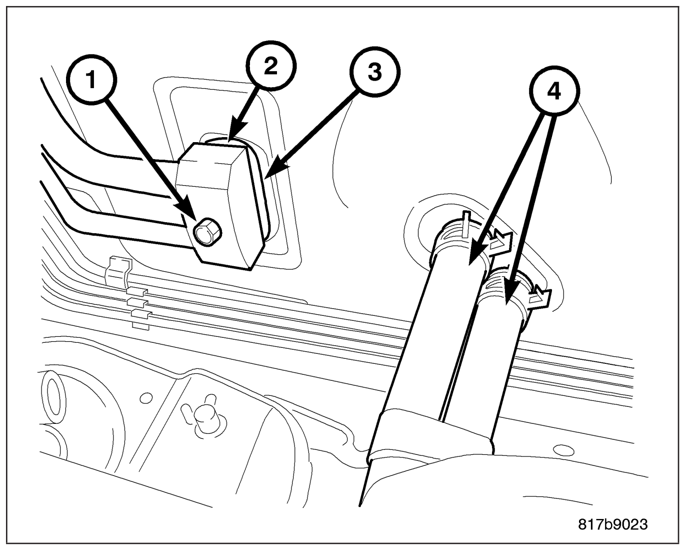
2. Install the recirculation door pivot shaft adapter (3) into the right side pivot shaft of the recirculation air-door. Make sure the adapter is fully engaged to the pivot shaft.

3. Install the recirculation door actuator (1) onto the right side of the air inlet housing (2). If necessary, rotate the actuator slightly to align the splines of the actuator output shaft (3) with those on the recirculation door pivot shaft adapter (4).

4. Install the air inlet housing (3) onto the HVAC housing (1) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR INLET - INSTALLATION).
5. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

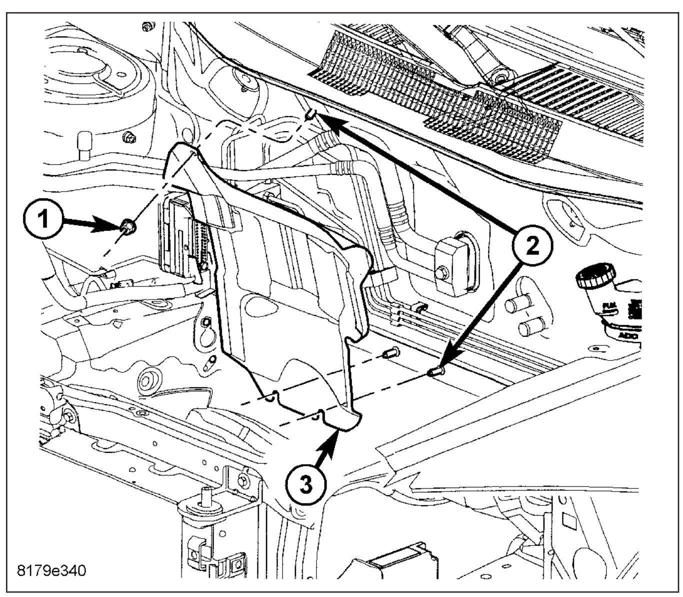


INSTALLATION



HOUSING-HVAC

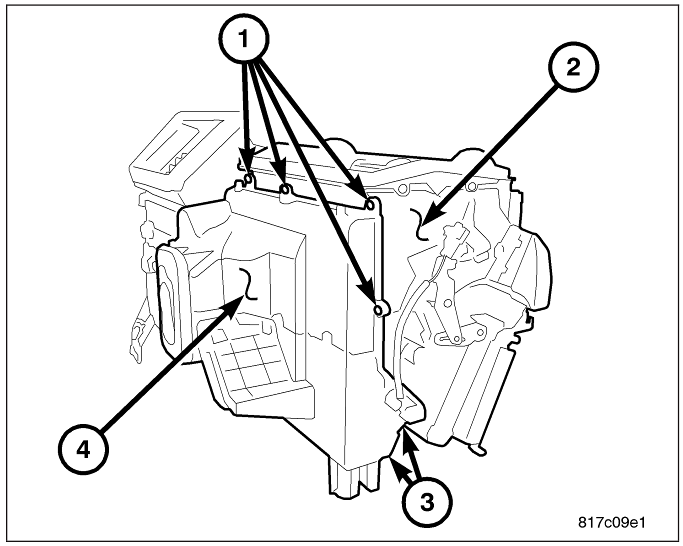
NOTE: LHD model shown in illustrations. RHD model similar.



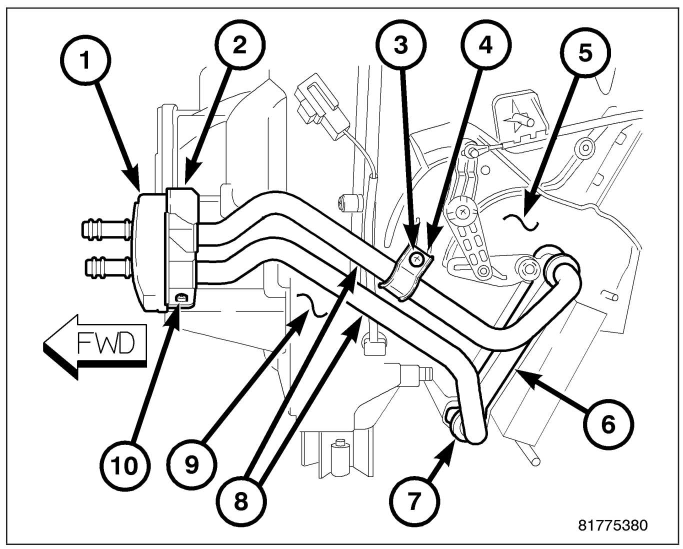
1. Position the HVAC housing assembly (2) to the dash panel (3). Be certain that the passenger side of the HVAC housing is correctly located over the dash panel mounting stud.
2. Install the nut (1) that secures the HVAC housing to the passenger compartment side of dash panel. Tighten the nut to 4.5 N·m (40 in. lbs.).
3. Install the condensation drain tube (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ TUBE-CONDENSATION DRAIN - INSTALLATION).
4. Install the rear floor ducts (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).
5. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/ASSEMBLY-INSTRUMENT PANEL - INSTALLATION).

6. Remove the previously installed plugs or caps and connect the heater hoses (4) to the heater core tubes.
7. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
8. Lubricate the rubber O-rings on new dual-plan seals with clean refrigerant oil and install the seals onto the liquid and suction line fittings. Use only the specified seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid and suction line assembly (2) to the A/C evaporator (3).
10. Install the bolt (1) that secures the A/C liquid and suction line assembly to the A/C evaporator. Tighten the bolt to 12 N·m (105 in. lbs.).

11. Position the heat shield (3) onto the studs (2) located on the dash panel in the engine compartment.
12. Install the three nuts (1) that secure the heat shield to the dash panel. Tighten the nuts to 1 N·m (10 in. lbs.).
13. Reconnect the negative battery cable.
14. If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).
15. Refill the engine cooling system (refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE - COOLING SYSTEM FILL).
16. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
17. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



HOUSING-AIR DISTRIBUTION



NOTE: LHD model with A/C shown in illustrations. RHD and heater-only models similar.

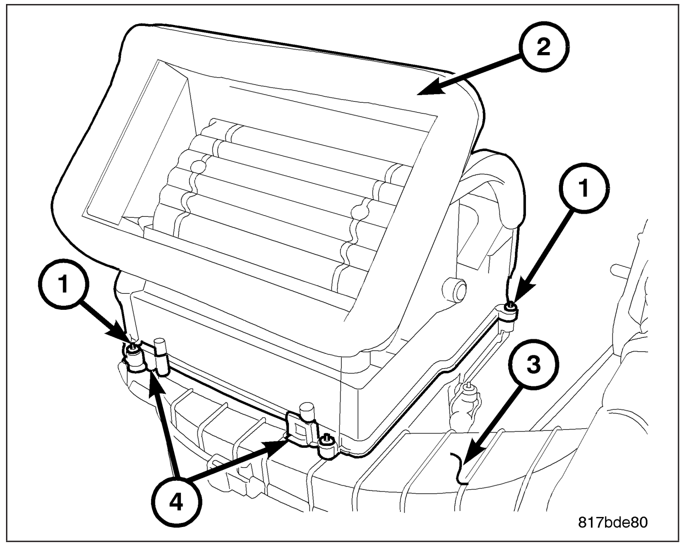
NOTE: Illustration shown with heater core and tubes removed from view for clarity.

1. Position the air distribution housing (2) onto the rear of the HVAC housing (4).
2. Install the two metal retaining clips (3) that secure the bottom of the air distribution housing to the HVAC housing.
3. Install the seven screws (1) that secure the air distribution housing to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

4. Carefully install the heater core (6) into the left side of the air distribution housing (5).
5. On RHD models, install the air distribution housing onto the HVAC housing (9) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).
6. Install the retaining bracket (4) and screw (3) that secure the heater core tubes (8). Tighten the screw to 1.2 N·m (10 in. lbs.)
7. Install the flange (2) that secures the heater core tubes to the front of the HVAC housing.
8. Install the screw (10) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

9. Install the foam seal (1) onto the flange.
10. Install all of the floor distribution ducts onto the air distribution housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).

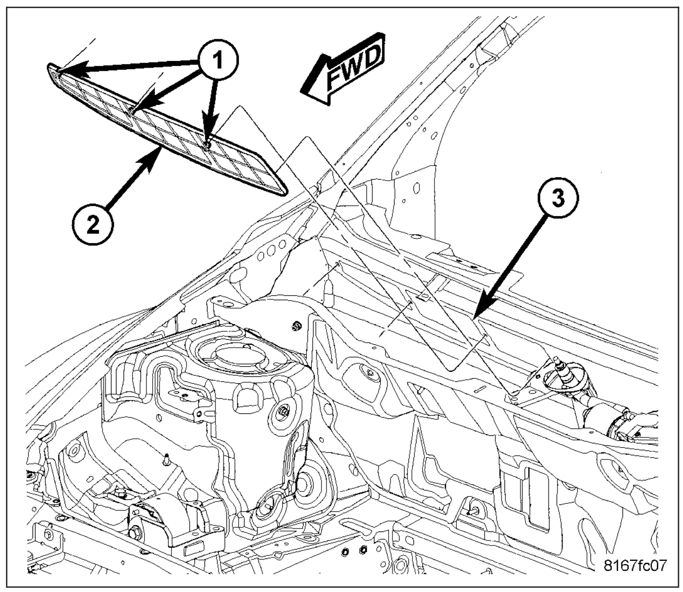


NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

11. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

HOUSING-AIR INLET

NOTE: LHD model with A/C shown. RHD and heater-only models similar.

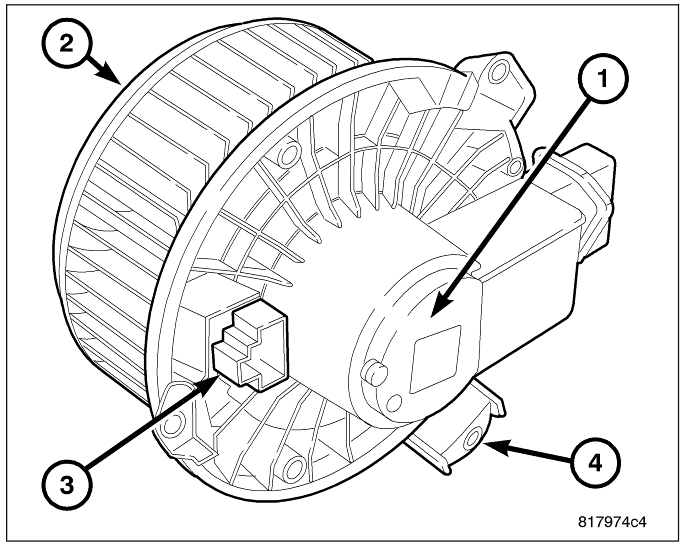


1. Install the air inlet housing (2) onto the top of the HVAC housing (3) and engage the two plastic retaining tabs (4). Make sure the retaining tabs are fully engaged.
2. Install the four screws (1) that secure the air inlet housing to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
3. If equipped, install the particulate air filter (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FILTER-PARTICULATE AIR - INSTALLATION).
4. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

SCREEN-AIR INLET

NOTE: LHD model shown. RHD model similar.

1. Position the HVAC housing air inlet screen (2) to the cowl panel (3) and fully engage the three push-in retainers (1) that secure the screen to the panel.
2. Install the cowl grille screen (refer to 23 - BODY/EXTERIOR/SCREEN-COWL GRILLE - INSTALLATION).



MOTOR-BLOWER

DESCRIPTION

The blower motor (1) is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel (2) within the HVAC air inlet housing at the selected speed.

The blower motor is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (3) and three mounting tabs (4). The squirrel cage-type blower wheel is secured to the blower motor shaft and is positioned within the air inlet housing on the passenger side of the HVAC housing.

OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the Run position and the blower motor control is in any position except Off. The blower motor receives battery current through the totally integrated power module (TIPM) whenever the ignition switch is in the Run position.

Blower motor speed is controlled by regulating the ground path through or around the blower motor resistor and through the blower motor control located within the A/C-heater control.

The blower motor can be accessed for service from underneath the instrument panel.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is UNABLE to detect an OPEN circuit for the blower motor.

The blower motor control system is diagnosed using a scan tool (refer to 24 - HVAC Electrical Diagnostics for more information).

The blower motor and blower wheel are factory balanced and cannot be adjusted or repaired. If faulty or damaged, the blower motor and wheel must be replaced as an assembly.

DIAGNOSIS AND TESTING

BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: The blower motor is supplied with a 12V feed from the TIPM, through the blower motor resistor, whenever the ignition switch is in the RUN position. Due to an open circuit condition within the blower motor control switch the TIPM is UNABLE to detect an OPEN circuit for the blower motor.

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter. For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.

OPERATION

Possible causes of the blower motor not operating include:

- Faulty blower motor
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor control

Possible causes of the blower motor not operating in one or more speeds include:

- Faulty blower motor resistor
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor control

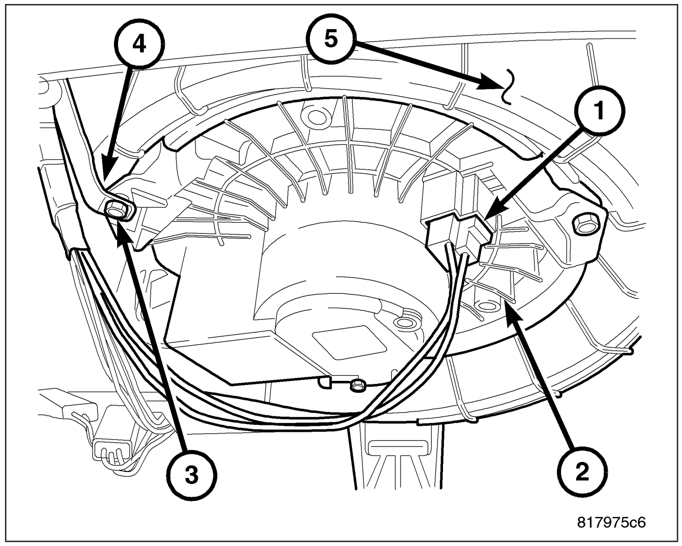
VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Deformed blower wheel
- Out of balance blower wheel due to foreign material in the wheel
- Faulty blower motor

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heating-A/C system. If the noise goes away, possible causes include:

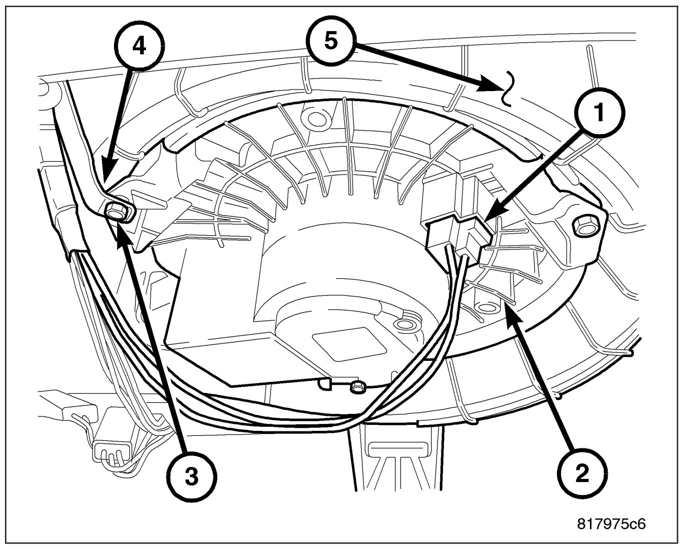


- Foreign material in the HVAC air inlet housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Faulty blower motor

REMOVAL

NOTE: The blower motor is located on the bottom of the passenger side of the HVAC housing. The blower motor can be removed from the vehicle without having to remove the HVAC housing.

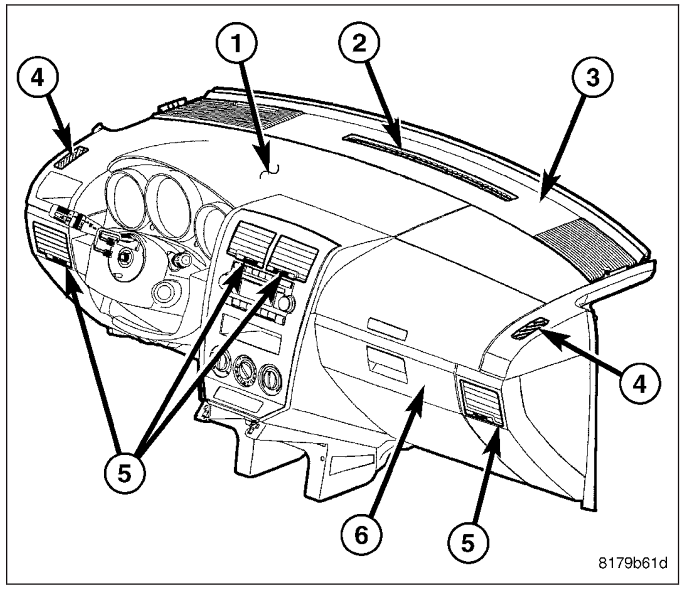
NOTE: LHD model shown. RHD model similar.



1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the silencer from below the passenger side of the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/SILENCER-INSTRUMENT PANEL - REMOVAL).
3. From underneath the instrument panel, disengage the connector lock and disconnect the instrument panel wire harness connector (1) from the blower motor (2).
4. Remove the three screws (3) that secure the blower motor and the wire lead bracket (4) (if equipped) to the bottom of the HVAC housing (5) and remove the blower motor.

INSTALLATION

NOTE: LHD model shown. RHD model similar.



1. Position the blower motor (2) into the bottom of the HVAC housing (5).
2. Install the three screws (3) that secure the blower motor and the wire lead bracket (4) (if equipped) to the HVAC housing. Tighten the screws to 1.2 N·m (10 in. lbs.).
3. Connect the instrument panel wire harness connector (1) to the blower motor and engage the connector lock.
4. If equipped, install the silencer below the passenger side of the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/SILENCER-INSTRUMENT PANEL - INSTALLATION).
5. Reconnect the negative battery cable.

OUTLETS-AIR

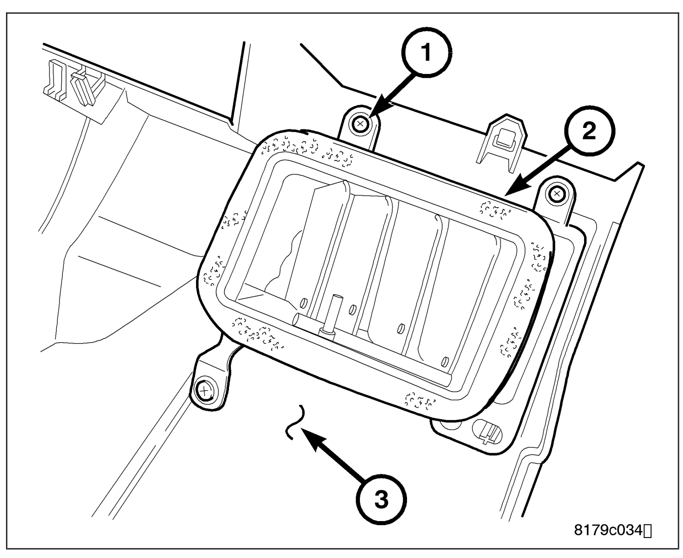
DESCRIPTION

NOTE: LHD model shown. RHD model similar.

There is one defroster air outlet (2) located on the top of the instrument panel (1). The airflow from the defroster outlet is directed by fixed vanes in the outlet and cannot be adjusted. The defroster air outlet is not serviceable from the instrument panel defroster grille (3) (refer to 23 - BODY/INSTRUMENT PANEL/ GRILLE-DEFROSTER - REMOVAL).

There are two side window demister air outlets (4). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are not serviceable from the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/ COVER-INSTRUMENT PANEL TOP - REMOVAL).

There are four rectangular instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain movable vanes that can direct or shut off the flow of the conditioned air leaving each of the instrument panel outlets. The driver and passenger side air instrument panel air outlets can be serviced separately. The center outlets are only serviced with the center bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CENTER - REMOVAL).



A cooled beverage storage bin, located in the top of the glove box (6) is standard on vehicles equipped with A/C. Vehicles so equipped have an outlet which, when opened with the A/C on, allows cooled air to flow into the bin.

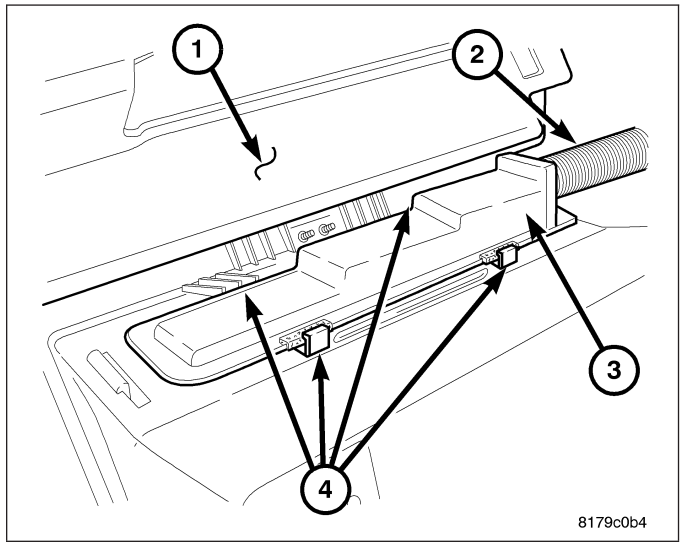
REMOVAL

INSTRUMENT PANEL

NOTE: Driver side air outlet shown. Passenger side outlet similar.

NOTE: LHD model shown. RHD model similar.

1. Depending on the air outlet being serviced, remove the instrument cluster bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CLUSTER - REMOVAL) or the passenger side IP bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-IP PASSENGER SIDE - REMOVAL).



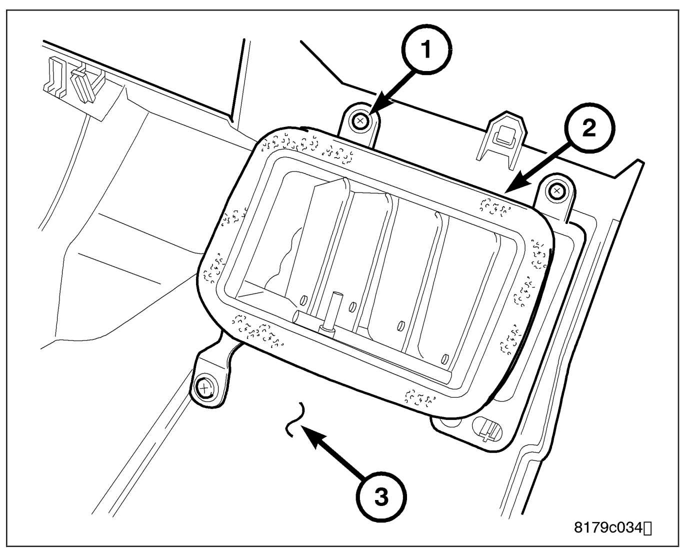
NOTE: If the foam seal on the air outlet is deformed or damaged, it must be replaced.

2. Remove the four screws (1) that secure the air outlet (2) to the bezel (3) and remove the outlet.

BEVERAGE COOLER

NOTE: LHD model shown. RHD model similar.

1. Remove the instrument panel top cover (1) (refer to 23 - BODY/INSTRUMENT PANEL/COVER-INSTRUMENT PANEL TOP - REMOVAL).
2. Disconnect the hose (2) from the beverage cooler outlet (3).
3. To disengage the four retaining tabs (4), slide the beverage cooler outlet toward the center of the cover and remove the outlet.

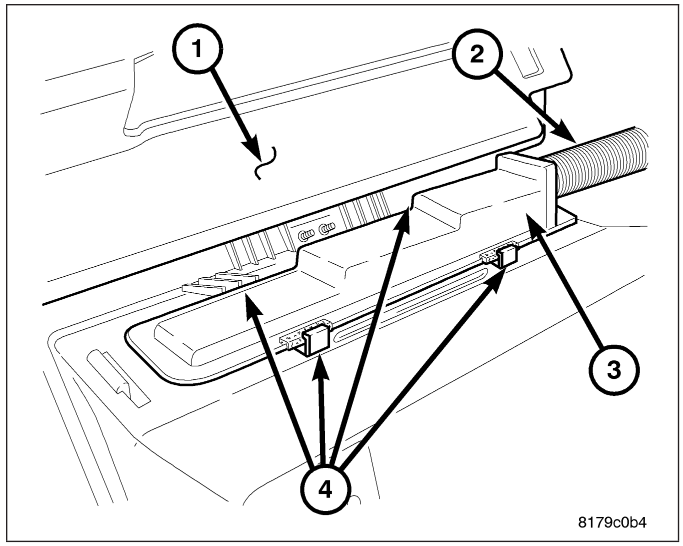


INSTALLATION

INSTRUMENT PANEL

NOTE: Driver side air outlet shown. Passenger side outlet similar.

NOTE: LHD model shown. RHD model similar.



1. Position the air outlet (2) onto the bezel (3).
2. Install the four screws (1) that secure the air outlet to the bezel. Tighten the screws to 2 N·m (17 in. lbs.).
3. Depending on the outlet being serviced, install the instrument cluster bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-CLUSTER - INSTALLATION) or the passenger side IP bezel (refer to 23 - BODY/INSTRUMENT PANEL/BEZEL-IP PASSENGER SIDE - INSTALLATION).

BEVERAGE COOLER

NOTE: LHD model shown. RHD model similar.

1. Position the beverage cooler outlet (3) to the top of the storage bin and engage the four retaining tabs (4) by sliding the outlet toward the center of the instrument panel top cover (1). Make sure the tabs are fully engaged.
2. Connect the hose (2) to the beverage cooler outlet.
3. Install the instrument panel top cover (refer to 23 - BODY/INSTRUMENT PANEL/COVER-INSTRUMENT PANEL TOP - INSTALLATION).

PLUMBING

TABLE OF CONTENTS

PLUMBING

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

Depending on vehicle, model and market application, refrigerant lines are connected to each other or other A/C system components with block-type or quick-connect type fittings. To ensure the integrity of the refrigerant system, flat gaskets and O-rings are used to seal the refrigerant system connections.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Severe personal injury or death may result from improper service procedures.

WARNING: If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kilopascals (21 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.
Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C refrigerant system charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the refrigerant system is fully charged with R-134a is to completely evacuate and recharge the A/C system.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT). If less than 345 kPa (50 psi), proceed to SYSTEM EMPTY . If greater than 345 kPa (50 psi), go to SYSTEM LOW .

SYSTEM EMPTY

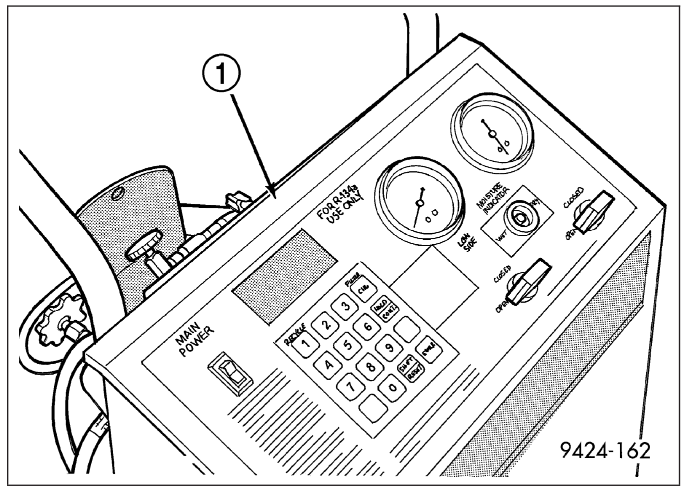
1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater vacuum) (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to Step 2.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) and proceed to Step 1 of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
   - Doors or windows open
   - Transaxle in Park or Neutral with the parking brake set (depending on application)
   - A/C-heater controls set to outside air, full cool, panel mode, high blower and with A/C compressor engaged

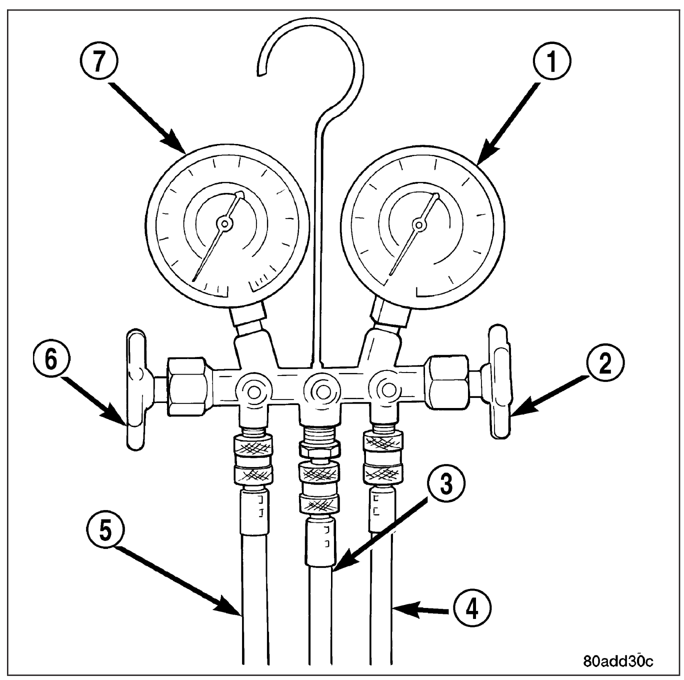
CAUTION: A leak detector only designed for R-12 refrigerant will not detect leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.



STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT



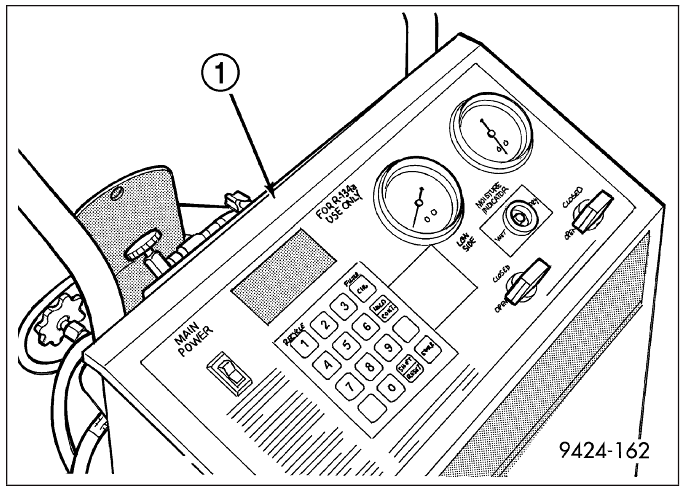
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

WARNING: Eye protection must be worn when servicing an air conditioning refrigerant system. Turn off (rotate clockwise) all valves on the equipment being used, before connecting to or disconnecting from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

When servicing the A/C system, an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS



CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

- **LOW PRESSURE GAUGE HOSE** - The low pressure hose (Blue with Black stripe) attaches to the low side service port. This port is located on the A/C liquid line near the right front strut tower.
- **HIGH PRESSURE GAUGE HOSE** - The high pressure hose (Red with Black stripe) attaches to the high side service port. This port is located on the A/C discharge line near the A/C condenser.
- **RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE** - The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. With the engine OFF, connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT). Do not operate the engine with a vacuum on the A/C system.

3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: Always refer to the Underhood HVAC Specification Label for the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to the Underhood HVAC Specification Label.

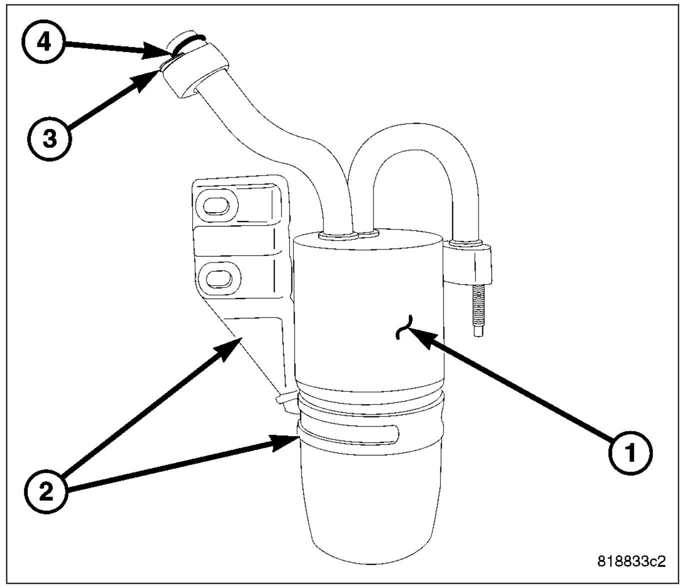
An R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is operating and the blower motor is running at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm).
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.



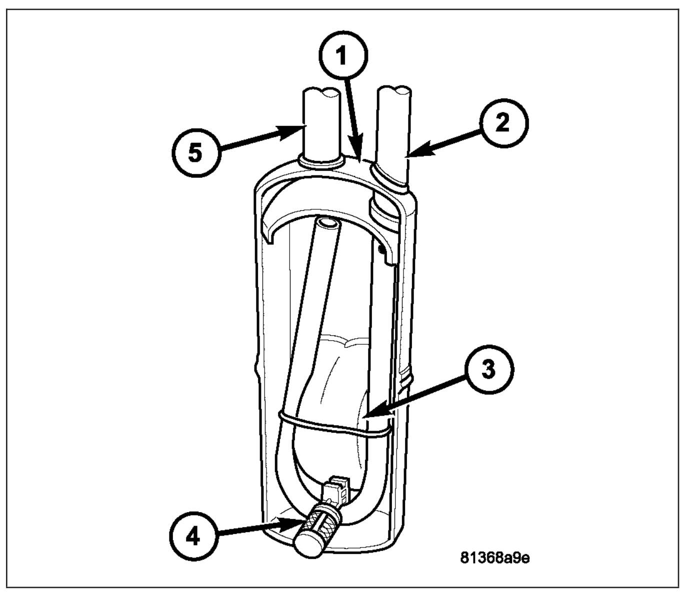
8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

ACCUMULATOR-A/C

DESCRIPTION

The A/C accumulator (1) is mounted below the engine compartment behind the right side of the front fascia. A band and mounting bracket (2) secures the A/C accumulator to the right front frame rail.

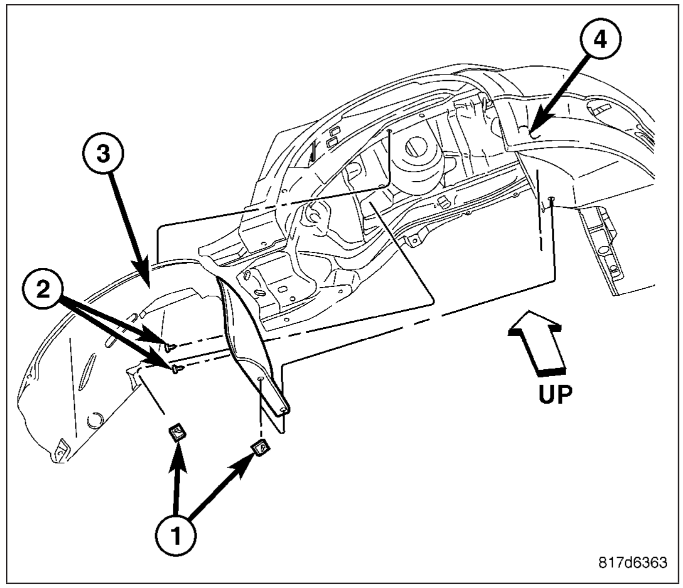
The A/C accumulator has no serviceable parts except for the metal gaskets (3) and rubber O-rings (4). The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C accumulator is removed and installed.



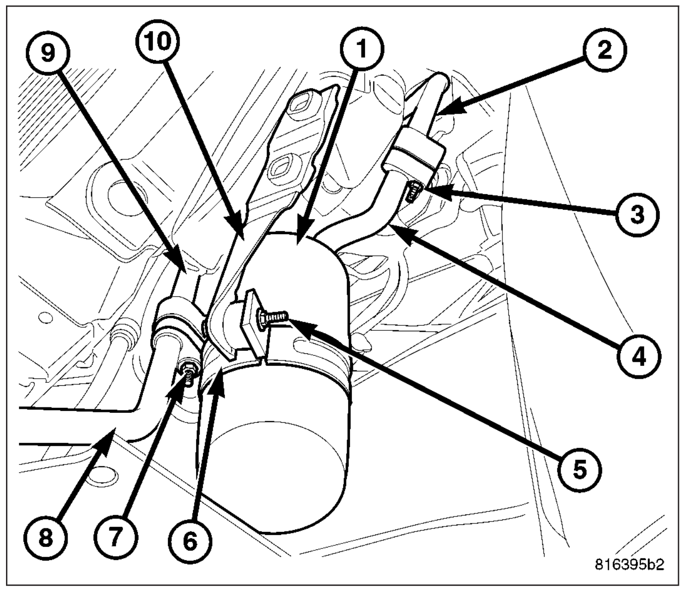
OPERATION

NOTE: Typical A/C accumulator shown.

Refrigerant enters the A/C accumulator (1) mostly as a low pressure vapor through the inlet tube (2). Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag (3) is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system. A filter (4) is also mounted inside the canister to trap any foreign material that may have entered the refrigerant system during assembly. The low pressure vapor exits the A/C accumulator through the outlet tube (5).



The A/C accumulator cannot be repaired. If the A/C accumulator is faulty or damaged, or if an internal failure of the A/C compressor has occurred, the A/C accumulator must be replaced.

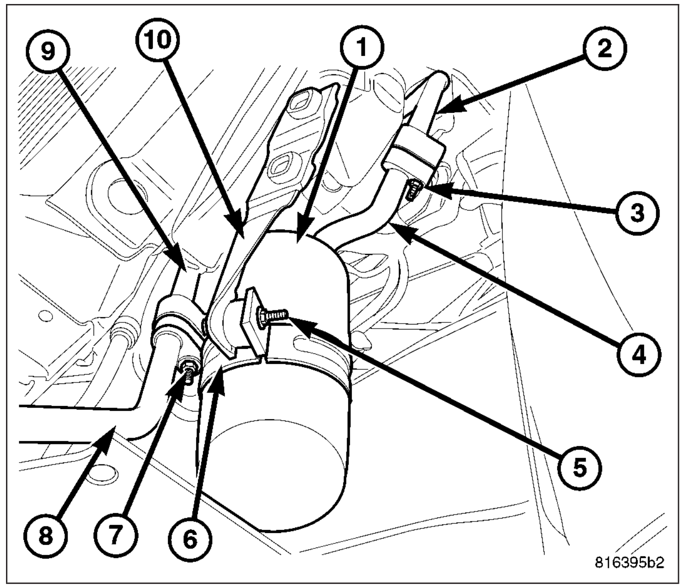


REMOVAL

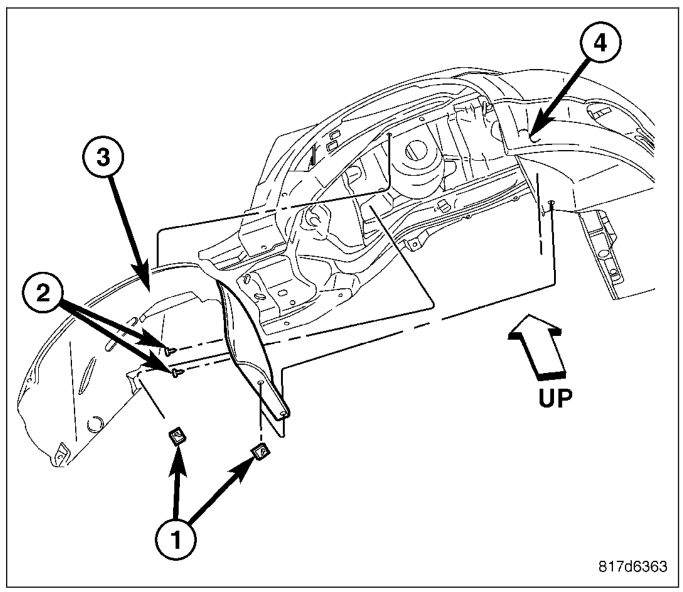
WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the right front wheel (refer to 22 - TIRES/ WHEELS - REMOVAL).
5. Remove the three push-pin retainers (1) and three screws (2) that secure the front portion of the right front wheelhouse splash shield (3) to body (4) and position the front of the wheelhouse splash shield out of the way to gain access to the A/C accumulator (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - REMOVAL).

6. Remove the nut (7) that secures the lower A/C suction line (8) to the accumulator outlet tube (9) and disconnect the suction line from the accumulator tube.
7. Remove the bolt (5) and retaining band (6) that secure the A/C accumulator to the mounting bracket (10).
8. Remove the nut (3) that secures the upper A/C suction line (2) to the accumulator inlet tube (4) and disconnect the suction line from the accumulator tube.
9. If necessary remove the accumulator mounting bracket from the body.
10. Remove and discard the O-ring seals and gaskets and install plugs in, or tape over the opened refrigerant line fittings and the accumulator ports.



INSTALLATION



NOTE: If the A/C accumulator is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

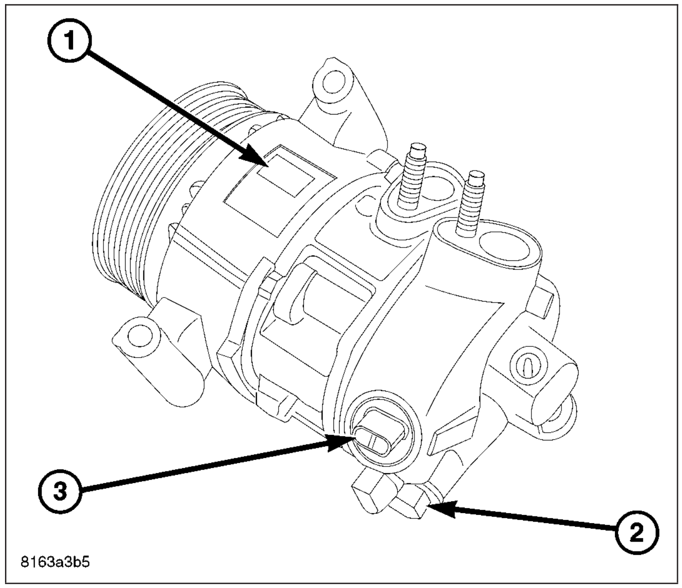
NOTE: Replacement of the refrigerant line O-ring seals and gasket is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and gasket could result in a refrigerant system leak.

1. If removed, install the accumulator mounting bracket (10). Tighten the retaining bolts to 15 N·m (11 ft. lbs.).
2. Remove the tape or plugs from all of the opened refrigerant line fittings and the accumulator ports.
3. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the suction line and accumulator fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the upper A/C suction line (2) to the accumulator inlet tube (4) and install the retaining nut (3). Tighten the nut to 5 N·m (44 in. lbs.).
5. Install the retaining band (6) and bolt (5) that secure the A/C accumulator to the mounting bracket. Tighten the bolt to 8 N·m (71 in. lbs.).

6. Connect the lower A/C suction line (8) to the accumulator outlet tube (9) and install the retaining nut (7). Tighten the nut to 5 N·m (44 in. lbs.).
7. Reposition the front of the right front wheel house splash shield (3) to the body (4) and install the three push-pin retainers (1) and the three screws (2). Tighten the screws securely (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - INSTALLATION).
8. Install the right front wheel (refer to 22 - TIRES/WHEELS - INSTALLATION).
9. Lower the vehicle.
10. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

11. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



COMPRESSOR-A/C

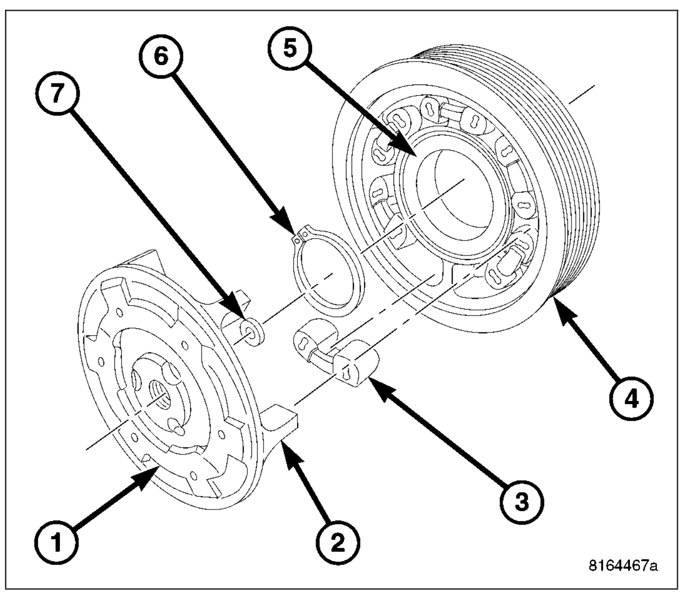
DESCRIPTION

A/C COMPRESSOR

The A/C system uses a Denso 5SE12C clutchless, five cylinder, variable displacement swashplate type A/C compressor (1). This A/C compressor has a total displacement of 126 cubic centimeters (7.6 cubic inches) and a high pressure relief valve (2) and a control valve (3) located on the back cover. The A/C compressor is secured with three bolts to the compressor bracket located near the oil pan at the front of the engine.

A label identifying the use of R-134a refrigerant is located on the A/C compressor.

HIGH PRESSURE RELIEF VALVE

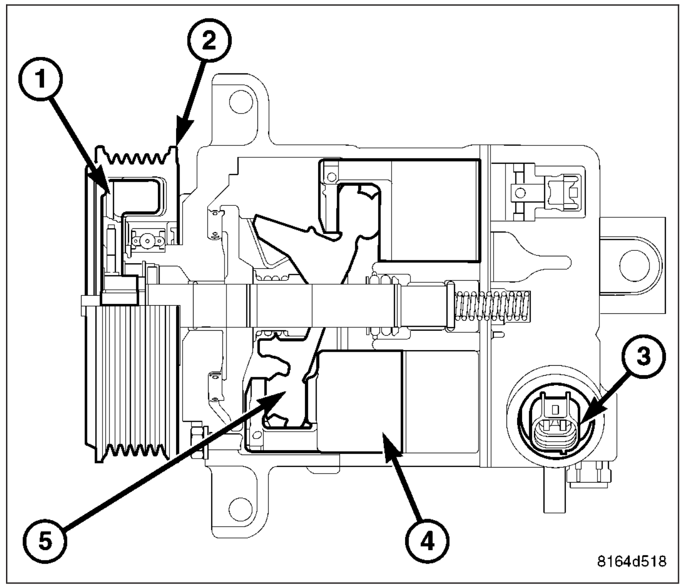


A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - DESCRIPTION). This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

HUB AND PULLEY

NOTE: Typical A/C compressor pulley and drive hub shown.

The A/C compressor hub and pulley assembly provides the means to drive the A/C compressor using the engine accessory drive belt. The hub and pulley assembly consists of an aluminum drive hub (1) with composite tabs (2) that are positioned between rubber dampeners (3) which are located inside of a composite pulley (4).



The A/C pulley has a non-servicable bearing (5) which is retained to the nose of the A/C compressor with a snap ring (6). The drive hub and shim (7) are retained to the compressor shaft by use of left handed threads.

OPERATION

A/C COMPRESSOR

The 5SE12C A/C compressor is a variable displacement compressor (VDC) which is driven by the engine through a drive hub (1) and pulley (2). This A/C compressor does not require the use of an electromagnetic clutch, as the compressor uses an integral control solenoid (3) to reduce or increase the stroke of the five pistons (4) within the compressor by automatically adjusting the angle of the swashplate (5).

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION).

The A/C compressor is controlled by the powertrain control module (PCM) or engine control module (ECM), depending on engine application. The PCM/ECM calculates compressor displacement required by A/C system load and demand by monitoring vehicle speed, A/C high side pressure, engine speed, evaporator temperature, accelerator pedal position, ambient temperature and A/C-heater request signals. The PCM/ECM then sends a pulse width modulated (PWM) signal to the A/C compressor control solenoid to increase or decrease refrigerant flow through an orifice located within the compressor housing. The amount of refrigerant allowed to pass through the orifice in the compressor determines the head pressure which controls the angle of the swashplate, which in turn, determines the amount of compressor displacement. When there is no demand for A/C, the swashplate is adjusted to nearly a zero degree angle, which removes compressor torque drag from the engine.

This A/C compressor will reduce the displacement of the compressor based on ambient air temperature. For example; as the outside temperature falls from 27° C (80° F) to 19° C (66° F), the amount of refrigerant flow required through the A/C orifice valve to keep the A/C evaporator cool becomes less, and the swashplate is adjusted to a lower angle, which reduces compressor displacement. However, due to the lower outside air temperature, panel air outlet temperature will not noticeably change.

The A/C compressor control system is diagnosed using a scan tool (refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Be certain to check and adjust the refrigerant system oil level when replacing an A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

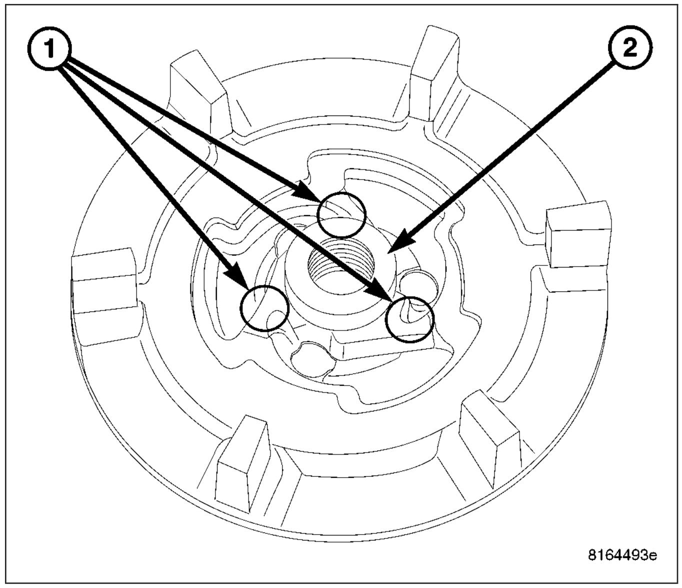
NOTE: The A/C compressor pulley and bearing assembly can be serviced separately in the event of damage or wear to the pulley or bearing. However, the compressor drive hub itself is not serviceable. In the event of drive hub failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.

The A/C compressor cannot be repaired and, if faulty or damaged it must be replaced. If an internal failure of the A/C compressor has occurred, the A/C accumulator must also be replaced (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - DESCRIPTION).

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.



The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

HUB AND PULLEY

NOTE: Typical A/C compressor pulley drive hub shown in illustration.

This compressor design does not require the use of an electromagnetic clutch, as the compressor is controlled by an integral control valve that allows refrigerant to bypass within the compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - DESCRIPTION).

The three bridges (1) located on compressor drive hub (2) are designed to break away in the event of compressor seizure. This action prevents damage to the serpentine accessory drive belt (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/HUB AND PULLEY-A/C COMPRESSOR - INSPECTION).

NOTE: The A/C compressor pulley and bearing assembly can be serviced separately in the event of damage or wear to the pulley or bearing. However, the compressor drive hub itself is not serviceable. In the event of drive hub failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.

The A/C compressor pulley and bearing cannot be repaired and, if faulty or damaged it must be replaced. The A/C compressor pulley and bearing is available for service in the event of pulley damage or pulley bearing failure. If an internal failure of the A/C compressor has lead to compressor seizure, the compressor, hub and pulley must be replaced as an assembly.

DIAGNOSIS AND TESTING

A/C COMPRESSOR NOISE TESTING

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: what sounds like a failed bearing, may be caused by loose bolts, nuts, mounting brackets or a loose compressor assembly.

NOTE: The A/C compressor must be replaced if any unusual noise is heard from the compressor itself.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C system On and Off several times to clearly identify any compressor noise. Listen to the A/C compressor while it is operating at maximum and minimum displacement. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2600 kPa (377 psi).

NOTE: Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor is operating at maximum displacement, which may not occur when the compressor is at minimum displacement.

2. Check the condition of the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING).

NOTE: The A/C compressor must be replaced if the drive hub is broken or if the compressor shaft does not rotate smoothly.

3. Check the compressor hub and pulley and bearing assembly. Be certain that the hub and pulley are properly aligned and that the pulley bearing is mounted securely to the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C-HUB AND PULLEY - INSPECTION).

NOTE: The A/C compressor must be replaced if any debris or unusually discolored oil is found on the A/C compressor manifold.

4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DESCRIPTION - REFRIGERANT LINES).
5. Loosen all of the compressor mounting hardware and retighten.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

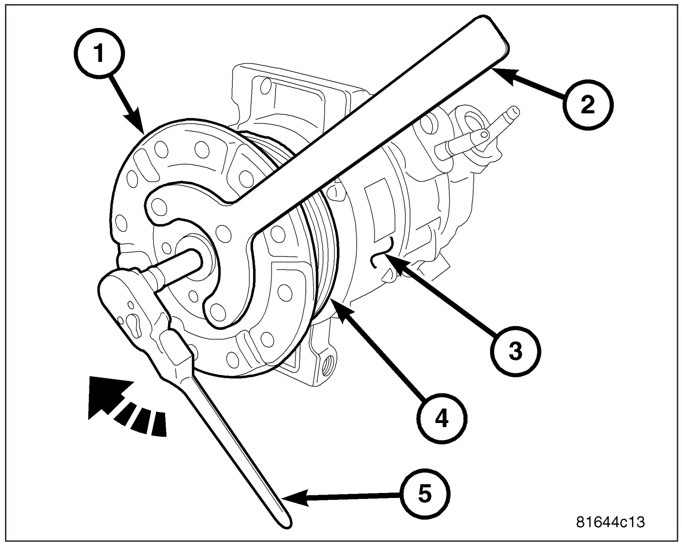
6. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).
7. If the noise is from liquid refrigerant slugging in the A/C suction line, replace the A/C accumulator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - REMOVAL) and check the refrigerant oil level and the refrigerant system charge (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL).
8. If a slugging condition still exists after replacing the A/C accumulator, then replace the A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).

REMOVAL

PULLEY AND BEARING

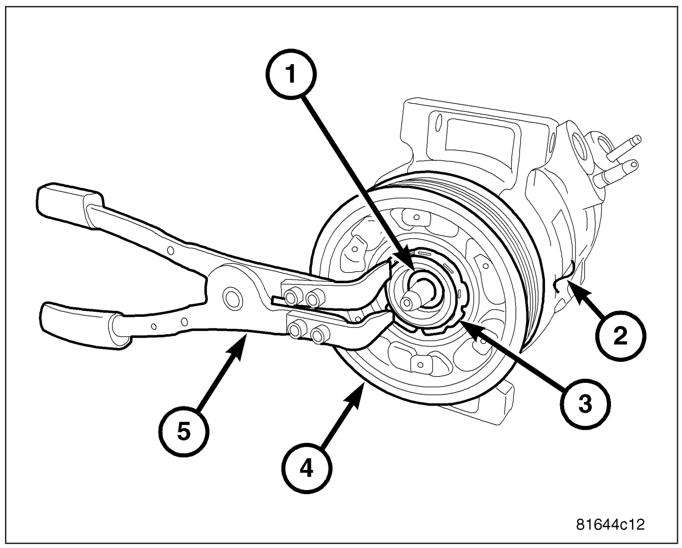
WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C compressor pulley and bearing assembly can be serviced separately in the event of damage or wear to the pulley or bearing. However, the compressor drive hub itself is not serviceable. In the event of drive hub failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.



NOTE: The A/C compressor pulley and bearing assembly can be serviced in the vehicle. The refrigerant system can remain fully charged during pulley and bearing replacement.

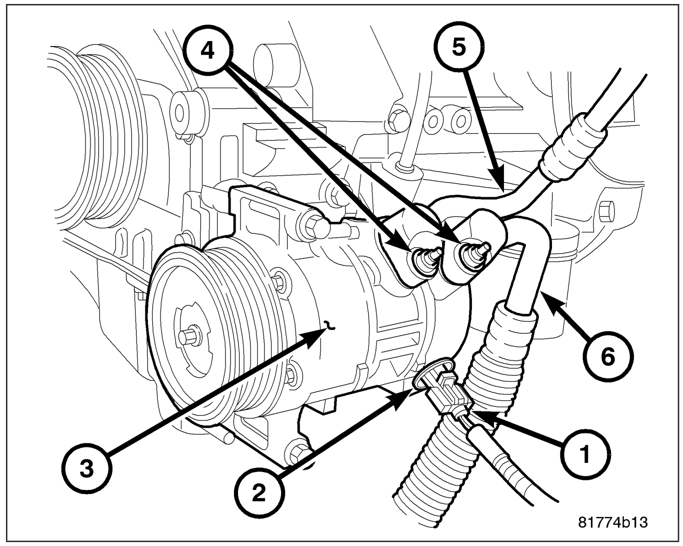
NOTE: Illustrations shown with A/C compressor removed from engine for clarity.



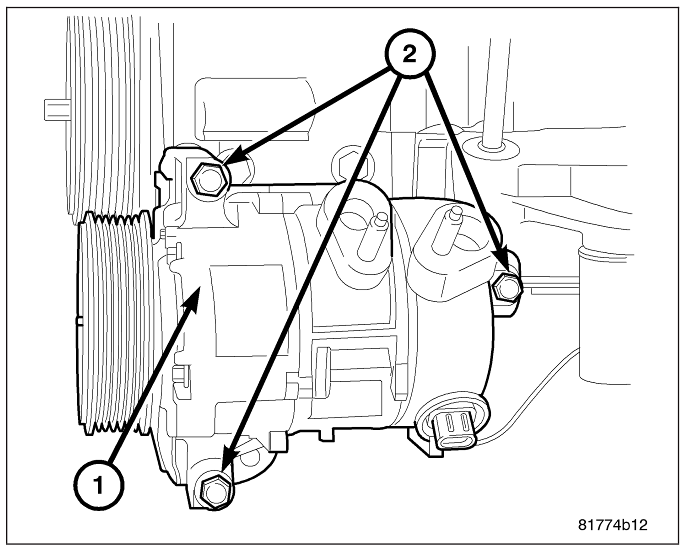
NOTE: Gasoline engine model A/C compressor pulley and drive hub shown. Diesel model similar.

1. Raise and support the vehicle.
2. Remove the splash shield from the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - REMOVAL).
3. Remove the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

NOTE: The drive hub on the gasoline engine model A/C compressor is removed using special tool 9907. The drive hub on the diesel engine model is removed using an open end wrench.



4. Using spanner wrench (Special Tool 9907 or equivalent) (2) or an open end wrench (depending on engine application), hold the drive hub (1) while rotating the shaft of the A/C compressor (3) clockwise using a 7 mm (9/32 in.) deep well socket and a ratchet (4) and remove the drive hub from the compressor.
5. Remove the shim (1) from the shaft of the A/C compressor (2).
6. Using snap ring pliers (Special Tool 9764 or equivalent) (5), remove the external snap ring (3) that secures the pulley and bearing assembly (4) to the front of the A/C compressor and remove the pulley and bearing assembly from the compressor.



A/C COMPRESSOR

WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

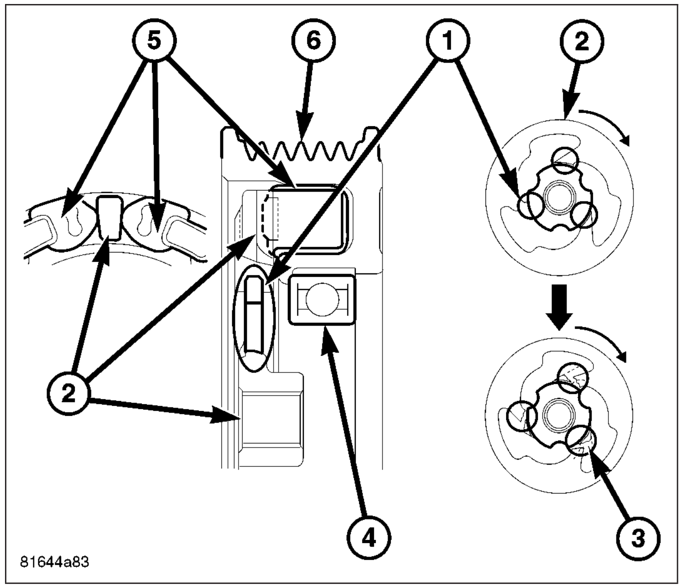
1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the splash shield from the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - REMOVAL).
5. Remove the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. Disconnect the engine wire harness (1) from the compressor control valve (2).
7. Remove the nuts (4) that secure the A/C discharge line (5) and the A/C suction line (6) to the A/C compressor (3).

8. Disconnect the A/C discharge and suction lines from the A/C compressor and remove and discard the O-ring seals and gaskets.
9. Support the A/C compressor (1) and remove the three bolts (2) that secure the compressor to the engine and remove the compressor.
10. Install plugs in, or tape over the opened refrigerant line fittings and compressor ports.

INSPECTION

HUB AND PULLEY INSPECTION

NOTE: The A/C compressor pulley and bearing assembly can be serviced separately in the event of damage or wear to the pulley or bearing. However, the compressor drive hub itself is not serviceable. In the event of drive hub failure, the A/C compressor, drive hub and pulley and bearing must be replaced as an assembly.



NOTE: The A/C compressor hub and pulley and bearing assembly can be serviced in the vehicle. The refrigerant system can remain fully charged during pulley and bearing replacement.

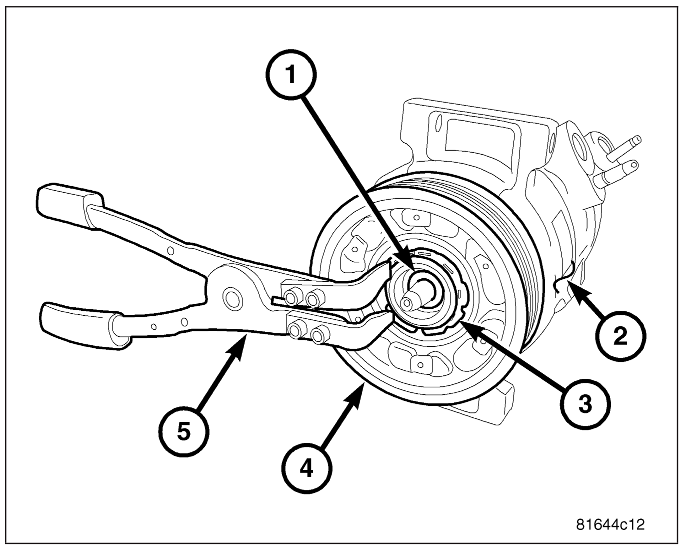
NOTE: Typical A/C compressor pulley drive hub shown.

The bridges (1) located on the compressor hub (2) are designed to break away in the event of compressor seizure. Examine the bridges for separation or cracks (3). Damage to the bridges are an indication of excessive compressor torque, which is most likely caused by compressor failure.

Check the pulley bearing (4) for roughness or excessive leakage of grease. Examine the pulley dampeners (5) for deterioration or damage. Inspect the belt surfaces of the pulley (4) for wear. The pulley should be replaced if there is excessive wear or scoring. If the pulley surfaces are oily, inspect the shaft and nose area of the A/C compressor for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Replace the A/C compressor pulley and bearing assembly if wear or damage is found.

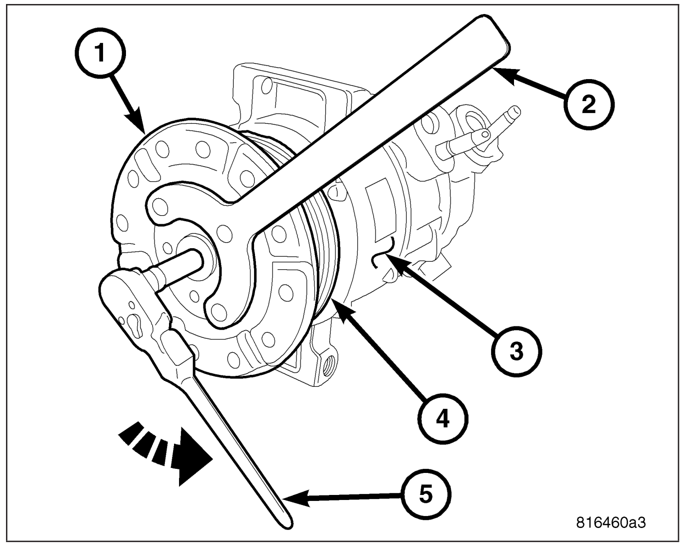
INSTALLATION



PULLEY AND BEARING

NOTE: Illustrations shown with A/C compressor removed from engine for clarity.

CAUTION: The pulley and hub are both constructed from composite materials and can be easily damaged if not properly installed. Always use care when installing the pulley and hub onto the A/C compressor.



1. Install the pulley and bearing assembly (4) onto the front of the A/C compressor (2). If necessary, place a block of wood over the pulley surface and gently tap on the wood with a light weight hammer.

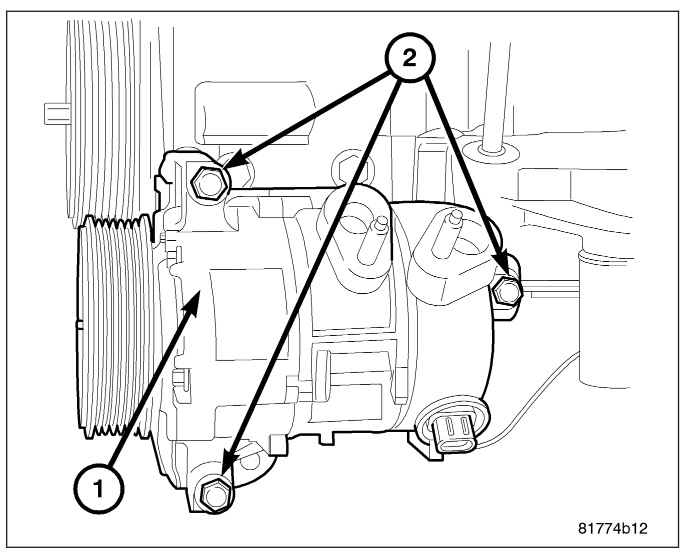
CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a pulley failure and possible severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

2. Using snap ring pliers (Special Tool 9764 or equivalent) (5), install the external snap ring (3) that secures the pulley and bearing assembly to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.
3. Install the shim (1) onto the shaft of the A/C compressor.

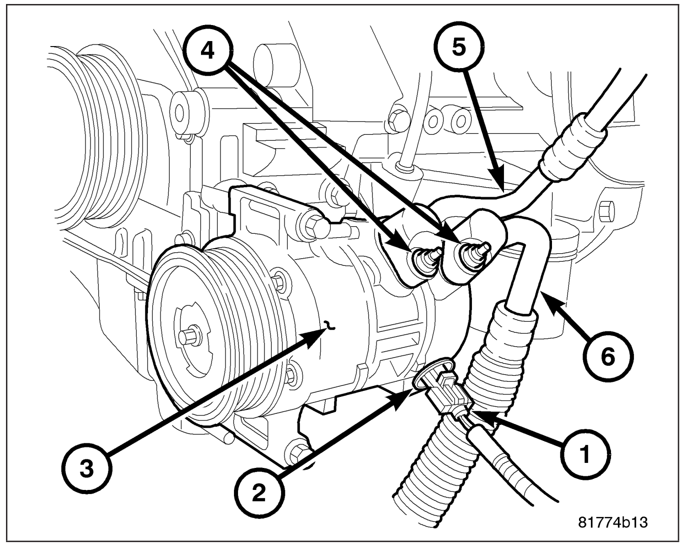
NOTE: Gasoline engine model A/C compressor pulley and drive hub shown. Diesel model similar.

4. Align the tabs of the drive hub (1) between the rubber dampers of the pulley and bearing assembly (4) and position the drive hub onto the shaft of the A/C compressor (3) (for more information, refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ COMPRESSOR-A/C-HUB AND PULLEY - DESCRIPTION).



NOTE: The drive hub on the gasoline engine model A/C compressor is installed using special tool 9907. The drive hub on the diesel engine model is installed using an open end wrench.

5. Rotate the shaft of the A/C compressor counterclockwise using a 7 mm (9/32 in.) deep well socket and a ratchet (5) while holding the drive hub using spanner wrench (Special Tool 9907 or equivalent) (2) or an open end wrench (depending on engine application). Tighten the drive hub securely onto the compressor shaft.
6. Install the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Install the splash shield onto the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - INSTALLATION).
8. Lower the vehicle.



A/C COMPRESSOR

CAUTION: When replacing an A/C compressor, be certain to check and adjust the refrigerant system oil level (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

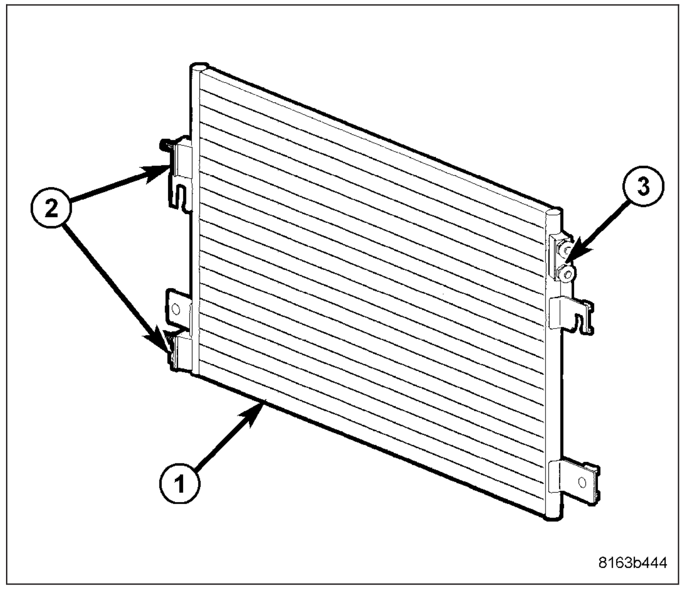
NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. If the A/C compressor (1) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then drain all of the oil from the new A/C compressor and fill the new compressor with the same amount of new refrigerant oil that was drained out of the old compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor into the engine compartment.
3. Install the three bolts (2) that secure the A/C compressor to the engine. Tighten the bolts to 25 N·m (18 ft. lbs.).

4. Remove the tape or plugs from the compressor ports and the refrigerant line fittings.
5. Lubricate new rubber O-ring seals with clean refrigerant oil and install them and new gaskets onto the refrigerant line fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the A/C discharge line (5) and the A/C suction line (6) to the A/C compressor (3).
7. Install the nuts (4) that secure the A/C suction and discharge lines to the A/C compressor. Tighten the nuts to 20 N·m (15 ft. lbs.).
8. Connect the engine wire harness (1) to the compressor control valve (2).
9. Install the accessory drive belt (refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
10. Install the splash shield onto the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - INSTALLATION).
11. Lower the vehicle.
12. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

13. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



CONDENSER-A/C

DESCRIPTION

NOTE: A/C condenser with automatic transmission cooler shown. A/C Condenser without cooler similar.

The A/C condenser (1) is located in the front of the engine compartment behind the grille. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

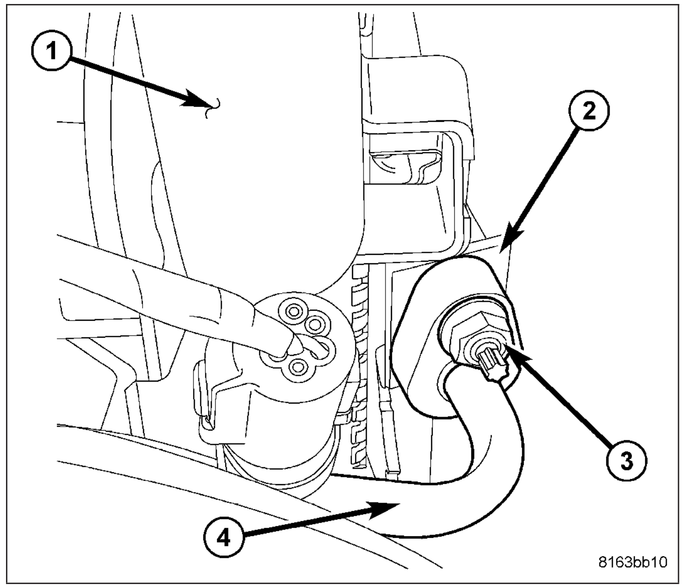
The A/C condenser is equipped with tapping blocks for the A/C discharge line and the A/C liquid line (2) and an integral automatic transmission cooler (3), when equipped with an automatic transaxle.

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged it must be replaced.

REMOVAL



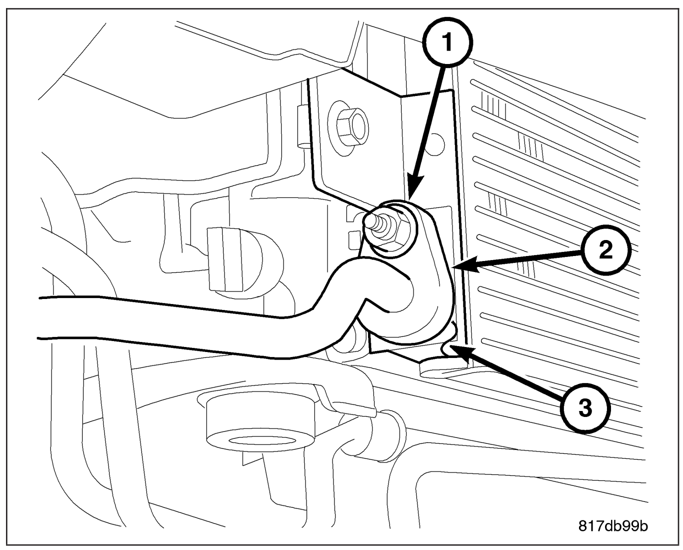
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. If equipped with the 2.2L diesel engine, remove the front fascia (refer to 13 - FRAME & BUMPERS/ BUMPERS/FRONT FASCIA - REMOVAL).

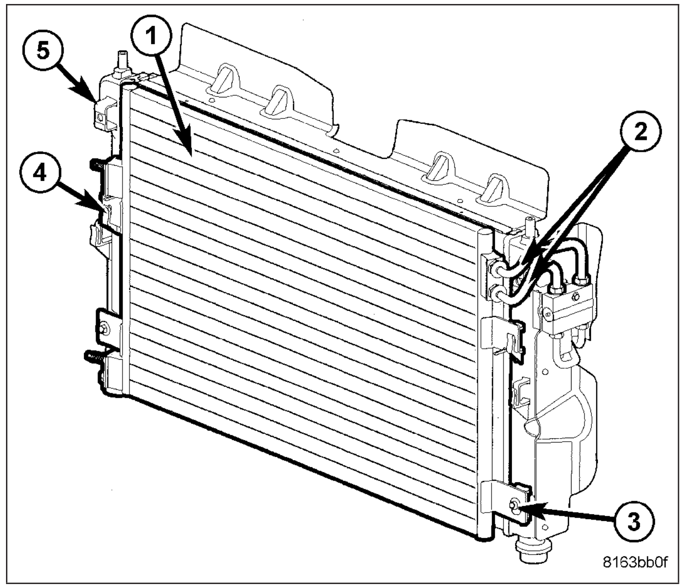
NOTE: It is not necessary to remove the hood latch from the upper radiator support on gasoline engine equipped models for A/C condenser service.

4. If equipped with a gasoline engine, remove the upper radiator support and position it out of the way (refer to 23 - BODY/EXTERIOR/SUPPORT-UPPER RADIATOR - REMOVAL).



5. On gasoline engine equipped models, carefully push the radiator (1) slightly rearward to gain access to the A/C condenser (2).
6. Remove the nut (3) that secures the A/C discharge line (4) to the right side of the A/C condenser and remove and discard the O-ring seal and gasket.
7. Install plugs in, or tape over the opened discharge line fitting and the condenser inlet port.

NOTE: Illustration shown with front fascia removed for clarity.

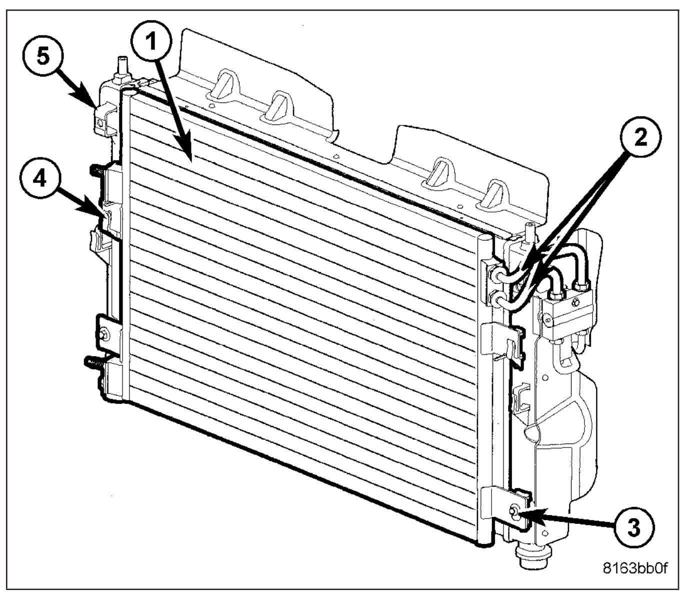


8. Raise and support the vehicle.

NOTE: On gasoline engine equipped models, reach up through the opening in the bottom of the front fascia located in the right front corner of the vehicle to gain access to the A/C liquid line.

9. Remove the nut (1) that secures the A/C liquid line (2) to the right side of the A/C condenser (3).
10. Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal and gasket.
11. Install plugs in, or tape over the opened liquid line fitting and the condenser outlet port.

NOTE: Illustration shown with front fascia and diesel engine charge air cooler (CAC) (when equipped) removed for clarity.

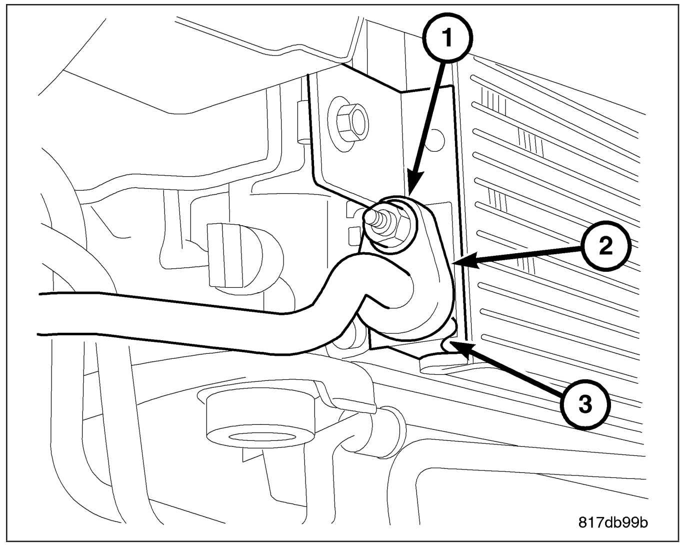


12. Remove the two bolts (3) that secure the lower condenser brackets to the radiator (5).
13. Lower the vehicle.
14. If equipped, disconnect the automatic transmission cooler lines (2) from the left side of the A/C condenser (1) (refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
15. If equipped with the 2.2L diesel engine, remove the charge air cooler (CAC) (refer to 7 - COOLING/ENGINE/CHARGE AIR COOLER - REMOVAL).
16. Carefully lift the A/C condenser straight up and disengage the two upper condenser brackets (4) from the radiator and remove the condenser from the engine compartment.

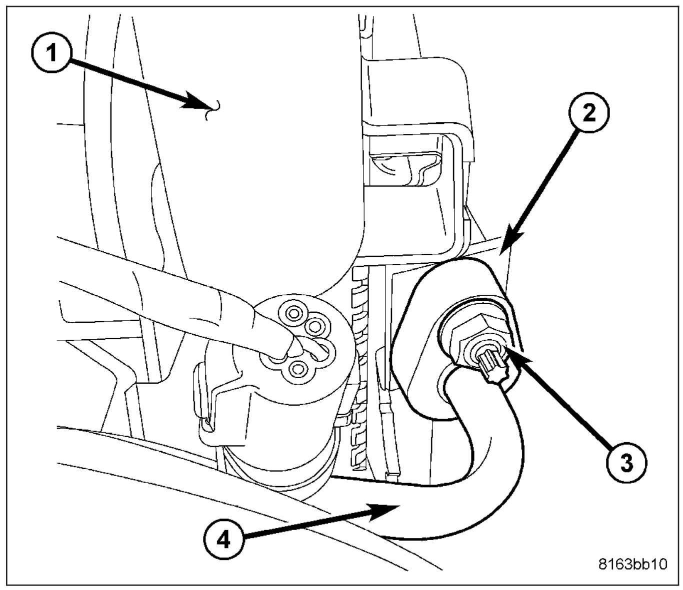
INSTALLATION

NOTE: If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.



NOTE: Illustration shown with front fascia and diesel engine charge air cooler (CAC) (when equipped) removed for clarity.



1. Carefully lower the A/C condenser (1) straight down in front of the radiator (5) and engage the upper condenser brackets (4) to the radiator.
2. If equipped with the 2.2L diesel engine, install the charge air cooler (CAC) (refer to 7 - COOLING/ENGINE/CHARGE AIR COOLER - INSTALLATION).
3. If equipped, connect the automatic transmission cooler lines (2) to the left side of the A/C condenser (refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
4. Raise and support the vehicle.
5. Install the two bolts (3) that secure the lower condenser brackets to the radiator. Tighten the bolts to 4.5 N·m (40 in. lbs.).

NOTE: Illustration shown with front fascia removed for clarity.

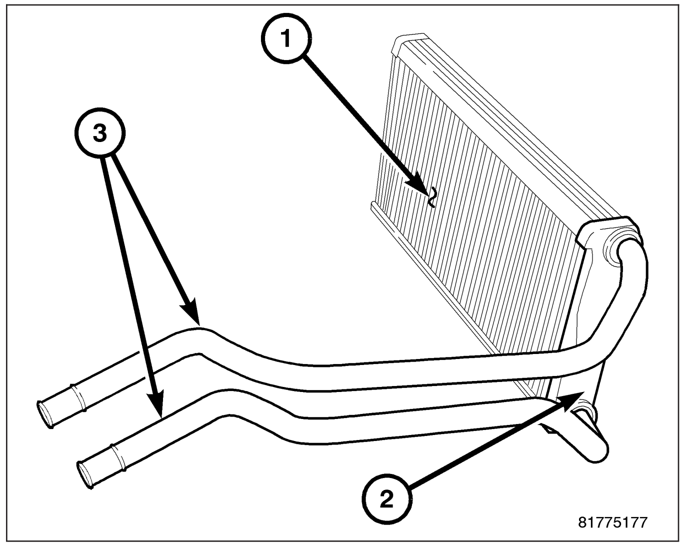
NOTE: On gasoline engine equipped models, reach up through the opening in the bottom of the front fascia located in the right front corner of the vehicle to gain access to the A/C liquid line.

6. Remove the tape or plug from the liquid line fitting and the condenser outlet port.
7. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the A/C liquid line (2) to the A/C condenser (3) and install the retaining nut (1). Tighten the nut to 5 N·m (44 in. lbs.).
9. Lower the vehicle.

10. Remove the tape or plug from the discharge line fitting and the condenser inlet port.
11. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. On gasoline engine equipped models, carefully push the radiator (1) slightly rearward to gain access to the A/C condenser (2).
13. Connect the A/C discharge line (4) to the A/C condenser and install the retaining nut (3). Tighten the nut to 5 N·m (44 in. lbs.).
14. If equipped with a gasoline engine, reposition and install the upper radiator support (refer to 23 - BODY/EXTERIOR/SUPPORT-UPPER RADIATOR - INSTALLATION).
15. If equipped with the 2.2L diesel engine, install the front fascia (refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
16. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

17. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)
18. Charge the A/C system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).



CORE-HEATER

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

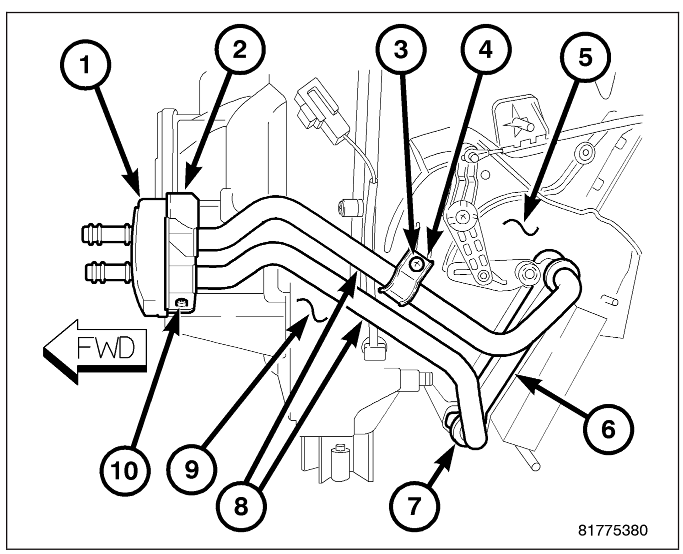
The heater core (1) for the heating-A/C system is mounted within the HVAC air distribution housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes with fins and is positioned within the air distribution housing so that only the selected amount of air entering the housing passes through the heater core before it is distributed through the heating-A/C system ducts and outlets. One end of the heater core is fitted with a tank (2) that includes the fittings for the heater core tubes (3).

The heater core can only be serviced by removing the HVAC housing from the vehicle.

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged it must be replaced.



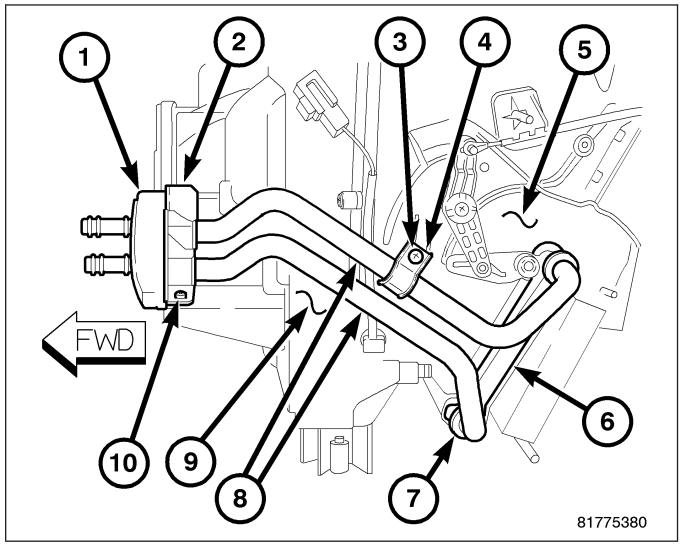
REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle for service of the heater core.

NOTE: LHD model with A/C shown. RHD and heater-only models similar.

1. Remove the HVAC housing assembly and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - REMOVAL).
2. Remove the left side front floor duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ DUCTS-FLOOR DISTRIBUTION - REMOVAL).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.



3. Remove the foam seal (1) from the flange (2) located on the front of the HVAC housing (9).
4. Remove the screw (10) that secures the flange to the front of the HVAC housing and remove the flange.
5. Remove the screw (3) that secures the retaining bracket (4) for the heater core tubes (8) to the left side of the air distribution housing (5).

6. On RHD models, remove the air distribution housing from the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - REMOVAL)
7. Carefully pull the heater core (6) out of the driver side of the air distribution housing.

INSTALLATION

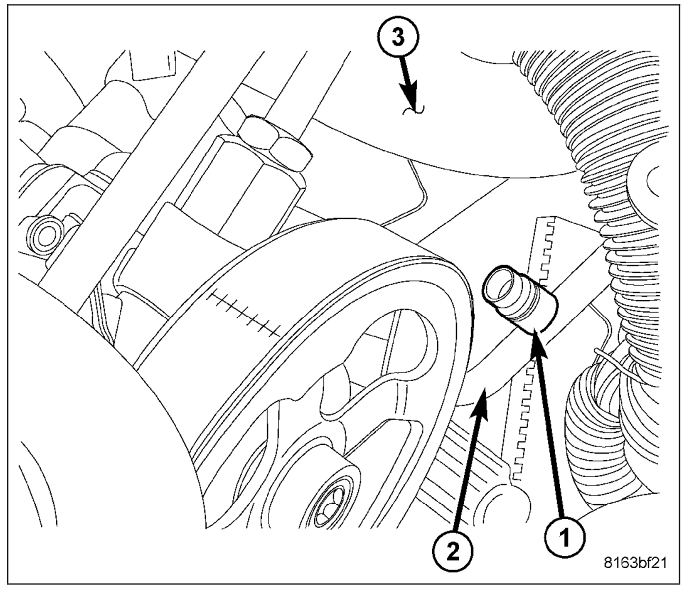
NOTE: LHD model with A/C shown. RHD and heater-only models similar.

1. Carefully install the heater core (6) into the left side of the air distribution housing (5).
2. On RHD models, install the air distribution housing (5) onto the HVAC housing (9) (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-AIR DISTRIBUTION - INSTALLATION).
3. Install the retaining bracket (4) and screw (3) that secure the heater core tubes (8). Tighten the screw to 1.2 N·m (10 in. lbs.)
4. Install the flange (2) that secures the heater core tubes to the front of the HVAC housing.
5. Install the screw (10) that secures the flange to the HVAC housing. Tighten the screw to 1.2 N·m (10 in. lbs.).

NOTE: If the foam seal for the flange is deformed or damaged, it must be replaced.

6. Install the foam seal (1) onto the flange.
7. Install the left side front floor duct (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).

NOTE: If the heater core is being replaced, flush the cooling system (refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM CLEANING/REVERSE FLUSHING).

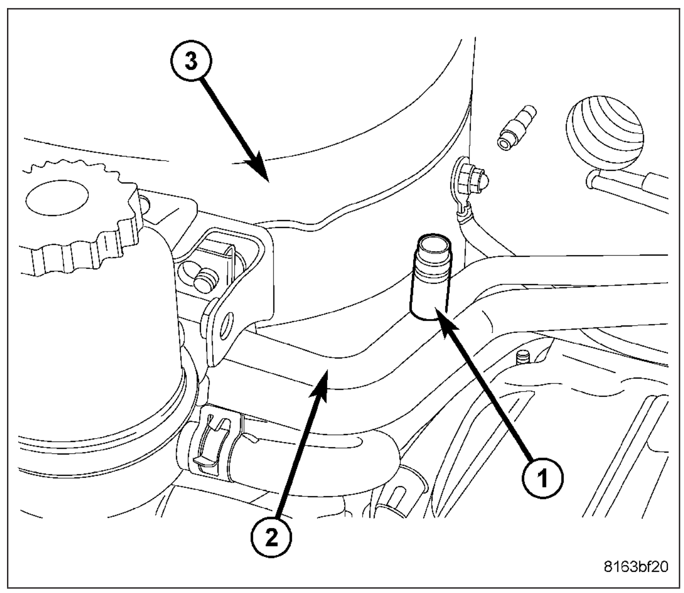


8. Install the HVAC housing assembly (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HOUSING-HVAC ASSEMBLY - INSTALLATION).

CORE-VALVE-SERVICE PORT

DESCRIPTION

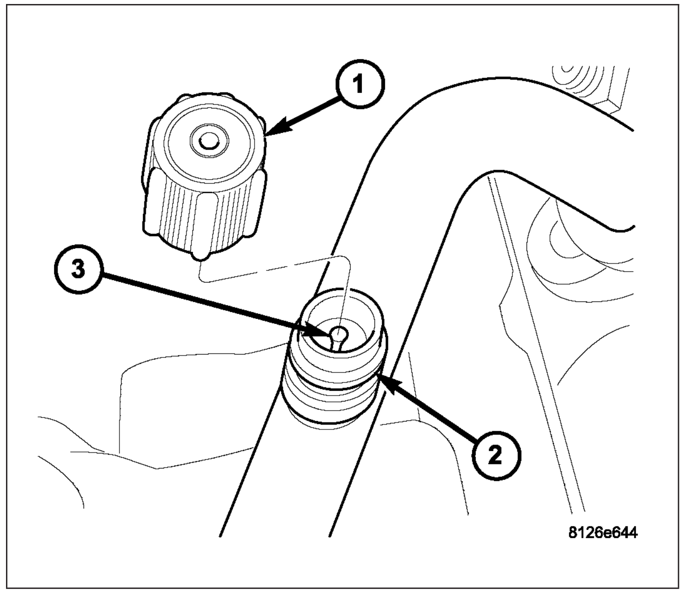
Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.



The high side service port (1) is located on the A/C discharge line (2) in front of the engine, below the upper radiator hose (3).

The low side service port (1) is located on the A/C liquid line (2) near the right front strut tower (3). Both the high side and low side A/C service port valve cores are serviceable.

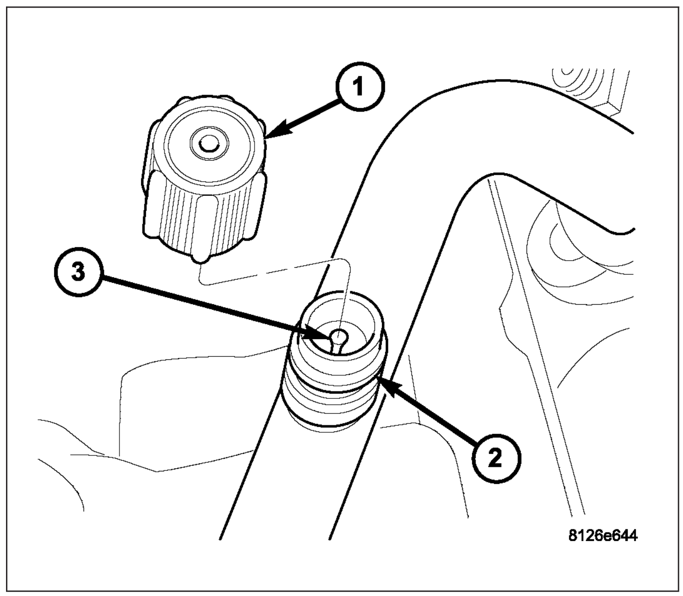
NOTE: The protective cap aids in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.



Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.



NOTE: Typical A/C service port shown.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

NOTE: Typical A/C service port shown.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

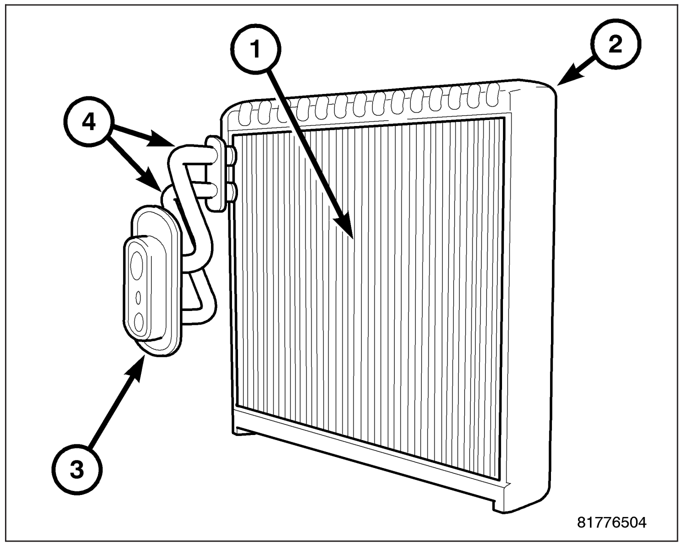
CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

4. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.



6. Install the protective cap (1) onto the service port.

EVAPORATOR-A/C

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

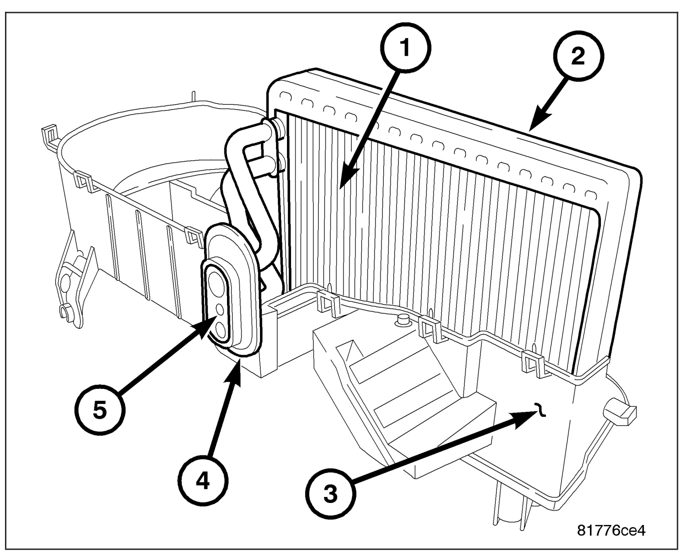
The A/C evaporator (1) for the heating-A/C system is mounted in the HVAC housing, which is located behind the instrument panel. The A/C evaporator and its insulator (2) are positioned within the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets.

A tapping block (3) and O-ring seals are used to connect and seal the A/C evaporator tubes (4) to the underhood refrigerant lines.

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

Refrigerant enters the A/C evaporator through the A/C orifice tube as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.



The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle and disassembled for service of the A/C evaporator.

NOTE: LHD model shown. RHD model similar.

1. Remove the HVAC housing and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Disassemble the HVAC housing to gain access to the A/C evaporator (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - DISASSEMBLY).

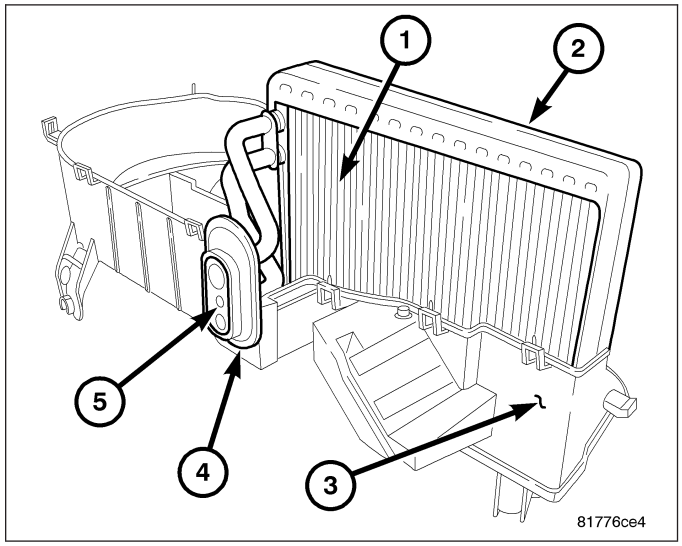
NOTE: If the foam insulator around the A/C evaporator is deformed or damaged, the insulator must be replaced.

3. Carefully lift the A/C evaporator (1) and the foam insulator (2) out of the lower half of the HVAC housing (3).

NOTE: If the seal around the evaporator tube tapping block is deformed or damaged, the seal must be replaced.

4. If required, remove the seal (4) from around the evaporator tube tapping block (5).

INSTALLATION



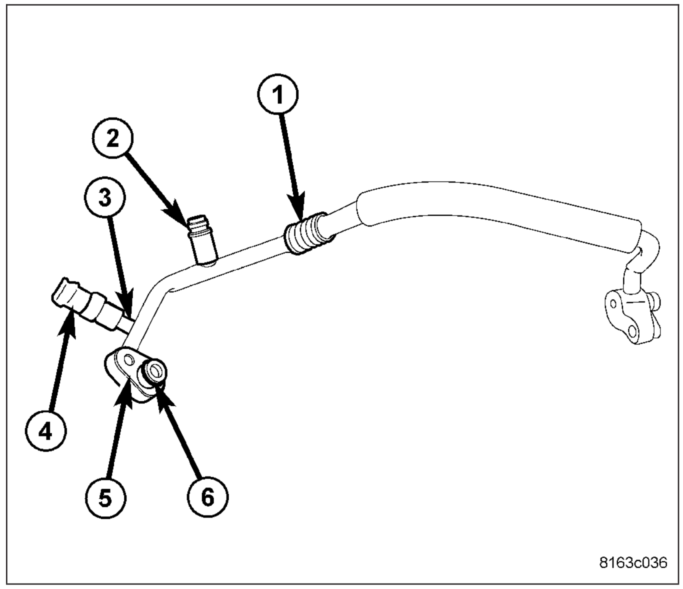
NOTE: If the A/C evaporator is being replaced, add 20 milliliters (0.7 fluid ounces) of refrigerant oil to the refrigerant system.

NOTE: LHD model shown. RHD model similar.

1. If removed, install the seal (4) onto the evaporator tube tapping block (5).

NOTE: Make sure that the foam insulator is properly positioned in the HVAC housing.

2. Carefully install the A/C evaporator (1) and foam insulator (2) into the lower half of the HVAC housing (3).
3. Assemble the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - ASSEMBLY).
4. Install the HVAC housing (refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).



LINE-A/C DISCHARGE

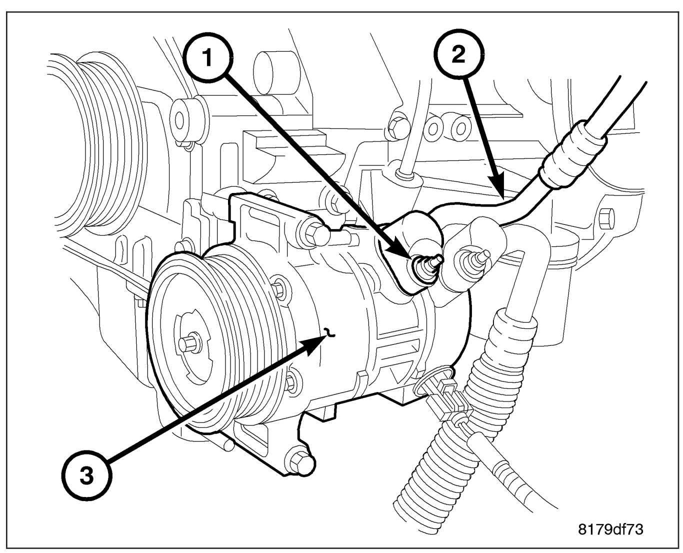
DESCRIPTION

NOTE: A/C discharge line for gasoline engine shown in illustration. A/C discharge line for diesel engine similar.

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser and includes the high side service port (2) and a fitting (3) for the A/C pressure transducer (4).

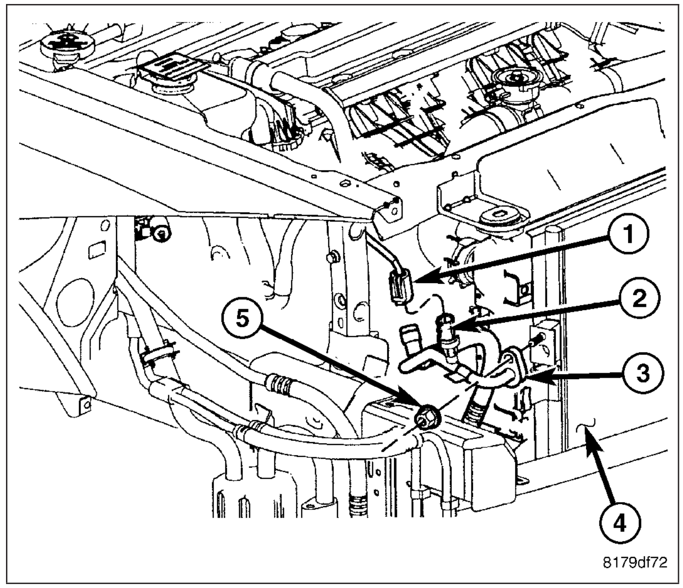
CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.

The A/C discharge line has no serviceable parts except for the metal gaskets (5) and rubber O-ring seals (6) and the high side service port valve core. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C discharge line is removed and installed.



The A/C discharge line cannot be repaired and, if leaking or damaged it must be replaced.

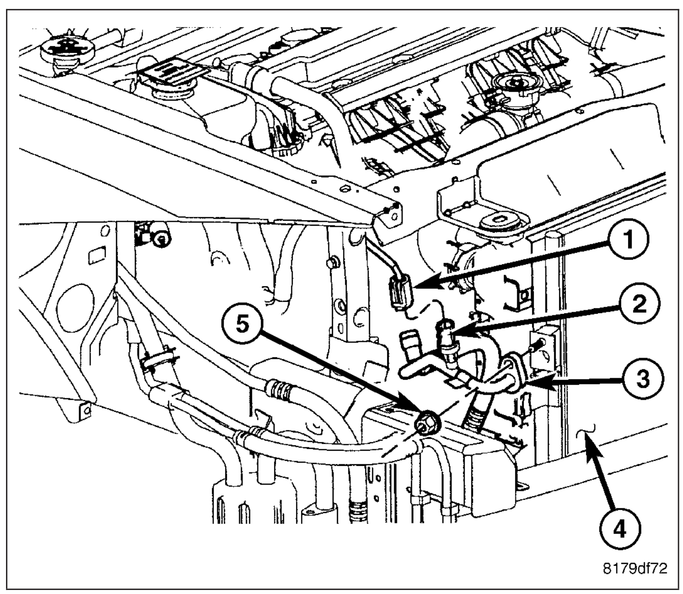
REMOVAL



WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

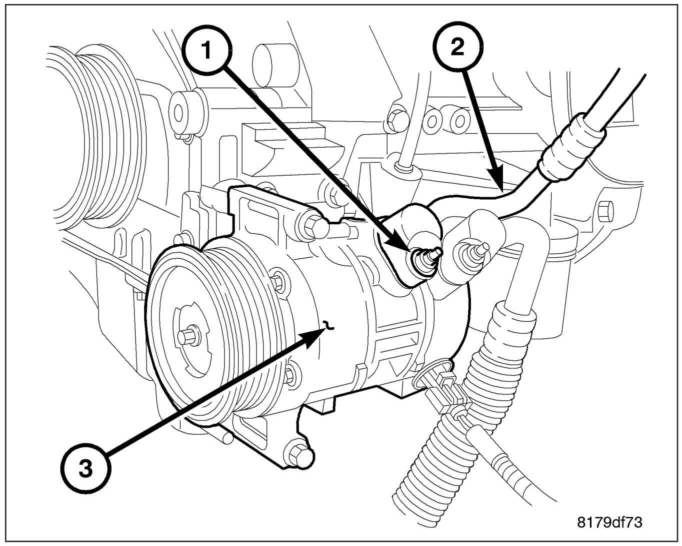
NOTE: It is not necessary to completely remove the front fascia for A/C discharge line service.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the splash shield from the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - REMOVAL).
5. Remove the nut (1) that secures the A/C discharge line (2) to the A/C compressor (3).
6. Disconnect the A/C discharge line from the A/C compressor and remove and discard the O-ring seal and gasket.
7. Install plugs in, or tape over the opened discharge line fitting and the compressor port.
8. Lower the vehicle.



9. Remove the upper radiator closure panel and carefully pull the top of the fascia forward to gain access to the A/C discharge line (3) (refer to 23 - BODY/EXTERIOR/CLOSURE PANEL-UPPER RADIATOR - REMOVAL).
10. Reach down through the opening between the radiator and the front fascia and disconnect the wire harness connector (1) from the A/C pressure transducer (2).
11. Remove the nut (5) that secures the A/C discharge line to the right side of the A/C condenser (4).
12. Disconnect the A/C discharge line from the A/C condenser and remove and discard the O-ring seal and gasket.
13. Install plugs in, or tape over the discharge line fitting and the condenser port.
14. If necessary, remove the A/C pressure transducer from the A/C discharge line.

INSTALLATION

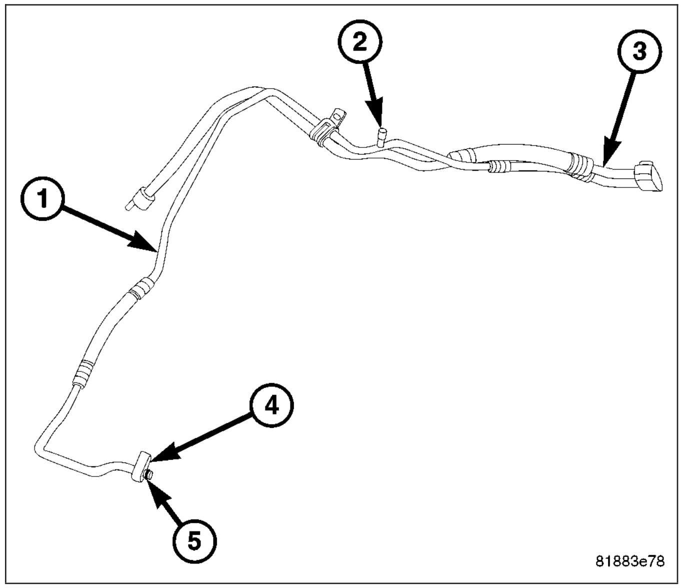


NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. If removed, install the A/C pressure transducer (2) onto the A/C discharge line (3). Tighten the A/C pressure transducer securely.
2. Position the A/C discharge line into the engine compartment.
3. Remove the tape or plugs from the discharge line fitting and the condenser port.
4. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Reach down through the opening between the radiator and the front fascia and connect the A/C discharge line to the A/C condenser (4).

6. Install the nut (5) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 5 N·m (44 in. lbs.).
7. Connect the wire harness connector (1) to the A/C pressure transducer.
8. Install the upper radiator closure panel (refer to 23 - BODY/EXTERIOR/CLOSURE PANEL-UPPER RADIATOR - INSTALLATION).

9. Raise and support the vehicle.
10. Remove the tape or plugs from the discharge line fitting and the compressor port.
11. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the discharge line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Connect the A/C discharge line (2) to the A/C compressor (3).
13. Install the nut (1) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 20 N·m (15 ft. lbs.).
14. Install the splash shield onto the right side frame rail (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-RIGHT SIDE RAIL - INSTALLATION).
15. Lower the vehicle.
16. Reconnect the negative battery cable.



CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

17. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
18. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C LIQUID

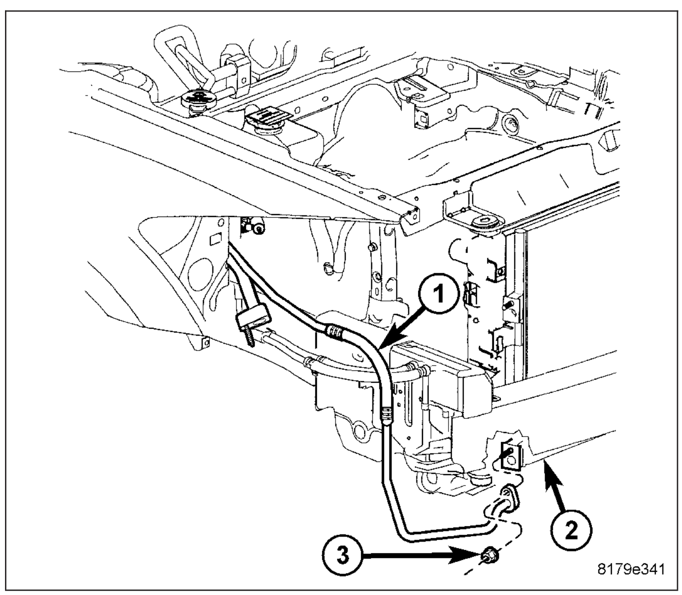
DESCRIPTION

The A/C liquid line (1) is the refrigerant line that carries refrigerant from the A/C condenser to the A/C evaporator. The A/C liquid line contains the low side service port (2) and the variable A/C orifice tube. The A/C liquid line is only serviced as an assembly with the upper A/C suction line (3).

CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.

The A/C liquid/suction line assembly has no serviceable parts except for the metal gaskets (4) and rubber O-ring seals (5) and the low side service port valve core. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C liquid/suction line assembly is removed and installed.

The A/C liquid/suction line assembly cannot be repaired and, if leaking or damaged it must be replaced.

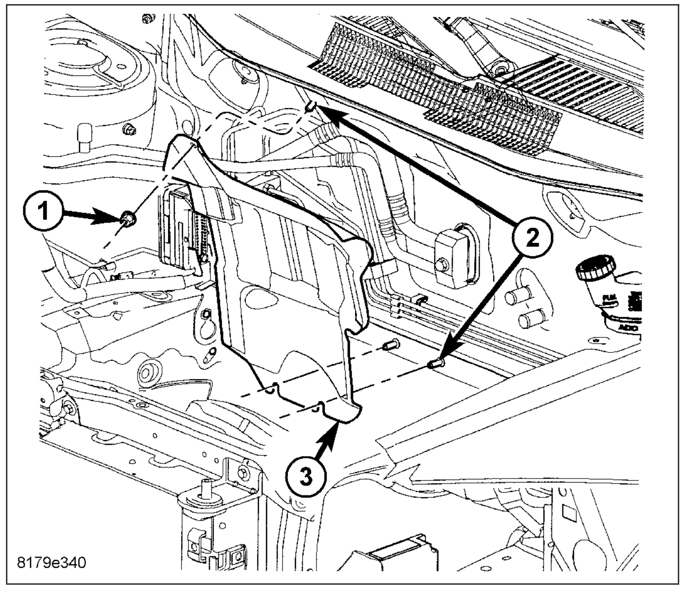


REMOVAL

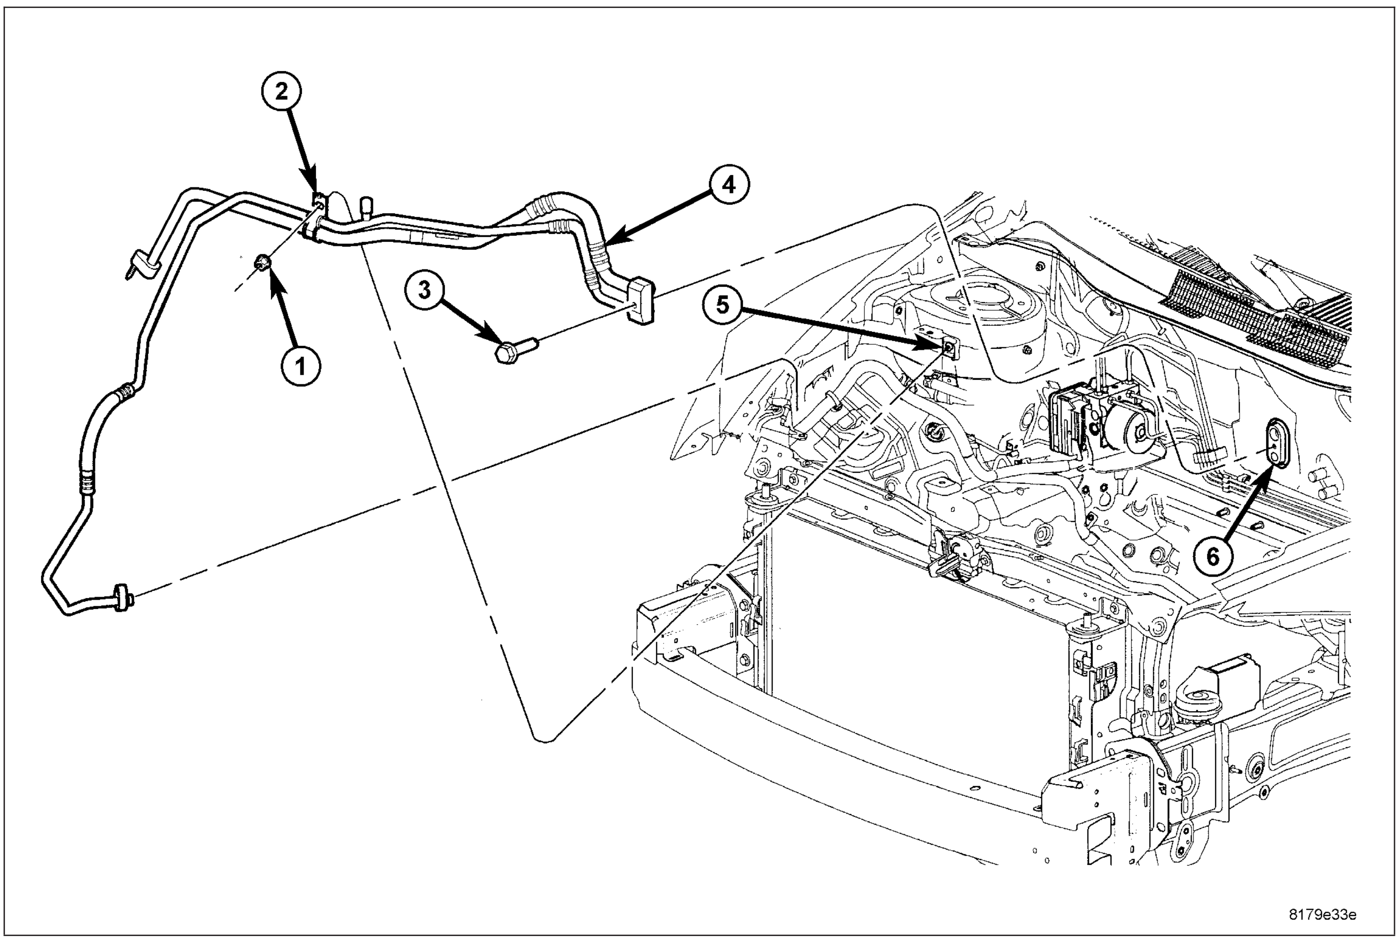
WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

NOTE: The A/C liquid line is only serviced as an assembly with the upper A/C suction line.

NOTE: LHD model shown in illustrations. RHD model similar.



NOTE: Illustration shown with front fascia removed for clarity.

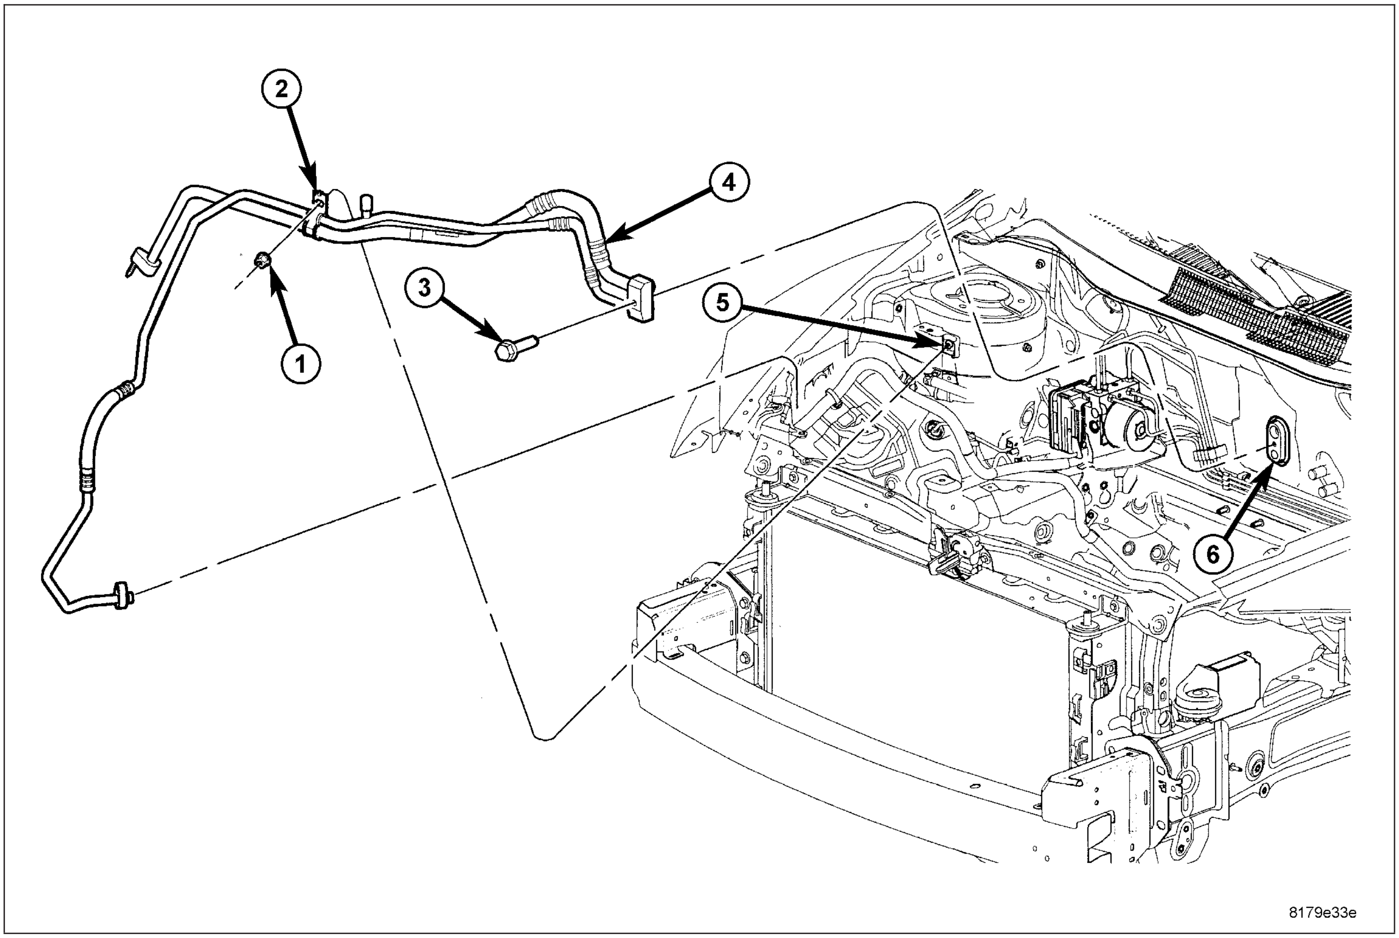


1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the A/C accumulator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - REMOVAL).
5. Reach up through the opening in the bottom of the front fascia located in the right front corner of the vehicle and remove the nut (3) that secures the A/C liquid line (1) to the A/C condenser (2).
6. Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal and gasket.

7. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and accumulator ports.

8. Lower the vehicle.
9. Remove the three nuts (1) that secure the heat shield (3) to the studs (2) located on the dash panel in the engine compartment and remove the heat shield.

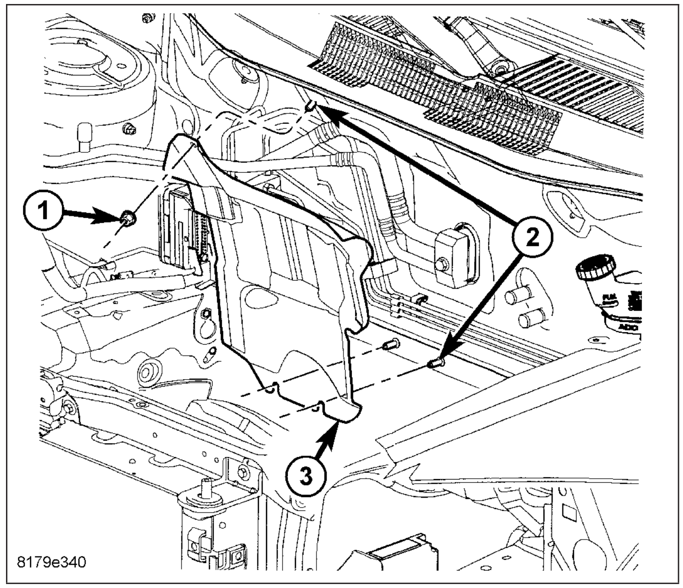
NOTE: It is only necessary to position the engine coolant reservoir and the power steering fluid reservoir out of the way. Draining of the coolant and brake fluid is not required when servicing the washer bottle.



10. Remove the windshield washer reservoir (refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).
11. Remove the nut (1) that secures the refrigerant line retaining bracket (2) to the right front strut tower (5).

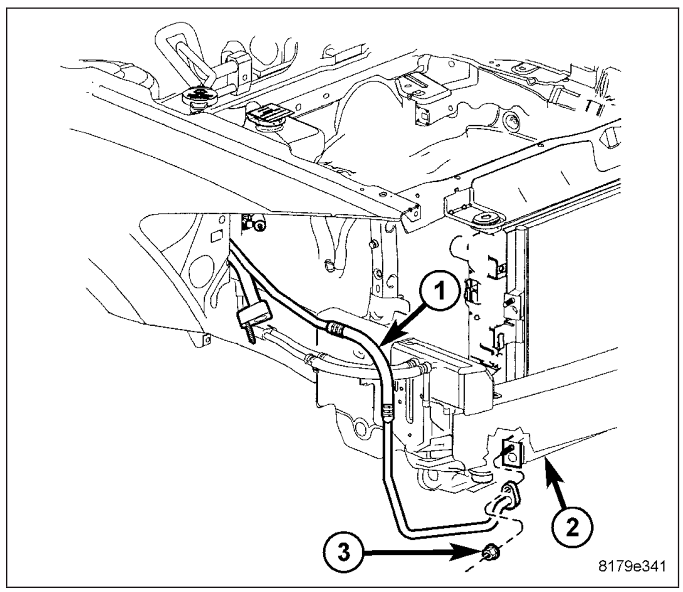
12. On RHD models, disengage the retainers that secure the power brake booster vacuum supply hose to the dash panel and position the vacuum line out of the way.
13. Remove the bolt (3) that secures the A/C liquid and suction line assembly (4) to the A/C evaporator (6).
14. Disconnect the A/C liquid and suction line assembly from the A/C evaporator and remove and discard the dual-plane seals.
15. Install plugs in, or tape over the opened refrigerant line fittings and the evaporator ports.
16. Remove the A/C liquid and suction line assembly from the engine compartment.

INSTALLATION



NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

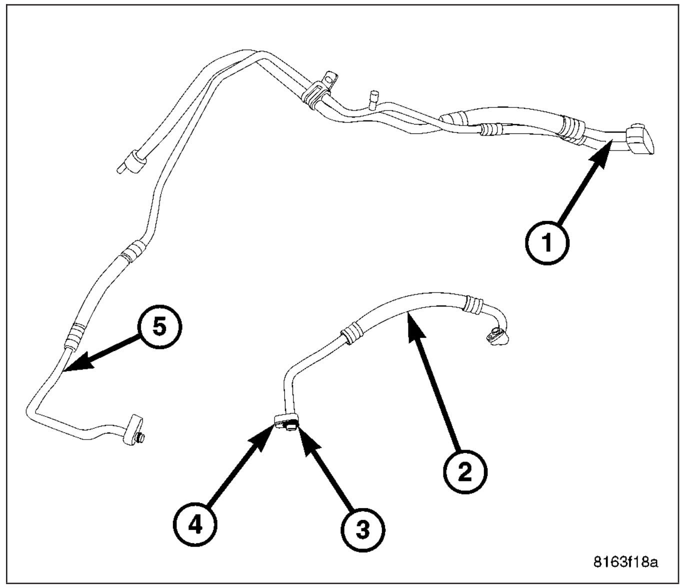


1. Position the A/C liquid and suction line assembly (4) into the engine compartment.
2. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
3. Lubricate the rubber O-rings on new dual-plan seals with clean refrigerant oil and install the seals onto the liquid and suction line fittings. Use only the specified seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid and suction line assembly to the A/C evaporator (6).
5. Install the bolt (3) that secures the A/C liquid and suction line assembly to the A/C evaporator. Tighten the bolt to 12 N·m (105 in. lbs.).
6. On RHD models, engage the retainers that secure the power brake booster vacuum supply hose to the dash panel.

7. Install the nut (1) that secures the refrigerant line bracket (2) to the right front strut tower (5). Tighten the nut to 4.5 N·m (40 in. lbs.).
8. Install the windshield washer reservoir, power steering reservoir and the engine coolant reservoir (refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).
9. Position the heat shield (3) onto the studs (2) located on the dash panel in the engine compartment.
10. Install the three nuts (1) that secure the heat shield to the dash panel. Tighten the nuts to 1 N·m (10 in. lbs.).

NOTE: Illustration shown with front fascia removed for clarity.

11. Raise and support the vehicle.
12. Remove the tape or plugs from the liquid line fitting and the condenser port.
13. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Reach up through the opening in the bottom of the front fascia and connect the A/C liquid line (1) to the A/C condenser (2) and install the retaining nut (3). Tighten the nut to 5 N·m (44 in. lbs.).
15. Install the A/C accumulator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - INSTALLATION).
16. Lower the vehicle.
17. Reconnect the negative battery cable.



CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

18. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)
19. Charge the A/C system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

LINE-A/C SUCTION

DESCRIPTION

The A/C suction line is serviced in two sections. The upper section of the A/C suction line (1) is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C accumulator. The lower section of the A/C suction line (2) carries refrigerant from the A/C accumulator to the A/C compressor. The upper portion of the A/C suction line is only serviced as an assembly with the A/C liquid line (5).

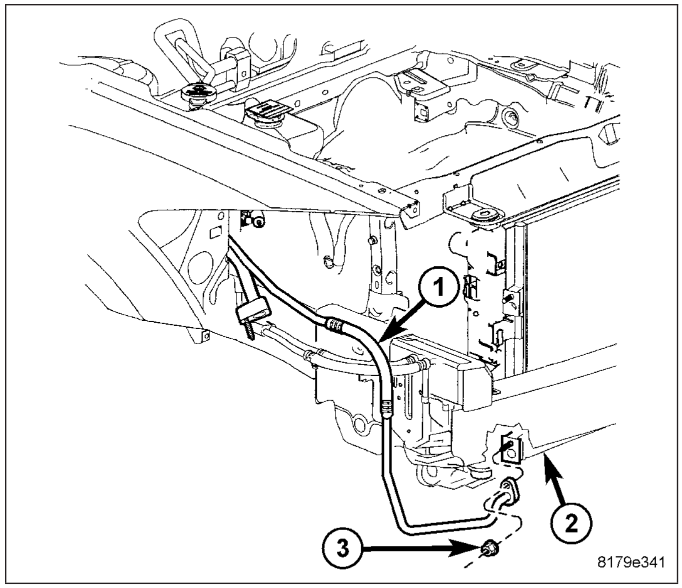
CAUTION: Use only the O-ring seals specified for the vehicle. Failure to use the correct O-ring seals will cause the refrigerant system connections to leak.

The lower A/C suction line and the A/C liquid/suction line assembly has no serviceable parts except for the rubber O-ring seals (3) and metal gaskets (4) and the low side service port valve core. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the lower A/C suction line and/or the A/C liquid/suction line assembly is removed and installed.

The lower A/C suction line and the A/C liquid/suction line assembly cannot be repaired and, if leaking or damaged they must be replaced.

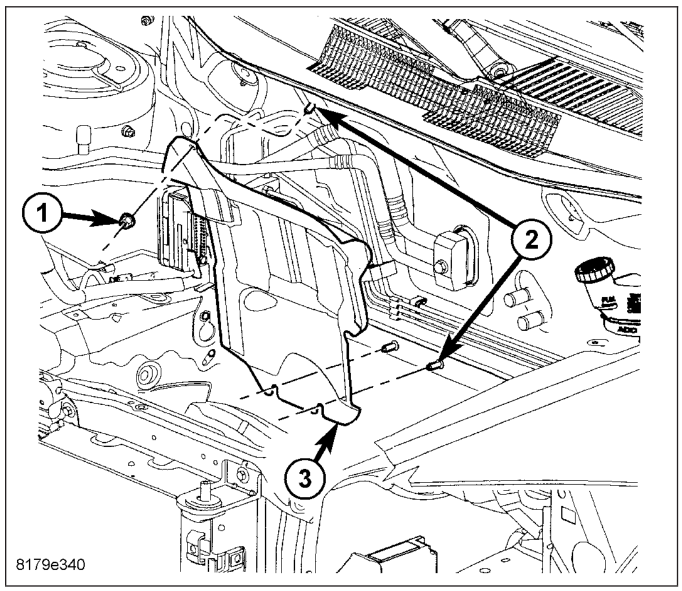
REMOVAL

WARNING: Review safety precautions and warnings in this group before performing this procedure (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

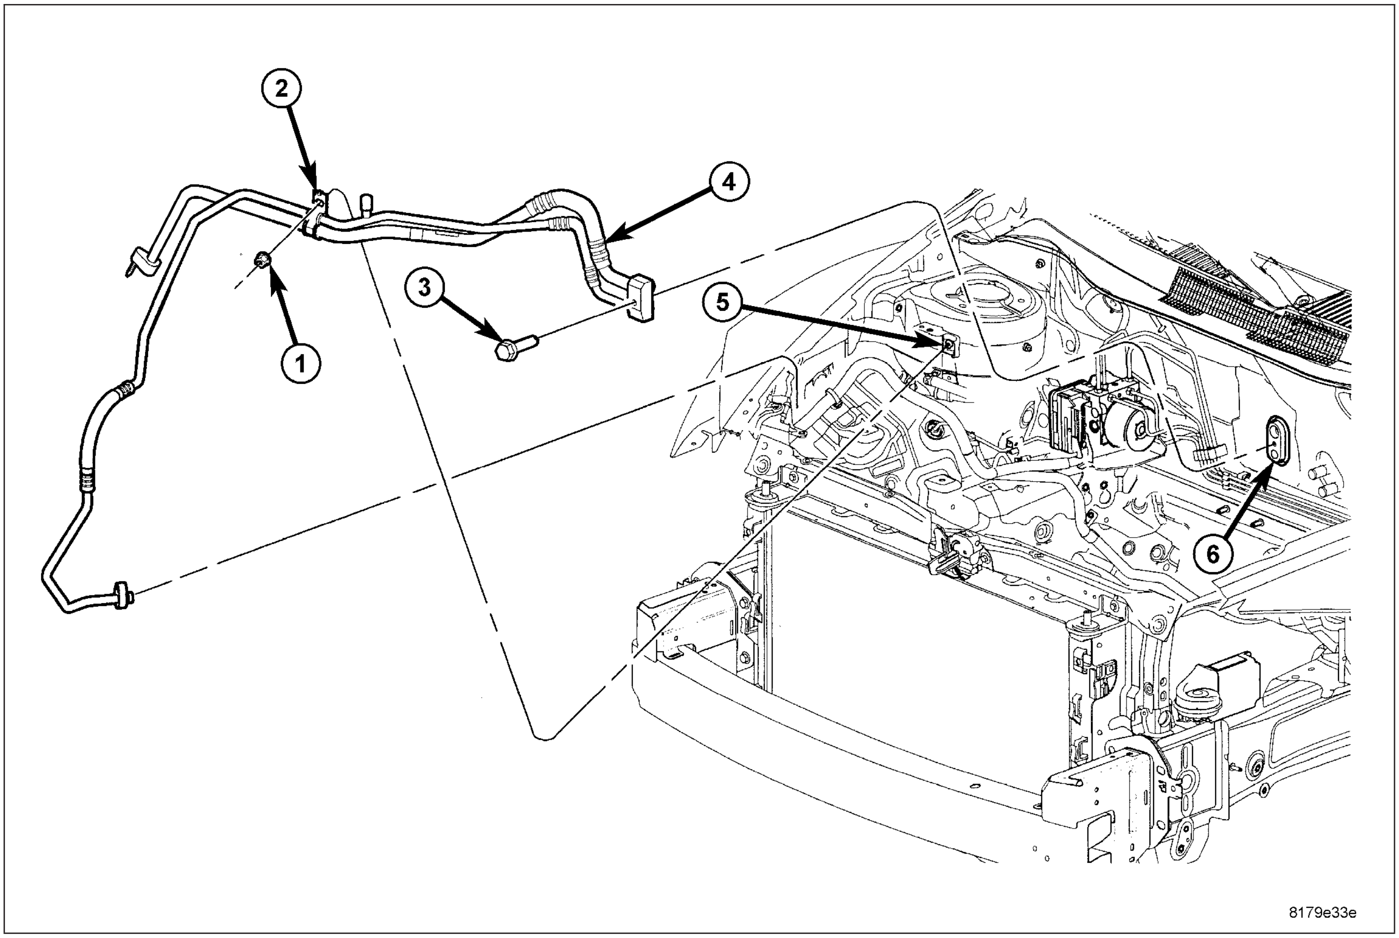


NOTE: The A/C suction line is serviced in two sections. The upper section of the A/C suction line is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C accumulator. The lower section of the A/C suction line carries refrigerant from the A/C accumulator to the A/C compressor.

NOTE: LHD model shown in illustrations. RHD model similar.



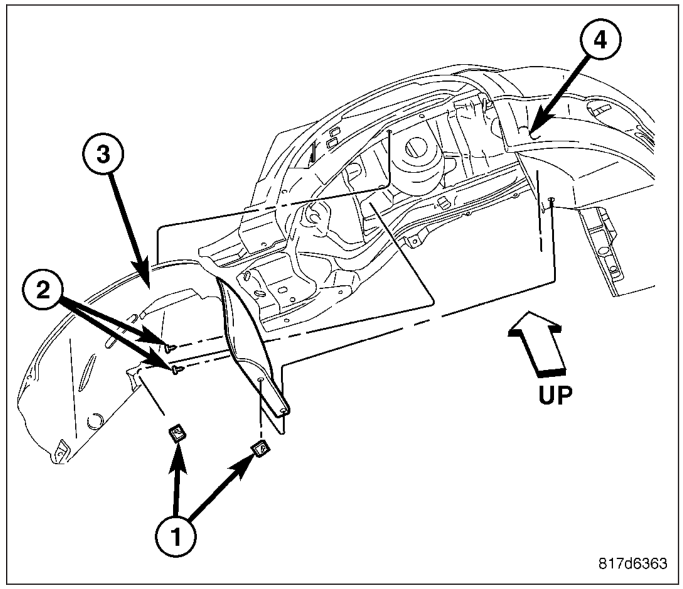
Upper A/C Suction Line



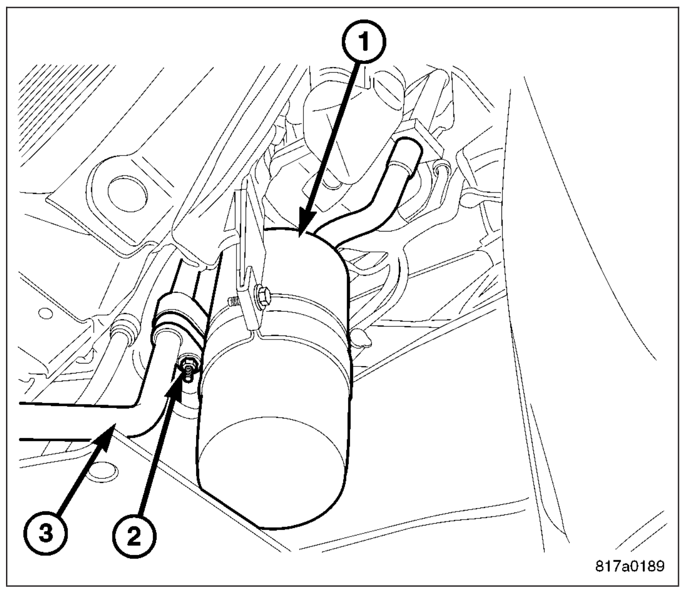
NOTE: The upper portion of the A/C suction line is only serviced as an assembly with the A/C liquid line.

NOTE: Illustration shown with front fascia removed for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the A/C accumulator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR-A/C - REMOVAL).
5. Reach up through the opening in the bottom of the front fascia located in the right front corner of the vehicle and remove the nut (3) that secures the A/C liquid line (1) to the A/C condenser (2).
6. Disconnect the A/C liquid line from the A/C condenser and remove and discard the O-ring seal and gasket.
7. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and accumulator ports.
8. Lower the vehicle.
9. Remove the three nuts (1) that secure the heat shield (3) to the studs (2) located on the dash panel in the engine compartment and remove the heat shield.

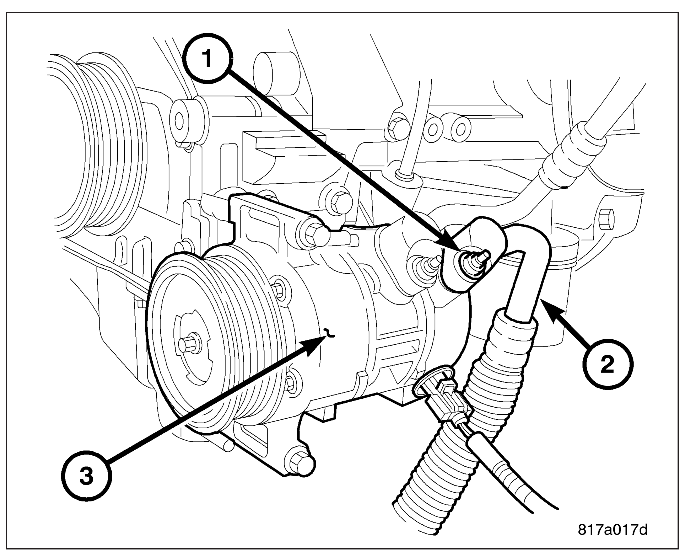


NOTE: It is only necessary to position the engine coolant reservoir and the power steering fluid reservoir out of the way. Draining of the coolant and brake fluid is not required when servicing the washer bottle.



10. Remove the windshield washer reservoir (refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).
11. Remove the nut (1) that secures the refrigerant line retaining bracket (2) to the right front strut tower (5).
12. On RHD models, disengage the retainers that secure the power brake booster vacuum supply hose to the dash panel and position the vacuum line out of the way.
13. Remove the bolt (3) that secures the A/C liquid and suction line assembly (4) to the A/C evaporator (6).
14. Disconnect the A/C liquid and suction line assembly from the A/C evaporator and remove and discard the dual-plane seals.
15. Install plugs in, or tape over the opened refrigerant line fittings and the evaporator ports.
16. Remove the A/C liquid and suction line assembly from the engine compartment.

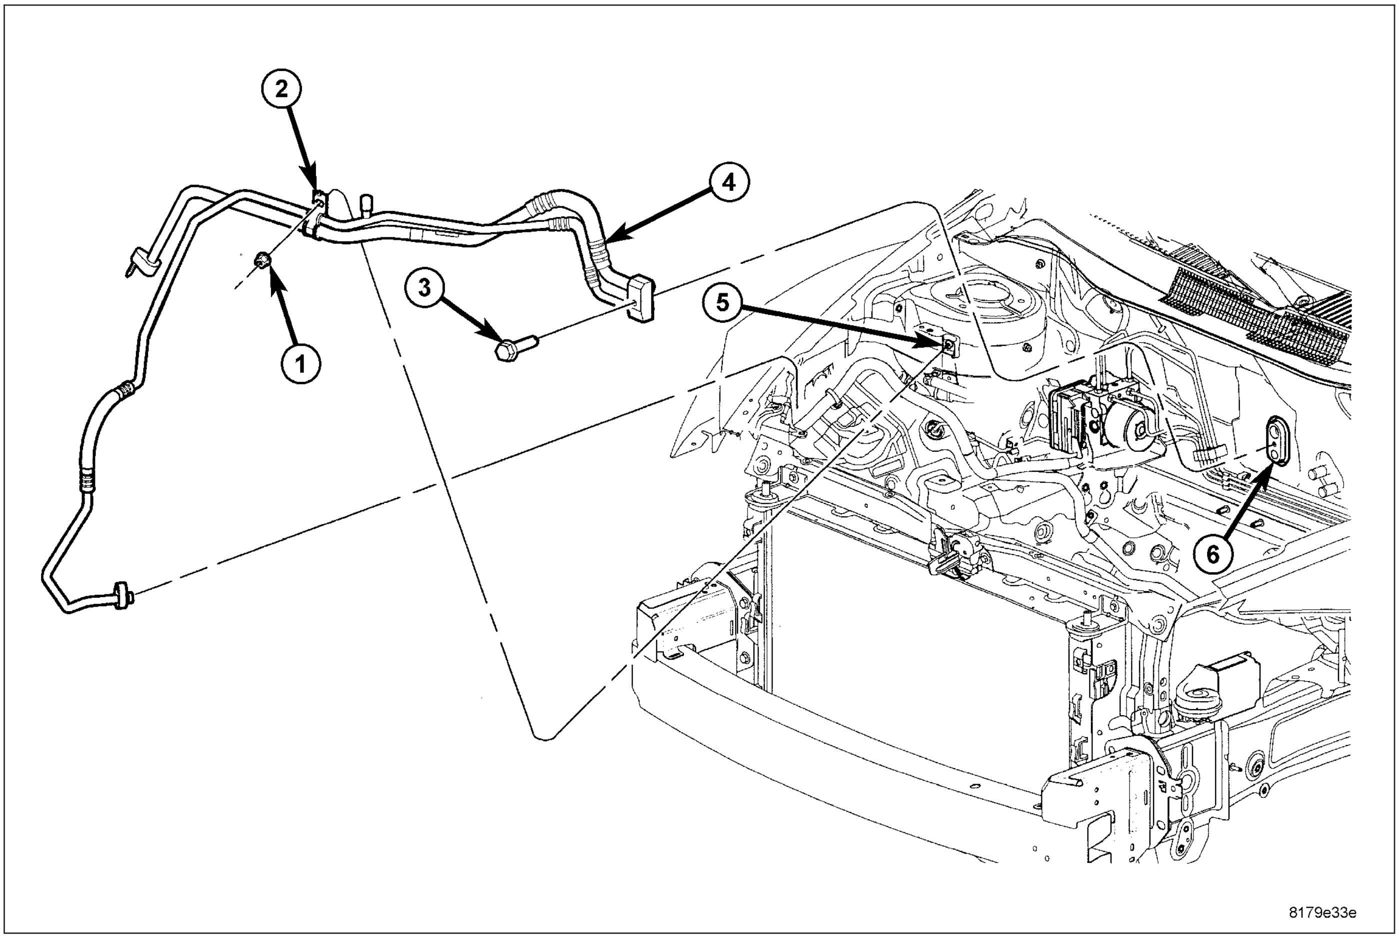
Lower A/C Suction Line



1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Raise and support the vehicle.
4. Remove the right front wheel (refer to 22 - TIRES/ WHEELS - REMOVAL).
5. Remove the three push-pin retainers (1) and three screws (2) that secure the front portion of the right front wheelhouse splash shield (3) to body (4) and position the front of the wheelhouse splash shield out of the way to gain access to the A/C accumulator (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - REMOVAL).

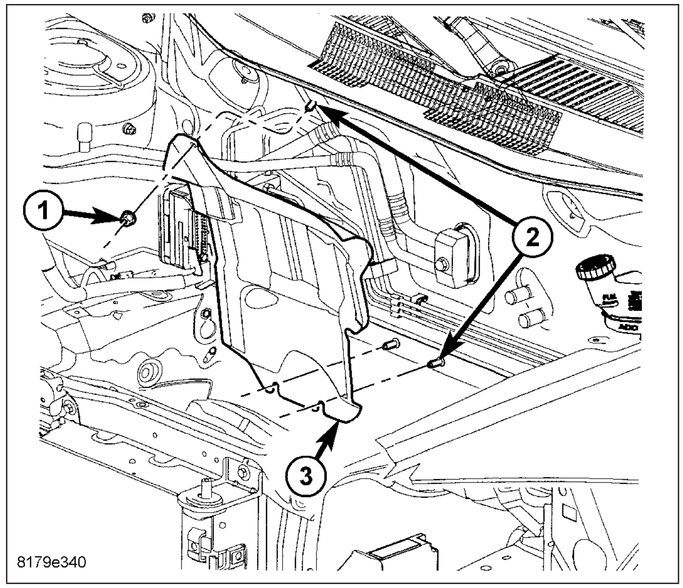
6. Remove the nut (2) that secures the lower A/C suction line (3) to the A/C accumulator (1).
7. Disconnect the lower A/C suction line from the A/C accumulator and remove and discard the O-ring seal and gasket.
8. Install plugs in, or tape over the opened suction line fitting and the accumulator port.

9. Remove the nut (1) that secures the lower A/C suction line (2) to the A/C compressor (3).
10. Disconnect the lower A/C suction line from the A/C compressor and remove and discard the O-ring seal and gasket.
11. Install plugs in, or tape over the opened suction line fitting and the compressor port.
12. Remove the lower A/C suction line from the engine compartment.



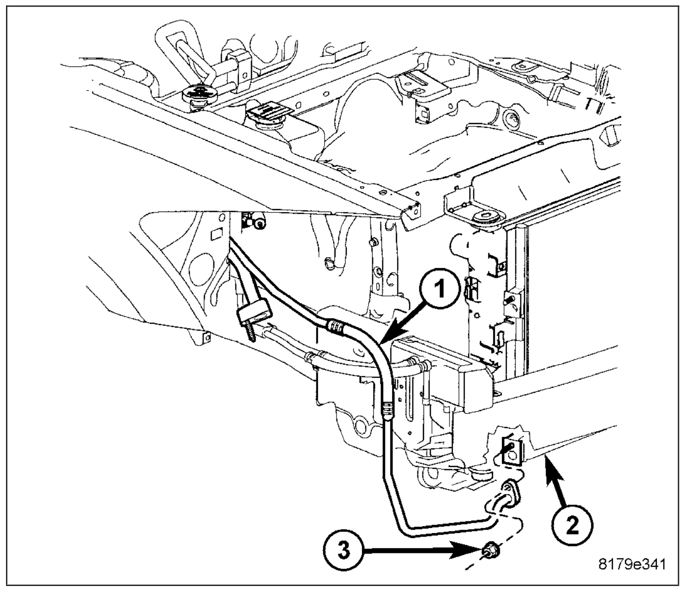
INSTALLATION

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.



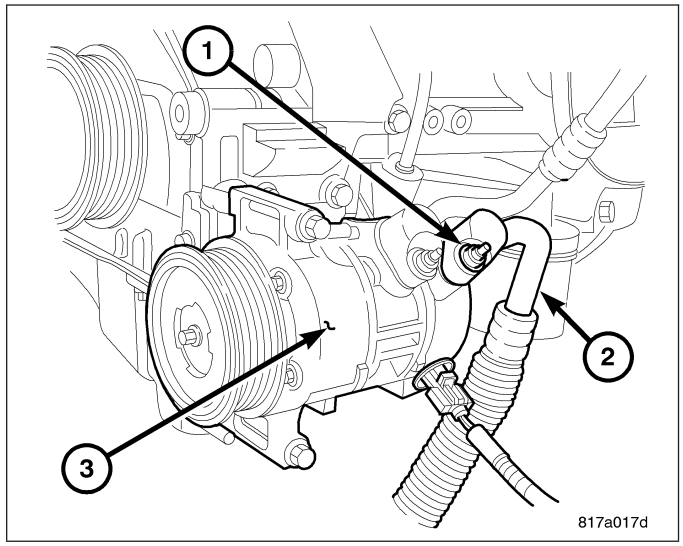
NOTE: LHD model shown in illustrations. RHD model similar.

Upper A/C Suction Line

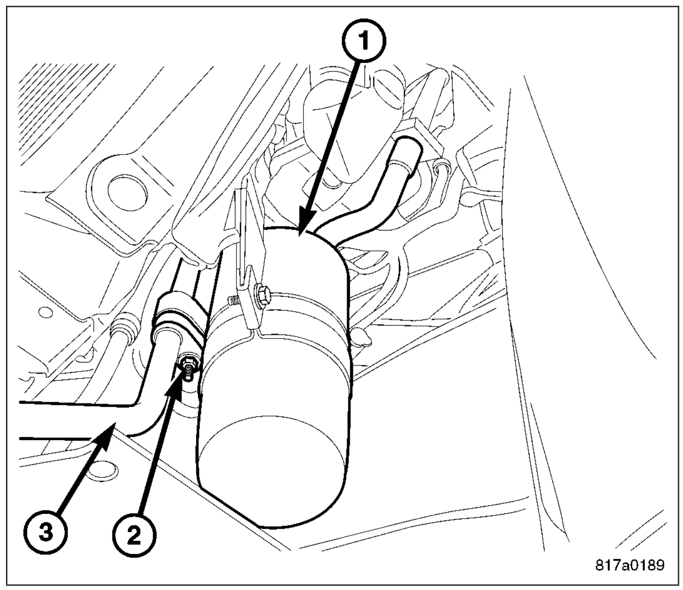


1. Position the A/C liquid and suction line assembly (4) into the engine compartment.
2. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
3. Lubricate the rubber O-rings on new dual-plan seals with clean refrigerant oil and install the seals onto the liquid and suction line fittings. Use only the specified seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid and suction line assembly to the A/C evaporator (6).
5. Install the bolt (3) that secures the A/C liquid and suction line assembly to the A/C evaporator. Tighten the bolt to 12 N·m (105 in. lbs.).
6. On RHD models, engage the retainers that secure the power brake booster vacuum supply hose to the dash panel.
7. Install the nut (1) that secures the refrigerant line bracket (2) to the right front strut tower (5). Tighten the nut to 4.5 N·m (40 in. lbs.).
8. Install the windshield washer reservoir, power steering reservoir and the engine coolant reservoir (refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).

9. Position the heat shield (3) onto the studs (2) located on the dash panel in the engine compartment.
10. Install the three nuts (1) that secure the heat shield to the dash panel. Tighten the nuts to 1 N·m (10 in. lbs.).



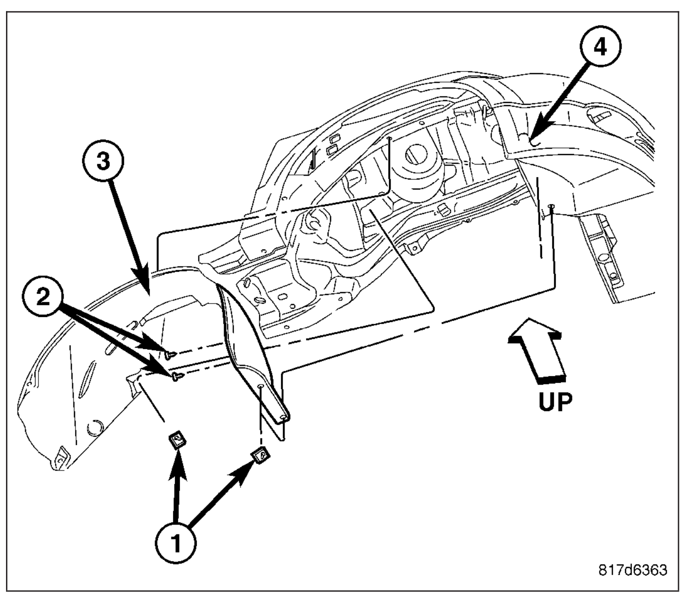
NOTE: Illustration shown with front fascia removed for clarity.



11. Raise and support the vehicle.
12. Remove the tape or plugs from the liquid line fitting and the condenser port.
13. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and a new gasket onto the liquid line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Reach up through the opening in the bottom of the front fascia and connect the A/C liquid line (1) to the A/C condenser (2) and install the retaining nut (3). Tighten the nut to 5 N·m (44 in. lbs.).
15. Install the A/C accumulator (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - INSTALLATION).
16. Lower the vehicle.
17. Reconnect the negative battery cable.
18. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)
19. Charge the A/C system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

Lower A/C Suction Line

1. Position the lower A/C suction line (2) into the engine compartment.
2. Remove the tape or plugs from the suction line fitting and the compressor port.
3. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and new gasket onto the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the lower A/C suction line to the A/C compressor (3).
5. Install the nut (1) that secures the A/C suction line to the A/C compressor. Tighten the nut to 20 N·m (15 ft. lbs.).



6. Remove the tape or plugs from the suction line fitting and the accumulator port.
7. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it and new gasket onto the suction line fitting. Use only the specified O-ring as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the lower A/C suction line (3) to the A/C accumulator (1).
9. Install the nut (2) that secures the lower A/C suction line to the A/C accumulator. Tighten the nut to 5 N·m (44 in. lbs.).

10. Reposition the front of the right front wheel house splash shield (3) to the body (4) and install the three push-pin retainers (1) and the three screws (2). Tighten the screws securely (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - INSTALLATION).
11. Install the right front wheel (refer to 22 - TIRES/WHEELS - INSTALLATION).
12. Lower the vehicle.
13. Reconnect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

14. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING -

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).

15. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

OIL-A/C REFRIGERANT

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available and each contain a different additive package. Always use only the type of refrigerant oil recommended for the A/C compressor in the vehicle.

CAUTION: Be certain to check and adjust the refrigerant system oil level when replacing an A/C compressor (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE - REFRIGERANT OIL LEVEL). Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The Denso 5SE12C A/C compressor used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil in the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE

REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C accumulator, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

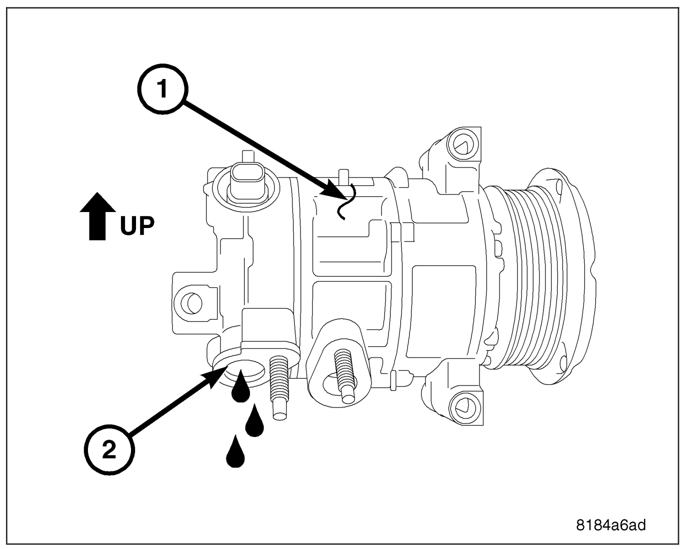
It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: ND-8 PAG refrigerant oil is used in the Denso 5SE12C A/C compressor. Only refrigerant oil of the same type should be used to service this R-134a A/C system. Do not use any other refrigerant oil. The refrigerant oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from moisture and dirt. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the amount of refrigerant oil being removed during the recovery process. This amount of refrigerant oil should always be added back into the refrigerant system. Refer to the reclaim/recycling equipment manufacturers instructions.

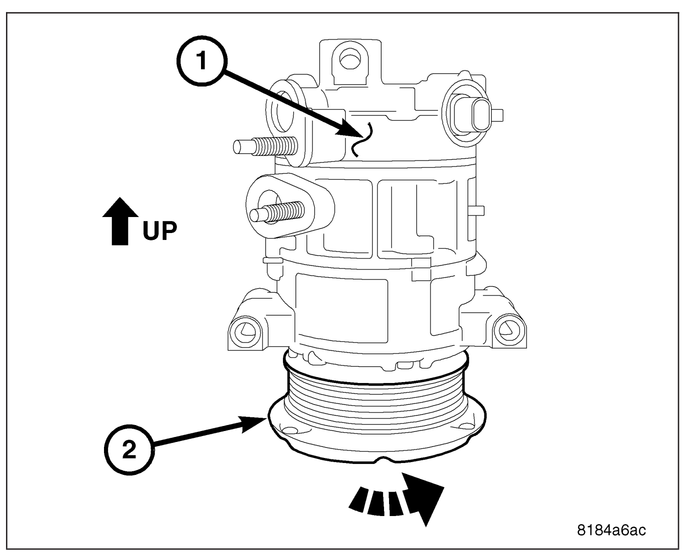
It will not be necessary to check the oil level within the A/C refrigerant system or to add oil, unless there has been an oil loss. A refrigerant oil loss may occur due to component replacement or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak does occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C accumulator, A/C evaporator or A/C condenser is replaced. Refer to the Refrigerant Oil Capacities chart.



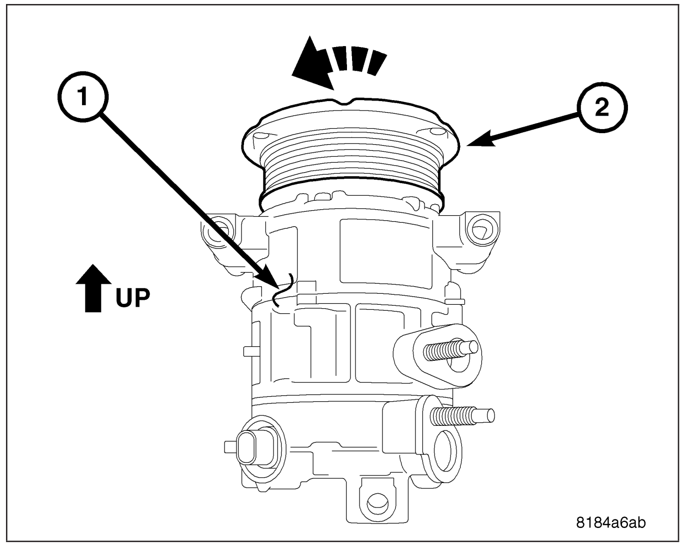
REFRIGERANT OIL CAPACITIES

Component	ml.	oz.
Total System Fill	100	3.4
A/C Accumulator	20	0.7
A/C Condenser	30	1.0
A/C Evaporator	20	0.7
A/C Compressor	Drain and measure the oil from the old compressor - see following text.	



CAUTION: Be certain to check and adjust the refrigerant system oil level when replacing an A/C compressor. The refrigerant oil in the Denso 5SE12C A/C compressor can only be drained using the procedure described below. Failure to properly drain the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

When an A/C compressor is replaced, the refrigerant oil must first be drained from the old compressor and measured. Then the refrigerant oil from the new A/C compressor must be completely drained. Finally, the new A/C compressor must be refilled with the same amount of refrigerant oil that was drained from the old compressor. Use the following procedure to drain and measure the refrigerant oil in the Denso 5SE12C A/C compressor.



1. Remove the original A/C compressor (1) and place it on a workbench (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).
2. Using a suitable clean measured container, position the A/C compressor so that the refrigerant oil can drain out of the suction port (2). Hold the A/C compressor in this position until no more oil comes out of the compressor port.

3. Reposition the A/C compressor (1) so that the pulley (2) is facing downward and rotate the compressor pulley clockwise ten full turns. Make sure that each rotation of the pulley is performed within two seconds.

4. Reposition the A/C compressor (1) so that the pulley (2) is facing upward and slowly rotate the compressor pulley clockwise one full turn.
5. Repeat steps 2 thru 4 at least five times.
6. Determine the amount of oil removed from the original A/C compressor.
7. Repeat steps 2 thru 4 with the new A/C compressor at least five times.
8. Using fresh ND-8 PAG refrigerant oil, place the same amount of oil that was removed from the original A/C compressor into the new A/C compressor.
9. Install the new A/C compressor onto the engine (refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING/COMPRESSOR-A/C - INSTALLATION).

REFRIGERANT-A/C

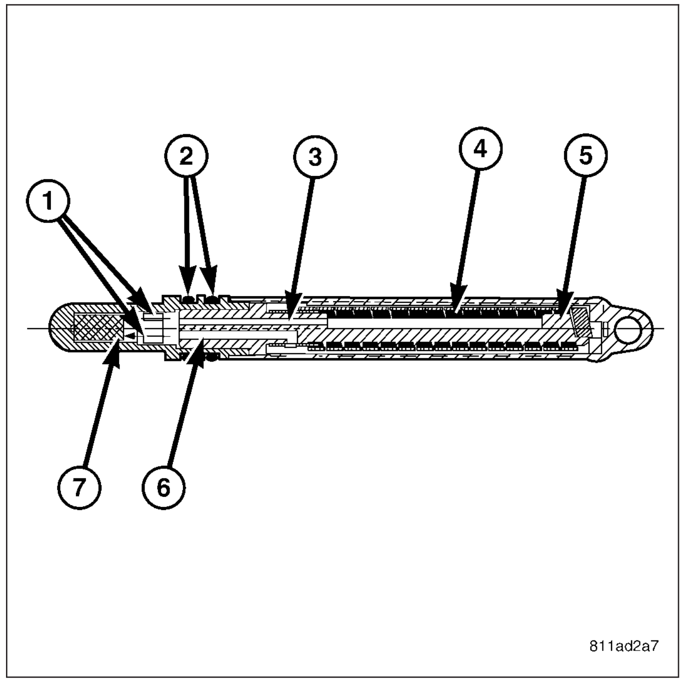
DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.



R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

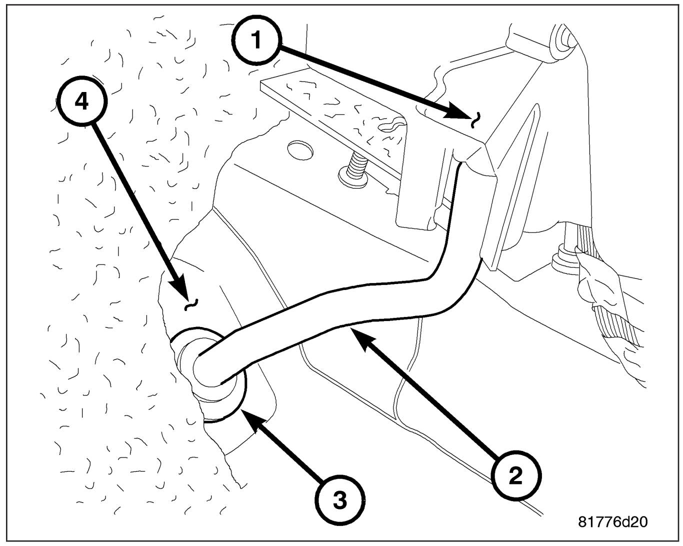
TUBE-A/C VARIABLE ORIFICE

DESCRIPTION

The A/C orifice tube establishes the pressure differential between the high and low pressure sides of the A/C system by providing a restriction between the A/C condenser and the A/C evaporator. The A/C orifice tube in this vehicle is installed in the A/C liquid line and is of a variable orifice valve (VOV) design.

The variable A/C orifice tube consists of the inlet filter screen (5), the bi-metal coil (4), the fixed port (3), the variable port (6), metering orifices (1), a nylon mesh diffuser screen (7) and two rubber O-rings (2) which seal the tube to the inside of the A/C liquid line to prevent refrigerant from bypassing the metering orifices.

OPERATION



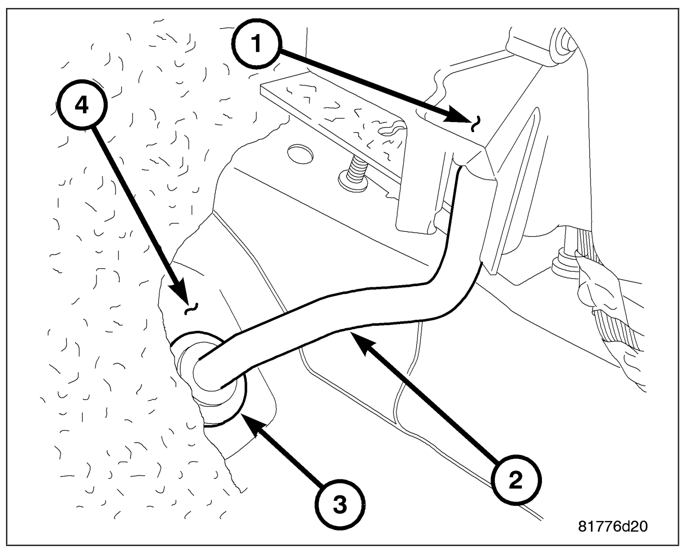
The variable A/C orifice tube provides improved A/C system cooling during city driving and when under heavy loads by controlling refrigerant flow through the two parallel flow paths integral to the orifice tube. Under normal loads, the refrigerant flows through the inlet filter screen, the fixed and variable ports and both metering orifices. As the load on the A/C system increases, the temperature of the refrigerant leaving the A/C condenser increases, which causes the bi-metal coil to expand and restrict the flow of refrigerant through the variable port of the tube. Restricting the flow of refrigerant through the variable port and its orifice provides a greater pressure differential between the high and low pressure sides of the A/C system, resulting in colder refrigerant vapor traveling through the A/C evaporator to help remove the heat from the conditioned air flowing into the passenger compartment.

The variable A/C orifice tube is not serviceable and cannot be repaired and, if faulty or plugged, the A/C liquid line must be replaced (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - DESCRIPTION).

TUBE-CONDENSATION DRAIN

DESCRIPTION

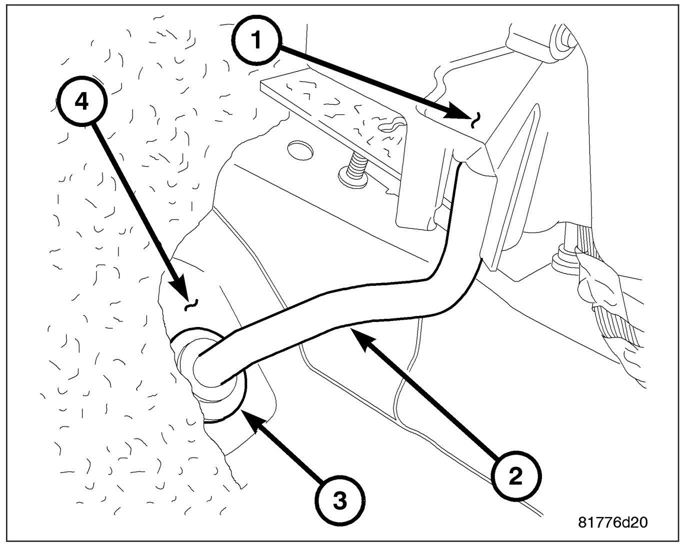
Condensation that accumulates within the HVAC housing is drained through a port located at the bottom of the HVAC housing (1). A rubber condensation drain tube (2) is installed onto the drain port and protrudes through a rubber grommet (3) in the left side floor panel (4) to ensure that any condensate completely drains out of the HVAC housing and to the ground.



NOTE: The condensation drain tube must be kept open to prevent water from collecting in the bottom of the HVAC housing.

The drain tube is designed to keep contaminants from entering the HVAC housing. If the tube is pinched or blocked, condensate cannot drain, causing water to back up and spill into the passenger compartment. It is normal to see condensation drainage below the vehicle in warm weather.

If the condensation drain tube is damaged or missing, it must be replaced.

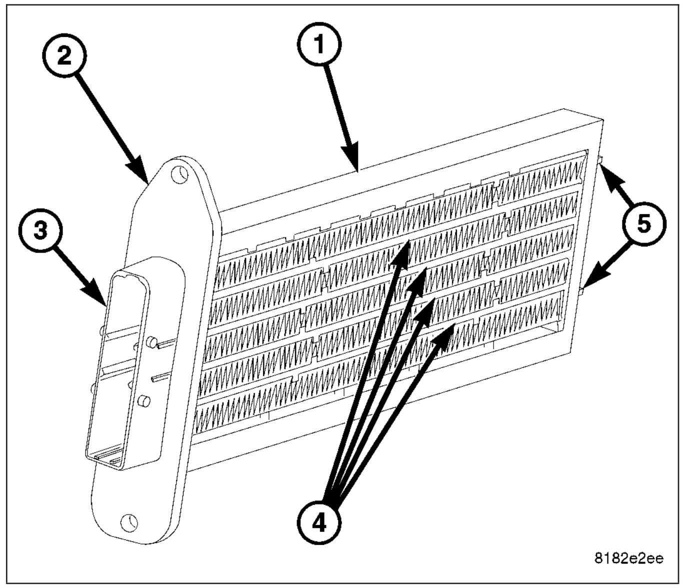


REMOVAL

1. Pull back the floor carpet to gain access to the condensation drain tube (2) located on the left side of the vehicle at the front right of the foot well.
2. Disconnect the condensation drain tube from the bottom of the HVAC housing (1).
3. Remove the condensate drain tube from the rubber grommet (3) in the front floor panel (4).
4. If required, remove the rubber grommet from the floor panel.

INSTALLATION

1. If removed, install the rubber grommet (3) onto the driver side front floor panel (4). Make sure the grommet is fully engaged to the floor panel.
2. Connect the condensation drain tube (2) onto the drain port located on the bottom of the HVAC housing (1).
3. Install the condensation drain tube into the rubber grommet.
4. Reinstall the floor carpet (refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).



HEATER-CABIN

TABLE OF CONTENTS

HEATER UNIT

DESCRIPTION

NOTE: LHD model shown. RHD model similar.

An electric positive temperature coefficient (PTC) heater unit (1) is used on vehicles when equipped with the 2.0L diesel engine. The PTC heater unit aids in passenger compartment heating by compensating for the lower engine coolant temperatures produced by the diesel engine. The PTC heater unit is mounted in the HVAC air distribution housing, downstream of the heater core and is controlled by the diesel engine control module (ECM) and the totally integrated power module (TIPM) through two relays in diesel accessory fuse/relay block located below the left front fender.

The PTC heater consists of a molded plastic mounting plate (2) with an integral wire connector receptacle (3). Concealed behind the mounting plate are four heating elements with fins (4) that transfer the heat produced by the PTC heater to the conditioned air flowing within the air distribution housing. Two retaining tabs (5) are molded onto the opposite end of the heater unit to support the heater unit inside the air distribution housing. The PTC heater unit is connected to the vehicle electrical system through the instrument panel wire harness.

The PTC heater unit is accessed for service by removing the instrument panel.

OPERATION

The positive temperature coefficient (PTC) heater unit dissipates 1 kW of electrical power through 4 heating bars. The totally integrated power module (TIPM) operates the two relays for the PTC heater unit. The PTC heater unit is split into two ″banks″. Each bank is driven separately based on alternator load. This allows for lower in-rush current and optimum battery charging. After a bank has been turned on, another bank can only be turned on 10 seconds after the previous. On average, the PTC banks are not switched more than 25 times for each vehicle start. Electrical power output is between 900-1050 W.

The control system for the PTC heater unit is diagnosed using a scan tool. Prior to replacing a PTC heater unit, check for any diagnostic trouble codes (DTCs) related to the ECM, TIPM and heating-A/C system (refer to 24 - HVAC Electrical Diagnostics for more information).

The PTC heater unit cannot be adjusted or repaired and, if faulty or damaged it must be replaced.

DIAGNOSIS AND TESTING

POSITIVE TEMPERATURE COEFFICIENT (PTC) HEATER UNIT

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

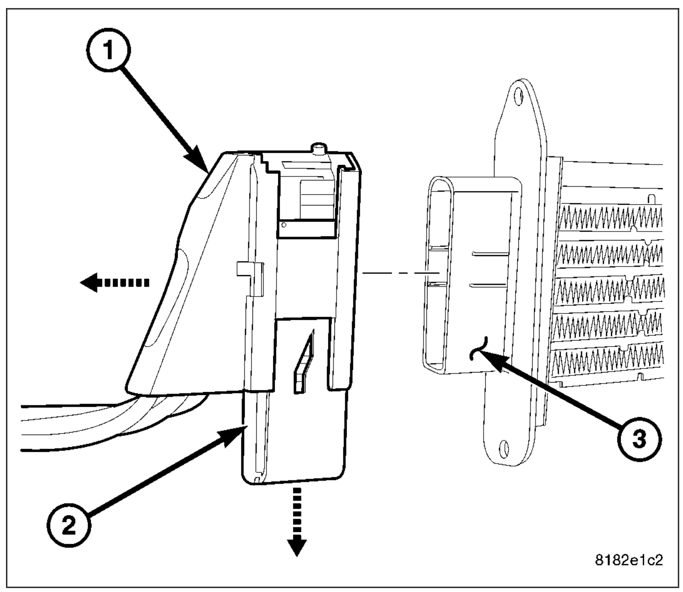
NOTE: For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

Prior to replacing the positive temperature coefficient (PTC) heater unit, check for any diagnostic trouble codes (DTCs) related to the engine control module (ECM), totally integrated power module (TIPM) and the heating-A/C system and repair as necessary (refer to 24 - HVAC Electrical Diagnostics for more information).

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the PTC heater unit (Refer to 24 - HEATING & AIR CONDITIONING/CABIN HEATER/HEATER UNIT - REMOVAL).
3. Using an ohmmeter, check for continuity between all of the PTC heater unit terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the PTC heater unit and the TIPM. If NOT OK, replace the PTC heater unit.

REMOVAL

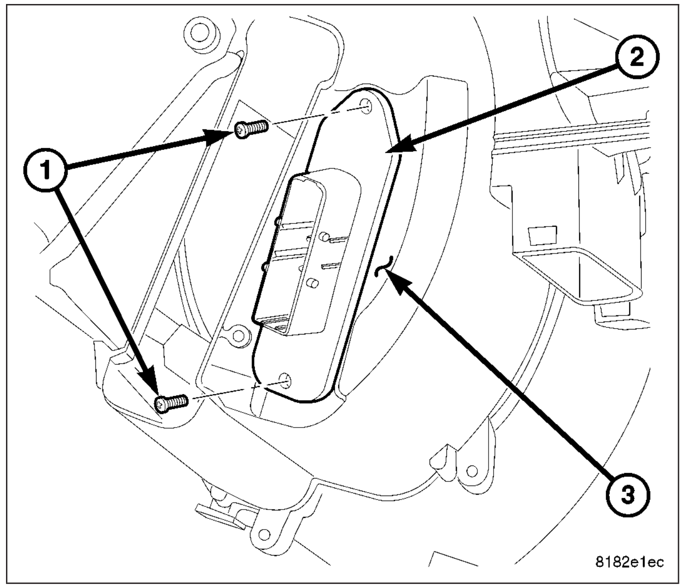
WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.



WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: PTC heater shown removed from distribution housing for clarity.

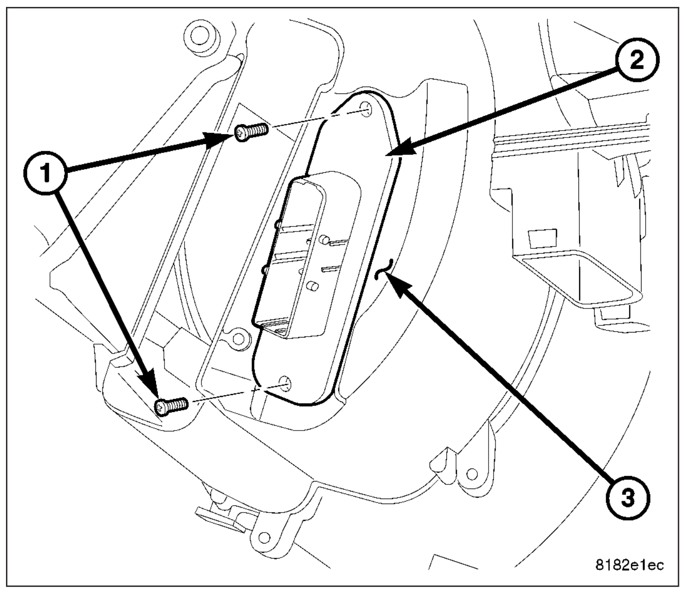
1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).



NOTE: To disconnect the wire harness connector from the heater unit, pull downward on the connector lock while pulling the connector away from the heater unit.

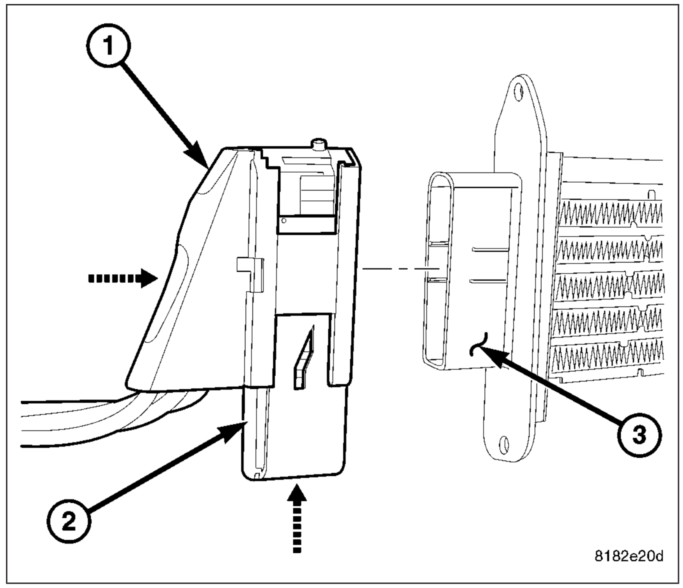
3. Disengage the wire connector lock (2) that secures the wire harness connector (1) to the positive temperature coefficient (PTC) heater unit (3) located on the left side of the HVAC air distribution housing and disconnect the connector from the heater.

NOTE: LHD model shown. RHD model similar.



4. Remove the two screws (1) that secure the PTC heater unit (2) to the left side of the HVAC air distribution housing (3).
5. Carefully remove the PTC heater unit from the air distribution housing by pulling it straight out of the housing.

INSTALLATION

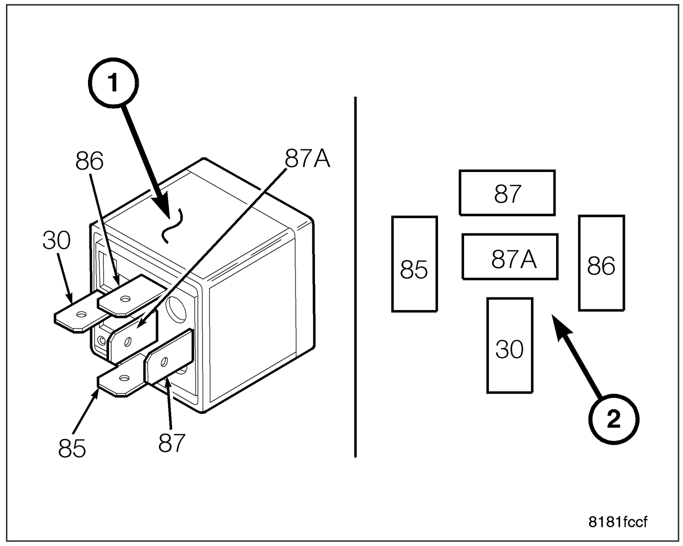


NOTE: LHD model shown. RHD model similar.

1. Carefully install the positive temperature coefficient (PTC) heater unit (2) into the left side of the HVAC air distribution housing (3). Make sure to position the two locator tabs on the end of the heater unit into the molded locator indentations on the right side of the air distribution housing.
2. Install the two screws (1) that secure the PTC heater unit to the air distribution housing. Tighten the screws to 1.2 N·m (10 in. lbs.).

NOTE: PTC heater shown removed from distribution housing for clarity.

3. Connect the wire harness connector (1) to the PTC heater unit (3) while pushing upward on the connector lock (2). Make sure the wire harness connector and lock are fully engaged.
4. Install the instrument panel (refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
5. Reconnect the negative battery cable.



RELAY-HEATER UNIT

DESCRIPTION

Two relays (1) are used for the electric positive temperature coefficient (PTC) heater system when equipped with the 2.0L diesel engine. The relays are International Standards Organization (ISO)-type relays. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The PTC relays are electromechanical devices that switch fused battery current directly to the heating elements of the PTC heater unit. The PTC relays are energized by control circuits of the totally integrated power module (TIPM).

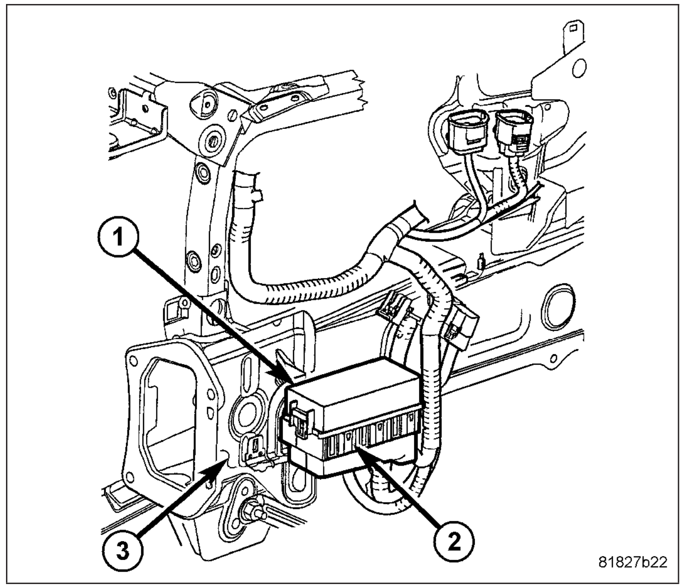
The two PTC relays are located diesel accessory fuse/relay block located below the left front fender.

OPERATION

The two ISO-standard relays (1) used for the electric positive temperature coefficient (PTC) heater system are electromechanical switches that use a low current ASD power input to control the high current fused battery power output to the PTC heater unit. On each relay, the movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to one or more of the heating elements of the PTC heater.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The terminals for the PTC relays are connected to the vehicle electrical system through receptacles in the diesel accessory fuse/relay block. The inputs and outputs of the PTC relays include:



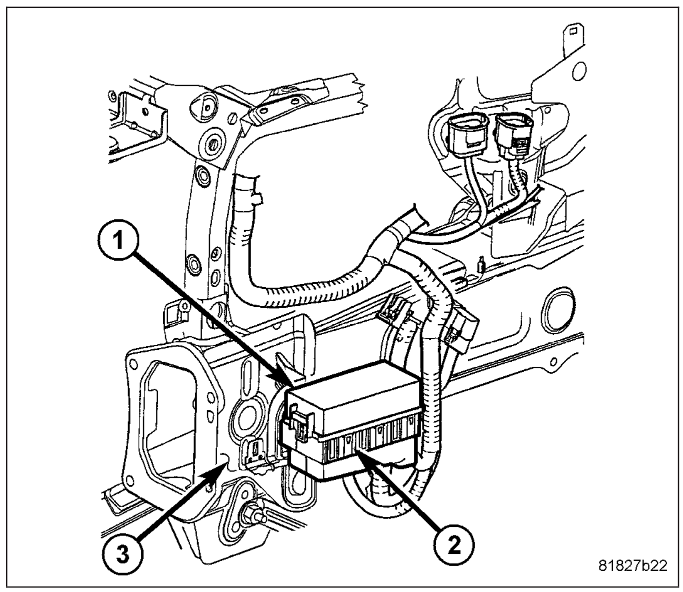
- Terminals (30) receive battery current through a fusible link at all times.
- Terminals (85) are connected to a ground circuit.
- Terminals (86) are connected to control circuits of the totally integrated power module (TIPM).
- Terminals (87) provide fused battery current to the PTC heating elements through the PTC relays only when the PTC relay coil is energized.
- Terminals (87A) are not connected to any circuit in this application, but provide battery current output only when the PTC relay coil is de-energized.

The two PTC relays cannot be repaired and, if faulty or damaged they must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the ISO-standard relays and for complete TIPM and HVAC wiring diagrams.

REMOVAL

NOTE: LHD model shown. RHD model similar.

NOTE: Illustration shown with left front fender removed for clarity.



1. Disconnect and isolate the negative battery cable.
2. Remove the left front wheelhouse splash shield (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - REMOVAL).
3. Open the cover (1) of the diesel accessory fuse/relay block (2) located on the left front frame rail (3).
4. Remove the positive temperature coefficient (PTC) relays as necessary from the fuse/relay block.

INSTALLATION

NOTE: LHD model shown. RHD model similar.

NOTE: Illustration shown with left front fender removed for clarity.

1. Position the positive temperature coefficient (PTC) relays as necessary into the proper receptacle of the diesel accessory fuse/relay block (2) located on the left front frame rail (3).
2. Align the PTC relay terminals with the terminal cavities in the fuse/relay block and push down firmly on each relay until the terminals are fully seated.
3. Close the cover (1) of the diesel accessory fuse/relay block.
4. Install the left front wheel house splash shield (refer to 23 - BODY/EXTERIOR/SPLASH SHIELD-FRONT WHEELHOUSE - INSTALLATION).
5. Reconnect the negative battery cable.

EMISSIONS CONTROL

TABLE OF CONTENTS

EMISSIONS CONTROL

DESCRIPTION

MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Purge
- Misfire
- Evaporative System Integrity Monitor (ESIM)

COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

1. Circuit Continuity
   - Open
   - Shorted high
   - Shorted to ground
2. Rationality or Proper Functioning
   - Inputs tested for rationality
   - Outputs tested for functionality

NOTE: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1- trip.

Input Rationality—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)

- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Inlet Air Temperature Sensor
- Throttle Position (TPS) Sensor
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Evaporative System Integrity Monitor (ESIM)
- P/N Switch
- Trans Controls

Output Functionality—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Purge Solenoid
- EGR Solenoid (if equipped)
- Radiator Fan Control
- Trans Controls

OXYGEN SENSOR (O2S) MONITOR

DESCRIPTION—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

Slow Response Rate (Big Slope)—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

Reduced Output Voltage (Half Cycle)—The output voltage of the O2S ranges from 2.5 to 5 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporary and

the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

Heater Performance—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

OPERATION—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

Enabling Conditions—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Barometric pressure
- Engine RPM within acceptable range of desired idle
- Closed throttle speed

Pending Conditions—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- EVAP Electrical
- EGR Solenoid Electrical (if equipped)
- Intake Air Temperature
- 5 Volt Feed

Conflict—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress

Suspend—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if an of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

OXYGEN SENSOR HEATER MONITOR (NGC)

DESCRIPTION—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300° C (572°F). Heating the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

Monitor Operation—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O2 switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O2 sensor switches is divided by the number of Front O2 sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

Enabling Conditions—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

Pending Conditions—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Vehicle Speed Sensor
- Brake switch
- Inlet air temperature

Conflict—The catalyst monitor does not run if any of the following are conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level
- Low ambient air temperature

Suspend—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. DaimlerChrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 4.4° C (40°F) in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 71° C (160°F)
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1–good trip.

NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the Powertrain Diagnostic manual for more information

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The

PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C (572 °F) Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (if equipped)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, drive-ability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

EVAPORATIVE SYSTEM INTEGRITY MONITOR (ESIM)

The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does – controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM. In most cases the ESIM mounts directly to the vapor canister. In the event that the ESIM can not be mounted directly to the canister, an adaptor is used. It is important to ensure the ESIM is mounted vertical due to the operation of the ESIM design. (Note: The electrical connector on the ESIM will be at the 3 o'clock position if mounted correctly.)

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately .5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools and the resulting vacuum lifts the small check valve from its seat and allows fresh air to enter the system and relieve the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

The ESIM weights seal the evap. system during engine off conditions. If the evap. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1" H20, the vacuum switch closes. The switch closure sends a

signal to the GPEC1. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

- After the vehicle is started, the engine coolant temperature must be within 10_C of ambient to indicate a cold start.
- The fuel level must be between 12% and 88%.
- The engine must be in closed loop.
- Manifold vacuum must be greater than a minimum specified value.
- Ambient temperature must be between 39 F and 98 F or 4 C and 37 C and the elevation level must be below 8500 feet.

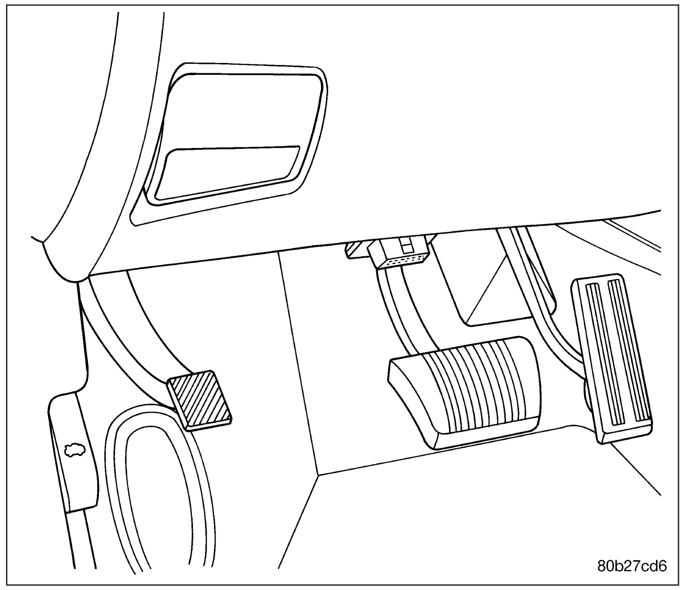
The test is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. IF the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. GPEC1 monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the GPEC commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the GPEC1 sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds, venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.



The GPEC1 also uses the ESIM to detect a loose or missing gas cap. The GPEC1 controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the GPEC1, this is a three-trip fault before the code matures

HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION

SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. For obtaining the DTC information, use the Data Link Connector with the scan tool.

EVAPORATIVE EMISSIONS

TABLE OF CONTENTS

EVAPORATIVE EMISSIONS

DIAGNOSIS AND TESTING

OBD II MONITOR INFORMATION

Comprehensive Components Monitor (Includes All Engine Hardware Sensor, Switches, Solenoids, etc.)	Major Monitors Non Fuel Control & Non Misfire (Monitors Entire Emission System)	Major Monitors Fuel Control & misfire (Monitors Entire System)
Most are one trip Faults	Most are Two Trips Faults	Two Trip Faults
Usually Turns on The Mill and Sets DTC After One Failure	Turns On The Mil and Sets DTC after Two Consecutive Failure	The Mil and Sets DTC After Two Consecutive Failure
Priority 3	**Priority 1 or 3**	**Priority 2 or 4**
All Checked For Continuity	Done Stop Test = Yes	**Fuel Control Monitor**
Open Short To Ground Short To Voltage	Oxygen Sensor Heater Oxygen Sensor Response Catalytic Converter	Monitors Fuel Control System For: Fuel System Lean
Inputs Checked For Rationality	Efficiency Except EWMA	Fuel System Rich
Outputs Checked For Functionality	up to 6 test per trip and a one trip fault (SBEC) and two trip fault on (JTEC)	Requires 3 Consecutive Fuel System Good Trips to Extinguish the MIL
	EGR System	**Misfire Monitor**
	Evaporative Emission System (purge and leak) Non-LDP LDP	Monitors for Engine Misfire At: 4 X 1000 RPM Counter (4000 Revs) (Type B) **200 X 3 (600) RPM counter (Type A)
Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL
*40 Warm Up Cycles are required to erase DTCs after the MIL has been extinguished		** Type A misfire is a one trip failure on pre-1999, 2 trip failure on 1999 and later. The MIL will illuminate at the first or second failure, based on MY.

OBD II MONITOR RUN PROCESS

The following procedure has been established to assist Daimler Chrysler Dealer Technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE:
Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. NVLD Monitor runs after key off. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

Monitor Preliminary Checks:

1. Plug a scan tool into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. Using a scan tool check for Powertrain related DTCs..
   - Verify that No Emissions Related DTCs are Present.
   - * If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
   - The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.

Using the scan tool check the CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?.

- *YES, then all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- *NO, then the following procedure needs to be followed to run/complete all available monitors.

NOTE:
Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. Specific criteria need to be met for each monitor. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.

Evaporative Emission System Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. For the monitor run conditions select the EVAP MON PRE-TEST in the scan tool, OBD II Monitors Menu. The Purge monitor will run if the small leak test reports a pass. Criteria for EVAP monitor:

- Engine off time greater than @ one hour.
- Fuel Level between 15% and 85 %.
- Start Up ECT and IAT within 10° C (18° F).
- Vehicle started and run until Purge Monitor reports a result.

NOTE: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

Catalyst / O2 Monitor

With NGC, Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (< 50 mph) for a few minutes. Some vehicles run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria. For the monitor run conditions, select the BANK 1 CAT MON PRE-TEST in the scan tool, OBD II Monitors Menu.

EGR Monitor

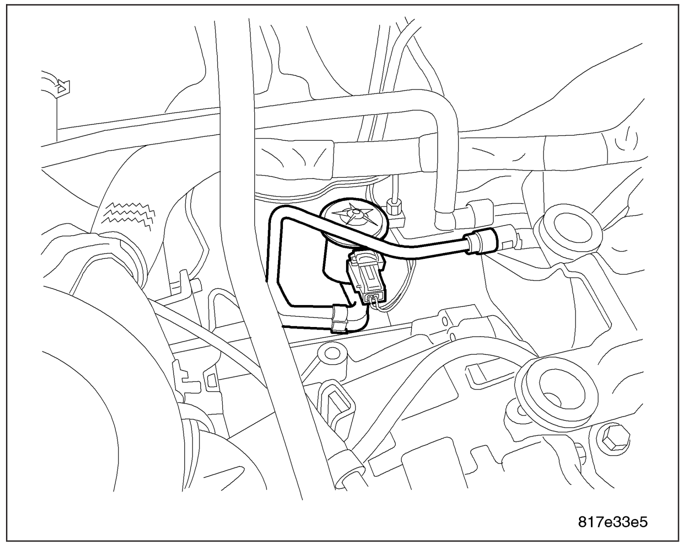
The EGR monitor now runs in a closed throttle decel or at idle on a warm vehicle. However, it is necessary to maintain the TPS, Map and RPM ranges to allow the monitor to complete itself. For the monitor run conditions, select the EGR PRE-TEST in the scan tool, OBD II Monitors Menu.

O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down. For the monitor run conditions, select the O2S HEATER MON PRE-TEST in the scan tool, OBD II Monitors Menu.

Mis-Fire Monitor

The NGC Misfire Monitor is a continuous two-trip monitor. The monitor uses two different tests/counters:



NOTE: The Adaptive Numerator must be learned before the PCM will run the Mis-Fire Monitor. The PCM updates the Adaptive Numerator at every key-ON, and is relearned after battery disconnect. The Misfire Monitor will not run until the Adaptive Numerator has updated since the last battery disconnect. If the Adaptive Numerator is equal to the default value then the PCM knows that the Adaptive Numerator has not been learned and does not permit the Misfire Monitor to run. If the Adaptive Numerator exceeds a calibrated percentage, the PCM sets a DTC for CKP NOT LEARNED and illuminates the MIL.

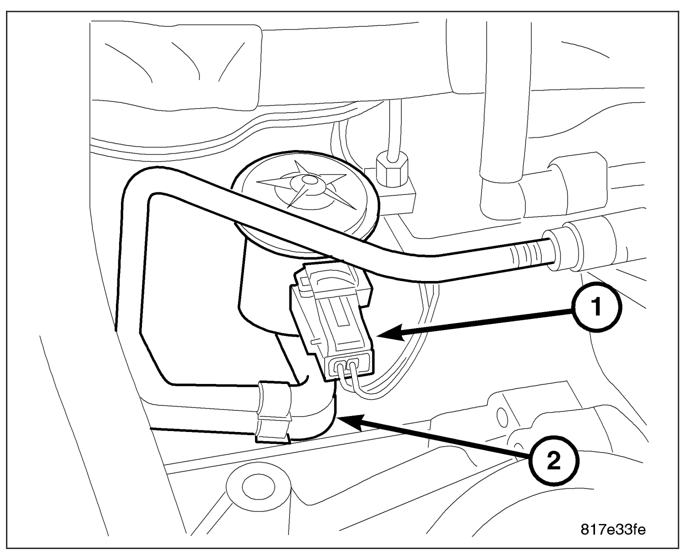
- 200 Revolution Counter - Looks for misfire that can cause immediate catalyst damage.
- 1000 Revolution Counter - Looks for misfire that can cause emissions to increase 1.5 times the Federal Test Procedure (FTP) standards. This test must also identify misfire percentages that might cause a “durability demonstration vehicle” to fail an Inspection and Maintenance Program tailpipe emissions test.

EVAP/PURGE SOLENOID

DESCRIPTION

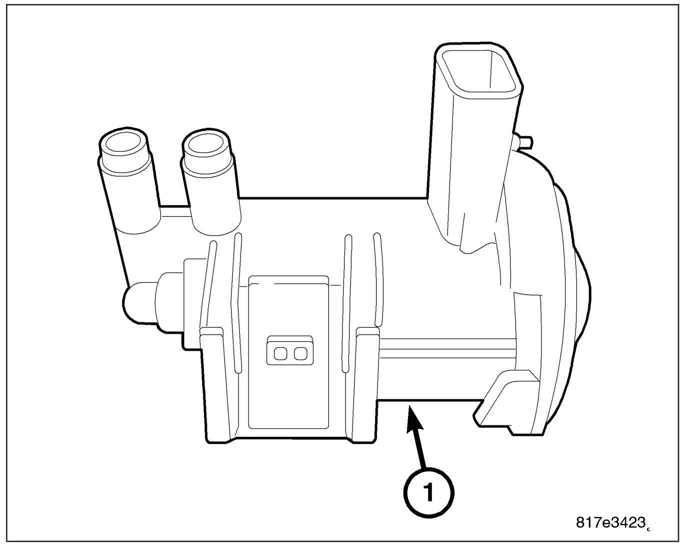
All vehicles use a proportional purge solenoid (1). The solenoid regulates the rate of vapor flow from the EVAP canister to the intake manifold. The PCM operates the solenoid.

OPERATION



All vehicles use a proportional purge solenoid. The solenoid regulates the rate of vapor flow from the EVAP canister to the intake manifold. The PCM operates the solenoid.

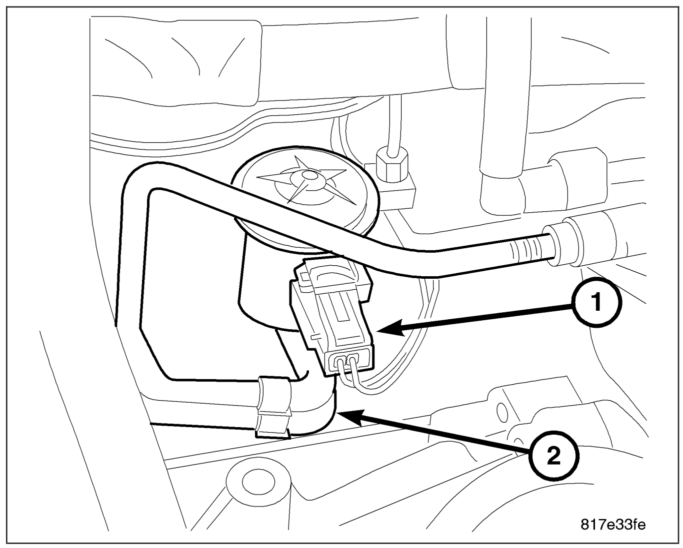
During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged.



The proportional purge solenoid operates at a frequency of 200 hz and is controlled by an engine controller circuit that senses the current being applied to the proportional purge solenoid and then adjusts that current to achieve the desired purge flow. The proportional purge solenoid controls the purge rate of fuel vapors from the vapor canister and fuel tank to the engine intake manifold.

REMOVAL

1. Remove air inlet resonator assembly.
2. Remove the air cleaner box.
3. Disconnect negative battery cable.
4. Unlock and disconnect electrical connector from solenoid (1).
5. Disconnect vacuum tubes from solenoid (2).



6. Remove solenoid (1) from bracket by depressing clip and pulling solenoid from bracket.

INSTALLATION

The top of the solenoid has TOP printed on it. The solenoid will not operate unless it is installed correctly.

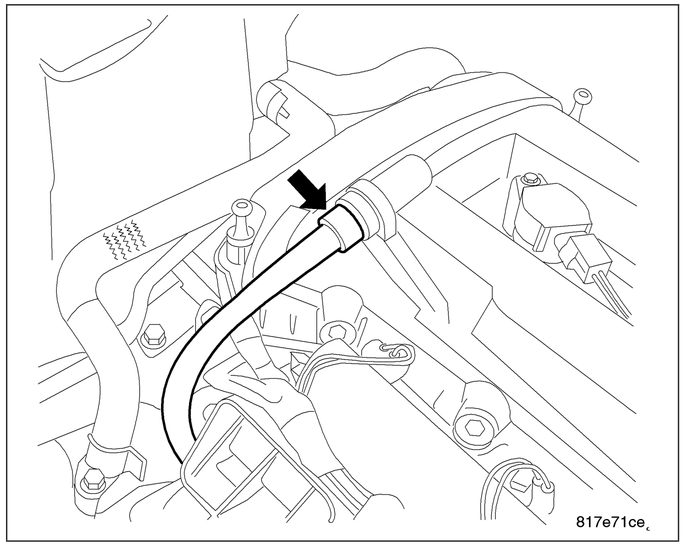
1. Connect vacuum tube to solenoid (2).
2. Connect electrical connector to solenoid and lock (1).
3. Install solenoid on bracket.
4. Install the negative battery cable.
5. Install air cleaner box.
6. Install resonator assembly.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel fill cap is threaded/quarter turn onto the end of the fuel filler tube. It's purpose is to retain vapors and fuel in the fuel tank.

OPERATION

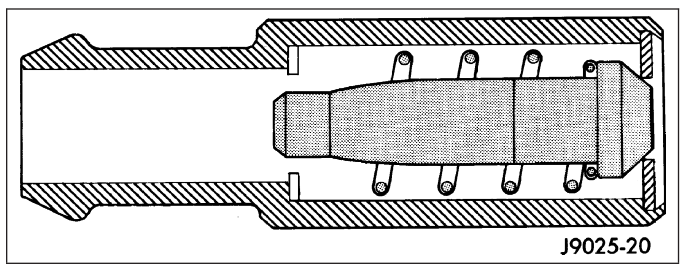


The fuel filler cap incorporates a two-way relief valve that is closed to atmosphere during normal operating conditions. The relief valve is calibrated to open when a pressure of 17 kPa (2.5 psi) or vacuum of 2 kPa (0.6 in. Hg) occurs in the fuel tank. When the pressure or vacuum is relieved, the valve returns to the normally closed position.

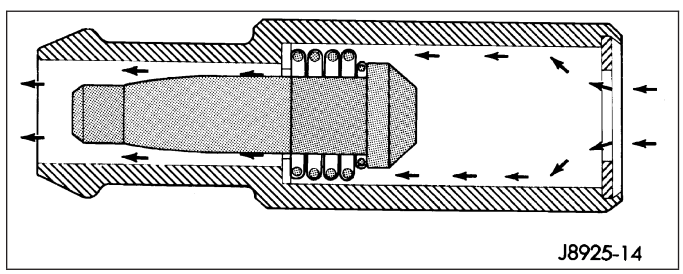
CAUTION: Remove the fuel filler cap to release fuel tank pressure before disconnecting any fuel system component.

PCV VALVE

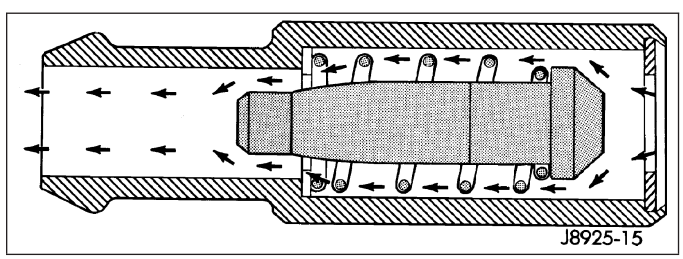
DESCRIPTION



It threads into the valve cover.



OPERATION

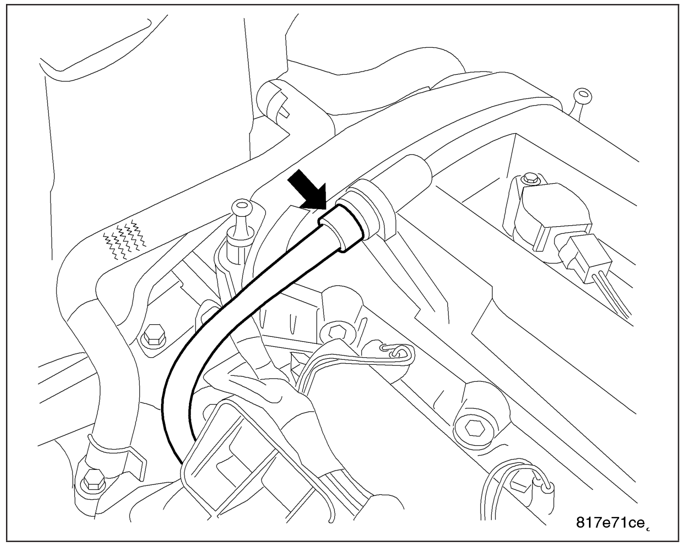


When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve.

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve. In this position there is minimal vapor flow through the valve.

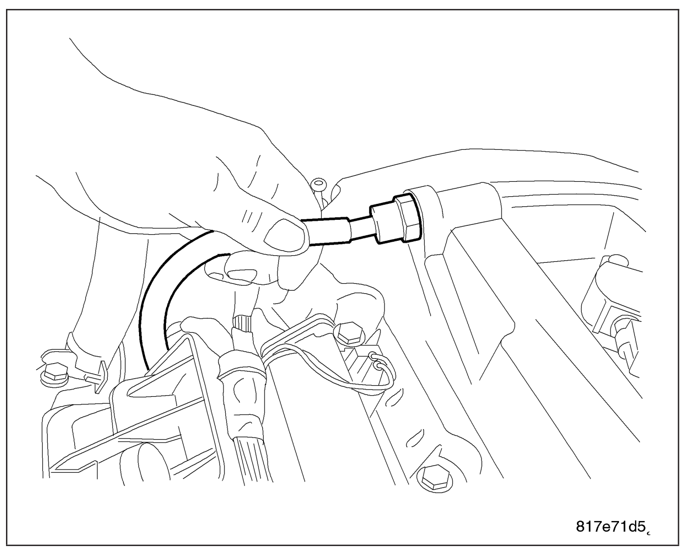
During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve.

DIAGNOSIS AND TESTING - PCV SYSTEM



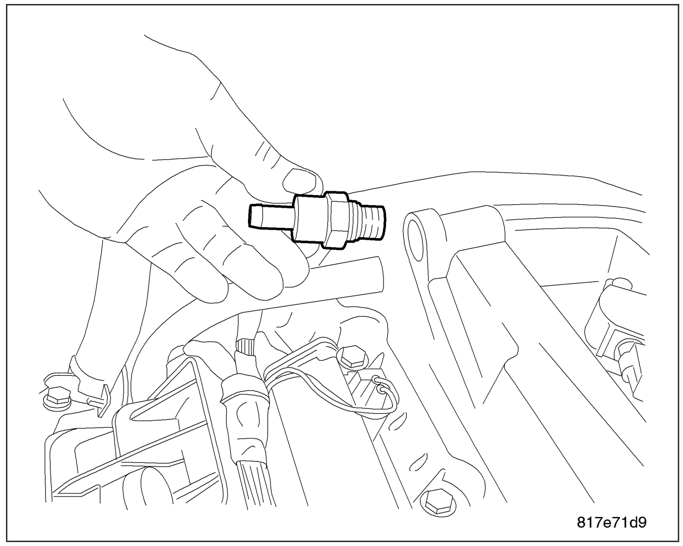
WARNING: apply parking brake and/or block wheels before performing any test or adjustment with the engine operating.

1. With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.
2. Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.



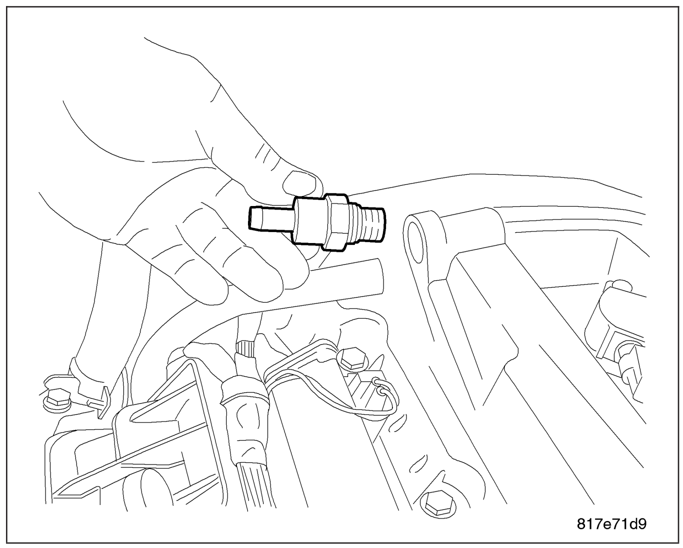
3. After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.
4. Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.
5. Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.**

REMOVAL

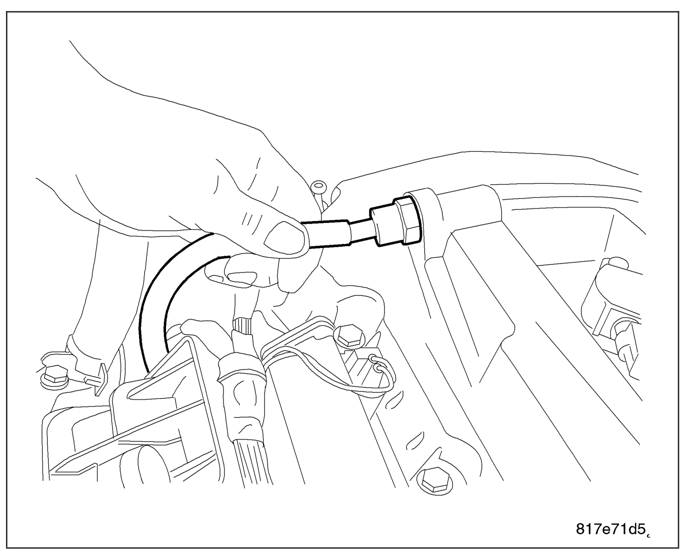


1. Remove the engine cover.

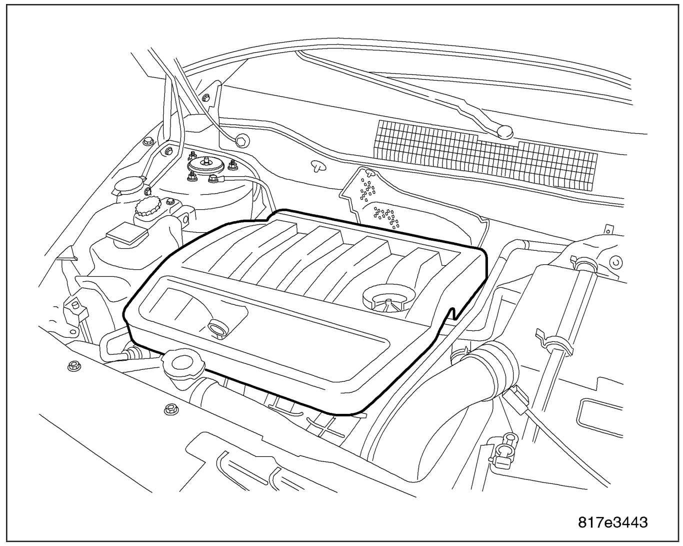
2. Remove the hose from the PCV valve.



3. Unscrew the PCV valve.



INSTALLATION



1. Lubricate the O-ring on the valve.
2. Install the PCV valve and tighten the valve to 8.1 N·m (72 in. lbs.).

3. Install the hose.

4. Install engine cover.

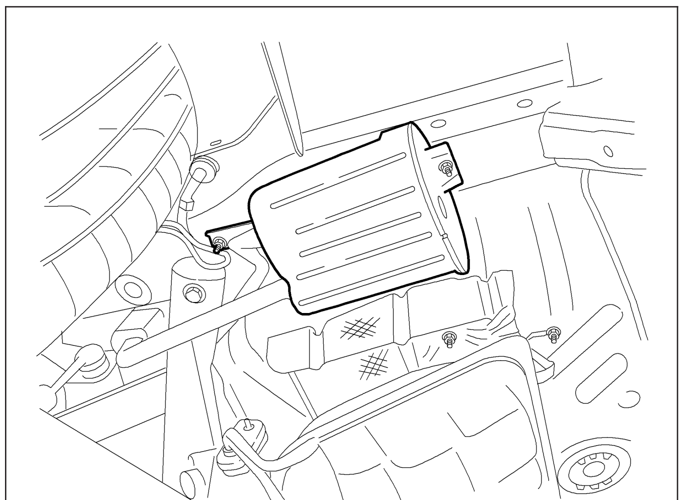
VAPOR CANISTER

DESCRIPTION

The canister mounts (1) to a left rear rail in the rear of the vehicle. The vacuum and vapor tube connect to the top of the canister.

OPERATION

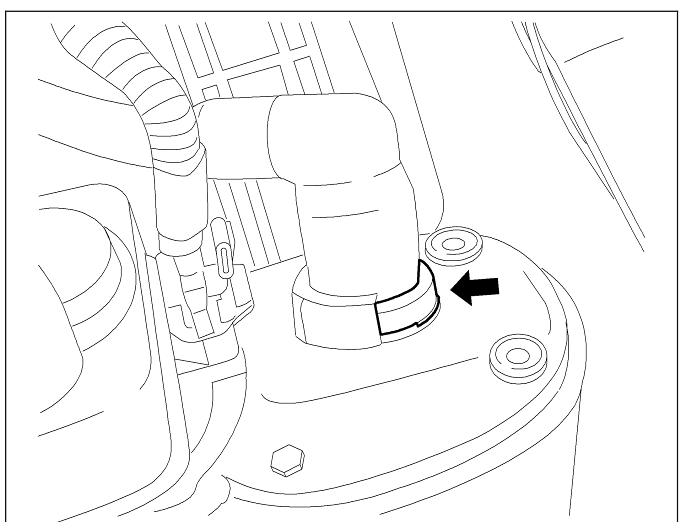
All vehicles use a maintenance free, evaporative (EVAP) canister. Fuel tank vapors vent into the canister. The canister temporarily holds the fuel vapors until intake manifold vacuum draws them into the combustion chamber. The Powertrain Control Module (PCM) purges the canister through the proportional purge solenoid. The PCM purges the canister at predetermined intervals and engine conditions.



Purge Free Cells

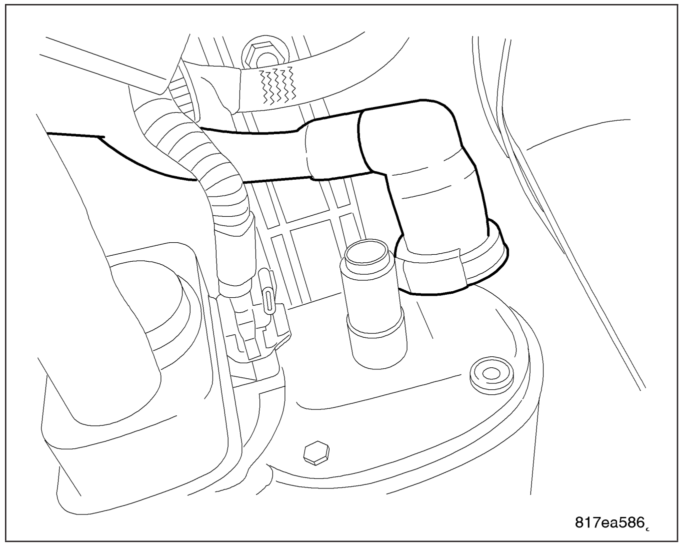
Purge-free memory cells are used to identify the fuel vapor content of the evaporative canister. Since the evaporative canister is not purged 100% of the time, the PCM stores information about the evaporative canister's vapor content in a memory cell.

The purge-free cells are constructed similar to certain purge-normal cells. The purge-free cells can be monitored by the scan tool. The only difference between the purge-free cells and normal adaptive cells is that in purge-free, the purge is completely turned off. This gives the PCM the ability to compare purge and purge-free operation.



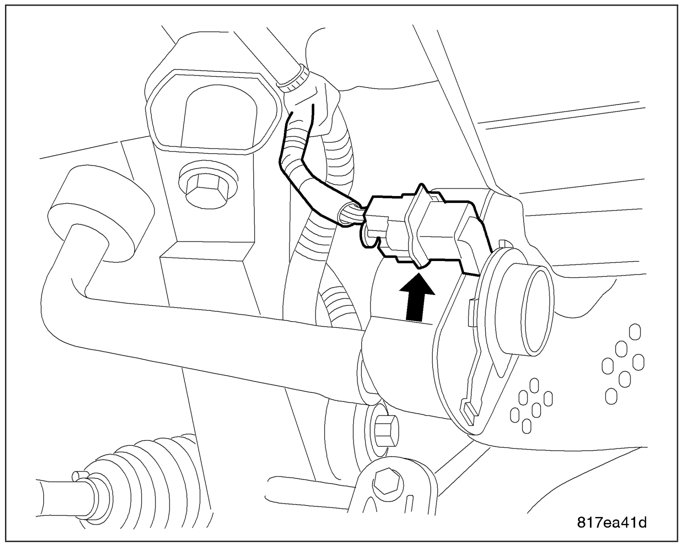
REMOVAL

1. Disconnect negative battery cable.
2. Raise and support vehicle.

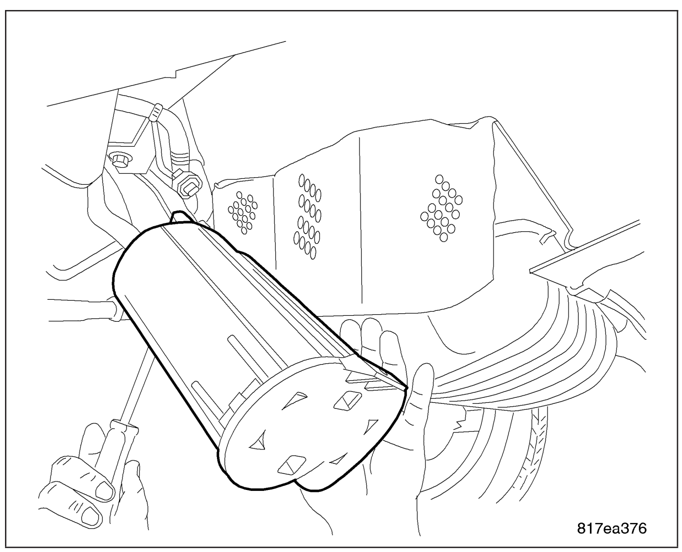


817ea370

3. Depress locking tab on vapor hose connector and pull off of canister.



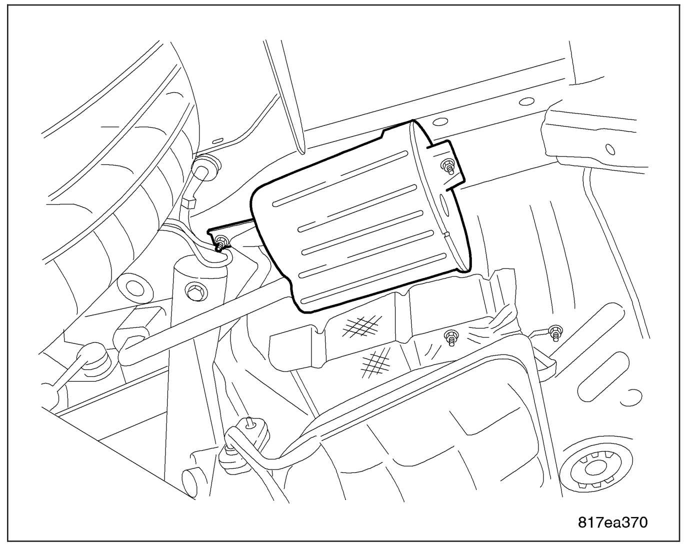
817ea582



4. Remove hose from ESIM module.
5. Vapor hose removed.

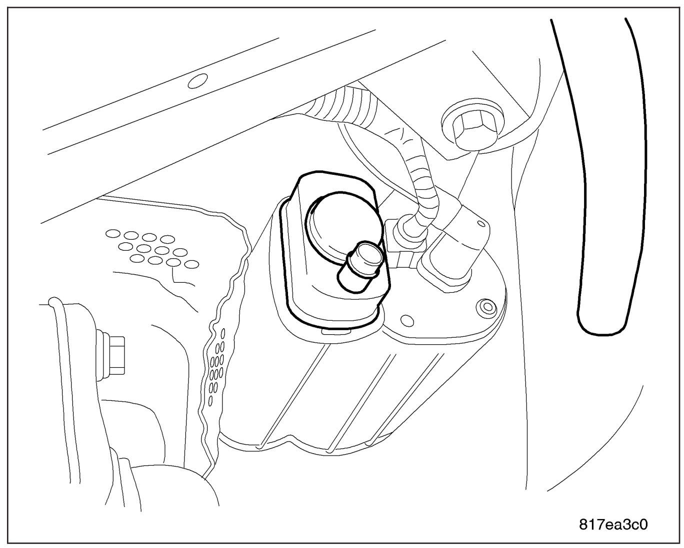
817ea586

6. Disconnect the electrical connector from ESIM module.



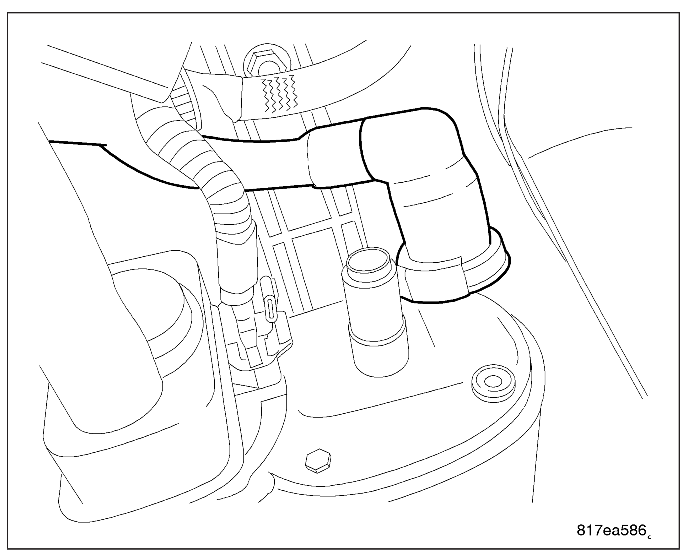
817ea41d

7. Remove two vapor canister mounting bolts.
8. Remove assembly.

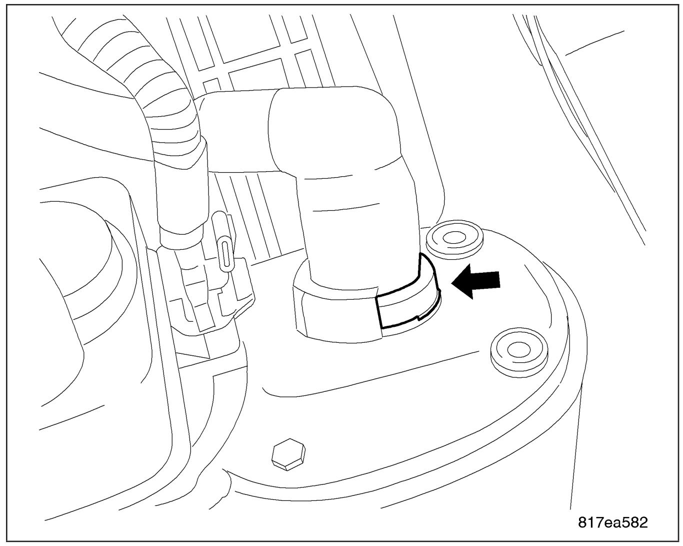


817ea376

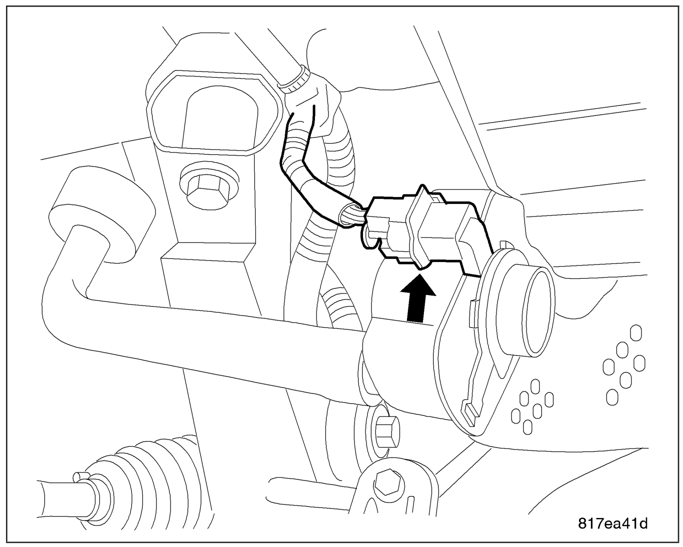
INSTALLATION



1. Install canister and bracket.

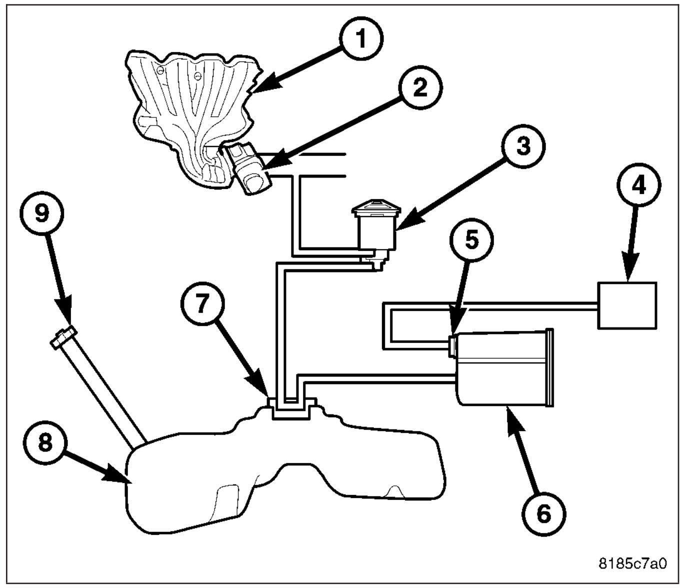


2. Connect filter hose to ESIM.



3. Connect vapor hose.

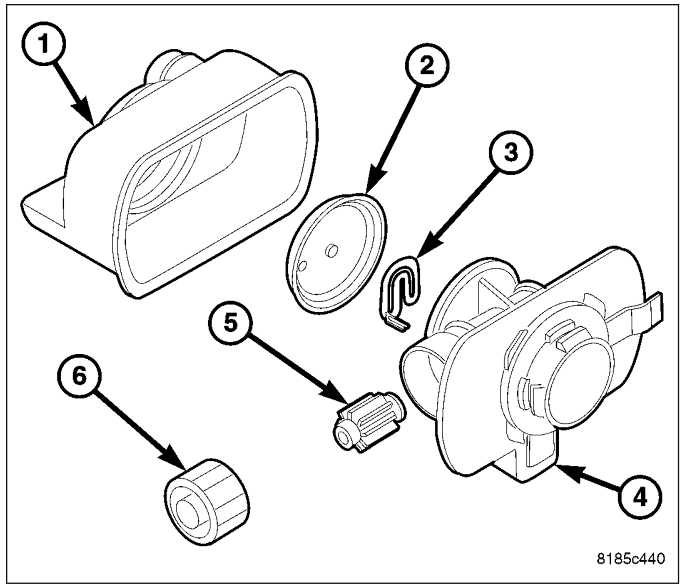
4. Make sure locking tab on hose connector locks in place.



5. Connect electrical connector to ESIM module.
6. Lower vehicle.
7. Connect negative battery cable.

SWITCH-EVAP SYSTEM MONITOR

OPERATION



The ESIM (Evaporative System Integrity Monitor) is very similar to the NVLD. However, the design of the ESIM has been simplified and unlike the NVLD the ESIM does not require a solenoid. The ESIM mounts directly to the canister, eliminating the need for a mounting bracket. It is critical that the ESIM is mounted vertically. On vehicles where the canister is mounted on an angle, the ESIM requires an adaptor to maintain a vertical position. When the ESIM is installed vertically, the electrical connector is in the 3 o'clock position.

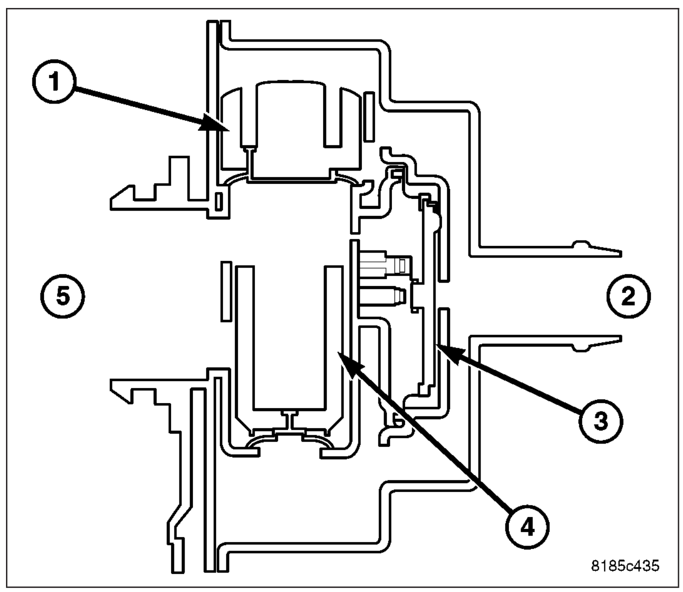
SYSTEM

1 - Intake Manifold
2 - Throttle Body
3 - Purge Solenoid
4 - Filter
5 - ESIM
6 - Vapor Canister
7 - Control Valve
8 - Fuel Tank
9 - Gas Cap

The ESIM assembly consists of a housing, a small weight and a large weight that serve as check valves, a diaphragm, a switch and a cover. There is one large weight and one small weight check valve in the ESIM assembly. A seal is attached at the end of each weighted check valve. The large weight check valve seals for pressure. The small weight check valve seals for vacuum. The weighted check valves are contained within the ESIM housing.

EXPLODED VIEW

1 - ESIM Housing
2 - Diaphragm
3 - Switch
4 - Cover
5 - Small Check Valve
6 - Large Check Valve



The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does – controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM.

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately .5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools and the resulting vacuum lifts the small check valve from its seat and allows fresh air to enter the system and relieve the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

CUT AWAY OF MODULE

1 - Large Check Valve
2 - Fresh Air Inlet
3 - Diagram
4 - Small Check Valve
5 - Vapor Canister

The ESIM weights seal the evap. system during engine off conditions. If the evap. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1” H20, the vacuum switch closes. The switch closure sends a signal to the GPEC1. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

- After the vehicle is started, the engine coolant temperature must be within 10_C of ambient to indicate a cold start.
- The fuel level must be between 12% and 88%.
- The engine must be in closed loop.
- Manifold vacuum must be greater than a minimum specified value.
- Ambient temperature must be between 39 F and 98 F or 4 C and 37 C and the elevation level must be below 8500 feet.

The test is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. IF the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. GPEC1 monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the GPEC commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the GPEC1 sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds, venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.

The GPEC1 also uses the ESIM to detect a loose or missing gas cap. The GPEC1 controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the GPEC1, this is a three-trip fault before the code matures

ON-BOARD DIAGNOSTICS

TABLE OF CONTENTS

TASK MANAGER

DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is call the “Task Manager”.

OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as ’two trip monitors.’ Other tests that turn the MIL lamp on after a single failure are known as ’one trip monitors.’ A trip is defined as ’start the vehicle and operate it to meet the criteria necessary to run the given monitor.’

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- **Pending**
  Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.
  For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.
- **Conflict**
  There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.
  For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.
- **Suspend**
  Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.
  For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the thirdgood trip) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 —Non-emissions related trouble codes.
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire. (MIL Off)
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire. (MIL Off)
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault. (MIL On)
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire. Catalyst damage misfire is a 2 trip MIL. The MIL flashes on the first trip when catalyst damage misfire levels are present. (MIL On)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ±375 RPM and load is within ±20% of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a scan tool. Erasing the DTC with the scan tool erases all OBD II information. The scan tool automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on scan tool)
    - Comprehensive Components

  - Major Monitor
- Warm-Up Cycles

Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Alternate Good Trip

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the scan tool. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 71° C (160° F)
- Engine coolant temperature must rise by 4.5° C (40° F)
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the scan tool; or by disconnecting the battery, also clears all Freeze Frame data.

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that ’Absolute MAP When Fuel Sys Fail’ and ’RPM When Fuel Sys Failed’ are all in the same range when the failure occurred. Indicated by switching from ’NO’ to ’YES’.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 71° C 160° F).
- **In Similar Misfire Window** — An indicator that ’Absolute MAP When Misfire Occurred’ and ’RPM When Misfire Occurred’ are all in the same range when the failure occurred. Indicated by switching from ’NO’ to ’YES’.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
